Conclusions drawn in this report are based on available information at the time of writing. Any additional information may alter such conclusions and the author reserves the right to do so if such information becomes available. This report has been made as at the date of the report and is not to be used after six (6) months and not if there are any material changes meanwhile. In either event it should be referred back for review. To the extent permitted by law BOOBOOK does not accept liability for any loss or damage which any person may suffer arising from any negligence or breach of contract on its part. This report was prepared for the benefit of the party to whom it is directed only and for the purpose identified within. BOOBOOK does not accept responsibility to any other person for the contents of the report.
1. Introduction

1.1. Purpose and Scope
Santos (the Client) required the following services in relation to identifying ecological values of vegetation in part of the property ‘Rockview’, Lot 5 on Plan WT314 (hereafter SWT314) and part of Lot 3 on Plan WT313 (hereafter 3WT313) within tenement PL 99 and hereafter referred to as ‘the Site’ (Appendix A), located north-east of Injune in south central Queensland:

- Regional ecosystem (RE) mapping using the functional RE condition thresholds;
- Quantification of Threatened Ecological Communities (TEC);
- Fauna general habitat mapping and assessment for nominated Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act) listed threatened species;
- Flora general habitat mapping and assessment for nominated EPBC Act listed threatened species;
- Searches for the presence of EPBC Act and/or Nature Conservation Act 1992 (NC Act) listed threatened flora; and
- Incidental observations of EPBC Act and/or NC Act listed threatened fauna.

1.2. Survey Team
A field survey of the Site was conducted by Richard Johnson (Senior Ecologist) and Rose Aisthorpe (Botanist) in the period 6th – 8th September 2017.

The project supervisor (Craig Eddie) was approved by the Department of the Environment and Energy (DoEE), formerly the Commonwealth Department of Sustainability, Environment, Water, Population and Communities (DSEWPaC), in writing on the 28th of January 2011 for the purpose of undertaking ecological assessment works for the Gladstone Liquefied Natural Gas (GLNG) project. All aspects of the project including field survey and reporting were conducted under the supervision of Craig Eddie.

2. Methodology

2.1. Desktop Assessment
A desktop assessment was conducted to inform the field survey. Sources of information utilised during the desktop assessment included the following:

- Remnant RE (DSITI 2017a) and mature regrowth (DEHP 2012) mapping – biodiversity status;
- Essential Habitat (EH) (DNRM 2017) mapping;
- EPBC Act Protected Matters Search Tool (PMST) (DoEE 2017a);
- Wildlife Online fauna and flora records (DSITI 2017b); and
- Protected Plants Flora Survey Trigger Map (DEHP 2017a).

2.2. Field Survey
In-field verification of desktop findings and additional findings of significance were undertaken in general accordance with the following:

- Methodology for Survey and Mapping of Regional Ecosystems and Vegetation Communities in Queensland (Neldner et al. 2017);
- Santos Methodology for Conducting Ecological Assessments – GLNG Areas Rev 4.1 (Santos 2014); and
- Santos Functional Thresholds for Assessing Regional Ecosystem Functionality (Santos 2015).

Methodologies that were employed for each element of the field survey are further described in the following sections.
The two properties were visited to examine areas of remnant and regrowth vegetation. For some vegetation only assessable from a distance, visual inspection was conducted using binoculars. Representative photographs of these areas were used as a guide in post-field delineation of map polygon boundaries.

### 2.2.1. RE and TEC Assessment

Ground-truthing (and confidence level scoring) of the DSITI regional ecosystem (RE) designation was undertaken using the quaternary level of data collection as described by Neldner et al. (2017).

Assessments were undertaken within 50 m x 10 m plots for the purpose of typifying the vegetation community under assessment. The number of vegetation community assessments undertaken at each property depended on the diversity of vegetation communities present at each. Plots were chosen within representative areas of each vegetation type encountered. Locations of quaternary assessment sites are mapped in Appendix A.

Vegetation community polygons were verified in accordance with Queensland RE description and biodiversity status as per the Regional Ecosystem Description Database (REDD) (DSITI 2017c) and classified as remnant RE, vegetation consistent with RE (advanced regrowth) or non-remnant vegetation (Santos 2014). For each area of potential TEC an assessment of vegetation survey data was made against TEC threshold criteria (e.g. TSSC 2013).

Vegetation community data was captured in the field and entered into Santos-specific data fields within spatial databases via Motion tablet devices. Representative photographs were taken via a Canon digital camera at each vegetation survey site and at vegetation patches as supporting evidence of the identity of the subject vegetation community where full documentation was not required. Capture and delineation of RE and TEC boundaries was undertaken using a combination of mobile GIS devices, GPS and/or delineation from imagery. A minimum mappable width of 30 m for linear vegetation corridors (e.g. road corridors and shade lines) was applied. Patches were mapped to their full extent within the Site within practical limits (including land access constraints).

For identified advanced regrowth (i.e. vegetation floristically equivalent to an RE but not meeting structural thresholds of remnant RE) an ecosystem functionality assessment was conducted. This assessed selected vegetation characteristics against the parameters described in Santos (2015).

Plant names used within this document conform to those given in Bostock and Holland (2017).

### 2.2.2. Threatened Species Habitat Assessment and Mapping

Microhabitat assessments were undertaken in conjunction with vegetation community surveys at each survey plot, or as required where significant variation in the type and abundance of habitat features occurred. The results of these assessments, combined with ecologist knowledge, were used to predict habitat suitability for the following species, as nominated by the Client:

- Chalinolobus dwyeri (Large-eared Pied Bat, Large Pied Bat);
- Dasyurus hallucatus (Northern Quoll);
- Nyctophilus corbeni (South-eastern Long-eared Bat, Corben’s Long-eared Bat);
- Petrogale penicillata (Brush-tailed Rock-wallaby);
- Phascolarctos cinereus (Koala);
- Botaurus poiciloptilus (Australasian Bittern);
- Turnix melanogaster (Black-breasted Button-quail);
- Erythrophias radiatus (Red Goshawk);
- Geophaps scripta scripta (Squatter Pigeon (Southern));
- Poephila cincta cincta (Black-throated Finch);
- Rostratula australis (Australian Painted Snipe);
- Neochmia ruficauda ruficauda (Star Finch);
- Polytelis swainsonii (Superb Parrot);
- Lathamus discolor (Swift Parrot);
- Ardea ibis (Cattle Egret);
- Ardea modesta (Great Egret);
- Plegadis falcinellus (Glossy Ibis);
- Pandion haliaetus (Osprey);
- Merops ornatus (Rainbow Bee-eater);
- Pedionomus torquatus (Plains-wanderer);
- Anomalopus mackayi (Five-clawed Worm-skink);
- Delma torquata (Collared Delma);
- Denisonia maculata (Ornamental Snake);
- Egernia rugosa (Yakka Skink);
- Furina dunmali (Dunmall’s Snake);
- Rheodytes leukops (Fitzroy River Turtle);
- Maccullochella peeli (Murray Cod);
These results were used to develop GIS-based mapping of potential habitat for the identified species within the Site.

2.2.3. Threatened Flora Survey

Targeted surveys for threat-listed flora were informed by the desktop search results and local experience. Searches for threat-listed flora under the EPBC and/or NC Act were carried out at vegetation assessment sites and in random meanders in targeted habitat types, including remnant and non-remnant vegetation.

If detected, counts and extent of each population of threat-listed flora were made as well as structural characteristics and representative photographs taken. Data was recorded using the Santos-specific Notable Species - Flora Point or Region data capture layer.

2.2.4. Incidental Threatened Fauna Records

Any incidental records of threatened fauna obtained during vegetation assessments and general property traverses to and between sites (on foot and driving) were fully documented including species name, location (with site co-ordinates or area of extent), habitat and number detected.

2.2.5. Survey Limitations

Vegetation mapping accuracy was dependent on the ability to examine areas in the field, reliability of imagery interpretation and the degree of heterogeneity within given vegetation polygons (i.e. diversity of RE present) (Neldner et al. 2017). Individual mapped vegetation polygons have been assigned a confidence level (high, moderate, low) for both boundary accuracy and vegetation attributes within the polygon. Within the spatial database confidence ratings are designated as ‘A’ for high, ‘B’ for moderate and ‘C’ for low. The following schema was applied to vegetation polygons:

<table>
<thead>
<tr>
<th>Confident Clarification</th>
<th>Range of Accuracy</th>
<th>Homogenous Patches</th>
<th>Heterogeneous Patches</th>
</tr>
</thead>
<tbody>
<tr>
<td>High (A)</td>
<td>&lt;1 - &lt;10 m</td>
<td>Ground-truthed on site, or viewed at a distance</td>
<td>Ground-truthed on site</td>
</tr>
<tr>
<td>Moderate (B)</td>
<td>&gt;10 - &lt;50 m</td>
<td>Not ground-truthed (image interpretation only)</td>
<td>Portion ground-truthed on site</td>
</tr>
<tr>
<td>Low (C)</td>
<td>&gt;50 - &gt;200 m</td>
<td>nil</td>
<td>No ground truthing: vegetation viewed at a distance or image interpretation only</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Vegetation Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>High (A)</td>
</tr>
<tr>
<td>Homogenous Patches</td>
</tr>
<tr>
<td>Heterogeneous Patches</td>
</tr>
</tbody>
</table>
In some instances vegetation communities may not be readily assigned to an RE, even when ground-truthed, as their floristics and structure reflected historical disturbance patterns such as clearing, thinning and fire history. In these cases RE have been allocated on the basis of ‘best fit’ with current RE descriptions.

Microhabitat assessments were conducted at several representative sites within each ground-truthed RE present at the Site. Though the presence and abundance of microhabitat features e.g. hollow logs likely varies within and between patches (mapping polygons) of a given RE for the purposes of predictive fauna habitat mapping it is assumed that the results of microhabitat assessment for an RE are applicable throughout the Site. That is to say, a conservative approach has been taken with regard to mapping of species habitat where no ground-truthing has been undertaken. Where patches have not been ground-truthed, relevant fauna microhabitat features were assumed to be present and patches have been mapped as habitat until further assessments can be undertaken. Similarly, where predictive mapping of flora habitat is based on known associations with RE it is assumed that suitable habitat exists in all patches of the RE at the Site.

Threatened fauna searches were confined to incidental observations only (i.e. no trapping or targeted search techniques were employed). Additional survey effort would be required to provide a more comprehensive inventory of threatened fauna species present at the Site.

Timing (season) and duration of the survey period during early spring and following some localised rainfall was generally favourable for identification of woody plants (trees and shrubs), despite dry conditions prevailing at the time of survey. Conditions were less favourable for detection and identification of grasses and forbs: however, no threatened species of this type were expected to be present.

### 3. Results & Discussion

#### 3.1. Vegetation Mapping

##### 3.1.1. Desktop RE Mapping

Mapped remnant RE (DSITI 2017a) and mature regrowth (DEHP 2012) is shown in Appendix B.

##### 3.1.2. Revised RE Mapping

Ground-truthing, inspection at a distance and examination of aerial imagery identified three remnant and three advanced regrowth RE types within the Site (Table 3). Mapping of remnant and regrowth RE based on desktop interpretation and field analysis is presented in Appendix C. The extent (total area) of each mapped remnant and regrowth RE is summarised in Table 3. In total, approximately 572.1 ha of vegetation (remnant and regrowth) was mapped within the Site, which covers an area of approximately 860.6 ha.

**Table 3: Summary of extent of individual mapped REs from ground-truthing and imagery analysis within the Site.**

### 3.1.3. TEC Assessment

The PMST (DoEE 2017a) predicted the potential presence of up to four TEC within the Site. However, field survey did not detect TEC within the Site.

### 3.2. Threatened and Migratory Species

#### 3.2.1. Likelihood of Occurrence of Flora and Fauna of Conservation Concern at the Site

PMST search results predicted the potential occurrence of two EPBC Act-listed threatened flora species, these being Ooline (*Cadellia pentastylis*) and Slender Tylophora (*Tylophora linearis*). The desktop assessment indicated that one EPBC Act listed flora species has been historically recorded from, or within 10km of the Site, this being *Bertya opponens*.

A Vulnerable fauna species under the EPBC Act has been previously reported from at or within 10km of the Site, this being the Squatter Pigeon (southern) (*Geophaps scripta scripta*) (DSITI 2017b). A migratory species, the White-throated Needletail (*Hirundapus caudacutus*) was also previously reported from at or within 10km of the Site (DSITI 2017b).

No threatened flora or fauna species were detected during the assessment. One EPBC Act listed migratory species was detected: the Rainbow Bee-eater (*Merops ornatus*). The locations of the two records of the species are mapped in Appendix D. Table 4 provides discussion of habitat requirements and likelihood of occurrence of the nominated (Section 2.2.2) threatened and/or migratory fauna and threatened flora at the Site.
Table 4: Assessment of likelihood of occurrence at the Site of nominated threatened/migratory flora and fauna.

<td>Fabaceae</td>
<td>Swainsona murrayana</td>
<td>V</td>
<td>V</td>
<td>This herbaceous species often grows in heavy soils, especially depressions, and is also found on grey and red to brown clay and clay-loam soils in Bladder Saltbush (Atriplex vesicaria) herbland, Black Box (Eucalyptus largiflorens) woodland and grassland communities and is frequently associated with Maireana species (DoEE 2017b). This species is known in Queensland from five specimens; one collected south of Surat in Brigalow Belt subregion 29 (Weribone High); and four from central western Queensland between Boulia, Birdsville and Longreach (ALA 2017).</td>
<td>Unlikely to be present. Suitable habitat (heavy soils associated with drainage depressions) is present to only a very limited extent within the Site, and the Site is outside the known range of this species (ALA 2017).</td>
<td>Not recorded within the Site.</td>
</tr>
<tr>
<td>Fabaceae</td>
<td>Swainsona murrayana</td>
<td>V</td>
<td>V</td>
<td>This species of low shrub is known to occur on stony and sandy soils supporting mallee woodland (Baker’s Mallee Eucalyptus bakeri, Green Mallee E. viridis) with a Spinifex (Triodia sp.) ground layer (DoEE 2017b). It is only known from a relatively small area in the Goondiwindi - Inglewood – Yelarbon area of the southern Darling Downs in Queensland, extending south to the Yetman area of New South Wales (ALA 2017, DoEE 2017b).</td>
<td>Unlikely to be present. Though some suitable habitat (E. bakeri mallee woodland on sandstone hills) is present in limited amounts within the Site, the Site is distant from the nearest record of the species with an apparently limited distribution.</td>
<td>Not recorded within the Site.</td>
</tr>
<tr>
<td>Mimosaceae</td>
<td>Acacia curraniai</td>
<td>V</td>
<td>V</td>
<td>This species has a disjunct distribution in western New South Wales (NSW) and south-eastern Queensland. The species is reported in Queensland from the Barakula and Gurulmundi areas (ALA 2017; DSITI 2017d) where it occurs on sandy soils of deeply weathered lateritic plateaus in widely scattered thickets in patches of diverse heath scrub with emergent trees (DoEE 2017b).</td>
<td>Unlikely to be present. Suitable habitat (lateritic plateaus, Land Zone 7) is not present within the Site.</td>

<td>E</td>
<td>This species is commonly associated with coastal wet heath/sedgeland wetlands, swampy grassland or swampy forest and is distributed from northern New South Wales to northern Queensland (DoEE 2017b). Typically, Phaius australis is restricted to the swamp-forest margins, where it occurs in sclerophyll forest of Broad-leaved Paperbark (Melaleuca quinquenervia) and/or Swamp Mahogany (Lophostemon suaveolens); swampy rainforest (often with sclerophyll emergents); or fringing open forest. It is often associated with rainforest elements such as Bangalow Palm (Archontophoenix cunninghamiana) or Cabbage Tree Palm (Livistona australis) (DoEE 2017b). Disjunct populations of the species are known from Blackdown Tableland and Carnarvon Gorge (DSITI 2017d).</td>
<td>Unlikely to be present. No suitable habitat (swamp forest) is present within the Site.</td>
<td>Not recorded within the Site.</td>
</tr>
<tr>
<td>Poaceae</td>
<td>Aristida annua</td>
<td>V</td>

<td>Poaceae</td>
<td><em>Dichanthium queenslandicum</em>&lt;br&gt;King Bluegrass</td>
<td>E</td>
<td>V</td>
<td>This grass occurs in tussock grasslands of sub-coastal eastern Queensland (DoEE 2017b) on heavy black cracking clays derived from basalt or fine-grained sedimentary rocks (DEHP 2017b). This species often grows in association with other species of blue grasses (<em>Dichanthium</em> and <em>Bothriochloa</em> spp.) and other grass species restricted to this soil type (DEHP 2017b). It is confined to natural grassland or Doolan (<em>Acacia salicina</em>) thickets in grassland and grassy eucalypt woodland communities (DEHP 2017b).</td>
<td>Unlikely to be present. Suitable habitat (grasslands and grassy woodlands on fertile deep clay soils) is not present within the Site.</td>
<td>Not recorded within the Site.</td>
</tr>
<tr>
<td>Poaceae</td>
<td><em>Dichanthium setosum</em>&lt;br&gt;A bluegrass</td>
<td>V</td>
<td>LC</td>
<td>Occurs in Queensland and north-eastern NSW (ALA 2017). In Queensland, it is patchily recorded from Toowoomba in the south to the upper Burdekin River catchment in the north. It grows on basaltic black clays and hard-setting red-brown loams (DoEE 2017b) in woodland or open grassy woodland dominated by Brigalow (<em>Acacia harpophylla</em>) and/or eucalypt species (DSITI 2017d). In Queensland and NSW it has also been found in moderately disturbed areas such as cleared woodland, grassy roadside remnants and highly disturbed pasture (DoEE 2017b).</td>
<td>Unlikely to be present. Suitable habitat (grasslands and grassy woodlands on fertile deep clay soils) is not present within the Site. Specimen records closest to the Site occur in Carnarvon NP and the Springsure / Emerald area (ALA 2017).</td>
<td>Not recorded within the Site.</td>
</tr>
<tr>
<td>Poaceae</td>
<td><em>Homopholis belsonii</em>&lt;br&gt;Belson’s Panic</td>
<td>V</td>
<td>E</td>
<td>Occurs in northern NSW and the southern Brigalow Belt of Queensland (ALA 2017, DoEE 2017b). Within Queensland it principally occurs in Poplar Box (<em>Eucalyptus populnea</em>), Brigalow (<em>Acacia harpophylla</em>) and Belah (<em>Casuarina cristata</em>) dominated communities where it grows preferentially in shaded areas (DoEE 2017b).</td>
<td>Unlikely to be present. Suitable habitat (Brigalow-dominated open forests and woodlands) is not present within the Site.</td>
<td>Not recorded within the Site.</td>
</tr>
<tr>
<td>Santalaceae</td>
<td><em>Thesium australe</em>&lt;br&gt;Austral Toadflax</td>
<td>V</td>
<td>V</td>
<td>This species of perennial herb is parasitic on grasses especially Kangaroo Grass (<em>Themeda triandra</em>) (DoEE 2017b). It is found in grasslands and grassy woodlands on basalt and fine-grained soils (DoEE 2017b). It is distributed from eastern Victoria to south central Queensland (DoEE 2017b). In Queensland it has been recorded from the Darling Downs, South Burnett and Carnarvon National Park (ALA 2017).</td>
<td>Unlikely to be present. Suitable habitat (grasslands and grassy woodlands on fine-grained soils) is not present within the Site.</td>
<td>Not recorded within the Site.</td>
</tr>
<tr>
<td>Surianaceae</td>
<td><em>Cadellia pentastylis</em>&lt;br&gt;Ooline</td>
<td>V</td>
<td>V</td>
<td>Occurs in northern NSW and southern Queensland (DoEE 2017b). Within Queensland it occurs patchily from near Rockhampton westward to near Blackall and southward to the State border (ALA 2017) where it occurs on undulating plains, valley slopes, hillsides and scarps, often in association with Brigalow and SEVT communities (DoEE 2017b, Santos 2012).</td>
<td>Unlikely to be present. No suitable habitat is present within the Site. Additionally, the species, a large and conspicuous tree, is not currently known from the Site. Specimen records closest to the Site occur about 30 km north-west (ALA 2017).</td>
<td>Not recorded within the Site.</td>

3.2.2. Habitat Assessment and Predictive Habitat Mapping

Sixteen (16) microhabitat assessments were conducted for nominated conservation-listed species (Section 2.2.2). The results of these assessments were then combined with ecologist knowledge to develop predictive habitat mapping for those species. Mapping rules and the estimated total availability of General Habitat within the survey area for the species is given in Table 5.

The suitability of areas of vegetation as fauna habitat is determined by the presence and abundance of microhabitat features relevant to the needs of individual species or groups of species (e.g. terrestrial reptiles). In general, mature vegetation (remnant or advanced regrowth) is more likely to support appropriate levels of these microhabitat features, while their presence in younger regrowth and clearings is less likely. This is particularly the case where clearing for agriculture has involved the destruction of fallen timber and coarse woody debris, such that where young regrowth is present it lacks necessary microhabitat for ground-dwelling fauna. It is acknowledged that some areas of young regrowth and derived grassland (pasture) may contain suitable habitat for some species (e.g. log piles used by reptiles). However, for the purposes of this report, General Habitat is assumed to be present only in remnant and advanced regrowth vegetation.

Habitat maps for the selected species are shown at Appendix E.

Table 5: Potentially suitable RE and estimated extent of General Habitat for nominated fauna and flora species potentially present at the Site.

---

### 4. Conclusions

No Endangered or Of Concern RE, nor any TEC, was detected during the survey. The desktop assessment and field survey identified the following potential ecological values and/or constraints within the Site:

- **Ardea ibis** (Cattle Egret)
- **Ardea modesta** (Eastern Great Egret)
- **Erythrotriorchis radiatus** (Red Goshawk)
- **Geophaps scripta scripta** (Squatter Pigeon (southern))
- **Merops ornatus** (Rainbow Bee-eater)
- **Plegadis falcinellus** (Glossy Ibis)
- **Rostratula australis** (Australian Painted Snipe)
- **Chalinolobus dwyeri** (Large-eared Pied Bat)
• *Dasyurus hallucatus* (Northern Quoll)
• *Nyctophilus corbeni* (South-eastern Long-eared Bat, Corben’s Long-eared Bat)
• *Phascolarctos cinereus* (Koala)
• *Delma torquata* (Collared Delma)
• *Egerinia rugosa* (Yakka Skink)
• *Furina dunmalli* (Dunmall’s Snake)
• *Bertya opponens*
• *Daviesia discolor*
• *Acacia grandifolia*
• *Eucalyptus beaniana* (Bean’s Ironbark)

5. Recommendations

It is recommended that:

- Pre-clearance surveys for threatened fauna microhabitat and threatened fauna and flora are conducted prior to any infrastructure development in vegetation within the Site.
