	+ Ongoing engagement with key contractors undertaking activities on Santos' behalf and the owners of land upon which activities will occur (e.g. Darwin Port, DIPL- East Arm, DLNG Management, Wickham Point Deed Reference Group) to ensure efficient communications and help maintain safe operations. + Ongoing engagement with the following stakeholders on specific issues raised: – Opportunities for collaboration on dredging-related activities – NT DIPL, Inpex, Department of Defence – Pipelay activities within Reef Fish Protection Area – NT DITT – Fisheries, AFANT, NTSC – Indigenous consultation resulting from AAPA Clearance Certification – AAPA, NLC, Wickham Point Deed Reference Group, other identified Larrakia stakeholders – Opportunities for collaboration on environmental studies and modelling – NT DPEWS, Inpex, Darwin Harbour Advisory Group, Larrakia Rangers – Road traffic management – NT DIPL – Darwin Harbour impacts management – NT DIPL, Darwin Port, DHAC, Tourism NT, Top End Tourism, AFANT, NTGFIA	+ Physical location on Darwin Harbour for distribution of project information and discussion of issues/concerns + Santos ASX and media statements	
Stage 7 – Pipeline Operations Ongoing from 2025	Aims: Ensure efficient, ongoing communication of any activities that may impact other users of the marine environment, e.g. pipeline maintenance; maintain ongoing liaison with DLNG Operations.	+ Email, phone communication + Distribution of activity updates via email + Activity fact sheets posted to Santos external website + Stakeholder meetings as required + Enquiries/complaints management via established Santos procedures	

Stage	Aims and Activities	Deliverables	Status
		+ 24-hour telephone line available for stakeholder queries Information posted to Santos website Santos ASX and media statements	
Stage 8 – Decommissioning Timeframe dependant on End of Pipeline Operations	Aim: Ensure early and ongoing consultation with all relevant stakeholders in compliance with legislative requirements and management of impacts on relevant communities.		Pending

Appendix 1 Stakeholder List

Sector	Stakeholders
Commonwealth Government	+ Department of Climate Change, Energy, the Environment and Water (formerly Department of Agriculture, Water and the Environment) + Department of Defence (including Australian Hydrographic Office and HMAS Coonawarra, Darwin)
NT Government Regulators / Agencies	+ Aboriginal Areas Protection Authority (AAPA) + Department of Environment, Parks and Water Security + Department of Chief Minister and Cabinet + Department of Industry, Tourism and Trade - Fisheries + Department of Industry, Tourism and Trade - Energy + Department of Industry, Tourism and Trade - Tenure + Department of Industry, Tourism and Trade - Tourism + Department of Infrastructure, Planning & Logistics - Planning + Department of Infrastructure, Planning & Logistics - - Regional Harbourmaster + Department of Infrastructure, Planning & Logistics - Middle Arm Sustainable Development Precinct Project + Department of Infrastructure, Planning & Logistics - Darwin Ship-lift Project; Mandorah Ferry Project + Department of Infrastructure, Planning & Logistics - Transport + Department of Territory Families, Housing and Communities - Heritage + Environmental Protection Authority + NT Power and Water + Tourism NT
Indigenous Groups / Representative Bodies	+ Aboriginal Areas Protection Authority (also noted as agency above) + Larrakia Nation (including Larrakia Sea Rangers) + Northern Land Council + Tiwi Land Council + Wickham Point Deed Reference Group
Environmental Group Representatives	+ Australian Marine Science Association + Australian National University (individual) + Environment Centre NT + Sea Turtle Foundation
Fishing Representative Bodies	+ Amateur Fishermans' Association of the NT (recreational) + NT Seafood Council (commercial)
Other Community Organisations	+ Darwin Harbour Advisory Committee

Sector	Stakeholders
	+ NT Chamber of Commerce and Industry
Other Industry / Operators	+ Darwin Port + DLNG Pty Ltd + Eni Australia + INPEX + NT Guided Fishing Industry Association + Paspaley Pearling + Sea Darwin + Sun Cable + Telstra + Top End Tourism + Tourism NT

Santos

Appendix 2 Consultation Register

The following is a list of the consultation undertaken to date via meetings with key stakeholders to inform preparation of the Referral prior to its submittal and, following the NT EPA's assessment decision on 7 April 2022, to inform preparation of the required Supplementary Environmental Report. The list is not a complete record of consultation as it does not include all email and telephone engagement.

Santos

Stakeholder(s)	Date	Description
Stage 1: Prior to submittal of referral to NT EPA		
Darwin Port/ NT Department of Infrastructure, Planning & Logistics (NT DIPL) - Regional Harbourmaster	3 August 2021	Meeting to discuss proposed route for Darwin Pipeline Duplication (DPD) and intention to submit a Referral to the NT EPA for the DPD section in NT Waters.
Darwin Port/ NT DIPL - Regional Harbourmaster)	21 August 2021	Further meeting to discuss proposed route for DPD in NT Waters in more detail.
NT Environment Protection Authority (NT EPA)	6 October 2021	Meeting with NT EPA Board to discuss intention to submit a Referral to the NT EPA for the DPD section in NT Waters.
Darwin Port/ NT-DIPL (Regional Harbourmaster)	8 October 2021	Further meeting to discuss proposed route for DPD in NT Waters in more detail.
ALL	8 October 2021	Direct distribution to all currently identified stakeholders via email of Barossa Project Quarterly Update, including information on the status of regulatory approvals including an additional Gas Export Pipeline section in Commonwealth Waters and the intention to submit a Referral to the NT EPA for the DPD section in NT Waters.
Tiwi Land Council (TLC)	19 October 2021	Meeting to discuss Barossa Project activities and potential areas for collaboration on environmental projects with relevance to an additional Gas Export Pipeline section in Commonwealth Waters. The intention to submit a Referral to the NT EPA for the DPD section in NT Waters was also advised. Meeting is part of an ongoing Barossa engagement process.
Australia Bay Seafoods	20 October 2021	Meeting with commercial fishing company to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters. Initial response from company was that there were unlikely to be major concerns. Following the meeting, Santos provided further specific information on the proposed pipeline route so any potential impacts on commercial fishing grounds in Commonwealth Waters and a Sea Gear Trial area in NT Waters can be considered by the company.
NT Department of Environment, Parks & Water Services (NT DEPWS)	21 October 2021	Meeting with department personnel who provide support services to the NT EPA to discuss content requirements and timeframe for submittal of Referral to the NT EPA and the separate regulatory process for other associated activities, i.e. secondary approval submissions for waste discharge, etc.

Stakeholder(s)	Date	Description
NT Department of Industry, Tourism & Trade – Fisheries (NT DITT – Fisheries)	21 October 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters. Initial response from department was that there were unlikely to be major concerns related to commercial fishing or fish sustainability. The department requested that the route not pass over or close to a jewfish aggregation area within the Charles Point Reef Fish Protection Area (CPRFPA), that artificial reef areas are not impacted, and Santos consult with the Amateur Fisherman's Association of the NT to gain recreational fishing sector views. Following the meeting, Santos provided further information on the proposed pipeline route.
NT Guided Fishing Industry Association (NTGFIA)	21 October 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters. The Association, which represents ~70 guided fishing/charter boat operations, provided initial advice that another pipeline was always welcome for fish attraction and artificial habitat creation and there should not be any major issues provided installation/trenching was of a relatively short duration and did not occur over known fishing spots or the artificial reefs. Following the meeting, Santos provided further information on the proposed pipeline route.
NT DITT - Energy	22 October 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters as well as processes involved with new NT pipeline licence applications and other associated secondary approvals, including Pipeline Management Plans. Department advised it was important to discuss the project with the Aboriginal Areas Protection Authority (AAPA).
Darwin Port	22 October 2021	Meeting to discuss DPD consultation process related to its users. Port advised that its preference will be for Santos to consult and communicate directly with all relevant stakeholders and keep the Port regularly informed. Consultation with the Darwin Harbour Advisory Committee is recommended. The Port will advise Santos if any briefings are required via its ongoing Port User Group consultation process.
Northern Prawn Fishing Pty Ltd (NPF Ltd)	25 October 2021	Meeting with representative organisation for all licence holders to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters. Initial view of organisation is that there won't be any major concerns, however Santos was requested to provide further specific information on the proposed pipeline route and spoil disposal area plus the other subsea infrastructure required in the additional Commonwealth Waters Area so any potential impacts on commercial fishing grounds in Commonwealth Waters and a Sea Gear Trial area in NT Waters can be considered.
NT DITT - Tenure	25 October 2021	Meeting to discuss processes involved with new NT pipeline licence applications and other related approvals including Pipeline Management Plans, validations, consents to construct/operate

Stakeholder(s)	Date	Description
Sun Cable	25 October 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters, including potential future crossovers of cables and indicative activity schedules.
Aboriginal Areas Protection Authority (AAPA)	26 October 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters including process to apply for Clearance Certificate for activities in NT Waters.
Northern Land Council (NLC)	26 October 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters. Legal Services section of the Council's Land and Law Division will continue to be engaged. Council agrees that Aboriginal Areas Protection Authority, Wickham Point Deed Reference Group and Tiwi Land Council are key stakeholders.
Amateur Fishers Association of the NT (AFANT)	27 October 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters. AFANT is concerned at impact of planned activities on recreational fishing in Harbour which is already subject to many pressures as a result of varied and something conflicting uses. AFANT advised that Santos needs to explain how the scale of its project will be different to Inpex's Ichthys Project. In addition to mitigation measures, Santos should look at how it can offset this impact by working with the sector on other beneficial projects with positive impacts. Santos and AFANT exchanged information on the proposed pipeline route and recreational fishing spots in Darwin Harbour for further consideration of impacts.
Tiwi Resources	27 October 2021	Meeting to organise Santos' attendance at clan group meetings and Leaders Forum to discuss Barossa Project activities and potential areas for collaboration on environmental projects with relevance to the DPD section in Commonwealth Waters. Part of ongoing Barossa engagement process.
NT DIPL - Executive	4 November 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters, as well as processes involved with other related approvals and consultation with project teams managing the department's ship-lift and Mandorah ferry activities in Darwin Harbour.
NOPSEMA/NOPTA	5 November 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters as well as process for licence variation of pipeline section within Commonwealth Waters. Santos also advised the intention to submit application for new pipeline licences in NT Waters to the NT DITT.

Stakeholder(s)	Date	Description
Inpex	8 November 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters. Information shared re proposed activities in Darwin Harbour and the indicative schedules involved. Part of ongoing engagement process.
NT Heritage Branch	9 November 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters. Meeting followed email and phone engagement conducted in August and October 2021 on Santos' intention to divert the proposed pipeline route around a submerged wreck site. The Heritage Branch will prepare scope of works for Santos to engage a contractor to conduct a desk-top assessment of its current pipeline route information.
NT DITT-Energy	10 November 2021	Meeting to further discuss processes involved with new NT pipeline licence applications and other related approvals including Pipeline Management Plans, Scope of Validation and Consents to Construct and Operate.
Commonwealth Director of National Parks / Commonwealth Department of Agriculture, Water & the Environment (DAWE)	11 November 2021	Meeting to discuss Santos' intention to submit a Referral on EPBC Act Matters to DAWE related to the DPD section in NT Waters. Focus of the meeting was the submittal and assessment process involved, including timeframes. The additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters was also discussed.
NT-DEPWS	17 November 2021	Meeting to further discuss additional information provided by Santos on recent habitat survey results, mapping to environmental assessment policy and framework of NT EPA Referral. DEPWS provided advice on information that would be required on range of matters including waste management, dredging methods and hydro-testing. DEPWS also advised that the EPA will be interested in how the pipeline relates to the overall management of greenhouse gas emissions at DLNG and the proposed Bayu-Undan to Darwin Gas Export Pipeline re-purposing for Carbon Capture and Storage (CCS). DEPWS will also provide specific information for Santos on applications of water and waste management and pollution control legislation and required secondary approvals.
HMAS Coonawarra Naval Base	17 November 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters. The Navy advised it was planning to undertake dredging operations during 2023/24 and consultation should occur between Defence, NT DIPL, Santos and Inpex re their respective works in the Harbour and any potential collaboration that could occur. Santos also offered to brief the Defence Department's Capital Infrastructure Facilities Group in Canberra.
Environment Centre NT (ECNT)	17 November 2021	Meeting to discuss additional Gas Export Pipeline section in Commonwealth Waters and intention to submit a Referral to the NT EPA for the DPD section in NT Waters. ECNT believes approvals should be submitted and assessed based on the entire Barossa project, i.e., from extraction at Barossa Field right through treatment at DLNG, re-use

Stakeholder(s)	Date	Description
		of Bayu-Darwin pipeline and planned CCS at Bayu-Undan. Would like to meet with representatives who can speak about the company's overall plan, and this should also be covered in a presentation to the Darwin Harbour Advisory Committee.
Sun Cable	18 November 2021	Meeting to further discuss specific matters related to work schedules and potential crossovers of cables. Sun Cable advised it was planning to install cable starting in 2024/25 and was considering two potential routes, both of which would cross the existing Bayu-Undan to Darwin Pipeline and therefore the proposed additional pipeline. Following the meeting, Santos and Sun Cable have shared relevant information.
NT-DIPL – Darwin Ship-lift and Mandorah Ferry projects	18 November 2021	Meeting to further discuss Santos DPD Project and NT DIPL projects and share information with a view to any potential areas for collaboration. DIPL advised that a Darwin Harbour Dredge Management Strategy would assist projects going forward once it was developed. DIPL and Santos will continue to liaise re any potential collaboration via Santos' geophysical work in Harbour early next year and other future collaborative opportunities related to planned dredging works in Harbour.
Wickham Point Deed Reference Group (WPDRG)	19 November 2021	Meeting to discuss DPD Project in both NT and Commonwealth Waters and intention to submit a Referral to the NT EPA. Meetings of WPDRG, which represents the Larrakia Traditional Owners of the land upon which DLNG is located, are held on an ongoing basis with Barossa Project and DPD now a standing item for update. Representatives present advised there were no specific concerns related to the proposed operational area in the Harbour or shore crossing as they would be occurring in an already disturbed area. DLNG advised that civil works had commenced associated with the Life Extension project. Barossa will keep the committee members informed on the progress of the AAPA certification work
Tiwi landowner group - Malawu	23 November 2021	Meeting with Malawu clan group to discuss Barossa Project activities and potential areas for collaboration on environmental projects with relevance to the DPD section in Commonwealth Waters. Part of ongoing Barossa engagement process.
Sea Darwin	24 November 2021	Phone discussion with owner/operator re DPD Project in both NT and Commonwealth Waters and intention to submit a Referral to the NT EPA. Owner/operator advised his main concern was the coordination of work programs in the Harbour that are being proposed by a range of organisations and how these relate to the NT Government's dredging strategy. Santos will be presenting to the DHAC on which Sea Darwin is represented.
Tiwi landowner group - Wurrumiyanga	25 November 2021	Meeting with Wurrumiyanga clan group to discuss Barossa Project activities and potential areas for collaboration on environmental projects with relevance to the DPD section in Commonwealth Waters. Part of ongoing Barossa engagement process.

Stakeholder(s)	Date	Description
AAPA Board meeting	2 December 2021	Meeting to provide update on intention to submit a Referral to the NT EPA for DPD Project in NT Waters and Santos' intention to applying for an AAPA Clearance Certification.
EPA Board	7 December 2021	Presentation by Santos summarising the content of the Referral that will be submitted shortly. The Board requested Santos provide additional detail on how the DPD Project relates to other Santos' activities, i.e., Barossa Project, DLNG Life Extension and Bayu-Undan CCS.
NT Power & Water Corporation (NT P&WC)	8 December 2021	Meeting to discuss DPD Project in both NT and Commonwealth Waters and intention to submit a Referral to the NT EPA. Discussions focused on the status of power and communications cables and crossings that will be required and may be required in the future. Santos advised the cables have recently been surveyed and their positions can be checked against the existing supplied position to determine any changes to their location. The latest survey data can also be supplied to PWC for their information. Santos and NT PWC to share detailed information and continue discussions.
TLC	15 December 2021	Meeting to discuss Barossa Project activities and potential areas for collaboration on environmental projects with relevance to the DPD section in Commonwealth Waters. Part of ongoing Barossa engagement process.
DAWE	20 December 2021	Meeting to advise the Department that Santos submitted an NT EPA referral for the DPD Project on 8 December 2021 and plans to submit an EPBC Act referral to align with the NT EPA's assessment process.
Darwin Port/ NT DIPL - Regional Harbourmaster	21 December 2021	Further meeting to discuss proposed route for Darwin Pipeline Duplication in NT Waters.
Stage 2: Following submission of referral to NT EPA		
DAWE	12 January 2022	Meeting to discuss whether any potential sea dumping legislative requirements apply to the DPD Project. Santos advised that approval is not required under the Commonwealth Sea Dumping Act as the material to be removed and disposed be wholly within the NT environment, i.e. no movement of materials between NT and Commonwealth Waters. DAWE's initial view was agreement and advice would follow if this was not the case. Note: no further advice or direction received.
ALL	18 January 2022	Direct distribution via email of information on DPD Project, notification that the Referral to the NT-EPA is now available for public comment and inviting discussion with Santos on the Project and Referral.
Paspaley Pearling	19 January 2022	Communication via phone, email and letter from Paspaley Pearling requesting Santos be mindful of pearling lease areas when undertaking project activities in the Beagle Gulf area, including within a proposed spoil disposal area.

Stakeholder(s)	Date	Description
		Paspaley requested that Santos not navigate through or anchor upon these areas. Santos advised it would consider internally and consult with the pipelay contractor.
NT DIPL - Regional Harbourmaster	21 January 2022	Further meeting to discuss proposed route for DPD in NT Waters.
NT DEPWS	31 January 2022	Meeting to discuss process for assessment and public comment associated with NT EPA Referral.
NT DITT - Energy	1 February 2022	Meeting to provide update on submittal of NT EPA Referral and discuss processes for submittal of associated secondary approvals that will also be required.
Paspaley Pealing	7 February 2022	Communication via phone and email by Santos with Paspaley Pearling to advise that the pipelay contractor had agreed that vessels traversing in NT Waters would not enter or anchor upon the identified lease areas.
AFANT	7 February 2022	Meeting to update AFANT on submittal of NT EPA Referral and further discuss issues and concerns raised by AFANT at the previous meeting held in October 2021. AFANT agreed that DPD was a significantly smaller and different project to Ichthys which was one of its main concerns and was pleased that trenching would not be occurring in the CPRFPA and spoil disposal would not occur within the Inpex spoil disposal area which had now become a recreational fishing spot. AFANT advised it would be providing a written submission during the public comment period and the cumulative impact on the Harbour from each project was an important factor in its thinking. AFANT was happy to continue a discussion on its research priorities and potential Santos' support.
NT DITT - Fisheries	9 February 2022	Meeting to update Department on submittal of NT EPA Referral and further discuss Department's views on range of environmental factors addressed in the Referral documentation. The Department's initial view was that the pipeline installation's local impact was unlikely to have any broader consequences for fisheries. Santos advised that the pipeline route within the Charles Point Reef Fish Protection Area would not be in close proximity to the jewfish aggregation area discussed at the last meeting with the Department held in October 2021.
DAWE	17 February 2022	Meeting with representatives of EPBC Referral Assessment Team to discuss required content and process surrounding submittal of EPBC Act referral for DPD Project in NT Waters.
NT DEPWS	2 March 2022	Meeting to discuss NT-EPA process for management and publication of submissions received during public comment period. DEPWS advised that a total of 311 had been received, including 284 as part of a campaign submission, and the main issues raised relate to GHG emissions management, how future CCS project relates to this approval, impacts to Harbour generally, Charles Point Reef Fish Protection Area and coastal areas near the spoil ground. The submissions will be published with the EPA's decision on the level of assessment.

Stakeholder(s)	Date	Description
WPDRG	3 March 2022	Meeting to provide update on submittal of NT EPA Referral and application for AAPA certification. Two members, one also representing Larrakia Nation, requested additional meetings with Santos.
TLC	4 March 2022	Meeting to discuss Barossa Project activities and potential areas for collaboration on environmental projects with relevance to the DPD section in Commonwealth Waters. Part of ongoing Barossa engagement process.
Darwin Harbour Advisory Committee (DHAC)	14 March 2022	Introductory meeting with new chair of Darwin Harbour Advisory Committee who explained its role and ways that Santos' DPD Project can link into the both the Committee's work and relevant personnel in NT DEPWS working with the Committee. Santos will present at the next DHAC meeting.
NT DITT - Fisheries	15 March 2022	Meeting to discuss the requirement for a fisheries licence under secondary approvals for the DPD Project and the process involved. Further discussion was held on CPRFPA with Fisheries advising while there is no heavy reef habitat in the area, the jewfish aggregation area needed to be avoided. Fisheries agreed that pipelines were generally beneficial to recreational fishing activities. It also did not see the DPD project causing problems for mud crab migration. Santos will provide the Department with data and imagery from its surveys in the harbour.
NT DITT - Tenure	15 March 2022	Meeting to discuss the process for submittal of secondary approvals for the DPD Project, i.e. pipeline licence, scope/statement of validation, consent to construct and operate and Pipeline Management Plans, including Dredge Management Plan.
NT DIPL	16 March 2022	Meeting to provide update on submittal of Referral and discuss process for submittal of secondary approvals.
Inpex	16 March 2022	Meeting to share information on respective projects involving future dredging in Darwin Harbour. Inpex has also commenced consultation on a five-year dredging maintenance program.
Darwin Harbour Advisory Committee (DHAC)	17 March 2022	Presentation to DHAC meeting on NT EPA Referral. Several members sought further information about how the pipeline factored into Santos' future greenhouse gas emissions management at DLNG and the proposal for CCS at Bayu-Undan. Barossa agreed to ask a representative from the CCS project team to attend a future meeting. AFANT member stressed that documents from proponents say things such as there are sparse corals and rocky areas in the Harbour as a reason to not be as concerned; but the sparse number also means their value is greater. Santos stated it was keen to get all feedback and to work with the committee going forward; the DPD trenching program will be quicker and less impactful than the program for Ichthys pipeline; and environmental information gained can be shared. Santos advised it would provide regular updates on the project.

Stakeholder(s)	Date	Description
Tiwi landowner group - Jikilaruwu	18 March 2022	Meeting with Jikilaruwu clan group to discuss Barossa Project activities and potential areas for collaboration on environmental projects with relevance to the DPD section in Commonwealth Waters. Part of ongoing Barossa engagement process.
Northern Territory Seafood Council (NTSC)	18 March 2022	NTSC, which represents commercial fishing licence-holders, did not make a submission. NTSC confirmed that commercial fishers do not operate within the harbour, however, there is some fishing activities within other NT Waters jurisdictions. NTSC's two main requests were for Santos to not disturb the jewfish aggregation area within the CPRFPA and to mitigate against fishing gear being snagged around the pipeline. NTSC will provide contacts from Coastal Line Fishery or other fisheries if more information is required.
AFANT	18 March 2022	Meeting to provide update re submission of NT-EPA Referral and outcomes of discussions held with NT-DITT (Fisheries) on fish protection area and protection of jewfish aggregation site.
Stage 3: Preparation of SER prior to submittal to NT EPA		
Charles Darwin University	4 April 2022	Meeting with researcher to discuss issues related to presence and potential impacts on turtles in Darwin Harbour and NT Waters generally. An expert contact was also provided within NT DEPWS who was also contacted by Santos. The experts advised that the main issue impacting turtles on Darwin beaches is the presence of human traffic and resulting interaction, especially with other animals. Lighting from vessels at sea was considered less of a problem than lighting on land. In terms of the wider region, experts advised there was still a significant knowledge gap impacting the ability to fully understand the impacts on the overall health of the turtle population.
DAWE	4 April 2022	Further meeting to discuss submittal of EPBC Act referral for DPD Project in NT Waters with focus on noise and light impact from vessels in the harbour.
NT DITT- Energy	21 April 2022	Further discussion around construction activities associated with the DPD Project and information on secondary approvals to SER (e.g. construction plans and pipeline management plans).
NT P&WC	28 April 2022	Further meeting to discuss the status of power and communications cables and crossings that will be required and may be required in the future.
NT DIPL - Middle Arm Project	3 May 2022	Meeting to share information on DPD Project and Middle Arm Sustainable Development Project, including indicative timeframes and plans for activities in Darwin Harbour and current/planned environmental studies. Aim is to investigate potential areas for collaboration and management of cumulative impacts.

Stakeholder(s)	Date	Description
DAWE	3 May 2022	Further meeting to discuss EPBC referral, focusing on provision of additional information on noise and light impact assessments. Santos presented its progress on the referral and the department clarified questions related to how impact significance is determined. Santos is awaiting two more technical reports in order to finalise responses.
Tourism NT	3 May 2022	Meeting to discuss DPD Referral to NT EPA and stakeholder consultation undertaken to date with other users of Darwin Harbour and surrounds. Tourism NT assisted Santos with further identification of stakeholders, including Tourism Top End which represents charter boat operators along with the NT Guided Fishing Industry Association. Tourism NT advised that communication prior to and during the activities was critical and offered to assist by passing on communication via its monthly newsletter.
TLC	4 May 2022	Meeting to discuss Barossa Project activities and potential areas for collaboration on environmental projects with relevance to the DPD section in Commonwealth Waters. Part of ongoing Barossa engagement process.
Sea Darwin	4 May 2022	Meeting to discuss DPD Referral to NT EPA and stakeholder consultation undertaken to date with other users of Darwin Harbour and surrounds. The business owner/operator reiterated the importance of communication and need to liaise with Tourism NT and Top End Tourism. The owner/operator is also a member of the DHAC and will be kept informed through that membership as well as directly by Santos.
Larrakia Nation/Larrakia Sea Rangers	4 May 2022	Meeting to discuss DPD Referral and progress of application to AAPA for Clearance Certificate as well as consultation being undertaken with WPDRG, NLC and TLC. Further discussions to be held with Larrakia Sea Rangers re potential involvement in future environmental monitoring programs and other tasks associated with DPD Project.
Darwin Dive Shop/Academy	6 May 2022	Meeting to discuss DPD Referral to NT EPA and anecdotal advice received from NT DITT - Fisheries related to recreational diving in Darwin Harbour. Advice provided that the Darwin Harbour area is generally challenging for divers without the necessary experience, but particularly during specific periods of the year. Santos requested to ensure it mitigates any impact causing turbidity near to any identified dive wreck sites and keep stakeholders informed prior to and during the proposed activities.
NT DIPL - Darwin Ship-lift and Mandorah Ferry projects	13 May 2022	Meeting to share information on DPD Project and DIPL Ship-lift and Mandorah Ferry Project, including indicative timeframes and plans for planned activities in Darwin Harbour and current/planned environmental studies. Aim is to investigate potential areas for collaboration and management of cumulative impacts.
NT DEPWS	13 May 2022	Meeting to discuss sections of department's submission on DPD Referral on monitoring of water quality in Darwin Harbour. Santos provided information re proposed environmental management studies for the Project and committed to work closely with the department's aquatic group and within its integrated marine monitoring and

Stakeholder(s)	Date	Description
		research program. Santos also agreed to share sediment and water quality data that will be produced with associated studies of the Project. Once modelling results from some studies are finalised, Santos will further discuss with deportment opportunities for alignment and collaboration.
NT DEPWS	25 May 2022	Meeting to discuss NT EPA additional information requirements for the DPD Project Supplementary Environmental Report (SER) related to marine environmental quality, marine ecosystems and atmospheric processes.
Top End Tourism	27 May 2022	Meeting to discuss DPD Referral to NT EPA and stakeholder consultation undertaken to date with other users of Darwin Harbour and surrounds. Top End Tourism represents charter boat operators and has established relationships with Larrakia and Tiwi indigenous organisations. Has a board of management and advised that it would be happy for Santos to present on the DPD Project.
NT DIPL - Regional Harbourmaster	27 May 2022	Further meeting to discuss proposed route for Darwin Pipeline Duplication in NT Waters.
NT DEPWS	31 May 2002	Further meeting to discuss NT-EPA additional information requirements for the DPD Project Supplementary Environmental Report (SER).
ALL	17 June 2022	Direct distribution to All identified stakeholders via email of Barossa Project Quarterly Update, including information on Darwin Pipeline Duplication and NT EPA Referral.
NLC	2 June 2022	Meeting to provide update on EPA Referral, AAPA clearance certification process and submittal and public comment process for pipeline licence application for NT Waters.
NT DITT - Fisheries	3 June 2022	Meeting to discuss pipeline survey work in Darwin Harbour related to DPD Project and whether the department would like any specific locations included. Santos committed to sharing all information gained from the survey with the department.
NLC	10 June 2022	Meeting to provide update on EPA Referral, AAPA clearance certification process, the potential need for additional consultation with indigenous stakeholders and the public comment process for pipeline licence application in NT Waters.
WPDRG	10 June 2022	Meeting to provide update on EPA Referral, AAPA clearance certification process and submittal and public comment process for pipeline licence application in NT Waters.
DAWE	17 June 2022	Further meeting to discuss EPBC referral, focusing on provision of additional information on noise modelling and impact thresholds.

Stakeholder(s)	Date	Description
DHAC	22 June 2022	Presentation to committee meeting providing update on progress of SER preparation and information on completed and habitat surveys and planned noise and plume modelling.
NT DITT - Fisheries	28 June 2022	Discussion on CPRFPA. Fisheries confirmed that reference in its submission on the DPD Referral to an 'important subsea structure' is the jewfish aggregation area previously advised and that the rest of the protection area is believed to be flat mud bottom. Santos reiterated that the proposed pipeline route is further away from the aggregation area than the existing Ichthys and Bayu-Undan to Darwin pipelines.
NT DEPWS	29 June 2022	Meeting to discuss plume modelling thresholds to be used in development of trenching plans for incorporation in SER being prepared.
DAWE	30 June 2022	Further meeting to discuss EPBC referral, focusing on provision of additional information on noise modelling and impact thresholds.
Chief Minister's Office	4 July 2022	Meeting to provide update on Barossa Project activities, including preparation of SER. Santos advised that information on economic and social benefits/impacts, as requested by the Chief Minister's Department in its submission, would be included in the SER.
NT DIPL - Middle Arm Project	5 July 2022	Further meeting to share information on DPD Project and Middle Arm Sustainable Development Project, including indicative timeframes and plans for activities in Darwin Harbour and current/planned environmental studies. Aim is to investigate potential areas for collaboration and management of cumulative impacts. DIPL shared information on the progress of developing a working group to inform the government's plans for a Darwin Harbour Dredging Strategy.
AFANT	5 July 2022	Further meeting to discuss progress on preparation of SER and how Santos will be responding to issues raised in AFANT's submission to the Referral and AFANT's views of current and potential fish and habitat research in Darwin Harbour.
TLC	6 July 2022	Meeting to discuss Barossa Project activities and potential areas for collaboration on environmental projects with relevance to the DPD section in Commonwealth Waters. Part of ongoing Barossa engagement process.
Darwin Port	6 July 2022	Meeting to provide update on progress of all aspects of DPD planning as related to port operations, including future communication with key contracting companies for marine, wharf and road activities.
NT DIPL - Regional Harbourmaster	6 July 2022	Further meeting to discuss proposed route for DPD in NT Waters.

Stakeholder(s)	Date	Description
NT DIPL – Planning (Roads)	8 July 2022	Meeting to discuss progress on preparation of SER and DIPL submission requesting that a traffic impact assessment be included for movement of materials and personnel associated with the DPD Project. Santos advised that a specialist consultancy would undertake the assessment.
Department of Defence - Navy	8 July 2022	Meeting to discuss progress on preparation of SER and specifically share proposed schedules to discuss any potential cumulative impacts and/or collaboration that may be possible between the DPD Project and the Department's dredging plans. Based on the available documentation it is likely the respective dredging programs will not coincide as DPD will not be commencing until mid-2023 at the earliest. Santos also raised a query related to potential anchoring of some vessels within a corridor that traverses two areas of Naval Waters and what permitting process was involved. Defence (Navy) representatives suggested Santos should also contact the Department of Defence in Canberra to discuss its requirements and any potential restrictions during naval exercises to be conducted during 2023
NT DIPL	12 July 2022	Further information share between Santos on the DPD Project and NT DIPL's Ship-lift and Mandorah Ferry projects. Santos provided an update via email on the DPD Project and progress with environmental approvals and supporting studies, including drafts of environmental management plans for construction, trenching, spoil disposal marine fauna and acid sulphate soil. Santos advised it has completed modelling for underwater noise, sediment transport, contingency treated seawater discharge and oil spill and can share outputs and spatial layers. The interpretation of plume modelling and design of water quality monitoring programs and results from an ROV survey in Darwin Harbour of habitat/potential heritage targets can also be shared. Santos asked if both projects could also share specific information to ensure collaborative investigations, e.g. locations of water quality monitoring sites and other GIS information.
NT DITT – Energy; Tenure	27 July 2022	Meeting to provide the department with an update on AAPA Clearance Certification process and discuss whether there are any other requirements related to Native Title consultation. Department advised it was not aware of any issues that would trigger additional legislative requirements and consultation than Santos was already progressing.
Inpex	10 August 2022	Ongoing sharing of information on respective projects involving future dredging in Darwin Harbour. Inpex has also commenced consultation on a five-year dredging maintenance program.
NT DIPL – Regional Harbourmaster	26 August 2022	Further meeting to discuss proposed route for DPD in NT Waters

Stakeholder(s)	Date	Description
NT DEPWS	31 August 2022	Meeting discuss progress of EPBC Act referral for DPD Project and NT secondary approval queries. Santos advised the EPBC Referral for NT Waters has been withdrawn and is being revised to also include Commonwealth waters section of pipeline. DEPWS advised that its SER additional information requirements will continue to await the outcome of the EPBC Act referral assessment. Discussion also held re accredited assessment process, SER submittal date and further public comment period and waste discharge licence requirements for dredging, treated seawater discharge and filter backflushing activities.
WPDRG	1 September 2022	Santos provided update on all Barossa-related activities, including progress on preparation of SER for DPD Project and AAPA Certificate Certification process. Specific information was requested on status of some DPD work contracts and this was provided following the meeting.
Commonwealth Department of Climate Change, Energy, the Environment & Water (DCCEW). Note: formerly DAWE.	7 September 2022	Meeting with representatives of EPBC Referral Assessment Team to discuss required content and process surrounding submittal of EPBC Act referral for DPD Project in NT and Commonwealth Waters. Santos advised that no additional MNES species have been identified for the for 23km section in Commonwealth Waters. The submission will include specific activities related to the additional 23km section including treated seawater and MEG discharge plus spool, PLET and mattress installation.
NLC	12 September 2022	Further meeting to discuss progress on DPD Project and AAPA Clearance Certificate, role of the NLC and other groups in Darwin Harbour and opportunity to engage with ranger groups for any project related compliance requirements.
TLC	12 September 2022	Meeting to discuss Barossa Project activities and potential areas for collaboration on environmental projects with relevance to the DPD section in Commonwealth Waters. Part of ongoing Barossa engagement process. Discussion also focussed on the organisation of further clan group meetings to discuss installation of the pipeline.
Inpex	14 September 2022	Ongoing sharing of information on respective projects involving future dredging in Darwin Harbour.
NT-DIPL	19 September 2022	Further meeting, with Santos' consultant also involved, to discuss preparation of Traffic Impact Assessment for DPD Project and information required. Santos confirmed the assessment attached to the SER document will include movement of both materials and personnel.
Inpex	21 September 2022	Ongoing sharing of information on respective projects involving future dredging in Darwin Harbour.
NT DITT - Energy; Tenure	6 October 2022	Meeting to further discuss preparation and submittal of secondary approvals related to DPD Project.
NT DIPL - Planning	6 October 2022	Meeting to further discuss preparation and submittal of secondary approvals related to DPD Project.

Stakeholder(s)	Date	Description
TLC	6 October 2022	Meeting to discuss Barossa Project activities and potential areas for collaboration on environmental projects with relevance to the DPD section in Commonwealth Waters. Part of ongoing Barossa engagement process. Removal of ghost nets, feral pests and turtle monitoring are ongoing focusses for Tiwi Land and Sea Rangers and provide opportunities to support. Meeting focussed on organisation of further clan group meetings to discuss installation of the pipeline and how information is provided. Santos also advised that it was resubmitted the DPD EPBC Act Referral to DCCEEW which will also now include the 23km section in Commonwealth Waters south of the Tiwi Islands.
AAPA	6 October 2022	Meeting to provide update re progress of DPD referrals to NT-EPA and Commonwealth Government, DPD NT (new) and Commonwealth (variation) pipeline licence applications and consultation with TLC and NLC
Inpex	12 October 2022	Ongoing sharing of information on respective projects involving future dredging in Darwin Harbour
NT-DIPL - Planning	18 October 2022	Further discussion with the relevant department personnel on the process for submittals of an Exceptional Development Permit (EDP) under the Planning Act 1999 (NT) and Planning Regulations 2000 (NT), for the dredging/trenching in Darwin harbour (pipeline up to the beach valve) and an Occupational Licence under the NT Crown Lands Act 1992 and Crown Lands Regulation 1992 (NT) for the activities to be undertaken in the dredge disposal area.
Department of Defence	8 November 2022	Meeting to discuss anchoring requirements in sections of Darwin Harbour identified for defence activities and schedules for future defence exercises and DPD activities in the event they coincide.
NT DIPL	8 November 2022	Further information share between Santos on the DPD Project and NT DIPL's Ship-lift and Mandorah Ferry projects. Topics included progress with environmental approvals and supporting studies, suitability of spoil materials for potential reuse and coordination of land traffic management in event that rock transport for projects is occurring simultaneously.
NT-DPIL Middle Arm	8 November 2022	Provision of status update to Middle Arm project management with emphasis on planning and progress of environmental studies and sharing of results.
NT-DIPL – Regional Harbourmaster	8 November 2022	Ongoing discussion re final route of pipeline in Darwin Harbour.
Tourism NT	9 November 2022	Provision of update on project approvals and proposed schedule of works in Darwin Harbour. Particular focus on consultation with guided fishing industry and other groups representing other users of the harbour and plans for future consultation in lead-up to and during execution phase.

Stakeholder(s)	Date	Description
DHAC	10 November 2022	Presentation by Santos, as requested by DHAC members, on the process of Carbon Capture and Storage, Santos' current CCS-related projects in Australia and the proposed Bayu-Undan CCS Project.
AFANT	10 November 2022	Provision of update on project approvals and proposed schedule of works in Darwin Harbour with particular focus on progress of environmental studies as related to issues previously raised by AFANT in its Referral submission.
WPDRG	18 November 2022	Provision of update on project approvals, including AAPA investigation for Clearance Certificate, and proposed schedule of works in Darwin Harbour and DLNG shore crossing.
NLC	2 December 2022	Provision of update on project approvals, including AAPA investigation for Clearance Certificate, and proposed schedule of works in Darwin Harbour and DLNG shore crossing.
Inpex	14 December 2022	Ongoing sharing of information on respective projects involving future dredging in Darwin Harbour.
Department of Territory Families, Housing & Communities - Heritage	20 December 2022	Provision of update on completed archaeological survey work in NT Waters and proposed process for further survey in Darwin Harbour.
NTGFIA	23 January 2023	Provision of update on progress of environmental approvals with particular focus on schedule for proposed works, mitigation of impacts on existing habitat, including in Charles Point Reef Fish Protection Area, consultation efforts that will occur in lead-up to and during execution of works in order to manage impacts on other users.
Paspaley Pearling	24 January 2023	Provision of update on progress of environmental approvals with particular focus on schedule for proposed works. Topics included avoidance of offshore pearl lease areas by transiting vessels, management of potential impacts due to spoil disposal activities, mitigation of impacts to aquaculture operations at Channel Island and nature and extent of exclusion zones during pipelay activities.
DITT – Mines & Energy	24 January 2023	Provision of update on progress of environmental approvals with particular focus on required secondary approvals via the Department, timing of approvals and progress on final pipeline route.
DITT - Fisheries	27 January 2023	Provision of update on progress of environmental approvals with specific discussion on avoidance of fish aggregation area in Charles Point Reef Fish Protection Area, extent of trenching and rock dumping required, progress of discussions with other fishing stakeholders on issues raised in Referral submissions and process for required Fisheries Permits for some activities.
DIPL	27 January 2023	Further information share between Santos on the DPD Project and NT DIPL's Ship-lift and Mandorah Ferry projects. Topics included progress with environmental approvals and supporting studies, suitability of spoil materials for

Stakeholder(s)	Date	Description
		potential reuse and coordination of land traffic management in event that rock transport for projects is occurring simultaneously.
DITT -Fisheries	1 March 2023	Presentation to NT Department of Fisheries and users of the Darwin Aquaculture Centre re progress of environmental documentation for EPA assessment, proposed activities and indicative schedule with specific focus on the outcomes of sediment dispersion modelling for planned trenching in closest proximity to Channel Island, potential for impacts from mobilisation and accumulation of heavy metals and proposed environmental monitoring program.

1 BACKGROUND

Santos proposes to construct and operate the Darwin Pipeline Duplication (DPD) Project, to allow gas from the Barossa gas field in the Timor Sea to be transported to Darwin LNG facility. As part of the referral process to obtain approval to dredge and install the Barossa pipeline , the Department of Agriculture, Water and the Environment (DAWE) has requested Santos provide further information on listed threatened and migratory species in the Darwin region, in particular, marine turtles nesting on beaches potentially exposed to lighting from Project vessels in the Darwin Harbour.

Santos has requested a Subject Matter Expert (SME) desktop assessment to determine the presence and significance of marine turtle nesting activity on beaches surrounding Darwin Harbour. This Technical Note compiles the available information on regional marine turtle nesting and assesses the likely level of impact the DPD Project will have on the Arafura Sea genetic stock of flatback turtles (*Natator depressus*).

1.1 Data sources

Information on the local (Darwin environs) and regional (Northern Territory) has been derived from several sources including:

- Online
  - Northern Territory Natural Resource Maps: https://nrmaps.nt.gov.au/
  - Atlas of Living Australia: https://www.ala.org.au/
- Grey Literature
  - Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia 2017)
  - Proceedings of the Australian Marine Turtle Conservation Workshop (ANCA 1994)
  - Marine Turtle Conservation and Management in Northern Australia (Centre for Indigenous Natural and Cultural Resource Management 1998)
  - A Biological Review of Australian Marine Turtles (QEPA 2009)
- Published, peer-reviewed literature.

1.2 Review on Darwin area nesting

Potential impact beaches with evidence of marine turtle nesting activity that are likely to be exposed to Project vessel lighting include Casuarina Beach in Darwin, and beaches on Cox Peninsula, including Wagait Beach and Mandorah (**Figure 1**).

The Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia 2017) identifies the known important habitat critical to the survival of all marine turtle species in Australia. The Arafura Sea genetic stock, which includes the Darwin area nesting beaches, is the largest genetic stock for flatback turtles in Australia and covers the largest geographic area (FitzSimmons et al 2020). The Recovery Plan does not recognise any of the potential impact beaches as significant nesting sites for the Arafura Sea genetic stock.

The threats identified for this stock include: marine debris entanglement (very high); climate change, terrestrial predators and indigenous take (high); international take, fisheries bycatch, noise, dredging, disease and pathogens, habitat modification and human recreation (low) (Commonwealth of Australia 2017). Light pollution was not identified as a threat for the Arafura Sea stock. Unlike smaller and more geographically constrained genetic stocks, the size and wide geographic distribution of the Arafura Sea flatback stock provides greater resilience to threats or impacts on the stock.

A number of species reviews and nesting distribution studies for Northern Territory stocks have been conducted which consistently identify regional rookeries remote from the Darwin Harbour as significant nesting sites, while the beaches surrounding Darwin Harbour, when they are acknowledged at all, are reported as supporting a relatively insignificant nesting effort (Chatto 1998; Chatto and Baker 2008; Guinea 1994a; Guinea 1994b; Parmenter 1994).

Chatto (1998) conducted a series of aerial surveys to identify hotspot nesting sites for subsequent ground truthing found flatback turtles are the most common nesting species in the Northern Territory and were widespread on island and mainland beaches. He identified low-level flatback nesting (1 – 10 track/nests) on Cox Peninsula and at Casuarina Beach near Darwin (**Figure 1**). This finding was further confirmed in Chatto and Baker (2008) who reported on data from regional snap shot surveys between 1990 and 2004 which also found turtle activity (tracks and nests) fell into the 1 – 10 range and were not recognised as significant rookeries. Significant flatback rookeries nearest to Darwin Harbour are located at Quail Island and Bare Sand Island off the western coast of the Cox Peninsula and ~40 km west of Darwin (**Figure 1**). Nest/track activity ranged from 100 – 200 events over the same sampling period at these locations (1991 – 2004). Whiting and Guinea (2003), reporting on systematic tagging surveys at Bare Sand Island, found 6 – 10 nests per night over a 14-day standardised survey period.

Chatto and Baker (2008) have identified the most important turtle nesting areas in the Northern Territory as: Turtle Point in Joseph Bonaparte Gulf, Bare Sand and Quail Islands near Darwin, the southwest of Bathurst Island, a number of beaches along the northern coastline of Melville Island, the Smith Point area of Cobourg Peninsula, islands to the north and east of Croker Island, the Goulburn Islands, NW Crocodile Island, many of the outer islands of the numerous island chains off northeast Arnhem Land, the mainland coast and islands between Cape Arnhem and Blue Mud Bay, the eastern part of Groote Eylandt and its associated islands, and some of the outer islands in the Sir Edward Pellew Group.

No systematic tagging or census surveys have been carried out on Cox Peninsula. Records held by the Atlas of Living Australia (ALA) include records submitted by the public and reports by local rangers between 2011 and 2019. Nine records exist for flatback turtles on the Cox Peninsula, and include one nesting event, three reports of individual hatchlings found on the beach, one floating animal unable to dive and four miscellaneous records with no further detail. These records further support the low level of nesting activity reported for beaches, including Wagait Beach and Mandorah beaches, on the peninsula. Furthermore, eight records exist for hawksbill (three records) and green turtles (five records) in the area, all of which were reports of stranded animals either found floating or washed ashore emaciated, with boat strike injuries or entangled in marine debris. No hawksbill or green turtle nesting has been reported at potential impact beaches. While the records are likely limited by several factors including low survey effort, low reporting effort and the lack of a systemic approach, the results are consistent with the reported low levels of nesting effort for this area (Chatto and Baker 2008), who also acknowledge similar limitations in their survey methods and data.

ALA records from the Casuarina Beach section of coastline show a similar result. Of the 10 hawksbill and 15 green turtle records, none were for nesting activity, and all were attributed to strandings (eight hawksbill, two green) and indigenous take (two hawksbill, 13 green). Flatback activity dominated the records over the nine years between 2011 and 2020, with a total of 47 records ranging from 1 – 12 reports per year for flatback turtles within 5 km of Lee Point, including Casuarina Beach. Given Casuarina is a popular beach for recreation, we can conclude this survey effort is consistently high, particularly in the southern half of the beach.

Systemic and intensive turtle monitoring conducted on Casuarina Beach between 1997 and 2006 recorded 107 nests along 8 km of beach: 104 flatback, two olive ridley and one green (Chatto and Baker 2008). The number of nests recorded ranged from 7 to 20 each year, peaking between May and October, and confirms this as a low-density nesting beach (Chatto and Baker 2008). This beach is recognised for its value as a public education program and not as a significant turtle nesting site (Chatto and Baker 2008).

No data is available on the orientation of hatchlings leaving beaches on the Cox Peninsula, or Casuarina Beach. The ALA database does not address this, nor is this data collected by the Northern Territory Department of Environment Parks and Water Security. Hatchlings use several cues to find the ocean, including horizon elevation and brightness, and beach slope. In the absence of orientation data, it can be assumed that some misorientation would be occurring as a result of the urban lights from the City of Darwin (**Figure 2**). Vehicle headlights and campfires on beaches may also misorient hatchlings under certain conditions.

Available records covering at least the last 30 years are consistent in demonstrating the low importance of beaches surrounding Darwin Harbour to nesting turtles, including Wagait Beach and Mandorah on Cox Peninsula, and Casuarina Beach in Darwin, to nesting turtles and specifically to flatback turtles within the wider Arafura Sea genetic stock. Current pressures on the few flatback turtles that use the potential impact beaches for nesting include substantial light pollution from Darwin (**Figure 2**), disturbance from recreational beach use, and indigenous take of turtles or eggs. Local aboriginals harvest eggs of all species from accessible mainland beaches throughout the Northern Territory (Chatto 1998), which are highly sought after for food (Kennett, Munungurritj, Yunupingu 1998, Winderlich, 1998). Illegal turtle egg harvest by non-Aboriginal people has also been reported in the Northern Territory (Risk and Browne 1998). Green turtles are the most hunted turtle species in Australia as they are the most favoured for food, whilst flatback turtles are not as well favoured and so not targeted by indigenous hunters (Kowarsky, 1982; Kennett, Munungurritj, Yunupingu 1998). The ALA includes records of turtle carcass dumps in Darwin which are dominated by green turtles and confirms the local indigenous take.

Human recreation, including presence of people, campfires and vehicles, will disturb turtles. Females coming ashore to nest can be forced to go elsewhere when exposed to human activity onshore, vehicles can crush nests or hatchlings, and tyre ruts can obstruct the hatchlings seaward crawl (Lutcavage et al , 1997). Furthermore, campfires have been known to attract emerging hatchlings, which have been observed to crawl into the flames. High recreational use of Casuarina Beach has been confirmed by R Chatto (Northern Territory Department of Environment Parks and Water Security), in communications with Santos staff on 4 April 2022, who provided the following advice on turtle nesting at Casuarina Beach:

- Artificial lighting is considered less of a problem than the amount of human (and dog) traffic on Casuarina Beach – Casuarina Beach is a very popular recreational area for Darwin residents.
- At least half of the turtle nests encountered are relocated to other areas like Lee Point.
- Artificial lighting at sea is considered less of a problem than lighting on land.
- R Chatto could not comment on the specifics of turtle nesting at Mandorah and Cox Peninsula but believed they attracted fewer numbers of nesting turtles than Casuarina Beach
- Information on the number of turtles, nests and re-locations, are available from the Northern Territory Fauna Atlas.

1.3 Assessment of dredge vessel impact

The location of dredge vessel activity proposed for the DPD Project in Darwin Harbour has been broken into five zones (**Figures 3 and 4**). Project activity is proposed to occur during a single marine turtle nesting season, including the May to October peak of flatback turtle nesting for the region.

It is clear from **Figure 3** that turtles using Casuarina and Wagait beaches will not have line-of-sight visibility of vessels within the harbour (scenarios 1 and 2) and so are at little to no risk from exposure to vessel lighting. Turtles that use beaches at Mandorah on the Cox Peninsula will be at low risk of impact from vessel lighting, due to the low number of turtles, nests and hatchlings likely to be present on these beaches, the short duration of dredging (i.e. limited to one nesting season), and the amount of existing light pollution from Darwin Harbour and City. To a marine turtle, vessel lighting is unlikely to be distinguishable from the background city lighting.

Offshore, the outer harbour approach (scenario 4, **Figure 4**) and spoil disposal area (Scenario 5, **Figure** 4) are 10 – 20 km from potential impact beaches. Over that distance, vessel lights will produce a relatively small amount of sky glow, similar in appearance to the vessels that currently use the offshore vessel anchorage area. If impact is not being currently observed from the vessel anchorage area, then it is unlikely Project vessels will cause any additional detectable impact.

The greatest risk of exposure is likely to occur when vessels are operating in the harbour mouth (scenario 3, **Figure 4**) during the May to October nesting season peak. Vessels at this location will be ~12 km away from Casuarina Beach and 2 – 8 km from the Wagait and Mandorah beaches. However, the risk of impact is again considered low due to the low number of turtles, nests and successfully emerged hatchlings on theses beaches, the short duration of dredging (i.e. limited to one nesting season), the large amount of urban and City light between the vessels and Casuarina Beach which is likely to mask the vessel lighting rendering it indistinguishable from the onshore lighting. Furthermore the vessels lights are likely to merge with large amount of light from Darwin and the harbour when viewed from Mandorah and Wagait, also rendering them indistinguishable from the onshore lighting.

Overall, there is no discernible risk of the project causing a significant impact to the Arafura Sea flatback turtle genetic stock based on presently and publicly available data. This is due to the short-term nature of the project, the low nesting effort on potential impact beaches, and their low reproductive value relative to other rookeries within the wider genetic stock.

Figure 1.2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability. 10

TERMS AND ABBREVIATIONS

°	Degrees
‘	Minutes
“	Seconds
µm	Micrometre (unit of length; 1 µm = 0.001 mm)
Actionable oil	Oil which is thick enough for the effective use of mitigation strategies
AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
API	American Petroleum Institute gravity. A measure of how heavy or light a petroleum liquid is compared to water.
ASTM	American Society for Testing and Materials
Biodegradation	Decomposition of organic material by microorganism
Bonn Agreement	An agreement for cooperation in dealing with pollution of the North Sea by oil and other harmful substances, 1983, includes: Governments of the Kingdom of Belgium, the Kingdom of Denmark, the French Republic, the Federal Republic of Germany, the Republic of Ireland, the Kingdom of the Netherlands, the Kingdom of Norway, the Kingdom of Sweden, the United Kingdom of Great Britain and Northern Ireland and the European Union.
BP	Boiling point
BTEX	Benzene, toluene, ethylbenzene, and xylenes
BU	Bayu-Undan
°C	degree Celsius (unit of temperature)
CFSR	Climate Forecast System Reanalysis
cP	Centipoise (unit of dynamic viscosity)
Decay	The process where oil components are changed either chemically or biologically (biodegradation) to another compound. It includes breakdown to simpler organic carbon compounds by bacteria and other organisms, photo-oxidation by solar energy, and other chemical reactions.
Dissolved hydrocarbons	Hydrocarbon droplets which are dissolved in water.
DPD	Darwin Pipeline Duplication
Dry Season	May to October
Dynamic viscosity	The dynamic viscosity of a fluid expresses its resistance to shearing flows, where adjacent layers move parallel to each other with different speeds.
EMBA	Environment that may be affected
Entrained hydrocarbons	Hydrocarbon droplets that are suspended into the water column, though not dissolved.
Evaporation	The process whereby components of the oil mixture are transferred from the sea-surface to the atmosphere as vapours.
g/m^2	Grams per square meter (unit of surface area density)
GDA	Geocentric Datum of Australia
GEBCO	General Bathymetric Chart of the Oceans
GEP	Gas Export Pipeline

GODAE	Global Ocean Data Assimilation Experiment
HYCOM	Hybrid Coordinate Ocean Model. A data-assimilative, three-dimensional ocean model.
ITOPF	International Tankers Owners Pollution Federation
KEF	Key Ecological Feature
km	Kilometre (unit of length)
km^2	Square Kilometres (unit of area)
Knots	unit of speed (1 knot = 0.514 m/s)
KP	Kilometre point. Refers to the surveyed distance along the main line or lateral line of a pipeline.
LC_{50}	Median lethal dose required for mortality of 50% of a tested population after a specified exposure duration.
m	Meter (unit of length)
m/s	Meter per Second (unit of speed)
m^3	Cubic meter (unit of volume)
MAHs	Monoaromatic hydrocarbons
MDO	Marine diesel oil
MGA	Map Grid of Australia
MNR	Marine Nature Reserve
MP	Marine Park
NASA	National Aeronautics and Space Administration
NCEP	National Centres for Environmental Prediction
nm	Nautical mile
NOAA	National Oceanic and Atmospheric Administration
NOPP	National Ocean Partnership Program
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NR	Nature Reserve
NRC	National Research Council
PAHs	Polynuclear aromatic hydrocarbons
ppb	parts per billion (concentration)
Pour point	The pour point of a liquid is the temperature below which the liquid loses its flow characteristics.
psu	Practical salinity units
Ramsar site	A site listed under the Ramsar Convention on wetlands which is an international intergovernmental treaty that provides the framework for the conservation and wise use of wetlands and their resources.
RFPA	Reef Fish Protected Areas
RSB	Reefs, shoals and banks
Sea surface exposure	Contact by floating oil on the sea surface at concentrations equal to or exceeding defined threshold concentrations. The consequence will vary depending on the threshold and the receptors.

Shoreline contact	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations. Shoreline contact is judged for floating oil arriving within a 1 km buffer zone from any shoreline as a conservative measure
SIMAP	Spill Impact Model Application Package. SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for surface or subsea releases
Single Oil spill modelling	Oil spill modelling involving a computer simulation of a single hypothetical oil spill event subject to a single sequence of wind, current and other sea conditions over time. Single oil spill modelling, also referred to as "deterministic modelling" provides a simulation of one possible outcome of a given spill scenario, subject to the metocean conditions that are imposed. Single oil spill modelling is commonly used to consider the fate and effects of 'worst-case' oil spill scenarios that are carefully selected in consideration of the nature and scale of the offshore petroleum activity and the local environment (NOPSEMA, 2018). Because the outcomes of a single oil spill simulation can only represent the outcome of that scenario under one sequence of metocean conditions, worst-case conditions are often identified from stochastic modelling. It is impossible to calculate the likelihood of any outcome from a single oil spill simulation. Single oil spill modelling is generally used for response planning, preparedness planning and for supporting oil spill response operations in the event of an actual spill.
Stochastic Oil spill modelling	Stochastic oil spill modelling is created by overlaying and statistically analysing the outcomes of many single oil-spill simulations of a defined spill scenario, where each simulation was subject to a different sequence of metocean conditions, selected objectively (typically by random selection) from a long sequence of historic conditions for the study area. Analysis of this larger set of simulations provides a more accurate indication of the area that maybe affected (EMBA) and also indicates which particular locations are more likely to be affected (as well as other statistics). Stochastic oil spill modelling avoids biases that affect single oil spill modelling (due to the reliance on only one possible sequence of conditions). However, when interpreting stochastic modelling, which is based on a wide range of potential conditions that might happen to occur, it is essential to understand that calculations for the Risk EMBA will enclose a much larger area than could be affected in any single spill event, where a more limited set of conditions will occur. Consequently, it is misleading to imply that the Risk EMBA contours derived from stochastic modelling indicate the outcomes expected from a single spill event (NOPSEMA, 2018). Stochastic modelling is generally used for risk assessment and preparedness planning by indicating locations that could be exposed and may require response or subsequent impact assessment.
TOPEX/Poseidon	A joint satellite mission between NASA and CNES to map ocean surface topography using an array of satellites equipped with detailed altimeters
USCG	United States Coast Guard
US EPA	United States Environmental Protection Agency
USA	United States of America
Weathered oil	Oil that no longer contains volatile or soluble components
Wet season	November to April
World Ocean Atlas	A collection of objectively analysed quality controlled physicochemical parameters (e.g., temperature, salinity, oxygen, phosphate, silicate, and nitrate) based on profile data from the World Ocean Database (NCEI, 2021) established by NOAA's National Centers for Environmental Information (NCEI)

EXECUTIVE SUMMARY

Background

Santos is assessing environmental impacts and risks associated with the Darwin Pipeline Duplication (DPD) Project. The DPD Project involves the installation of a gas export pipeline (GEP) from a point (kilometre point (KP) 0) in Commonwealth waters (25km from the Commonwealth/ NT waters boundary) to the Darwin LNG (DLNG) facility on Wickham Point in Darwin Harbour (KP122.2). The pipeline will transfer dry gas from the offshore Barossa field to the DLNG facility. The new pipeline (nearshore Barossa GEP) would run alongside the existing Bayu-Undan (BU) to Darwin GEP, typically within 50-100m, thereby effectively duplicating that pipeline.

To support the environmental risk assessment and approval requirements for the DPD Project, including the development of management plans, an oil spill modelling study was undertaken which considered the following four scenarios:

- **Scenario 1** – An offshore pipelay vessel fuel tank rupture at KP91.5 resulting in the release of 700 m^3 of marine diesel oil (MDO) on the surface over 6 hours;
- **Scenario 2** – A vessel fuel tank rupture at KP114 resulting in the release of 87.5 m^3 MDO on the surface over 6 hours;
- **Scenario 3** – An instantaneous surface spill of 10 m^3 of MDO due to a vessel to vessel refuelling incident within the harbour at KP114; and
- **Scenario 4** – A vessel fuel tank rupture at KP114 resulting in the release of 300 m^3 MDO on the surface over 6 hours.

The potential risk of exposure to the surrounding waters and contact to shorelines was assessed for wet (November to April) and dry (May to October) seasons.

The purpose of the modelling is to provide an understanding of the conservative 'outer envelope' of the potential area that may be affected in the unlikely event of a vessel-based spill. Since the modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill, the results presented herein are conservative.

Methodology

The modelling study was carried out in stages. Firstly, two-years (2019 – 2020) of wind and high-resolution current data covering Darwin Harbour and Beagle Gulf was generated. Secondly, the currents, winds and detailed hydrocarbon characteristics were used as inputs in the three-dimensional oil spill model (SIMAP) to simulate the drift, spread, weathering and fate of the spilled oil.

As spills can occur during any set of wind and current conditions, modelling was conducted using a stochastic (or statistical) approach, which involved running 100 spills modelled for each scenario, per season, with each simulation having the same information (i.e., spill volume, duration and MDO composition) and randomly selected start times. This ensured that each simulation was subjected to different wind and current conditions and, in turn, movement and weathering of the MDO. The results from the simulations were combined to determine the potential exposure to the surrounding waters, shorelines and sensitive receptors based on established exposure thresholds endorsed by NOPSEMA (NOPSEMA 2019).

The SIMAP system, methods and analysis presented herein, use modelling algorithms which have been anonymously peer reviewed and published in international journals. Further, RPS warrants that this work meets and exceeds the ASTM Standard F2067-13 "*Standard Practice for Development and Use of Oil Spill Models*".

Oil Properties

MDO has a density of 829.1 kg/m^3 (API gravity of 37.6) and a dynamic viscosity of 4.0 cP at 25ºC, classifying it as a Group II light persistent oil according to the International Tankers Owners Pollution Federation (ITOPF, 2014) and USEPA/USCG classifications. MDO is characterised by a high percentage of volatile components (95%), which will evaporate when on the sea surface. It also contains 5% persistent hydrocarbons, which will not evaporate and decay slowly over time. It is important to note that some heavy components contained in MDO have a strong tendency to physically entrain into the upper water column in the presence of moderate winds (i.e., >12 knots) and breaking waves but can re-float to the surface when the winds ease.

Results

Scenario 1 – Offshore Pipelay Vessel Fuel Tank Rupture at KP91.5 (700 m^3 of marine diesel oil)

- The KP91.5 stochastic modelling results showed that due to the location, the predominant movement of the oil would be in a northwest and south easterly direction. This was largely due to the sweep of the ebb and flood tide.
- The maximum distances of floating oil exposure zones to the release location at the low (≥1 g/m^2), moderate (≥10 g/m^2) and high (≥ 50 g/m^2) thresholds were 26.4 km (southeast), 19.9 km (southeast) and 14 km (west northwest).
- Floating oil exposure was greatest (100% at the low threshold for both seasons) at Charles Point Wide Reef Fish Protected Area (RFPA and Outer Harbour Water Quality (WQ) Zone) due the proximity of the release location (1.11 km east and 0.65 km north, respectively). Otherwise, exposure at the low and moderate thresholds were predicted at Restricted Area 5 and Middle Harbour WQ Zone with all probabilities ≤10%.
- The probability of oil accumulating on any shoreline at, or above, the low threshold (≥10 g/m^2) was highest for spills commencing during the wet season conditions (50%) and lower during the dry season months (25%) conditions. The quickest time for oil to accumulate on shorelines at, or above, the low threshold was 0.96 days during the wet. The greatest volume of oil ashore from a single spill during dry and wet conditions was 28.1 m^3 and 59.7 m^3, respectively. The wet season simulation resulting in the highest volume ashore took 2 days to initially reach the shorelines.
- The greatest probabilities of oil accumulation at, or above, the low threshold were predicted for the East Arm (16% dry and 33% wet conditions), Outer Harbour East (4% dry and 20% wet seasons) and Outer Harbour West (9% dry and 10% wet seasons). The greatest volume (peak) of oil accumulation during the dry and wet seasons was predicted occurred along Outer Harbour West (22.2 m^3) and Outer Harbour East shorelines (43.8 m^3), respectively. The minimum time for an oil spill simulation to reach a shoreline (at the low threshold) was 1.50 days (Outer Harbour West) during the dry season and 0.96 days (Cox-Finniss) during the wet season conditions.
- Dissolved hydrocarbon exposure at, or above, the low (10 ppb) and moderate (≥ 50 ppb) thresholds were 16.9 km (west) and 13.7 km (southeast), respectively, from the release location during both seasons. No exposure predicted for either season at the high threshold (≥ 400 ppb).
- Not including Charles Point Wide RFPA and Outer Harbour WQ Zone receptors due the proximity of the release location (1.11 km east and 0.65 km north, respectively) Booya shipwreck and Middle Harbour were predicted to be exposed to dissolved hydrocarbons at the low threshold in the 0 – 10 m depth during the dry and wet seasons with probabilities ranging from 1% to 7%. The maximum instantaneous concentrations were 23 ppb predicted at Middle Harbour WQ Zone during the dry season and 38 ppb at Booya shipwreck during the wet season.
- The maximum distances from the release location within the 0 – 10 m depth layer to the low (at the low (≥ 10 ppb) and moderate (≥ 100 ppb) thresholds, ranged between 182.3 km northeast (wet conditions) and 51.3 km east northeast (wet conditions) from the release location, respectively.

- Due to that the proximity of the release location to Charles Point Wide RFPA (1.11 km east) and Outer Harbour WQ Zone (0.65 km north), the probability of exposure was greatest for these receptors (100% at the low threshold for both seasons) and would take 1 hour for a spill to reach the boundaries of the receptors.

Scenario 2 – Vessel Fuel Tank Rupture at KP114 (87.5 m^3 of marine diesel oil)

- Results indicated that the predominant movement for the spilt diesel oil was in a north and south easterly direction, in line with the major tidal axis. Due to the high energy environment, the oil spills were predicted to spread rapidly across the water surface within various reaches of the port.

- The maximum distances to the low, moderate and high floating oil exposure zones were 29.3 km (west northwest), 14.9 km (southeast) and 0.1 km (west northwest), respectively.

- The probability of oil accumulation at, or above, the low threshold was 94% (dry season) and 83% (wet season). The quickest time for a spill to reach a shoreline and for oil accumulation to occur at, or above, the low threshold ranged between 0.21 days (dry season) and 0.17 days (wet season). The maximum volume ashore for a single spill ranged between 24.8 m^3 (dry season) and 24.7 m^3 (wet season). The maximum length of shoreline contacted at the low threshold was 29.6 km (dry season).
- The highest probability of oil accumulation at the low threshold was predicted along the West Arm (78% dry and 47% wet seasons) and East Arm (32% dry and 48% wet conditions) shorelines. The highest volume of oil accumulation during the dry and wet seasons occurred along the West Arm shoreline (24.2 m^3 (dry season) and 24.6 m^3 (wet season)). The minimum time for oil accumulation at the low threshold was 0.21 days (East Arm) for the dry season and 0.17 days (East Arm) during the wet season conditions.
- There was no exposure predicted for the moderate and high dissolved hydrocarbon thresholds. The maximum distances to the low threshold exposure zones during the dry and wet seasons were 3.9 km and 12.2 km north northwest, respectively. Exposure was limited to the 0 – 10 m depth layer.
- There was no exposure to any receptor during the dry season. Under wet season conditions, 3 receptors had recorded exposure at the low threshold (Ham Luong and Mauna Loa USAT shipwreck, and Outer Harbour WQ Zone) and the probabilities ranged between 1 and 6%. The maximum instantaneous dissolved concentrations were 9 ppb and 21 ppb predicted at the Mauna Loa USAT shipwreck during dry and wet seasons, respectively.

- The maximum distances travelled by entrained hydrocarbons within the 0 – 10 m depth layers at the low and moderate thresholds, which ranged between 36.1 km and 23.9 km northwest from the release location.

- For both seasons assessed, the Charles Point Wide RFPA and four Restricted Areas (1, 4, 5 and 6) were predicted to be exposed to entrained hydrocarbons at the low threshold with probabilities ranging from 45 – 97% and 5 – 69% during the dry and wet seasons, respectively. During both seasons Restricted Area 6 was predicted to have the greatest probability of low threshold exposure (97% and 69%). The maximum instantaneous concentrations were predicted at Outer Harbour during both the dry (436 ppb) and wet (677 ppb) seasons.

Scenario 3 – Vessel to Vessel Refuelling at KP 114 (10 m^3 of marine diesel oil)

- Floating oil exposure zones to the low and moderate thresholds were limited to 22.9 km (northwest) and 12.5 km (northwest), respectively during dry season conditions. There was no exposure predicted for the high threshold.
- During the dry and wet seasons the probability of oil accumulation at the low threshold was 58%, and the minimum time was 0.25 days and 0.29 days, respectively. The maximum volume ashore for a single spill ranged between 3.9 m^3 (dry season) and 4.3 m^3 (wet season). The maximum length of shoreline contacted at the low threshold was 9 km for the two seasons.
- The West Arm (49% dry and 28% wet conditions) and East Arm (8% dry and 26% wet seasons) shorelines recorded the highest probability of oil accumulation at the low threshold. The minimum time

before the accumulation was 0.29 days (Middle Arm and West Arm) during the dry season and 0.25 days (East Arm and Wickham Point) during the wet season conditions.

- There was no dissolved hydrocarbon exposure predicted for any spills during this scenario at or above the low threshold (≥ 10 ppb).
- Entrained hydrocarbons within the 0 – 10 m depth layers for the low (≥ 10 ppb) and moderate (≥ 100 ppb) thresholds, were predicted to range between 32 km and 19.6 km northwest.
- The highest probability of entrained hydrocarbon exposure was predicted at Ham Luong (61%) and Mauna Loa USAT (64%) shipwrecks during dry and wet seasons conditions. The maximum entrained concentrations were also predicted Ham Luong (745 ppb) and Mauna Loa USAT (639 ppb) shipwrecks for the two seasons. Also, there were four WQ Zones predicted to be exposed to entrained hydrocarbons at the low threshold during both seasons with probabilities ranging from 6% (East Arm) and 36% (Outer Harbour) during the dry season and 7% (Middle Arm) and 30% (Outer Harbour) during the wet season.

Scenario 4 – Vessel Fuel Tank Rupture at KP114 (300 m^3 of marine diesel oil)

- Floating oil exposure zones to the low, moderate and high thresholds were limited to 33.4 km (northwest; wet season), 19.6 km (northwest; dry season) and 10.2 km (north-northwest; dry season), respectively.
- The probability of shoreline accumulation at, or above, the low threshold (10 g/m^2) was 100% (dry season) and 91% (wet season). The minimum time before oil accumulation at, or above, the low threshold was 0.21 days during dry and wet seasons. The maximum volume ashore for a single spill during the dry and wet season was 114.8 m^3 and 115.5 m^3, respectively, and the maximum length of shoreline contacted at the low threshold was 57.7 km (dry season) and 54.2 km (wet season).
- The highest probability of oil accumulation at the low threshold was predicted along the West Arm (88% dry and 49% wet seasons) and East Arm (44% dry and 60% wet conditions) shorelines. The highest volume of oil accumulation during the dry and wet seasons occurred along the West Arm shoreline (103.5 m^3 (dry season) and 111.7 m^3 (wet season)).
- The maximum distances travelled by dissolved hydrocarbons from the release location to the low (≥ 10 ppb) exposure zone was 12.8 km (dry season) and 20.0 km (wet season), whilst distances were reduced to 0.6 km (dry season) and 7.3 km (wet season) for the moderate (≥ 50 ppb) exposure threshold. Exposure was limited to the 0 – 10 m depth layer. No exposure was predicted for the high (≥ 400 ppb) threshold.
- Dissolved hydrocarbon exposure at the low threshold was also predicted at shipwreck receptors during the dry (3) and wet seasons (5) with dry season probabilities ranging from 1 – 10% and wet season probabilities of exposure ranging between 2 – 17%. The greatest probability of low threshold exposure during the dry and wet season was predicted for Ham Luong and Mauna Loa USAT, respectively.
- The maximum distances travelled by entrained hydrocarbons from the release location to the low (≥ 10 ppb) exposure zone was 41.7 km (dry season) and 48.3 km (wet season), whilst distances were reduced to 30.3 km (dry season) and 32.4 km (wet season) for the moderate exposure threshold.
- During both seasons the Charles Point Wide RFPA and four Restricted Areas (1, 4, 5 and 6) were predicted to be exposed to entrained hydrocarbons at the low threshold with probabilities ranging from 14 – 99% and 50 – 94% during the dry and wet seasons, respectively. During both seasons, Restricted Area 6 was predicted to have the highest probability of exposure (99% and 94%).
- Exposure at the low threshold was predicted at 18 and 19 shipwreck receptors during the dry and wet season, respectively, with probabilities ranging from 5% (East Arm Vietnamese Refugee Boat 1) and 100% (Ham Luong, Mauna Loa USAT and Yu Han 22) during the dry season and 4% (Elizabeth River - unidentified wreck) and 95% (Ham Luong) during the wet season.

1 INTRODUCTION

1.1 Background

Santos is assessing environmental impacts and risks associated with the Darwin Pipeline Duplication (DPD) Project. The DPD Project involves the installation of a gas export pipeline (GEP) from a point (kilometre point (KP) 0) in Commonwealth waters (25km from the Commonwealth/ NT waters boundary) to the Darwin LNG (DLNG) facility on Wickham Point in Darwin Harbour (KP122.2). The pipeline will transfer dry gas from the offshore Barossa field to the DLNG facility. The new pipeline (nearshore Barossa GEP) would run alongside the existing Bayu-Undan (BU) to Darwin GEP, typically within 50-100m, thereby effectively duplicating that pipeline.

To support the environmental risk assessment and approval requirements for the DPD Project, including the development of management plans, an oil spill modelling study was undertaken which considered the following four scenarios:

- **Scenario 1** – An offshore pipelay vessel fuel tank rupture at KP91.5 resulting in the release of 700 m^3 of marine diesel oil (MDO) on the surface over 6 hours;
- **Scenario 2** – A vessel fuel tank rupture at KP114 resulting in the release of 87.5 m^3 MDO on the surface over 6 hours;
- **Scenario 3** – An instantaneous surface spill of 10 m^3 of MDO due to a vessel to vessel refuelling incident within the harbour at KP114; and
- **Scenario 4** – A vessel fuel tank rupture at KP114 resulting in the release of 300 m^3 MDO on the surface over 6 hours.

Table 1.1 presents the coordinates of each location and Figure 1.1 is the location map.

The potential risk of exposure to the surrounding waters and contact to shorelines was assessed for wet (November to April) and dry (May to October) seasons.

The purpose of the modelling is to provide an understanding of the conservative ‘outer envelope’ of the potential area that may be affected in the unlikely event of a vessel-based spill. Since the modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill, the results presented herein are conservative.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Mapping and Assessment Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Note that the oil spill model, method and analysis presented herein uses modelling algorithms which have been anonymously peer reviewed and published in international journals. Furthermore, RPS warrants that this work meets and exceeds the American Society for Testing and Materials (ASTM) Standard F2067-13 “*Standard Practice for Development and Use of Oil Spill Models*” (ASTM, 2013).

Table 1.1 Release locations for the Barossa DPD oil spill modelling study.

Scenario	Identifier	Easting (S)	Northing (E)	Water Depth (LAT m)
1	KP91.5	681,788.21	8,635,852.42	17.1
2, 3 & 4	KP114	696,972.89	8,619,537.48	19.44

1.2 What is Oil Spill Modelling?

Oil spill modelling is a valuable tool widely used for risk assessment, emergency response and contingency planning where it can be particularly helpful to proponents and decision makers. By modelling a series of the most likely oil spill scenarios, decisions concerning suitable response measures and strategic locations for deploying equipment and materials can be made, and the locations at most risk can be identified. The two types of oil spill modelling often used are stochastic (Section 1.2.1) and deterministic (Section 1.2.2) modelling.

1.2.1 Stochastic Modelling (Multiple Spill Simulations)

Stochastic oil spill modelling is created by overlaying a great number (often hundreds) of individual, computer-simulated hypothetical spills (NOPSEMA, 2018; Figure 1.2).

Stochastic modelling is a common means of assessing the potential risks from oil spills related to new projects and facilities. Stochastic modelling typically utilises hydrodynamic data for the location in combination with historic wind data. Typically, 100 iterations of the model will be run utilising the data that is most relevant to the season or timing of the project.

The outcomes are often presented as a probability of exposure and is primarily used for risk assessment purposes in view to understand the range of environments that may be affected or impacted by a spill. Elements of the stochastic modelling can also be used in oil spill preparedness and planning.

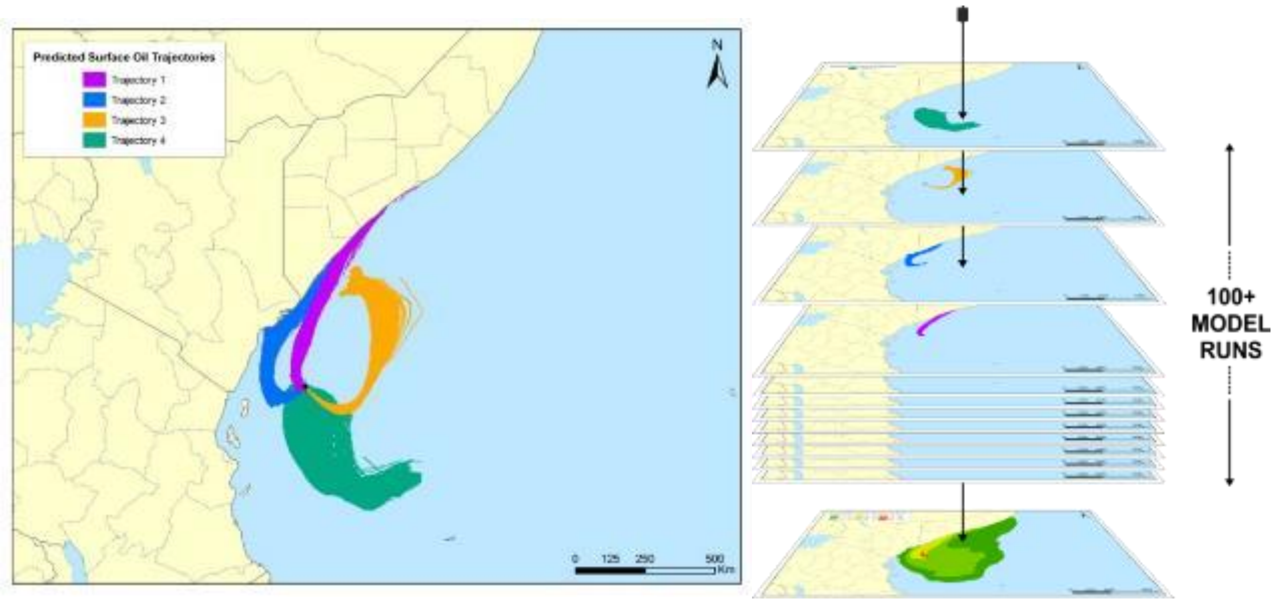

Figure 1.2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability.

1.2.2 Deterministic Modelling (Single Spill Simulation)

Deterministic modelling is the predictive modelling of a single incident subject to a single sample of wind and weather conditions over time (NOPSEMA, 2018; Figure 1.3).

Deterministic modelling is often paired with stochastic modelling to place the large stochastic footprint into perspective. This deterministic analysis is generally a single run selected from the stochastic analysis and serves as the basis for developing the plans and equipment needs for a realistic spill response. Deterministic spills can be selected based on parameters such as minimum time to shoreline, largest swept area, maximum volume ashore and longest length of shoreline contacted by oil.

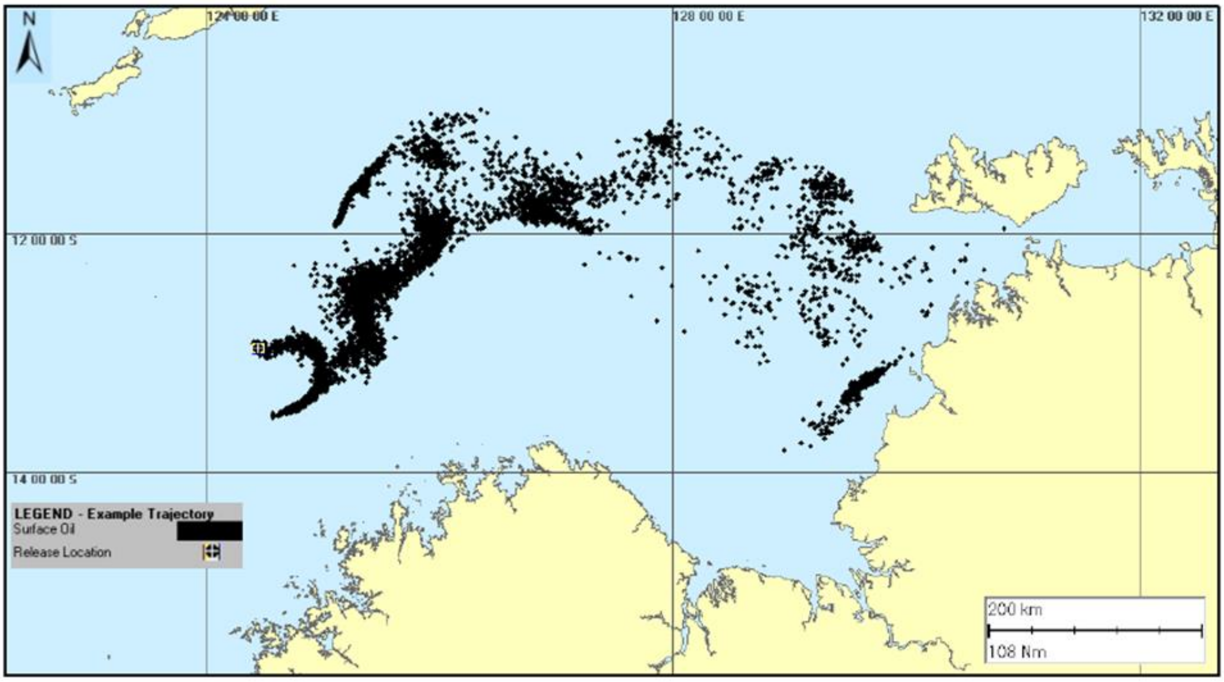

Figure 1.3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil and does not take any thresholds into consideration.

2 SCOPE OF WORK

The scope of work included the following components:

1. Generate 2 years (2019 – 2020) of wind and high-resolution current data covering Darwin Harbour and the Beagle Gulf representing the complex tidal flows, in addition to the tidal wetting and drying of intertidal zones;
2. Include the wind and current data and the MDO characteristics as input into the three-dimensional oil spill model, SIMAP, to model the movement, spreading, weathering and shoreline accumulation by hydrocarbons over time;
3. For each scenario, run 100 oil spill simulations per season (200 total per scenario), with each simulation having the same spill information (spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill trajectory was subjected to a unique set of wind and current conditions;
4. Combine the results from the 100 spill trajectories (per season) to determine the probability and level of exposure to the waters and shorelines for defined thresholds;
5. Present the combined results from the 200 spill simulations, per scenario, to assess the low threshold environment that maybe affected (EMBA); and
6. From the 200 simulations modelled for each scenario, identify and present the “worst case” deterministic run resulting in the maximum volume of oil ashore.

3 CURRENTS

3.1 Development of Regional Current Data

To simulate the hydrodynamics within Darwin Harbour and Beagle Gulf, a three-dimensional model was setup which accounted for tidal and oceanic currents, bathymetry, bottom roughness and wind stress. The model framework was developed through the combination of a large-scale regional model with smaller refined regions, or sub-domains. The D-FLOW model is ideally suited to represent the hydrodynamics of complex coastal waters, including regions where the tidal range creates large intertidal zones.

The three-dimensional simulations were generated using a rectangular grid in the horizontal with a series of interconnected (two-way, dynamically-nested) grids of varying resolution; a technique referred to as “domain decomposition”. This allows for the generation of a series of grids with progressively increasing spatial resolution, down to an appropriate scale for accurate resolution of the hydrodynamics to resolve flows more accurately along the coastline, around islands and over regions with more complex bathymetry. The main advantage of domain decomposition over traditional one-way, or static, nesting systems is that the model domains interact seamlessly, allowing transport and feedback between the regions of different scales. The ability to dynamically couple multiple model domains offer a flexible framework for hydrodynamic model development. In the vertical, a sigma-coordinate approach was employed to divide the water column into a series of layers.

D-FLOW allows for the establishment of a:

- Detailed bathymetry of the study area with wetting and drying of the intertidal zones simulated in applicable areas;
- Boundary elevation forcing data in the form of water levels representing the tides was sourced from the TPXO8.0 database, which is derived from sea-surface topography measurement by the TOPEX/Poseidon satellite-borne radar altimeters; TOPEX). While elevation data representing the ocean currents sourced from Hybrid Coordinate Ocean Model (HYCOM); and
- Spatially-varying surface wind data.

3.2 Grid Setup

To optimise the computational effort required for a large, multi-layered model domain, and to achieve adequate horizontal and temporal resolution, a multiple-grid (domain-decomposition) strategy was applied using five sub-domains of varying horizontal grid cell size (Figure 3.1). The horizontal resolution within Darwin Harbour was 80 m (sub-grid 4), 240 m for the intermediate region (sub-grid 3), 720 m, 2.2 km and 6.5 km for the outer domains (sub-grids 2, 1 and 0, respectively).

A combination of datasets was used and merged to describe the shape of the seabed within Darwin Harbour and the intermediate area, including spot depths and contours which were digitised from nautical charts released by the hydrographic offices. For the outer domains, depths extracted from the General Bathymetric Chart of the Oceans (GEBCO) dataset on a 15 arc-second interval grid was used.

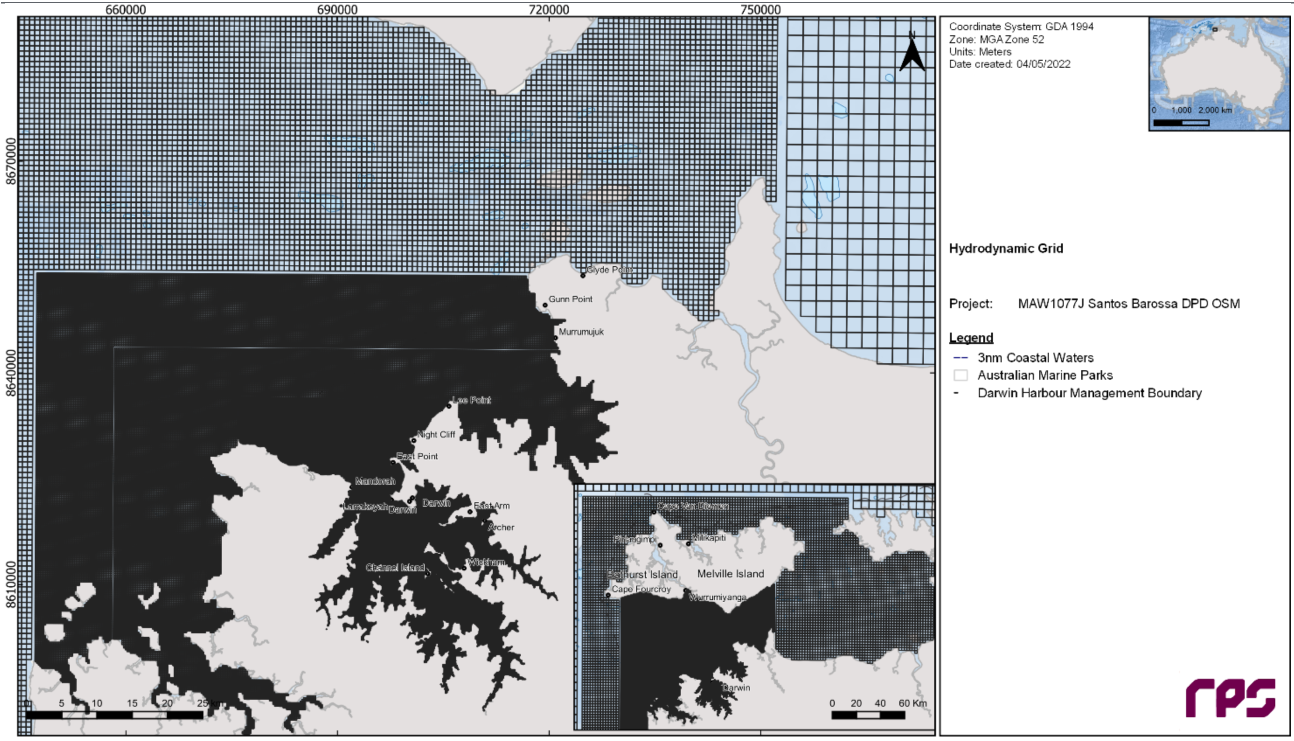

Figure 3.1 Detail of the hydrodynamic model grid.

3.3 Boundary Conditions

3.3.1 Overview

While the hydrodynamics in Darwin Harbour are controlled primarily by tidal flows, oceanic and wind forcing were explicitly included to account for the conditions beyond the port limits.

The model was forced on the open boundaries of the outer sub-domain with time series of water elevation obtained for the chosen simulation period. Spatial and temporal variation in wind forcing across the entire domain was accounted for by applying spatially-varying wind speed and wind direction data that varied over time.

3.3.1.1 Water Elevation

Water elevations at hourly intervals were obtained from the TPXO8.0 database, which is derived from measurements of sea-surface topography by the TOPEX/Poseidon satellite-borne radar altimeters. Tides are provided as complex amplitudes of earth-relative sea-surface elevation for eight primary (M_2, S_2, N_2, K_2, K_1, O_1, P_1, Q_1), two long-period (M_f, M_m) and three non-linear (M_4, MS_4, MN_4) harmonic constituents at a spatial resolution of 0.25°.

The tidal sea level data was augmented with non-tidal (or oceanic) sea level elevation data from the global Hybrid Coordinate Ocean Model (HYCOM; Bleck, 2002; Chassignet *et al.*, 2007, 2009; Halliwell, 2004), created by the USA's National Ocean Partnership Program (NOPP) as part of the Global Ocean Data Assimilation Experiment (GODAE). The HYCOM model is a three-dimensional model that assimilates observations of sea surface temperature, sea surface salinity and surface height, obtained by satellite instrumentation, along with atmospheric forcing conditions from atmospheric models to predict drift currents generated by such forces as wind shear, density, sea height variations and the rotation of the Earth. The model has a global coverage with a horizontal resolution of 1/12th of a degree (~7 km at mid-latitudes) and a temporal resolution of 24 hours.

3.3.1.2 Wind Forcing

Wind forcing was included in the hydrodynamic model as a boundary condition to capture its effect on water currents. For this model, wind data was sourced from the National Center for Environmental Prediction (NCEP) Climate Forecast System Reanalysis (CFSR; see Saha *et al.*, 2010). The CFSR wind model includes observations from many data sources: surface observations, upper-atmosphere air balloon observations, aircraft observations and satellite observations. The model is capable of accurately representing the interaction between the earth’s oceans, land and atmosphere. The gridded wind data output is available at a horizontal resolution of 0.25° (~33 km) and a temporal resolution of 1 hour.

3.4 Surface Currents

Table 3.1 displays the predicted monthly average and maximum combined surface current speeds adjacent to the release locations. The surface modelled current speeds were relatively consistent ranging from 0.39 m/s to 0.42 m/s at KP91.5 and 0.33 m/s to 0.36 m/s (KP114). The dominant current directions at KP91.5 and KP114 were along the east-southeast to west-northwest axis and south-southeast to north-northwest axis, respectively. In addition, the maximum monthly current speeds ranged from 1.08 m/s to 1.23 m/s (KP91.5) and 1.07 m/s and 1.33 m/s (KP114).

Figure 3.2 and Figure 3.3 present the monthly and total surface current rose distributions from 2019 – 2020 (inclusive), respectively. Note the convention for defining current direction is the direction the current flows towards, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. The rose branches are each divided into segments of different colour according to speed intervals of 0.1 m/s, which represent current speeds within the monthly or seasonal datasets, respectively. The length of each coloured segment (indicative of speeds) is relative to the proportion of time the currents flow in that direction.

Table 3.1 Summary of the predicted average and maximum surface current speeds adjacent to the KP91.5 and KP 114 release locations, derived from the modelled 2019 – 2020 dataset.

Season		KP91.5 (Scenario 1)			KP114 (Scenario 2, 3 and 4)		
	Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (towards)	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (towards)
Wet	January	0.39	1.17	East-southeast and west-northwest	0.33	1.18	South-southeast and north-northwest
	February	0.41	1.14		0.35	1.20	
	March	0.40	1.16		0.35	1.26	
	April	0.41	1.15		0.35	1.33	
Dry	May	0.39	1.19		0.33	1.27	
	June	0.39	1.13		0.33	1.16	
	July	0.39	1.08		0.33	1.07	
	August	0.40	1.12		0.34	1.15	
	September	0.41	1.15		0.36	1.29	
	October	0.42	1.19		0.36	1.30	
Wet	November	0.40	1.23		0.34	1.31	
	December	0.39	1.16		0.33	1.21	
	Minimum	**0.39**	**1.08**		**0.33**	**1.07**	
	Maximum	**0.42**	**1.23**		**0.36**	**1.33**

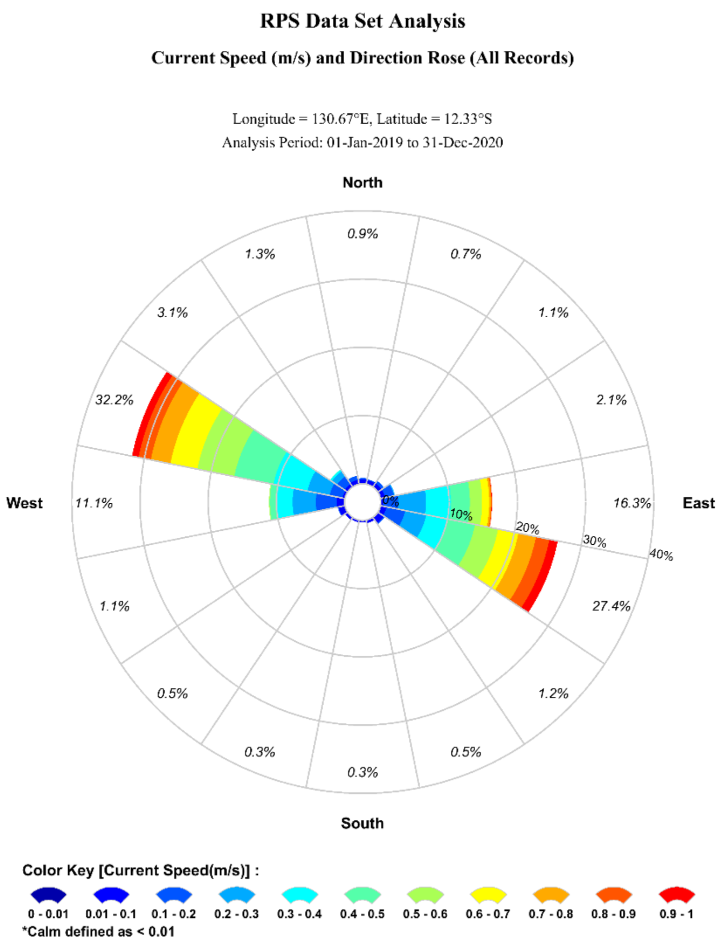

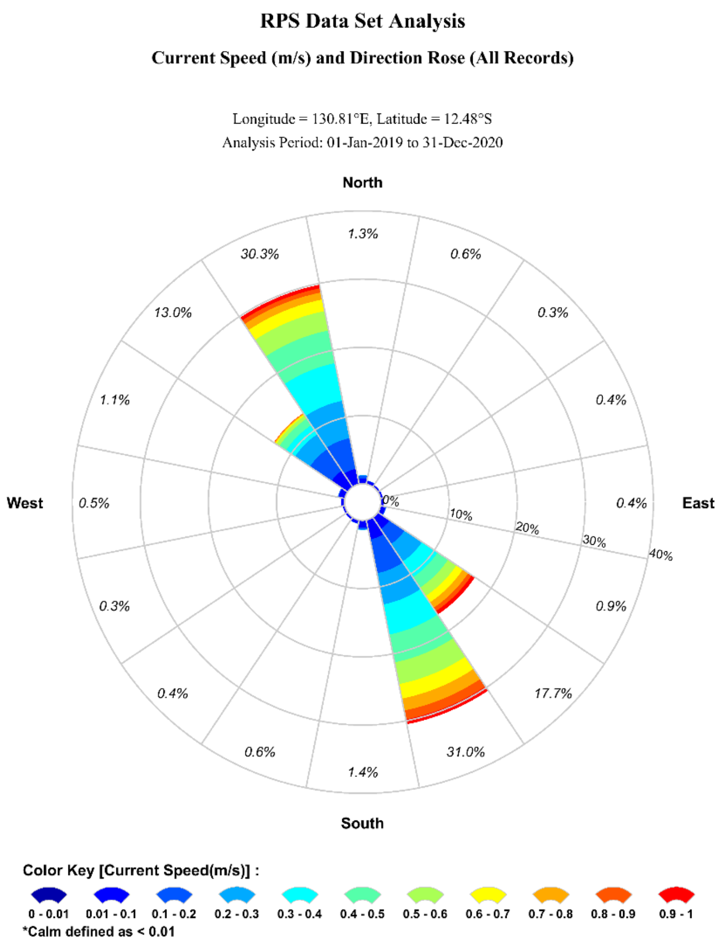

Figure 3.3 **Total surface current rose distributions from 2019 – 2020 (inclusive), for the closest current nodes to the KP91.5 (left) and KP 114 (right) release locations, derived from the modelled dataset.**

4 WIND DATA

To account for the influence of the wind on the floating oil, the wind conditions between 2019 – 2020 (inclusive) was sourced from the CFSR model (see Section 3.3.1.2). Table 4.1 presents the monthly average and maximum winds derived from a CFSR wind node closest to the release locations. Monthly average wind speeds ranged from 7.1 to 13.5 knots at KP91.5 and 17.5 to 28.2 knots at KP114, while monthly maximums ranged from 17.3 to 29.2 knots at KP91.5 and 17.5 to 28.2 knots at KP114. The wind direction varied between the months, with the winds blowing generally from the west during the wet season and east-southeast during the dry season at both locations.

Figure 4.1 and Figure 4.2 show the monthly and total wind rose distributions derived from the nearest wind node to the KP91.5 release location. Plots for KP114 are not presented as they are identical to KP91.5. Note that the atmospheric convention for defining wind direction, that is, the direction the wind blows from, is used to reference wind direction throughout this report. Each branch of the rose represents wind coming from that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent wind speed ranges from that direction. Speed ranges of 3 knots are predominantly used in these wind roses. The length of each segment within a branch is proportional to the frequency of winds blowing within the corresponding range of speeds from that direction.

Table 4.1 Summary of the predicted average and maximum winds for the nearest CFSR wind nodes to the KP91.5 and KP 114 release locations, derived from CFSR hindcast model from 2019 – 2020 (inclusive).

Season	Month	KP91.5 (Scenario 1)			KP114 (Scenario 2, 3 and 4)		
		Average wind speed (knots)	Maximum wind speed (knots)	General direction (from)	Average wind speed (knots)	Maximum wind speed (knots)	General direction (from)
Wet	January	11.9	29.2	West	11.3	28.2	West
	February	13.5	28.5	West	12.9	27.4	West
	March	8.3	22.9	West	7.9	22.0	West
	April	7.9	28.2	East	7.6	25.7	East

5 WATER TEMPERATURE AND SALINITY

Table 5.1. provides a summary of the monthly mean sea surface temperature and salinity values in the 0 – 5 m depth layer at the release locations. The temperature and salinity data throughout the water column was obtained from the World Ocean Atlas 2018 database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration, NOAA) and its co-located World Data Centre for Oceanography (Levitus *et al.*, 2013). The data is used to inform the weathering, movement and evaporative loss of hydrocarbon spills in the surface and subsurface layers.

The monthly average sea surface temperatures ranged between 26.0°C (July) and 30.9°C (December) at KP91.5. While the sea surface temperatures at KP114 ranged between 24.4°C (June) and 31.0°C (December). The monthly average salinity values remain relatively consistent between the two locations (between 33.6 psu to 34.7 psu at KP91.5; and between 32.9 psu to 34.8 psu at KP114). The data align with the Darwin Harbour water quality monitoring program (https://depws.nt.gov.au/water/water-management/darwin-harbour/darwin-harbour-region-report-cards/2018-report-cards).

Table 5.1 Monthly average sea surface temperature and salinity adjacent to the KP91.5 and KP114 release locations.

6 OIL SPILL MODEL – SIMAP

The spill modelling was carried out using a purpose-developed oil spill trajectory and fates model, SIMAP. This model is designed to simulate the transport and weathering processes that affect the outcomes of hydrocarbon spills to the sea, accounting for the specific oil type, spill scenario, and prevailing wind and current circulation patterns.

SIMAP is the evolution of the United States Environmental Protection Agency (US EPA) Natural Resource Damage Assessment model (French & Rines, 1997; French *et al.*, 1999) and is designed to simulate the fate and effects of spilled oils and fuels for both the surface slick and the three-dimensional plume that is generated in the water column. SIMAP includes algorithms to account for both physical transport and weathering processes. The latter are important for accounting for the partitioning of the spilled mass over time between the water surface (surface slick), water column (entrained oil and dissolved compounds), atmosphere (evaporated compounds) and land (stranded oil). The model also accounts for the interaction between weathering and transport processes.

The physical algorithms calculate transport and spreading by physical forces, including surface tension, gravity and wind and current forces for both surface slicks and oil within the water column. The fates algorithms calculate all the weathering processes known to be important for oil spilled to marine waters. These include droplet and slick formation, entrainment by wave action, emulsification, dissolution of soluble components, sedimentation, evaporation, bacterial and photo-chemical decay and shoreline interactions. These algorithms account for the specific oil type being considered.

Entrainment is the physical process where globules of oil are transported from the sea surface into the water column by wind and wave-induced turbulence or be generated subsea by a pressurised discharge at depth. It has been observed that entrained oil is broken into droplets of varying sizes. Small droplets spread and diffuse into the water column, while larger ones rise rapidly back to the surface (Delvigne & Sweeney, 1988; Delvigne, 1991).

Dissolution is the process by which soluble hydrocarbons enter the water from a surface slick or from entrained droplets. The lower molecular weight hydrocarbons tend to be both more volatile and more soluble than those of higher molecular weight.

The formation of water-in-oil emulsions, or mousse, which is termed ‘emulsification’, depends on oil composition and sea state. Emulsified oil can contain as much as 80% water in the form of micrometre-sized droplets dispersed within a continuous phase of oil (Daling & Brandvik, 1991; Bobra, 1991; Daling *et al.*, 1997; Fingas, 1995, 1997).

Entrainment, dissolution and emulsification rates are correlated to wave energy, which is accounted for by estimating wave heights from the sustained wind speed, direction and fetch (i.e. distance downwind from land barriers) at different locations in the domain. Dissolution rates are dependent upon the proportion of soluble, short-chained hydrocarbon compounds, and the surface area at the oil/water interface of slicks. Dissolution rates are also strongly affected by the level of turbulence. For example, dissolution rates will be relatively high at the site of the release for a deep-sea discharge at high pressure.

Evaporation can result in the transfer of large proportions of spilled oil from the sea surface to the atmosphere, depending on the type of oil (Gundlach & Boehm, 1981). Evaporation rates vary over space and time dependent on the prevailing sea temperatures, wind and current speeds, the surface area of the slick and entrained droplets that are exposed to the atmosphere as well as the state of weathering of the oil. Evaporation rates will decrease over time, depending on the calculated rate of loss of the more volatile compounds. By this process, the model can differentiate between the fates of different oil types.

Decay (degradation) of hydrocarbons may occur as the result of photolysis, which is a chemical process energised by ultraviolet light from the sun, and by biological breakdown, termed biodegradation. Many types of marine organisms ingest, metabolise and utilise oil as a carbon source, producing carbon dioxide and water as by-products.

The SIMAP weathering algorithms include terms to represent these dynamic processes. Technical descriptions of the algorithms used in SIMAP and validations against real spill events are provided in French (1998), French *et al.*, (1999) and French-McCay (2004).

Input specifications for oil types include density, viscosity, pour-point, distillation curve (volume of oil distilled off versus temperature) and the aromatic/aliphatic component ratios within given boiling point ranges. The model calculates a distribution of the oil by mass into the following components:

- Surface-bound or floating oil;
- Entrained oil (non-dissolved oil droplets that are physically entrained by wave action);
- Dissolved hydrocarbons (principally the aromatic and short-chained aliphatic compounds);
- Evaporated hydrocarbons;
- Sedimented hydrocarbons; and
- Decayed hydrocarbons.

7 OIL PROPERTIES

Table 7.1 and Table 7.2 present the physical properties and boiling point ranges of the MDO used in this study. It has a density of 829.1 kg/m³ (API of 37.6) and a low pour point of -14°C. The low viscosity (4 cP) indicates that this oil will spread quickly when released and will form a thin to low thickness film on the sea surface, increasing the rate of evaporation.

Generally, about 6.0% of the MDO mass should evaporate within the first 12 hours (Boiling point (BP) < 180°C); a further 34.6% should evaporate within the first 24 hours (180°C < BP < 265°C); and an additional 54.4% should evaporate over several days (265°C < BP < 380°C). Approximately 5% (by mass) of MDO will not evaporate though will decay slowly over time.

The oil is categorised as a group II oil (light-persistent) according to the International Tankers Owners Pollution Federation (ITOPF, 2014) and US EPA/USCG classifications. The classification is based on the specific gravity of hydrocarbons in combination with relevant boiling point ranges.

It is important to note that some heavy components contained in MDO have a strong tendency to physically entrain into the upper water column in the presence of moderate winds (i.e. >12 knots) and breaking waves but can re-float to the surface if these energies abate.

Table 7.1 Physical properties of the MDO

Characteristic	Marine Diesel Oil (MDO)
Density (kg/m³)	829.1 (at 25 °C)
API	37.6
Dynamic viscosity (cP)	4.0 (at 25 °C)
Pour point (°C)	-14
Hydrocarbon property category	Group II
Hydrocarbon property classification	Light - Persistent

Table 7.2 Boiling point ranges of the MDO

Oil Type	Component	Volatile (%)	Semi-volatile (%)	Low-volatility (%)	Residual (%)
	Boiling point (°C)	<180 C_4 to C_{10}	180-160 C_{11} to C_{15}	160-380 C_{16} to C_{20}	>380 >C_{20}
Marine diesel oil (MDO)	% of total	6.0	34.6	54.4	5.0

8 FLOATING, SHORELINE AND IN-WATER THRESHOLDS

The thresholds and their relationship to exposure for the sea surface, shoreline, and water column (entrained and dissolved hydrocarbons) are presented in Sections 8.1 to 8.3. Supporting justifications of the adopted thresholds applied during the study and additional context relating to the area of influence are also provided. It is important to note that the thresholds herein are based on NOPSEMA (2019).

8.1 Floating Oil Exposure Thresholds

The modelling results can be presented to any levels; therefore, thresholds have been specified (based on scientific literature) to record floating oil exposure to the sea-surface at meaningful levels only, described in the following paragraphs.

The low threshold to assess the potential for floating oil exposure, was 1 g/m^2, which equates approximately to an average thickness of 1 µm, referred to as visible oil. Oil of this thickness is described as rainbow sheen in appearance, according to the Bonn Agreement Oil Appearance Code (Bonn Agreement, 2009; AMSA, 2014) (see Table 8.1). Table 8.1 provides a description of the appearance in relation to exposure zone thresholds used to classify the zones of floating oil exposure. Figure 8.1 shows photographs highlighting the difference in appearance between a silvery sheen, rainbow sheen and metallic sheen. The low threshold is considered below levels which would cause environmental harm and it is more indicative of the areas perceived to be affected due to its visibility on the sea surface and potential to trigger temporary closures of areas (i.e., fishing grounds) as a precautionary measure.

Ecological impact has been estimated to occur at 10 g/m^2 (a film thickness of approximately 10 µm or 0.01 mm) (French *et al.*,1996 and French-McCay 2009) as this level of fresh oiling has been observed to mortally impact some birds through adhesion of oil to their feathers, exposing them to secondary effects such as hypothermia. The appearance of oil at this average thickness has been described as a metallic sheen (Bonn Agreement, 2009). Concentrations above 10 g/m^2 is also considered the lower actionable threshold, where oil may be thick enough for containment and recovery as well as dispersant treatment (AMSA, 2015).

Oil concentrations on the sea surface of 25 g/m^2 (or greater) would be harmful for all birds that have landed in an oil film due to potential contamination of their feathers, with secondary effects such as loss of temperature regulation and ingestion of oil through preening (Scholten *et al.*, 1996 and Koops *et al.*, 2004). The appearance of oil at this thickness is also described as metallic sheen (Bonn Agreement, 2009). For this study the high exposure threshold was set to 50 g/m^2 and above based on NOPSEMA (2019). This threshold can also be used to inform response planning.

Table 8.2 defines the thresholds used to classify the zones of floating oil exposure reported herein.

Table 8.1 The Bonn Agreement Oil Appearance Code.

Code	Description Appearance	Layer Thickness Interval (g/m^2 or µm)	Litres per km^2
1	Sheen (silvery/grey)	0.04 – 0.30	40 – 300
2	Rainbow	0.30 – 5.0	300 – 5,000
3	Metallic	5.0 – 50	5,000 – 50,000
4	Discontinuous True Oil Colour	50 – 200	50,000 – 200,000
5	Continuous True Oil Colour	≥ 200	≥ 200,000

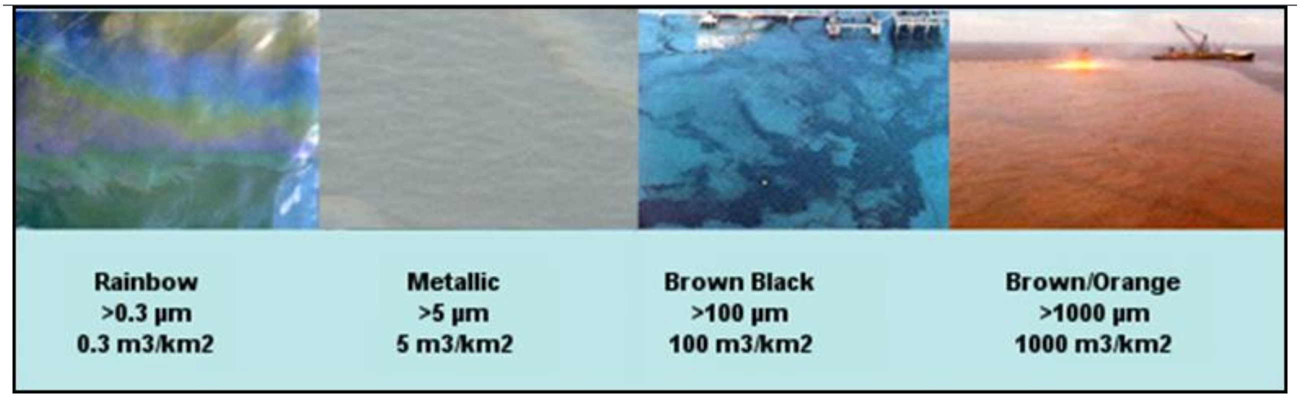

Figure 8.1 Photographs showing the difference between oil colour and thickness on the sea surface (source: adapted from Oil Spill Solutions, 2015).

Table 8.2 Floating oil exposure thresholds used in the Barossa DPD oil spill modelling study (in alignment with NOPSEMA, 2019).

Threshold level	Floating oil (g/m^2)	Description
Low	1	Approximates range of socio-economic effects and establishes planning area for scientific monitoring
Moderate	10	Approximates lower limit for harmful exposures to birds and marine mammals
High	50*	Approximates surface oil slick and informs response planning

* 50 g/m^2 also used to define the threshold for actionable floating oil.

8.2 Shoreline Accumulation Thresholds

There are many different types of shorelines, ranging from cliffs, rocky beaches, sandy beaches, mud flats and mangroves, and each of these influences the volume of oil that can remain stranded ashore and its thickness before the shoreline saturation point occurs. For instance, a sandy beach may allow oil to percolate through the sand, thus increasing its ability to hold more oil ashore over tidal cycles and various wave actions than an equivalent area of water; hence oil can increase in thickness onshore over time. A sandy beach shoreline was assumed as the default shoreline type for the modelling in this study, as it allows for the highest carrying capacity of oil (of the available open/exposed shoreline types). Hence the results are considered conservative (i.e., worst-case) given that a large part of the shoreline in the study area (especially the western part of the Joseph Bonaparte Gulf) is characterised by exposed rocky shorelines, with southern parts characterised by tidal mudflats and mangroves and eastern shorelines containing more sandy beaches.

Previous risk assessment studies used a threshold of 10 g/m^2 to assess the potential for shoreline accumulation (French-McCay *et al.*,2005a; 2005b). This is a conservative threshold used to define regions of socio-economic impact, such as triggering temporary closures of adjoining fisheries or the need for shore clean-up on beaches or man-made features/amenities (breakwaters, jetties, marinas, etc.). It would equate to approximately 2 teaspoons of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a stain/film. On that basis, the 10 g/m^2 shoreline accumulation threshold has been selected to define the zone of potential “low shoreline accumulation”.

French *et al.* (1996) and French-McCay (2009) define a shoreline oil accumulation threshold of 100 g/m^2, or above, would potentially harm shorebirds and wildlife (fur-bearing aquatic mammals and marine reptiles on or along the shore) based on studies for sub-lethal and lethal impacts. This threshold has been used in previous environmental risk assessment studies (see French-McCay, 2003; French-McCay *et al.*, 2004, French-McCay *et al.*, 2011; 2012; NOAA, 2013). Additionally, a shoreline concentration of 100 g/m^2, or above, is the minimum concentration that the oil can be effectively cleaned according to AMSA (2015). This threshold equates to approximately ½ a cup of oil per square meter of shoreline accumulation. The appearance is described as a thin oil coat. Therefore, 100 g/m^2 has been selected to define the zone of potential "moderate shoreline accumulation".

Observations by Lin & Mendelssohn (1996) demonstrated that loadings of more than 1,000 g/m^2 of hydrocarbon during the growing season would be required to impact marsh plants significantly. Similar thresholds have been found in studies assessing hydrocarbon impacts on mangroves (Grant *et al.*, 1993; Suprayogi & Murray, 1999). This loading equates to approximately 1 litre of hydrocarbon per square meter of shoreline accumulation and the appearance is described as a hydrocarbon cover. A loading of 1,000 g/m^2 has been selected to define the zone of potential "high shoreline accumulation".

These shoreline accumulation thresholds derived from extensive literature review (outlined in Table 8.3) align with the threshold values for oil spill modelling specified in NOPSEMA (2019).

Table 8.3 Shoreline accumulation thresholds used in the Barossa DPD oil spill modelling study (in alignment with NOPSEMA, 2019).

Threshold level	Shoreline loading(g/m^2)	Description
Low (socioeconomic/sublethal)	10	Predicts potential for some socio-economic impact
Moderate	100*	Loading predicts area likely to require clean-up effort
High	1,000	Loading predicts area likely to require intensive clean-up effort

* 100 g/m^2 also used to define the threshold for actionable shoreline oil.

8.3 In-water Exposure Thresholds

Oil is a mixture of thousands of hydrocarbons of varying physical, chemical, and toxicological characteristics, and therefore, demonstrate varying fates and impacts on organisms. As such, for in-water exposure, the SIMAP model provides separate outputs for dissolved and entrained hydrocarbons from oil droplets. The consequences of exposure to dissolved and entrained components will differ because they have different modes and magnitudes of effect.

Entrained hydrocarbon concentrations were calculated based on oil droplets that are suspended in the water column, though not dissolved. The composition of this oil would vary with the state of weathering (oil age) and may contain soluble hydrocarbons when the oil is fresh. Calculations for dissolved hydrocarbons specifically calculates oil components which are dissolved in water, which are known to be the primary source of toxicity exerted by oil.

A complicating factor that should be considered when assessing the consequence of dissolved and entrained oil distributions is that there will be some areas where both physically entrained oil droplets and dissolved hydrocarbons co-exist. Higher concentrations of each will tend to occur close to the source where sea conditions can force mixing of relatively unweathered oil into the water column, resulting in more rapid dissolution of soluble compounds.

8.3.1 Dissolved Hydrocarbons

Laboratory studies have shown that dissolved hydrocarbons exert most of the toxic effects of oil on aquatic biota (Carls *et al.*, 2008; Nordtug *et al.*, 2011; Redman, 2015). The mode of action is a narcotic effect, which is positively related to the concentration of soluble hydrocarbons in the body tissues of organisms (French-McCay, 2002). Dissolved hydrocarbons are taken up by organisms directly from the water column by absorption through external surfaces and gills, as well as through the digestive tract. Thus, soluble hydrocarbons are termed "bioavailable".

Hydrocarbon compounds vary in water-solubility and the toxicity exerted by individual compounds is inversely related to solubility, however bioavailability will be modified by the volatility of individual compounds (Nirmalakhandan & Speece, 1988; Blum & Speece, 1990; McCarty, 1986; McCarty *et al.*, 1992a, 1992b; McCarty & Mackay, 1993; Verhaar *et al.*, 1992, 1999; Swartz *et al.*, 1995; French-McCay, 2002; McGrath & Di Toro, 2009). Of the soluble compounds, the greatest contributor to toxicity for water-column and benthic organisms are the lower-molecular-weight aromatic compounds, which are both volatile and soluble in water.

Although they are not the most water-soluble hydrocarbons within most oil types, the polynuclear aromatic hydrocarbons (PAHs) containing 2 – 3 aromatic ring structures typically exert the largest narcotic effects because they are semi-soluble and not highly volatile, so they persist in the environment long enough for significant accumulation to occur (Anderson *et al.*, 1974, 1987; Neff & Anderson, 1981; Malins & Hodgins, 1981; McAuliffe, 1987; NRC, 2003). The monoaromatic hydrocarbons (MAHs), including the BTEX compounds (benzene, toluene, ethylbenzene, and xylenes), and the soluble alkanes (straight chain hydrocarbons) also contribute to toxicity, but these compounds are highly volatile, so that their contribution will be low when oil is exposed to evaporation and higher when oil is discharged at depth where volatilisation does not occur (French-McCay, 2002).

French-McCay (2002) reviewed available toxicity data, where marine biota was exposed to dissolved hydrocarbons prepared from oil mixtures, finding that 95% of species and life stages exhibited 50% population mortality (LC_{50}) between 6 and 400 ppb (with an average of 50 ppb) total PAH concentration after 96 hrs exposure. Therefore, concentrations lower than 6 ppb total PAH value should be protective of 97.5% of species and life stages even with exposure periods of days (at least 96 hours). Early life-history stages of fish appear to be more sensitive than older fish stages and invertebrates.

Exceedances of 10, 50 or 400 ppb over a 1-hour timestep (see Table 8.4) were applied in this study to indicate the increasing potential for sub-lethal to lethal toxic effects (or low to high), based on NOPSEMA (2019).

8.3.2 Entrained Hydrocarbons

Entrained hydrocarbons consist of oil droplets that are suspended in the water column and insoluble. Insoluble compounds in oil cannot be absorbed from the water column by aquatic organisms, therefore they are not bioavailable through absorption of compounds from the water. Exposure to these compounds would require routes of uptake other than absorption of soluble compounds. The route of exposure of organisms to whole oil alone include direct contact with tissues of organisms and uptake of oil by direct consumption, with potential for biomagnification through the food chain (NRC, 2003).

Thresholds of 10 ppb and 100 ppb were applied over a 1-hour time exposure (Table 8.4) as per NOPSEMA (2019).

The 10-ppb threshold exposure zone is not considered to be of significant biological impact and is therefore outside the adverse exposure zone. This exposure zone represents the area contacted by the spill.

Table 8.4 Dissolved and entrained hydrocarbon exposure thresholds assessed over a 1-hour time step used in the Barossa DPD oil spill modelling study (in alignment NOPSEMA 2019).

	Exposure level	In-water threshold (ppb)	Description
Dissolved hydrocarbons	Low	10	Establishes planning area for scientific monitoring based on potential for exceedance of water quality triggers
	Moderate	50	Approximates potential toxic effects, particularly sublethal effects to sensitive species
	High	400	Approximates toxic effects including lethal effects to sensitive species
Entrained hydrocarbons	Low	10	Establishes planning area for scientific monitoring based on potential for exceedance of water quality triggers
	Moderate	100	As appropriate given oil characteristics for informing risk evaluation

9 RECEPTORS

A range of receptors and shorelines were assessed for floating oil exposure, shoreline contact and water column exposure (entrained and dissolved) as part of the study (Figure 9.1 to Figure 9.6). Receptor categories (see Table 9.1) include sections of shorelines and within the Harbour the shorelines have been sectorised to closely aligned with the nine water quality zones. Also included in the assessment were the nine water quality reporting zones in the Harbour. Risks of exposure were separately calculated for each receptor and have been tabulated in the respective sections. It should be noted, that given that the release location for Scenarios 2 and 3 resides within the Middle Harbour WQ Zone receptor, there is no tabulated results presented for the floating oil and water column.

Table 9.1 Summary of receptors used to assess floating oil, shoreline, and in-water exposure to hydrocarbons in the Barossa DPD oil spill modelling study.

Receptor Category	Acronym	Hydrocarbon Exposure Assessment		
		Water Column	Floating oil	Shoreline

10 MODEL SETTINGS

Table 10.1 provides a summary of the oil spill scenarios and model settings used in the assessment. The table also shows the thresholds that were used. The simulation lengths for each scenario were carefully selected based on extensive sensitivity testing. During the sensitivity testing process, sample spill simulations were run for longer than intended durations. Upon completion of the spill simulations, the results were carefully assessed to examine the persistence of the MDO (i.e., whether the maximum evaporative loss has been achieved for the period modelled; and whether a substantial volume of hydrocarbons remain in the water column (if any)) in conjunction with the extent of floating oil exposure based on reporting thresholds. Once there was agreement between the two factors (i.e., the final fate of hydrocarbon is accounted for, and the full exposure area is identified) the simulation length was deemed appropriate.

Table 10.1 Summary of the oil spill scenarios and model settings used in the Barossa DPD oil spill modelling study.

Parameter	Scenario 1	Scenario 2	Scenario 3	Scenario 4
Description	Offshore pipelay vessel fuel tank rupture	Vessel fuel tank rupture	Vessel to vessel refuelling	Vessel fuel tank rupture
Location Name	KP91.5	KP114	KP114	KP114
Spill volume (m^3)	700	87.5	10	300
Release duration (hours)	6	6	Instantaneous	6
Simulation length (days)	50	20	10	30
Number of randomly selected spill start times per season	100			
Model period	Wet season (November to April) and dry season (May to October).			
Oil type	MDO			
Release type	Surface			
Floating oil exposure thresholds (g/m^2)	1 (low exposure) 10 (moderate exposure) 50 (high exposure)			
Shoreline accumulation thresholds (g/m^2)	10 (low potential exposure) 100 (moderate potential exposure) 1,000 (high potential exposure)			
Dissolved hydrocarbon exposure thresholds (ppb)	10 (10 ppb x 1 hr, potential low exposure) 50 (50 ppb x 1 hr, potential moderate exposure) 400 (400 ppb x 1 hr, potential high exposure)			
Entrained hydrocarbon exposure thresholds (ppb)	10 (10 ppb x 1 hr, potential low exposure) 100 (100 ppb x 1 hr, potential moderate exposure)			

11 CALCULATION OF EXPOSURE RISK

The stochastic sampling approach provides an objective measure of the possible outcomes of a spill because randomly selected environmental conditions with more simulations will tend to use the most commonly occurring conditions, while more unusual conditions will be represented less frequently.

During each simulation, the SIMAP model records the location (by latitude, longitude and depth) of each of the particles (representing a given mass of oil) on or in the water column, at regular time steps. For any particles that contact a shoreline, the model records the accumulation of oil mass that arrives on each section of shoreline over time, less any mass that is lost to evaporation and/or subsequent removal by current and wind forces.

The collective records from all simulations are then analysed by dividing the study region into a three-dimensional grid. For oil particles that are classified as being at the water surface (floating oil), the sum of the mass in all oil particles (including accounting for spreading and dispersion effects) located within a grid cell, divided by the area of the cell provides estimates of the concentration of oil in that grid cell, at each time step. For entrained and dissolved hydrocarbons particles, concentrations are calculated at each time step by summing the mass of particles within a grid cell and dividing by the volume of the grid cell.

The concentrations of oil calculated for each grid cell, at each time step, are then analysed to determine whether concentration estimates exceed defined threshold concentrations over time.

Risks are then summarised as follows:

- The probability of exposure to a location is calculated by dividing the number of spill simulations where any contact occurred above a specified threshold at that location by the total number of replicate spill simulations. For example, if contact occurred at a location (above a specified threshold) during 21 out of 100 simulations, a probability of exposure of 21% is indicated;
- The minimum potential time to a shoreline location is calculated by the shortest time over which oil at a concentration above a threshold was calculated to travel from the source to the location in any of the replicate simulations;
- The maximum potential concentration of oil predicted for each shoreline section is the greatest mass per m^2 of shoreline calculated to strand at any location within that section during any of the replicate simulations; and
- Similar treatments were undertaken for entrained and dissolved hydrocarbon exposures.

Thus, the minimum time to shoreline and the maximum potential concentration estimates indicate the worst potential outcome of the modelled spill scenario for each section of shoreline. However, the average over the replicates presents an average of the potential outcomes, in terms of oil that could strand.

Note also that results quoted for sections of shoreline are derived for any individual location within that section, as a conservative estimate. Locations will represent shoreline lengths of the order of ~1 km for Scenario 1 and 0.5 km for Scenario 2 & 3, while sections or regions will represent shorelines spanning tens to hundreds of kilometres. The maximum potential concentrations quoted will not necessarily occur over the full extent of each section, therefore multiplying the maximum concentration estimates by the full area of the section is not recommended as this will greatly overestimate the total volume expected on that section.

12 SCENARIO 1 RESULTS – OFFSHORE PIPELAY VESSEL FUEL TANK RUPTURE AT KP91.5

This scenario examined the potential exposure following a 700 m^3 surface release of MDO over 6 hours in the event of an offshore pipelay vessel fuel tank rupture at KP91.5. A total of 200 spill trajectories were simulated (i.e., 100 spills per season) and tracked for 50 days.

Section 12.1 presents the low threshold environment that may be affected (EMBA), resulting from the 200 spill simulations. Section 12.2 shows the seasonal (or stochastic) analysis, while Section 12.3 presents in more detail the results for the simulation resulting in the largest volume of oil ashore.

12.1 EMBA

Figure 12.1 shows the full geographic EMBA derived by overlaying the results from all 200 spill simulations at the low (≥1 g/m^2) exposure thresholds.

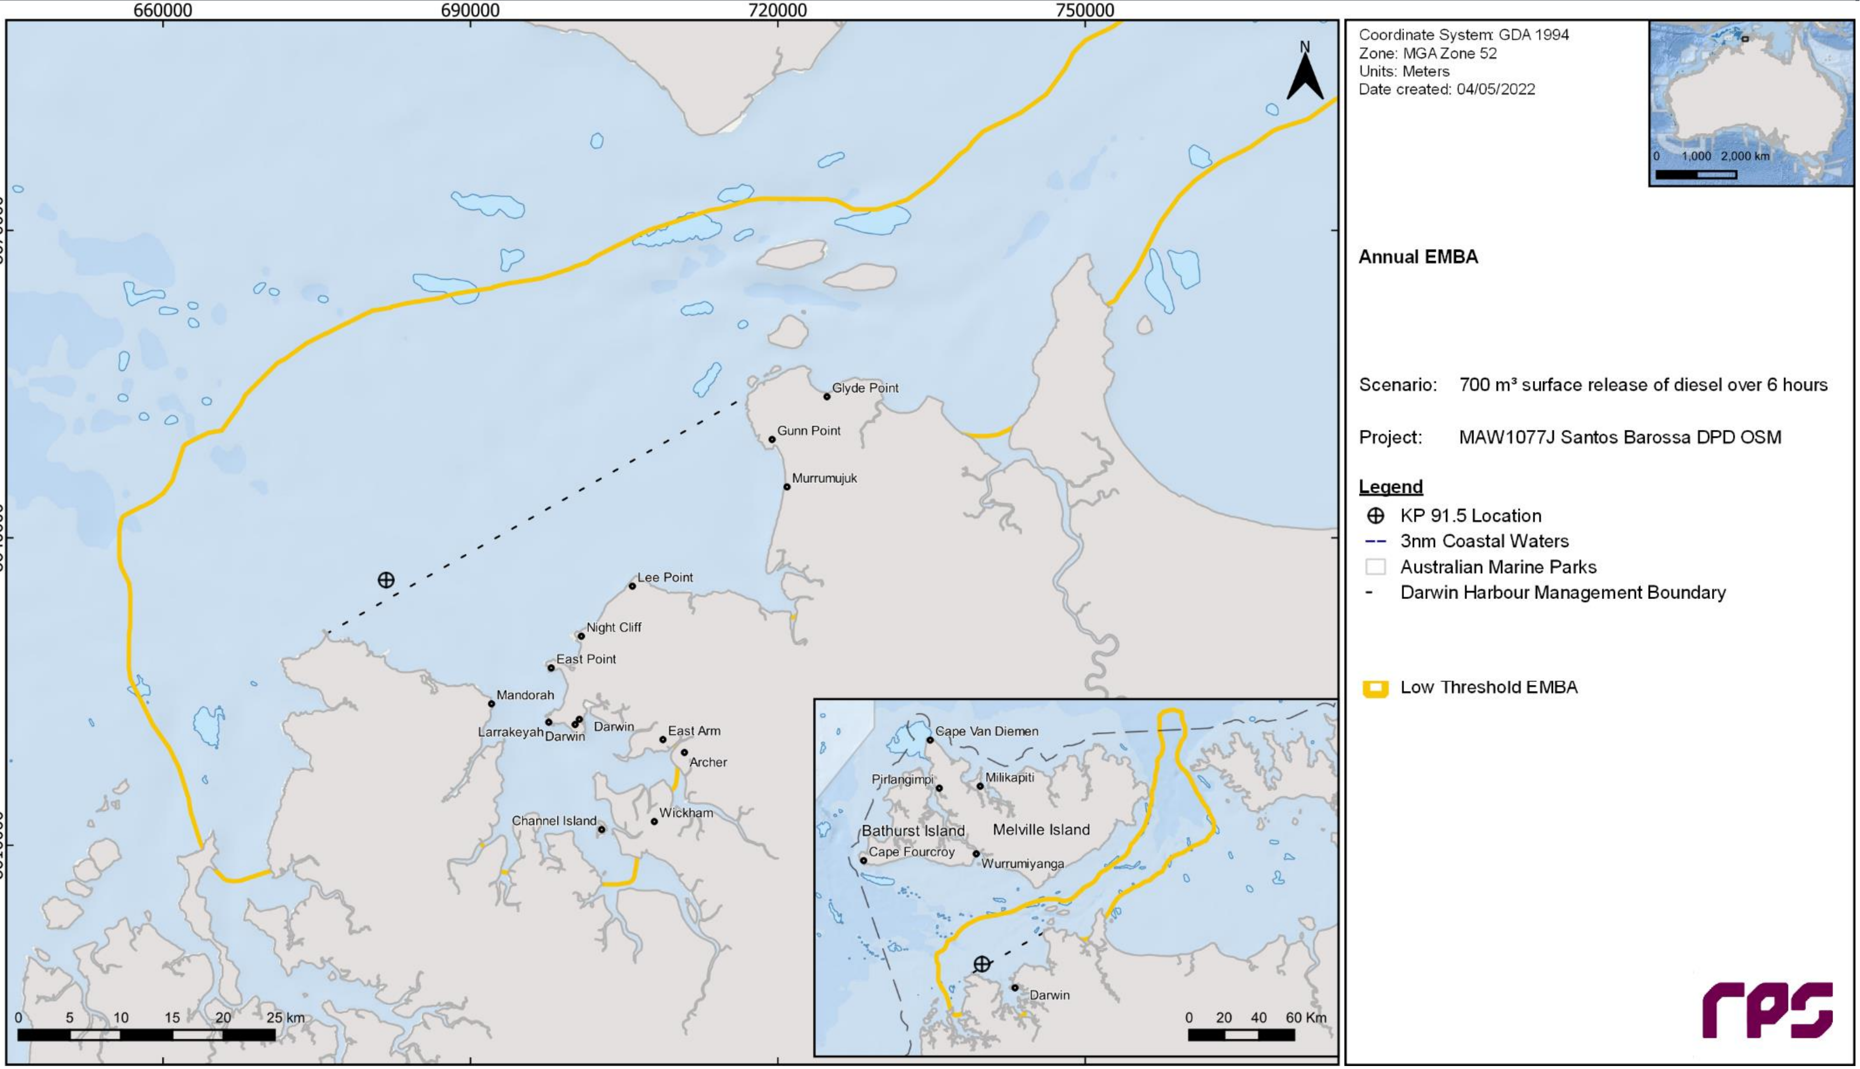

Figure 12.1 Predicted low threshold risk EMBA from an offshore pipelay vessel fuel tank rupture at KP91.5. The annualised results were calculated from 200 spill simulations.

12.2 Stochastic Analysis

12.2.1 Floating Oil Exposure

Table 12.1 summarises the maximum distances and directions travelled by the floating oil from the release location at each threshold for each season. The maximum distances to the low (≥1 g/m^2), moderate (≥10 g/m^2) and high (≥ 50 g/m^2) exposure zones were 26.4 km (southeast), 19.9 km (southeast) and 14 km (west northwest), occurring during dry season conditions. Table 12.2 summarises the potential floating oil exposure to individual receptors for each season and Figure 12.2 to Figure 12.3 illustrate the extent of floating oil exposure for each season.

Given that the release location was 1.11 km east of Charles Point Wide RFPA and 0.65 km north of the Outer Harbour WQ Zone, the probability of oil exposure was greatest for these receptors (100% at the low threshold for both seasons) and would take 1 hour for a spill to reach the boundaries of the receptors.

Otherwise, floating oil exposure at the low and moderate thresholds were predicted at Restricted Area 5 and Middle Harbour WQ Zone with all probabilities ≤10% (see Table 12.2).

Table 12.1 Maximum distances and directions travelled by floating oil from an offshore pipelay vessel fuel tank rupture at KP91.5 for each season. Results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Dry	Maximum distance (km) from release location	26.4	19.9	14.0
	Maximum distance (km) from the release location (99th percentile)	23.5	17.5	13.8
	Direction	SE	SE	WNW
Wet	Maximum distance (km) from release location	24.9	19.3	12.4
	Maximum distance (km) from release location (99th percentile)	20.6	18.0	12.2
	Direction	SE	WNW	SE

Table 12.2 Summary of the potential exposure by floating oil to individual receptors from an offshore pipelay vessel fuel tank rupture at KP91.5 for each season. Results were calculated from 100 spill simulations per season.

Receptor		Dry						Wet					
		Probability of floating oil exposure (%)			Minimum time before floating oil exposure (days)			Probability of floating oil exposure (%)			Minimum time before floating oil exposure (days)		
		Low	Moderate	High	Low	Moderate	High	Low	Moderate	High	Low	Moderate	High
RFPA	Charles Point Wide	100	90	38	0.04	0.04	0.13	97	82	27	0.04	0.04	0.08

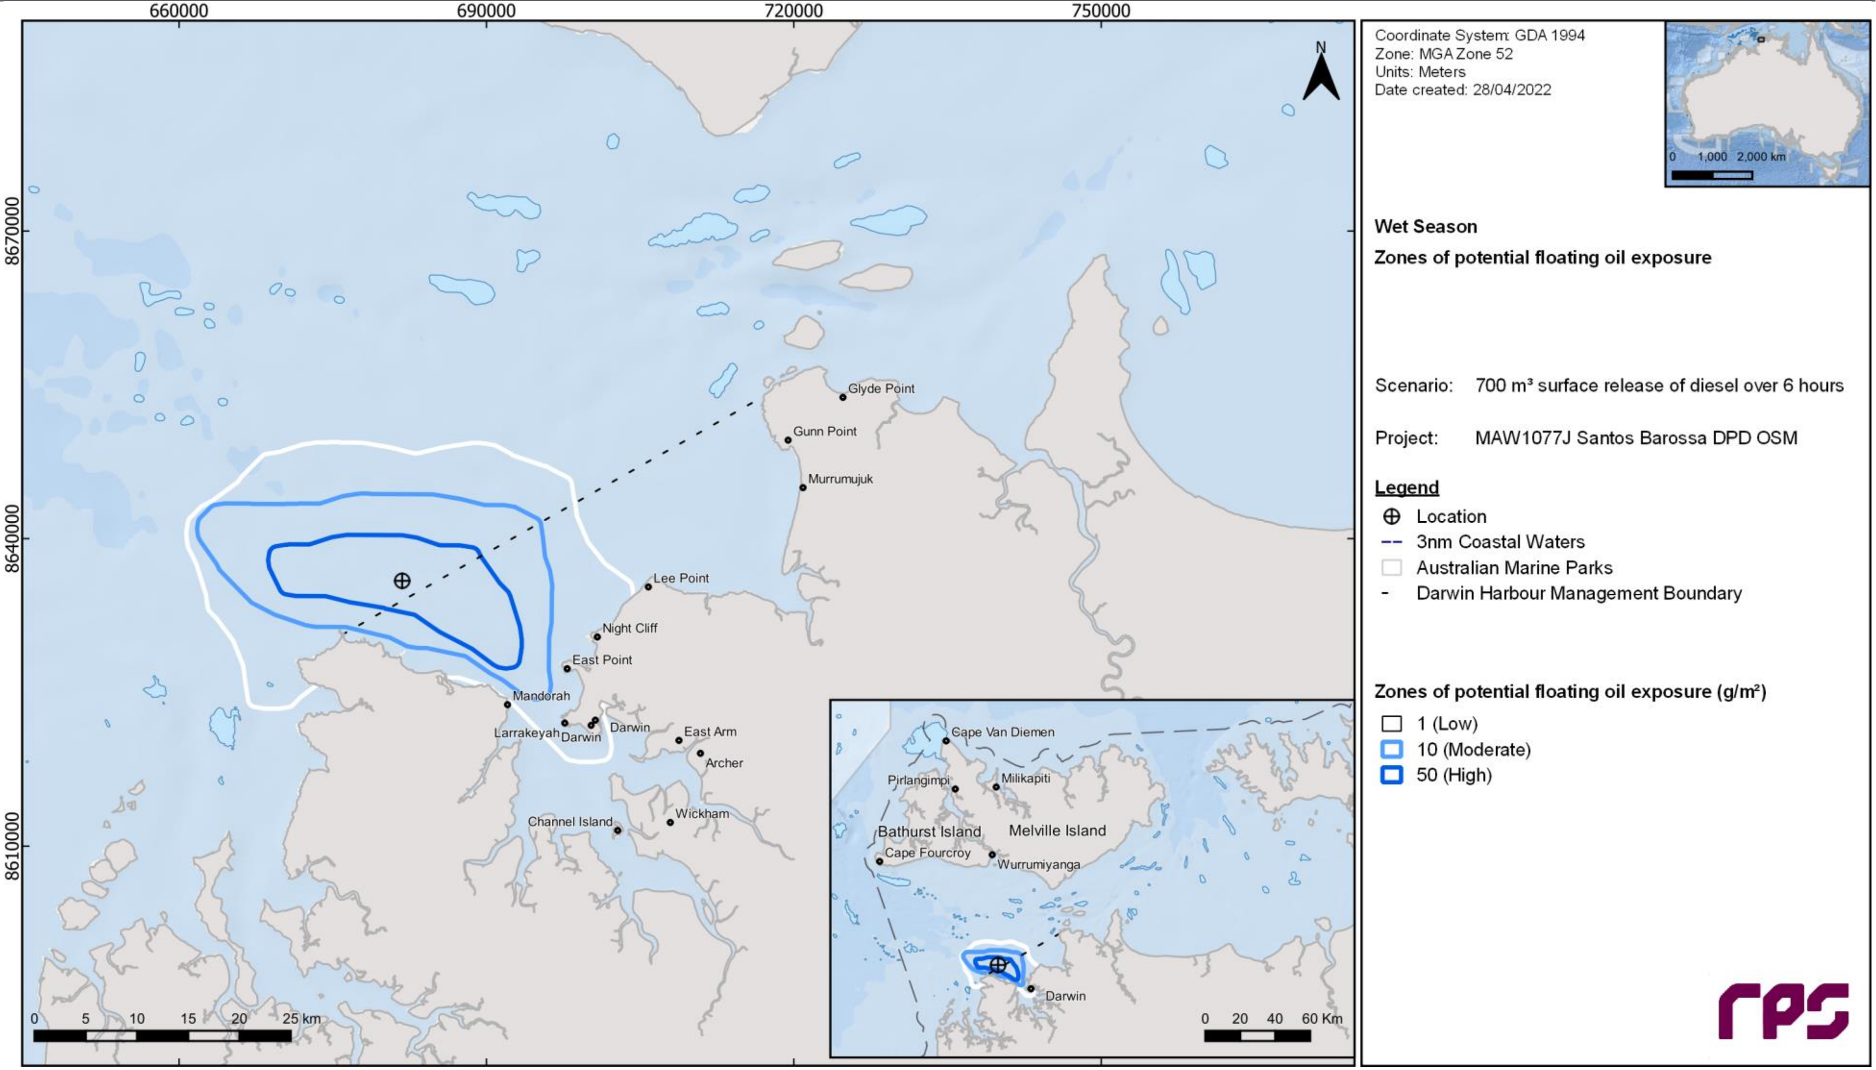

Figure 12.3 Zones of potential floating oil exposure from an offshore pipelay vessel fuel tank rupture at KP91.5 during wet season conditions. The results were calculated from 100 spill simulations.

12.2.2 Shoreline Accumulation

Table 12.3 summarises the predicted oil accumulation on any shoreline during each season. The probability of oil accumulation at, or above, the low threshold (10 g/m^2) was 25% (dry season) and 50% (wet season). The minimum time before oil accumulation at, or above, the low threshold ranged between 1.5 days (dry season) and 0.96 days (wet season). The maximum volume ashore for a single spill ranged between 28.1 m^3 (dry season) and 59.7 m^3 (wet season) and the maximum length of shoreline contacted at the low threshold was 23.1 km (dry season) and 22.1 km wet season). The maximum lengths of oil accumulation on shorelines at, or above, the moderate (100 – 1,000 g/m^2) and high (≥1,000 g/m^2) thresholds was 12 km and 2 km, respectively, during the wet season.

Table 12.4 and Table 12.5 summarise the oil accumulation on individual shoreline receptors for each season. The maximum potential shoreline loading for the specified thresholds for each season are presented in Figure 12.4 and Figure 12.5.

The greatest probabilities of oil accumulation at, or above, the low threshold was predicted for the East Arm (16% dry and 33% wet conditions), Outer Harbour East (4% dry and 20% wet seasons) and Outer Harbour West (9% dry and 10% wet seasons). The greatest volume (peak) of oil accumulation during the dry and wet seasons was predicted occurred along Outer Harbour West (22.2 m^3) and Outer Harbour East shorelines (43.8 m^3), respectively. The minimum time before oil accumulation at the low threshold was 1.50 days (Outer Harbour West) during the dry season and 0.96 days (Cox-Finniss) during the wet season conditions.

Table 12.3 Summary of oil accumulation on any shoreline from an offshore pipelay vessel fuel tank rupture at KP91.5 during each season. Results were calculated from 100 spill simulations per season.

Shoreline Statistics	Dry			Wet		
	Low	Moderate	High	Low	Moderate	High

12.2.3 In-water exposure

12.2.3.1 Dissolved Hydrocarbons

Table 12.6 summarises the maximum distances and directions travelled by dissolved hydrocarbons from the release location to each threshold in the 0 – 10 m depth layer. The maximum distances to the low (≥ 10 ppb) and moderate (≥ 50 ppb) exposure zones were 16.9 km (west) and 13.7 km (southeast), respectively. There was no exposure predicted for either season at the high threshold (≥ 400 ppb).

Table 12.7 and Table 12.8 summarise the potential exposure to receptors from dissolved hydrocarbons in the 0 – 10 m and 10 – 20 m depth layers, respectively, for each threshold and season. Figure 12.6 to Figure 12.9 illustrate the extents of dissolved hydrocarbon exposure for each season in the 0 – 10 m and 10 – 20 m depth layers.

Four receptors (Charles Point Wide RFPA, Booya shipwreck, Middle Harbour and Outer Harbour WQ Zones) were predicted to be exposed to dissolved hydrocarbons at the low threshold in the 0 – 10 m depth during the dry and wet seasons with probabilities ranging from 1% to 40%. The maximum instantaneous concentrations were 97 ppb predicted at Charles Point Wide RFPA during the dry season and 91 ppb within the Outer Harbour WQ Zone during the wet season.

In comparison, within the 10 – 20 m depth layer only two receptors were predicted to be exposed to dissolved hydrocarbons at the low threshold (Charles Point Wide RFPA (dry and wet seasons) and the Outer Harbour WQ Zone (wet season)) and probabilities of 1% (meaning 1 simulation out of 100 had triggered the exposure).

Table 12.6 Maximum distances and directions travelled by dissolved hydrocarbons (0 – 10 m depth layer) from an offshore pipelay vessel fuel tank rupture at KP91.5 during each season. Results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential dissolved hydrocarbon exposure		
		Low 10 ppb	Moderate 50 ppb	High 400 ppb
Dry	Maximum distance (km) from the release location	16.9	10.0	-
	Maximum distance (km) from the release location (99th percentile)	16.5	9.6	-
	Direction	W	ESE	-
Wet	Maximum distance (km) from the release location	15.8	13.7	-
	Maximum distance (km) from the release location (99th percentile)	15.2	13.5	-
	Direction	W	SE	-

12.2.3.2 Entrained Hydrocarbons

Table 12.9 summarises the maximum distances and directions travelled by entrained hydrocarbons within the 0 – 10 m depth layer at the low (≥ 10 ppb) and moderate (≥ 100 ppb) thresholds, which ranged between 182.3 km northeast (wet conditions) and 51.3 km east northeast (wet conditions) from the release location, respectively.

Table 12.10 and Table 12.11 summarise the potential exposure to receptors from entrained hydrocarbons in the 0 – 10 m and 10 – 20 m depth layers, respectively, for each season. Figure 12.10 to Figure 12.13 illustrate extent of entrained hydrocarbon exposure for each season in the 0 – 10m and 10 – 20 m depth layers.

Given that the proximity of the release location to Charles Point Wide RFPA (1.11 km east) and Outer Harbour WQ Zone (0.65 km north), the probability of exposure was greatest for these receptors (100% at the low threshold for both seasons) and would take 1 hour for a spill to reach the boundaries of the receptors.

During the dry and wet seasons 5 and 10 RSBs, respectively, were predicted to be exposed to entrained hydrocarbons at the low threshold with probabilities ranging from 1 – 28% during the two seasons. During both seasons the Foelsche Bank was predicted to have the greatest probability of low exposure threshold (28% dry season wet season). It was also the only RSB to be exposed at the moderate threshold, with a 1% probability and took up to 6.46 days before exposure.

In addition, low entrained hydrocarbon exposure was predicted at 9 and 11 shipwreck receptors during the dry and wet season, respectively, with probabilities ranging from 23% (Marchart 3) and 100% (Booya) during the dry season, and 2% (Marchart 3) and 98% (Booya) during the wet season.

Furthermore, 6 and 7 WQ Zones for the dry and wet season conditions were predicted to be exposed to entrained hydrocarbons at the low threshold. The probabilities ranged from 42% (Buffalo Creek) and 100% (Middle Harbour) during the dry season and 25% (Middle Arm) and 98% (Middle Harbour) during the wet season. The maximum entrained hydrocarbon concentrations were also predicted at Outer Harbour during both the dry (8,733 ppb) and wet (8,974 ppb) seasons.

In comparison, in the 10 – 20 m depth layer only Charles Point Wide RFPA and the Outer Harbour WQ Zone were predicted to be exposed to hydrocarbons at the low threshold during the two seasons. Exposure at the high threshold was predicted within Charles Point Wide RFPA and the probability was 6%.

Table 12.9 Maximum distances and directions travelled by entrained hydrocarbons (0 – 10 m depth layer) from an offshore pipelay vessel fuel tank rupture at KP91.5 during each season. Results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential entrained hydrocarbon exposure	
		Low 10 ppb	Moderate 100 ppb
Dry	Maximum distance (km) from release location	147.7	36.9
	Maximum distance (km) from release location (99th percentile)	142.1	34.5
	Direction	NE	ENE
Wet	Maximum distance (km) from release location	182.3	51.3
	Maximum distance (km) from release location (99th percentile)	174.7	48.7
	Direction	NE	ENE

12.3 Deterministic Analysis

The stochastic modelling results were assessed and the deterministic simulation resulting in the largest volume ashore (59.7 m^3) was identified as run 97, which commenced at 4 pm 14 March 2019, during the wet season.

Zones of floating oil exposure on the sea surface (swept area) and shoreline accumulation over the entire 50-day simulation are presented in Figure 12.14. The spill drifted predominantly east-southeast from the release location and the oil was predicted to initially accumulate on the shoreline between Lee Point and Larrakeyah.

Zones of entrained hydrocarbon exposure within the 0 – 10 m depth layer (surface layer) are presented in Figure 12.15.

No zones of dissolved hydrocarbon exposure above the minimum reporting threshold were predicted for the simulation.

Figure 12.16 and Figure 12.17 displays timeseries of the area of floating oil exposure and volume of oil ashore for each threshold during the 50-day simulation.

Figure 12.18 presents the fates and weathering for the corresponding single spill trajectory. At the conclusion of the simulation, approximately 590 m^3 (85%) of the spilled oil had evaporated and 33 m^3 (5%) remained on the shoreline. In addition, 54 m^3 (8%) was predicted to have decayed by the end of the simulation, while there was no oil predicted to remain on the surface.

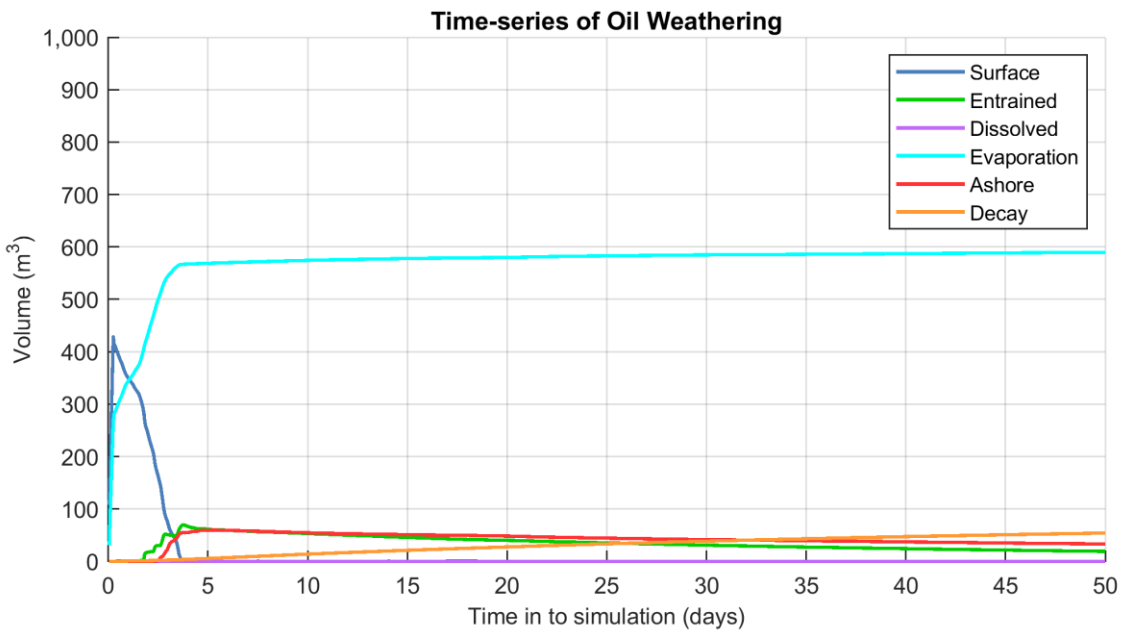

Figure 12.18 Predicted weathering and fates for the simulation resulting in the maximum volume of oil ashore starting at 4 pm 14 March 2019, during the wet season.

13 SCENARIO 2 RESULTS – VESSEL FUEL TANK RUPTURE AT KP114

This scenario examined the potential exposure following an 87.5 m^3 surface release of MDO over 6 hours in the event of a vessel fuel tank rupture at KP114. A total of 200 spill trajectories were simulated (i.e., 100 spills per season) and tracked for 20 days.

Section 13.1 presents the low threshold environment that may be affected (EMBA), resulting from the 200 spill simulations. Section 13.2 shows the seasonal (or stochastic) analysis, while Section 13.3 presents in more detail the results for the simulation resulting in the largest volume of oil ashore.

13.1 EMBA

Figure 13.1 shows the full geographic EMBA derived by overlaying the results from all 200 spill simulations at the low (≥1 g/m^2) exposure thresholds.

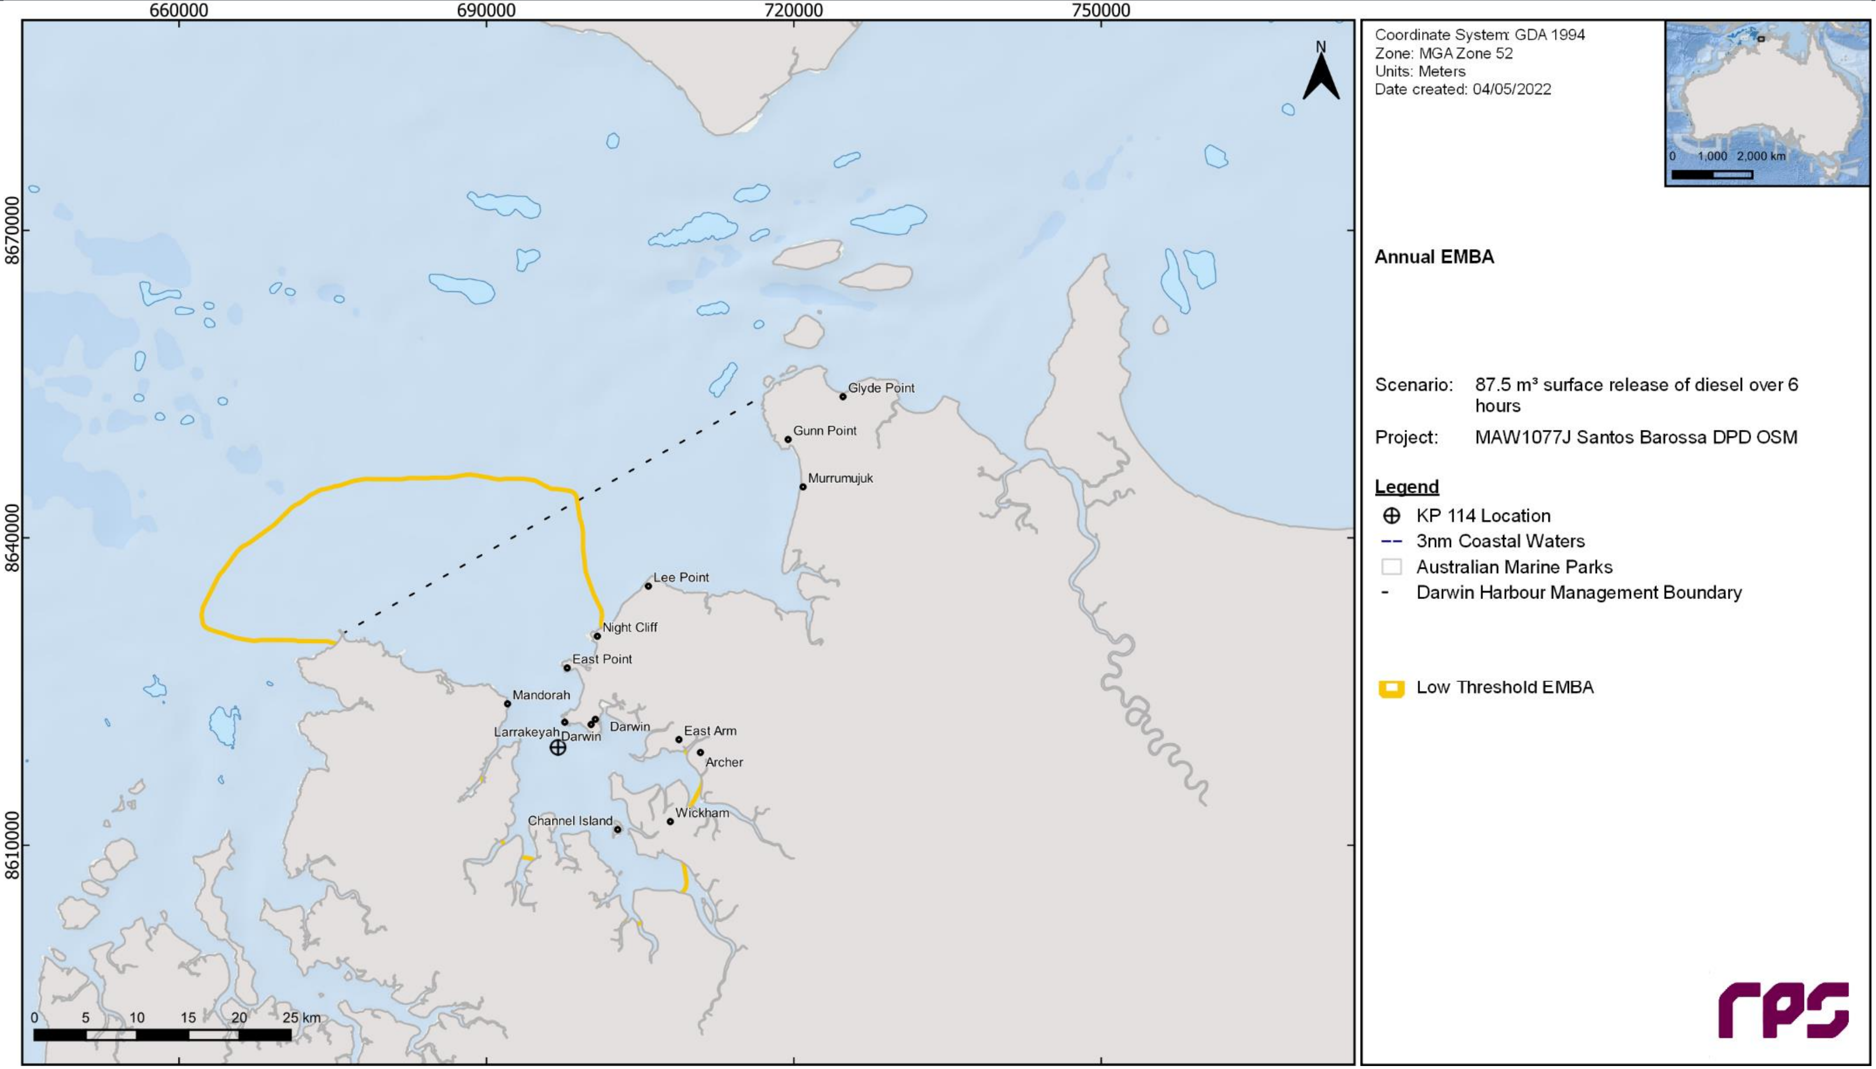

Figure 13.1 Predicted low threshold risk EMBA from a vessel fuel tank rupture at KP114. The annualised results were calculated from 200 spill simulations.

13.2 Stochastic Analysis

13.2.1 Floating Oil Exposure

Table 13.1 summarises the maximum distances and directions travelled by the floating oil from the release location at each threshold for each season. The maximum distances to the low (≥1 g/m^2), moderate (≥10 g/m^2) and high (≥ 50 g/m^2) exposure zones were 29.3 km (west northwest), 14.9 km (southeast) and 0.1 km (west northwest), respectively, during dry season conditions and 29.3 km (west northwest), 11.0 km (southeast) and 0.1 km (west northwest), respectively during wet season conditions. Table 13.2 summarises the potential floating oil exposure to individual receptors for each season and Figure 13.2 and Figure 13.3 illustrate the extent of floating oil exposure for each season.

During both the dry and wet seasons, floating oil exposure at the low threshold was predicted at Restricted Areas 4, 5 and 6 with probabilities ranging between 11 – 35% and 2 – 27%, respectively. No moderate or high exposure was predicted for any Restricted Area.

Only the one simulation during wet season conditions (1% probability) had triggered the low threshold exposure within Charles Point Wide RFPA and it took 0.67 days.

Additionally, four WQ Zones had recorded floating oil exposure at the low threshold with probabilities ranging between 7 – 60% and 11 – 35% during the dry and wet seasons, respectively, (see Table 13.2). Due to the influence of the tides forcing the oil out of the harbour during the ebb tide, the Outer Harbour WQ Zone had also recorded exposure at the moderate threshold during dry (8%) and wet (3%) season conditions, which took as a minimum 0.21 days.

Table 13.1 Maximum distances and directions travelled by floating oil from vessel fuel tank rupture at KP114 at each threshold for each season. Results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Dry	Maximum distance (km) from release location	20.3	14.9	0.1
	Maximum distance (km) from the release location (99th percentile)	19.6	12.8	0.1
	Direction	NW	NW	SE
Wet	Maximum distance (km) from release location	29.3	11.0	0.1
	Maximum distance (km) from release location (99th percentile)	24.0	9.6	0.1
	Direction	WNW	NW	SE

Table 13.2 Summary of the potential exposure by floating oil to individual receptors from a vessel fuel tank rupture at KP114 for each season. Results were calculated from 100 spill simulations per season.

Receptor		Dry						Wet					
		Probability of floating oil exposure (%)			Minimum time before floating oil exposure (days)			Probability of floating oil exposure (%)			Minimum time before floating oil exposure (days)		
		Low	Moderate	High	Low	Moderate	High	Low	Moderate	High	Low	Moderate	High

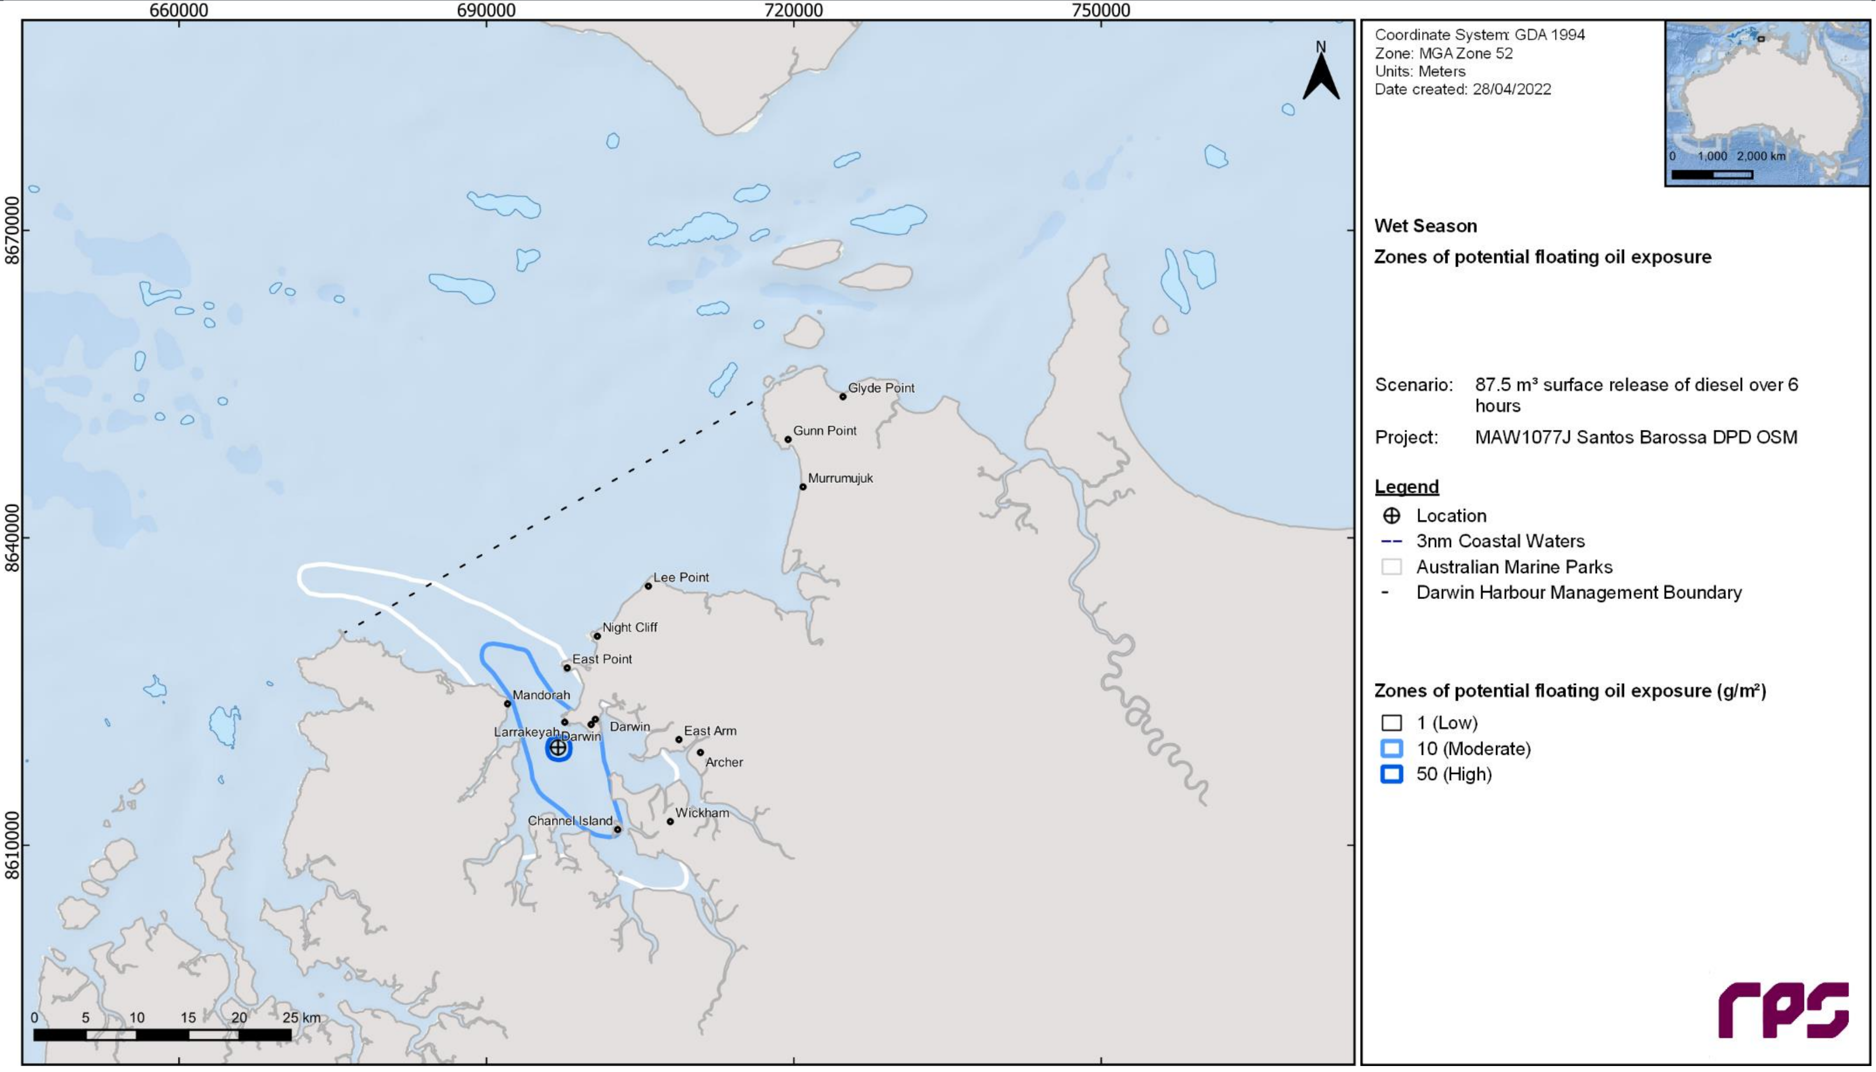

Figure 13.3 Zones of potential floating oil exposure from a vessel fuel tank rupture at KP114 during wet season conditions. The results were calculated from 100 spill simulations.

13.2.2 Shoreline Accumulation

Table 13.3 summarises the predicted oil accumulation on any shoreline during each season. The probability of oil accumulation at, or above, the low threshold (10 g/m^2) was 94% (dry season) and 83% (wet season). The minimum time before oil accumulation at, or above, the low threshold ranged between 0.21 days (dry season) and 0.17 days (wet season). The maximum volume ashore for a single spill ranged between 24.8 m^3 (dry season) and 24.7 m^3 (wet season) and the maximum length of shoreline contacted at the low threshold was 29.6 km (dry season) and 28.1 km (wet season). The maximum lengths of oil accumulation on shorelines at, or above, the moderate (100 – 1,000 g/m^2) and high (≥1,000 g/m^2) thresholds was 5.5 km (dry season) and 6.5 km (wet season), and 0.5 km (dry season), respectively there was no shoreline contact at the high (≥1,000 g/m^2) threshold during wet season conditions.

Table 13.4 and Table 13.5and summarise the oil accumulation on individual shoreline receptors for each season. The maximum potential shoreline loading for the specified thresholds for each season are presented in Figure 13.4 and Figure 13.5.

The highest probability of oil accumulation at the low threshold was predicted along the West Arm (78% dry and 47% wet seasons) and East Arm (32% dry and 48% wet conditions) shorelines. The greatest volume (peak) of oil accumulation during the dry and wet seasons occurred along the West Arm shoreline (24.2 m^3 (dry season) and 24.6 m^3 (wet season)). The minimum time before oil accumulation at the low threshold was 0.21 days (East Arm) for the dry season and 0.17 days (East Arm) during the wet season conditions.

Table 13.3 Summary of oil accumulation on any shoreline from a vessel fuel tank rupture at KP114 during each season. Results were calculated from 100 spill simulations per season.

Shoreline Statistics	Dry			Wet		
	Low	Moderate	High	Low	Moderate	High
Probability of accumulation on any shoreline (%)	94	45	1	83	52	-
Absolute minimum time before oil ashore (days)	0.21	0.38	1.25	0.17	0.21	-
Maximum length of shoreline contacted	29.6	5.5	0.5	28.1	6.5	-

13.2.3 In-water exposure

13.2.3.1 Dissolved Hydrocarbons

Table 13.6 summarises the maximum distances and directions travelled by dissolved hydrocarbons from the release location to the low threshold (≥ 10 ppb), in the 0 – 10 m depth layer as there was no exposure predicted for the moderate and high thresholds. The maximum distances during the dry and wet seasons were 3.9 km and 12.2 km north northwest, respectively. Exposure was limited to the 0 – 10 m depth layer.

Table 13.7 summarises the potential exposure to receptors from dissolved hydrocarbons in the 0 – 10 m depth layer for each threshold and season. Figure 13.6 and Figure 13.7 illustrate the extent of dissolved hydrocarbon exposure for each season in the 0 – 10 m depth layers.

There was no exposure to any receptor during the dry season. Under wet season conditions, 3 receptors had recorded exposure at the low threshold (Ham Luong and Mauna Loa USAT shipwreck, and Outer Harbour WQ Zone) and the probabilities ranged between 1 and 6%. There was no exposure at the moderate threshold to any receptor. The maximum instantaneous dissolved concentrations were 9 ppb and 21 ppb predicted at the Mauna Loa USAT shipwreck during dry and wet seasons, respectively.

Table 13.6 Maximum distances and directions travelled by dissolved hydrocarbons (0 – 10 m depth layer) from a vessel fuel tank rupture at KP114 during each season. Results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential dissolved hydrocarbon exposure		
		Low 10 ppb	Moderate 50 ppb	High 400 ppb
Dry	Maximum distance (km) from the release location	3.9	-	-
	Maximum distance (km) from the release location (99th percentile)	3.9	-	-
	Direction	NNW	-	-
Wet	Maximum distance (km) from the release location	12.2	-	-
	Maximum distance (km) from the release location (99th percentile)	12.2	-	-
	Direction	NNW	-	-

Table 13.7 Summary of dissolved hydrocarbon exposure for each receptor in the 0 – 10 m depth layer from a vessel fuel tank rupture at KP114 during each season. Results were calculated from 100 spill simulations per season.

Receptor		Dry							Wet						
		Maximum instantaneous concentration (ppb)	Probability of instantaneous dissolved hydrocarbon exposure			Minimum time (days) before instantaneous dissolved hydrocarbon exposure			Maximum instantaneous concentration (ppb)	Probability of instantaneous dissolved hydrocarbon exposure			Minimum time (days) before instantaneous dissolved hydrocarbon exposure		
			Low	Moderate	High	Low	Moderate	High		Low	Moderate	High	Low	Moderate	High

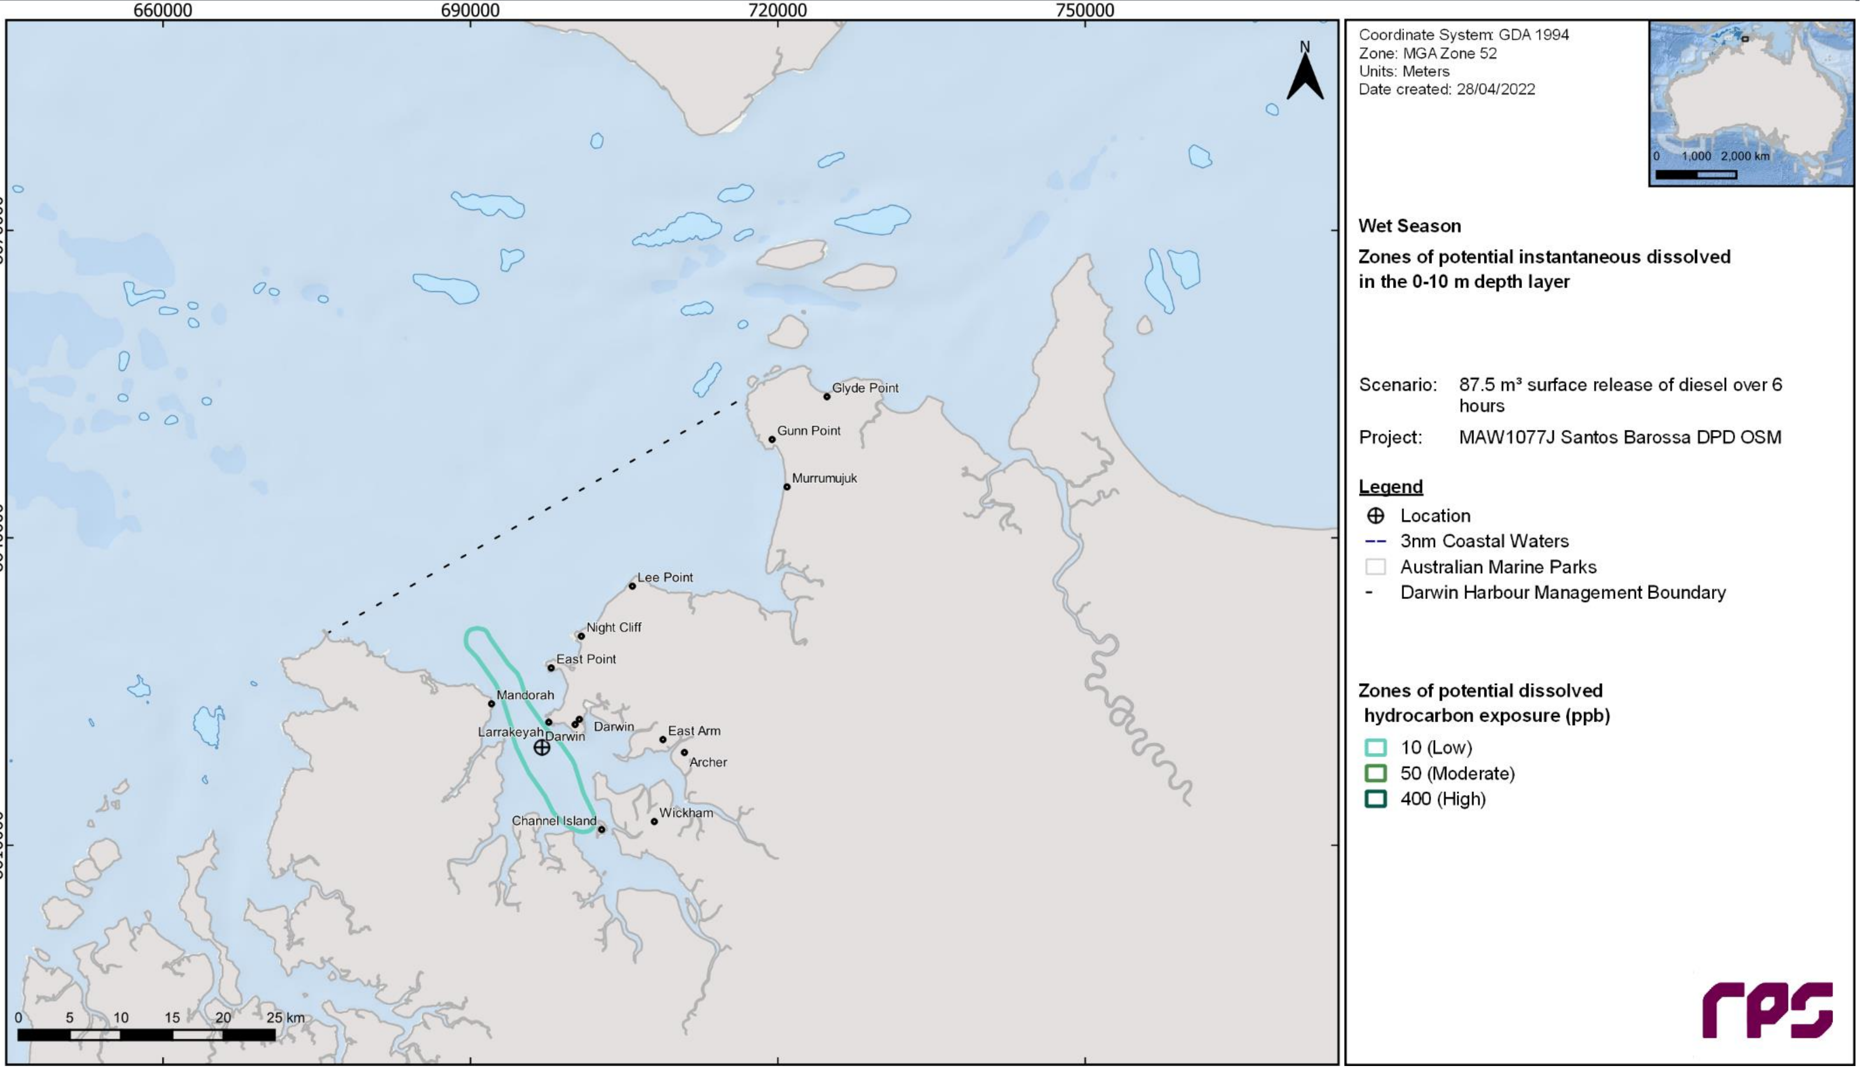

Figure 13.7 Zones of potential dissolved hydrocarbon exposure at 0 – 10 m below the sea surface from a vessel fuel tank rupture at KP114 during wet season conditions. The results were calculated from 100 spill simulations.

13.2.3.2 Entrained Hydrocarbons

Table 13.8 summarises the maximum distances and directions travelled by entrained hydrocarbons within the 0 – 10 m depth layers at the low (≥ 10 ppb) and moderate (≥ 100 ppb) thresholds, which ranged between 36.1 km and 20.3 km west northwest from the release location, during the dry season conditions and 33.8 km and 23.9 km northwest from the release location, during the wet season conditions.

Table 13.9 summarises the potential exposure to receptors from entrained hydrocarbons in the 0 – 10 m depth layer for each season. Figure 13.8 and Figure 13.9 illustrate the extent of entrained hydrocarbon exposure for each season in the 0 – 10 m depth layer.

During both seasons the Charles Point Wide RFPA and four Restricted Areas (1, 4, 5 and 6) were predicted to be exposed to entrained hydrocarbons at the low threshold with probabilities ranging from 45 – 97% and 5 – 69% during the dry and wet seasons, respectively. During both seasons Restricted Area 6 was predicted to have the greatest probability of low threshold exposure (97% and 69%).

Exposure at the low threshold was predicted at 15 and 16 shipwreck receptors during the dry and wet season, respectively with probabilities ranging from 28% (Ellengowan) and 97% (Mauna Loa USAT) during the dry season and 2% (East Arm Vietnamese Refugee Boat 1) and 78% (Mauna Loa USAT) during the wet season.

Furthermore, 4 WQ Zones were predicted to be exposed at the low threshold with probabilities ranging from 31% (Middle Arm) and 93% (Outer Harbour) during the dry season. While under wet season conditions there were 5 receptors and probabilities ranging from 2% (Elizabeth River) and 70% (Outer Harbour) during the wet season. The maximum instantaneous concentrations were predicted at Outer Harbour during both the dry (436 ppb) and wet (677 ppb) seasons.

Table 13.8 Maximum distances and directions travelled by entrained hydrocarbons (0 – 10 m depth layer) from the release location vessel fuel tank rupture at KP114 during each season. Results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential entrained hydrocarbon exposure	
		Low 10 ppb	Moderate 100 ppb

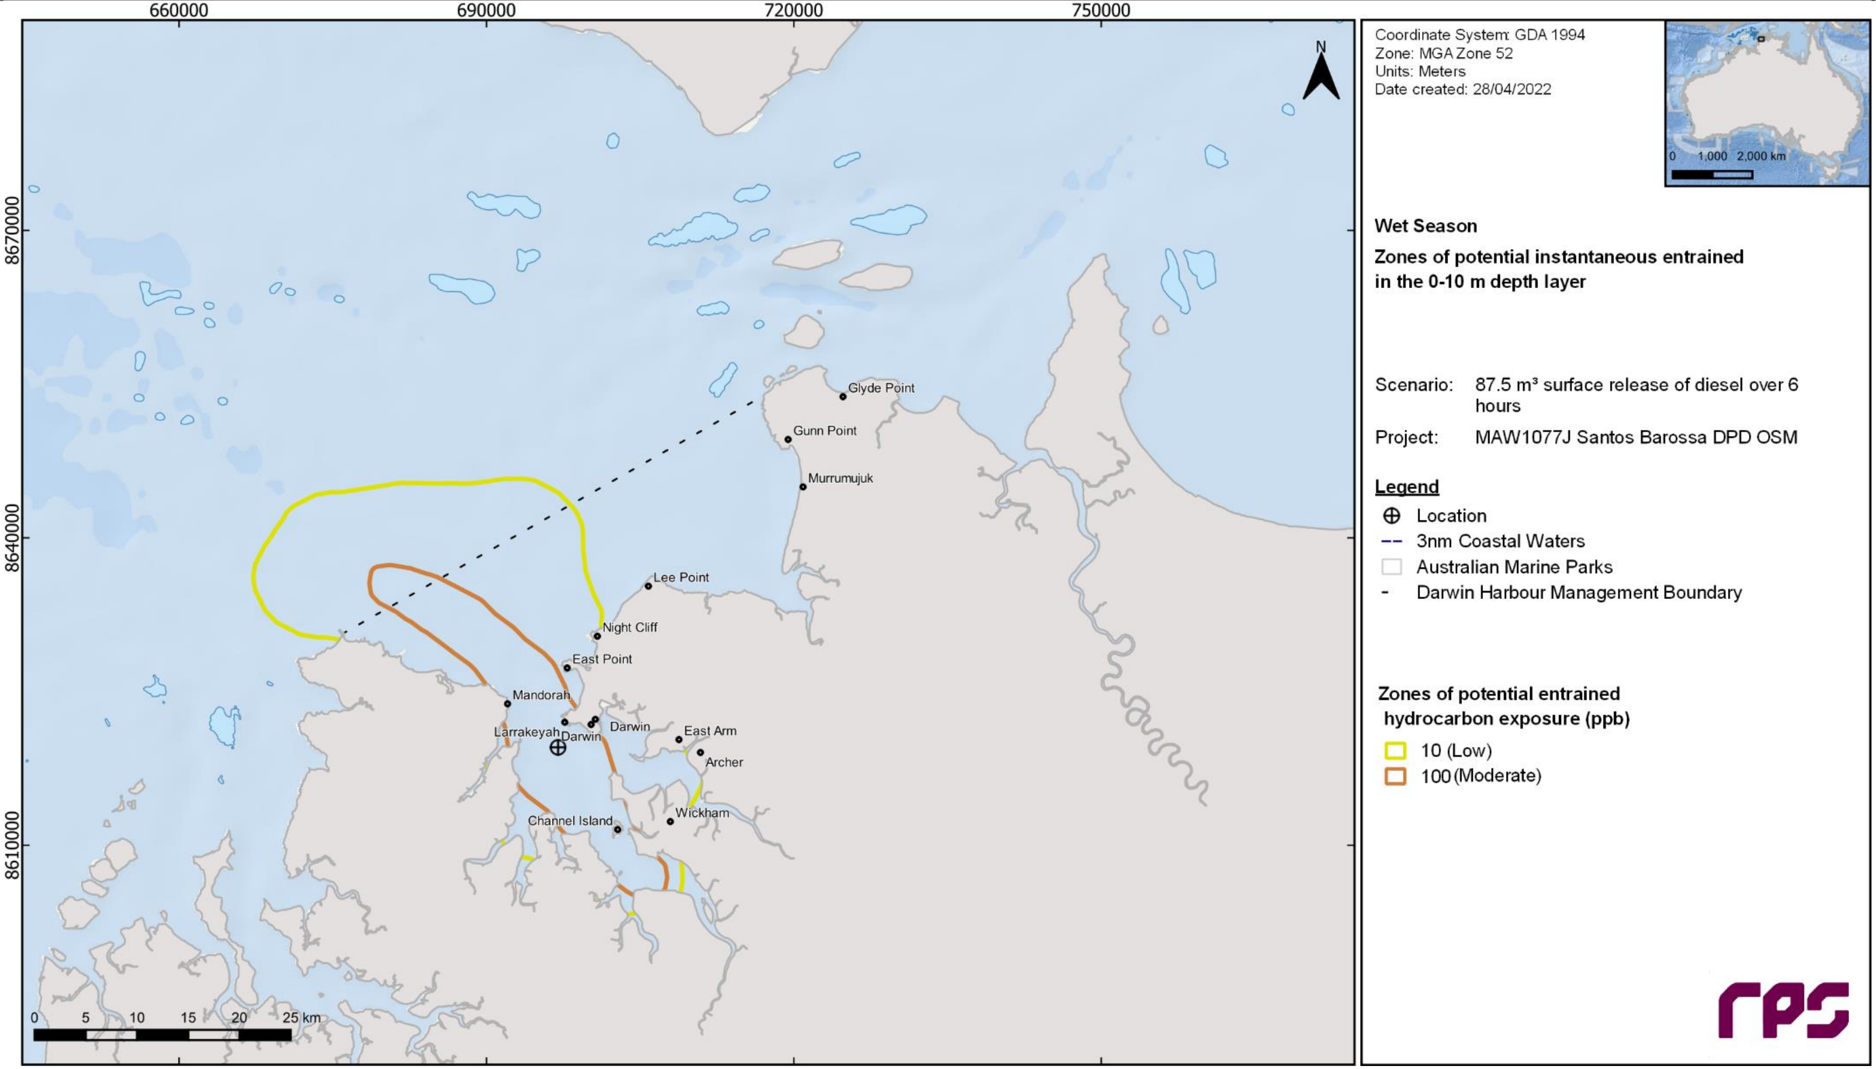

Figure 13.9 Zones of potential entrained hydrocarbon exposure at 0 – 10 m below the sea surface from a vessel fuel tank rupture at KP114 during wet season conditions. The results were calculated from 100 spill simulations.

13.3 Deterministic Analysis

The stochastic modelling results were assessed and the deterministic simulation resulting in the largest volume ashore (24.8 m^3) was identified as run 38, which commenced at 2 am 2 September 2019 during the dry season.

Zones of exposure on the sea surface (swept area) and shoreline accumulation over the entire 20-day simulation are presented in Figure 13.10. The spill had drifted predominately south and west from the release from the release location and the oil was predicted to accumulate on the western shoreline up to Mandorah.

Zones of entrained hydrocarbon exposure within the 0 – 10 m depth layer (surface layer) over the 20-day simulation are presented in Figure 13.11.

No zones of dissolved hydrocarbon exposure above the reporting threshold were predicted for the simulation.

Figure 13.12 and Figure 13.13 show time series of the area of floating oil and the volume of oil ashore exposure for each threshold during the 20-day simulation.

Figure 13.14 presents the fates and weathering for the corresponding single spill trajectory. At the conclusion of the simulation, approximately 74 m^3 (85%) of the spilled oil was lost to the atmosphere through evaporation and 10 m^3 (12%) remained on the shoreline. In addition, 2 m^3 (2%) was predicted to have decayed by the end of the simulation, while there was no oil predicted to remain on the surface.

14 SCENARIO 3 RESULTS – VESSEL TO VESSEL REFUELLING AT KP114

This scenario examined the potential exposure following an instantaneous 10 m^3 surface release of MDO vessel to vessel refuelling incident at KP114. A total of 200 spill trajectories were simulated (i.e., 100 spills per season) and tracked for 10 days.

Section 14.1 presents the low threshold environment that may be affected (EMBA) resulting from the 200 spill simulations. Section 14.2 shows the seasonal (or stochastic) analysis, while Section 14.3 presents in more detail the results for the simulation resulting in the largest volume of oil ashore.

14.1 EMBA

Figure 14.1 shows the full geographic EMBA derived by overlaying the results from all 200 spill simulations at the low (≥1 g/m^2) exposure thresholds.

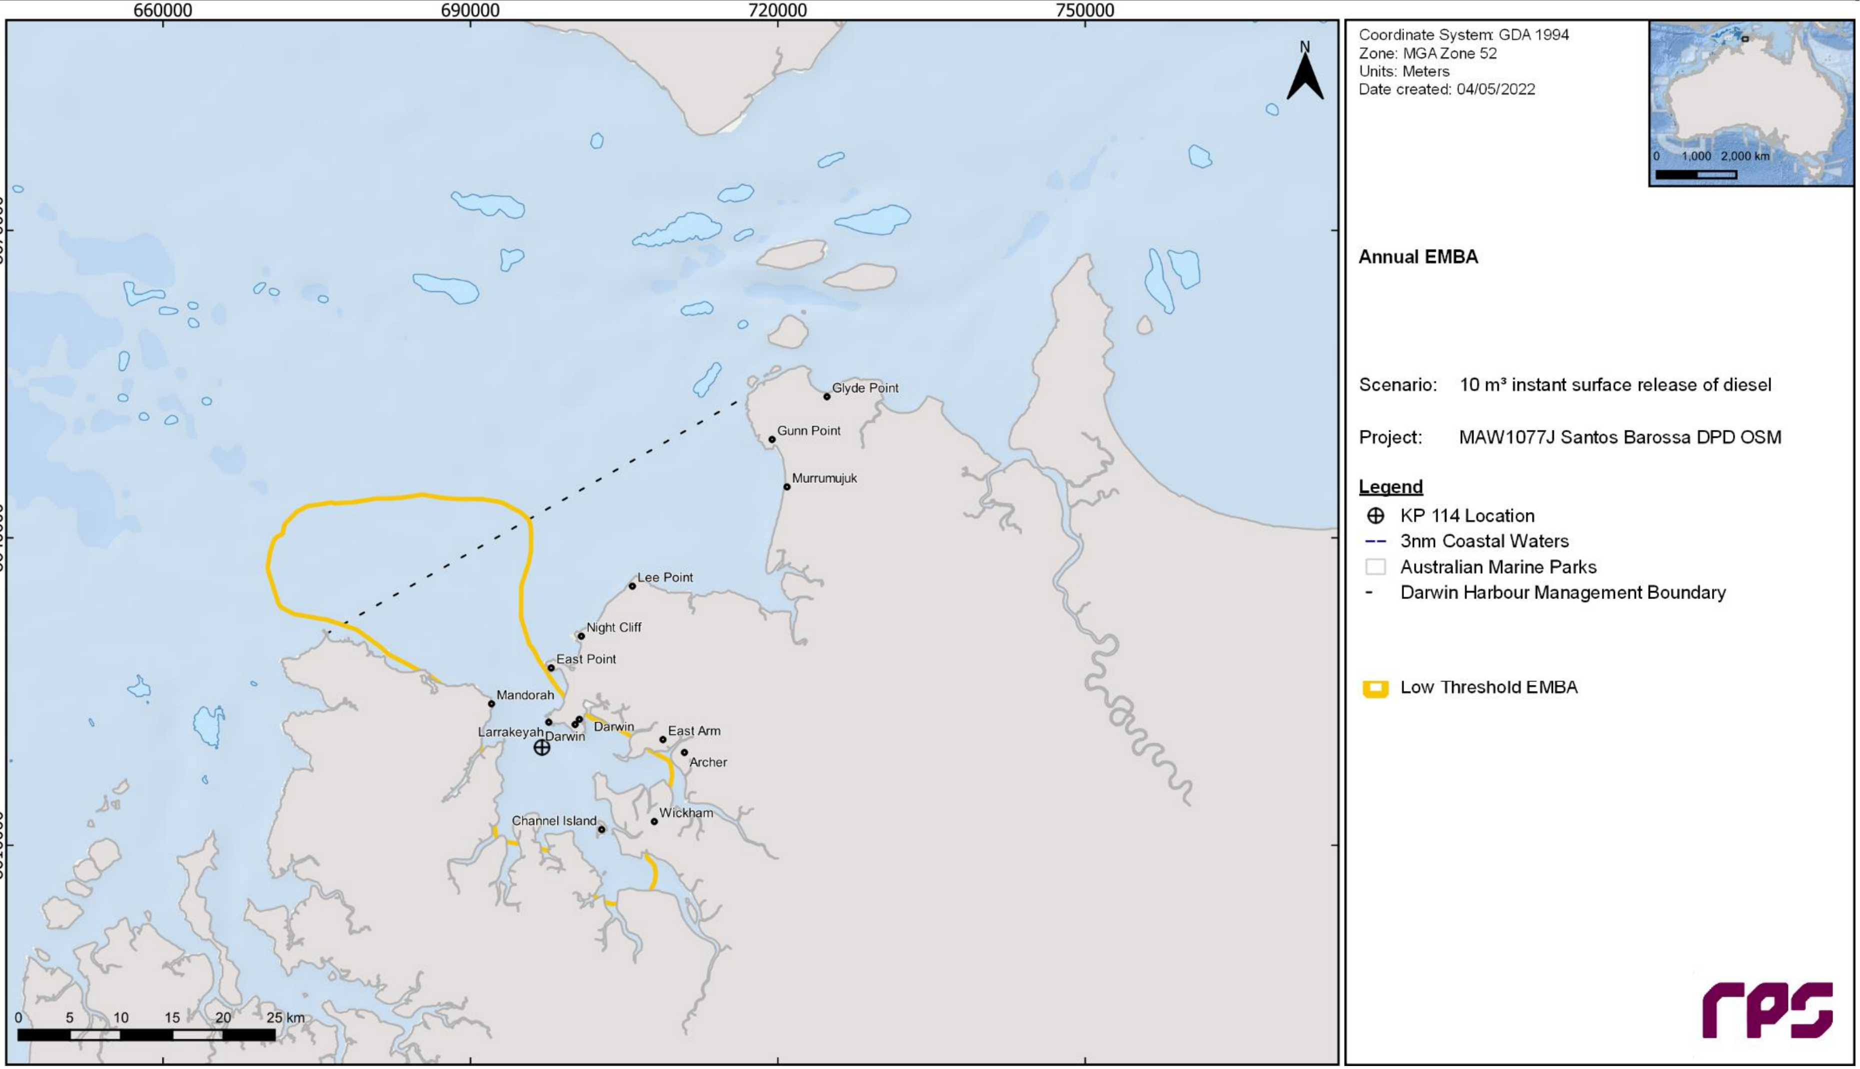

Figure 14.1 Predicted low threshold risk EMBA from a vessel to vessel refuelling incident at KP114. The annualised results were calculated from 200 spill simulations.

14.2 Stochastic Analysis

14.2.1 Floating Oil Exposure

Table 14.1 summarises the maximum distances and directions travelled by the floating oil from the release location at each threshold for each season. The maximum distances to the low (≥1 g/m^2) and moderate (≥10 g/m^2) exposure zones were 22.9 km (northwest) and 12.5 km (northwest), respectively during dry season conditions. There was no exposure predicted for the high threshold (≥ 50 g/m^2).

Table 14.2 summarises the potential floating oil exposure to individual receptors for each season. Figure 14.2 and Figure 14.3 illustrate the extent of floating oil exposure for each season.

During the dry season, exposure at the low threshold was predicted at Restricted Areas 4, 5 and 6 with probabilities ranging between 2 – 7%, while during the wet season exposure was predicted at Restricted Areas 4 (2%) and 5 (1%). No moderate or high threshold exposure was predicted for any Restricted Area.

Additionally, five WQ Zones were predicted to experience floating oil exposure at the low threshold with probabilities ranging between 2 – 21% and 2 – 19% during the dry and wet seasons, respectively (see Table 14.2).

Table 14.1 Maximum distances and directions travelled by floating oil from a vessel to vessel refuelling incident at KP114 at each threshold for each season. Results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Dry	Maximum distance (km) from release location	22.9	12.5	-
	Maximum distance (km) from the release location (99th percentile)	21.5	12.5	-
	Direction	NW	NW	-
Wet	Maximum distance (km) from release location	19.6	5.5	-
	Maximum distance (km) from release location (99th percentile)	15.2	5.5	-
	Direction	NW	NNW	-

Table 14.2 Summary of the potential exposure by floating oil to individual receptors from a vessel to vessel refuelling incident at KP114 for each season. Results were calculated from 100 spill simulations per season.

Receptor		Dry						Wet					
		Probability of floating oil exposure (%)			Minimum time before floating oil exposure (days)			Probability of floating oil exposure (%)			Minimum time before floating oil exposure (days)		
		Low	Moderate	High	Low	Moderate	High	Low	Moderate	High	Low	Moderate	High
Restricted Areas	4	7	-	-	0.42	-	-	2	-	-	0.33	-	-

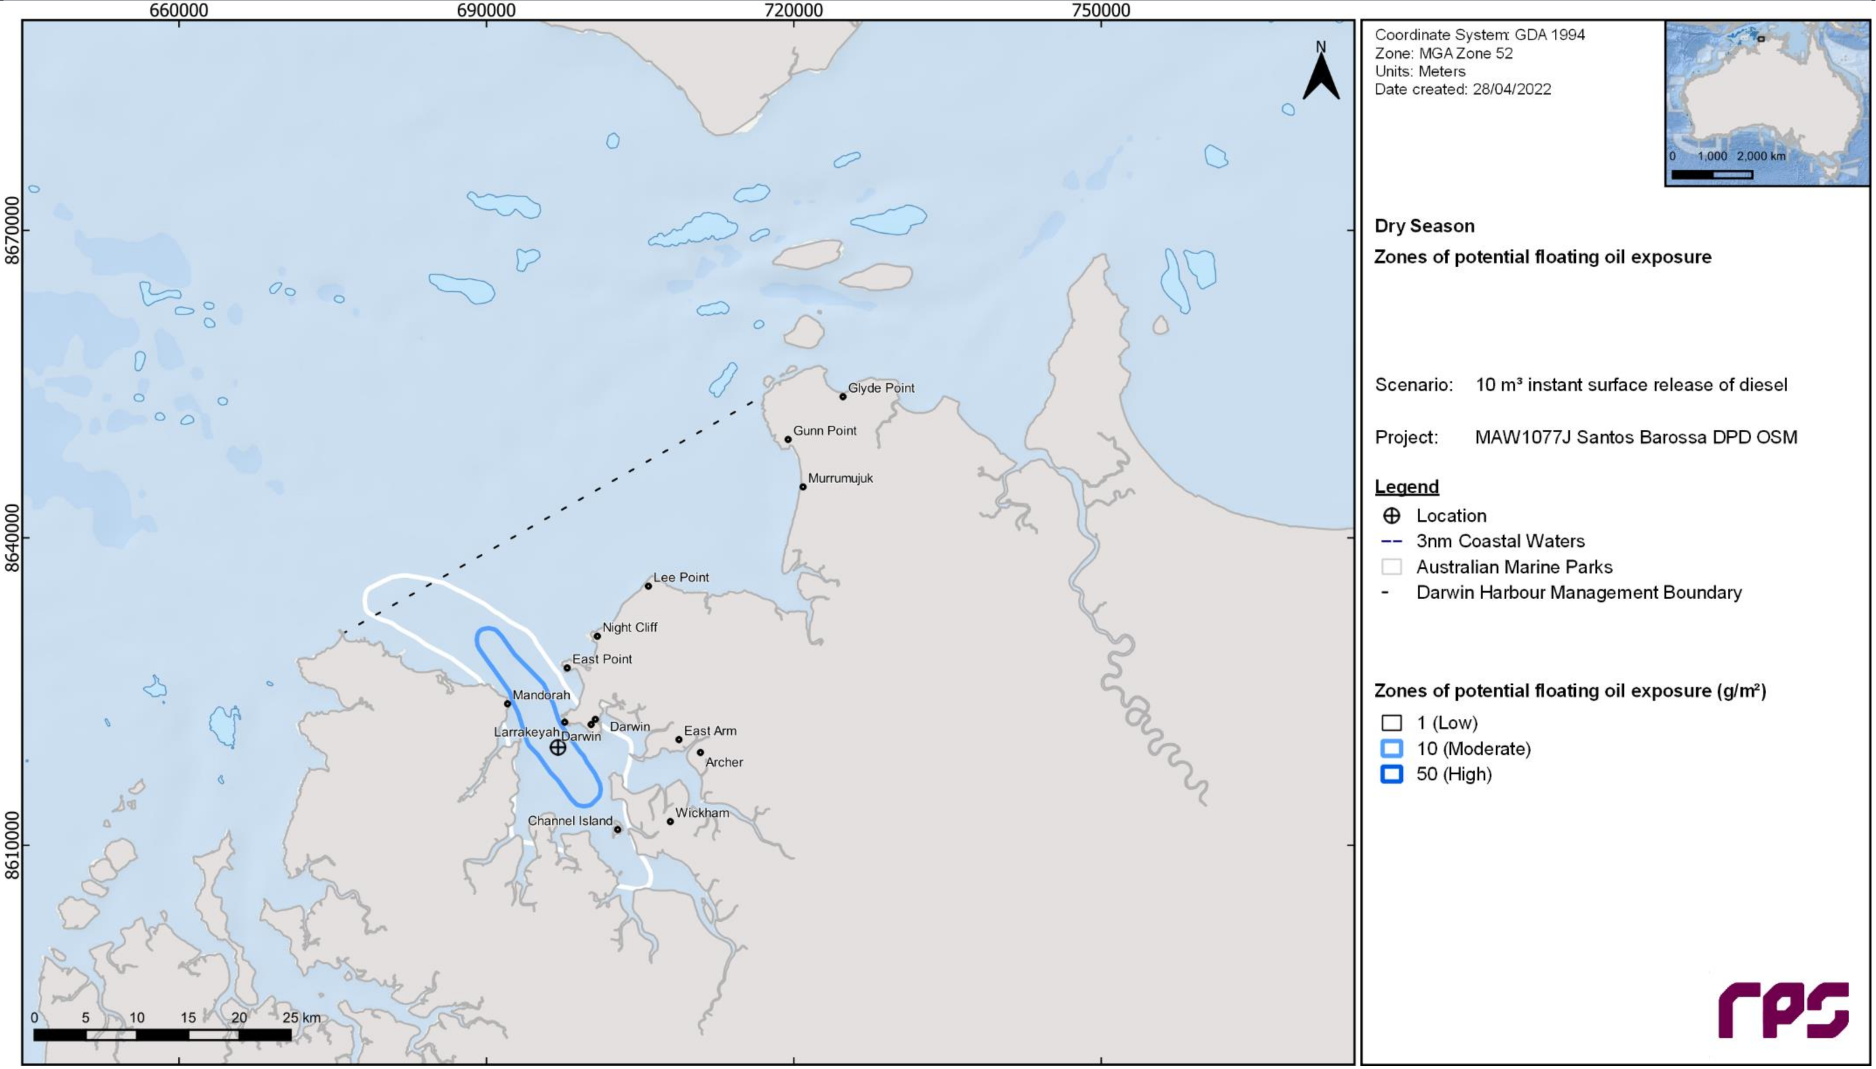

Figure 14.2 Zones of potential floating oil exposure from a vessel to vessel refuelling incident at KP114 during dry season conditions. The results were calculated from 100 spill simulations.

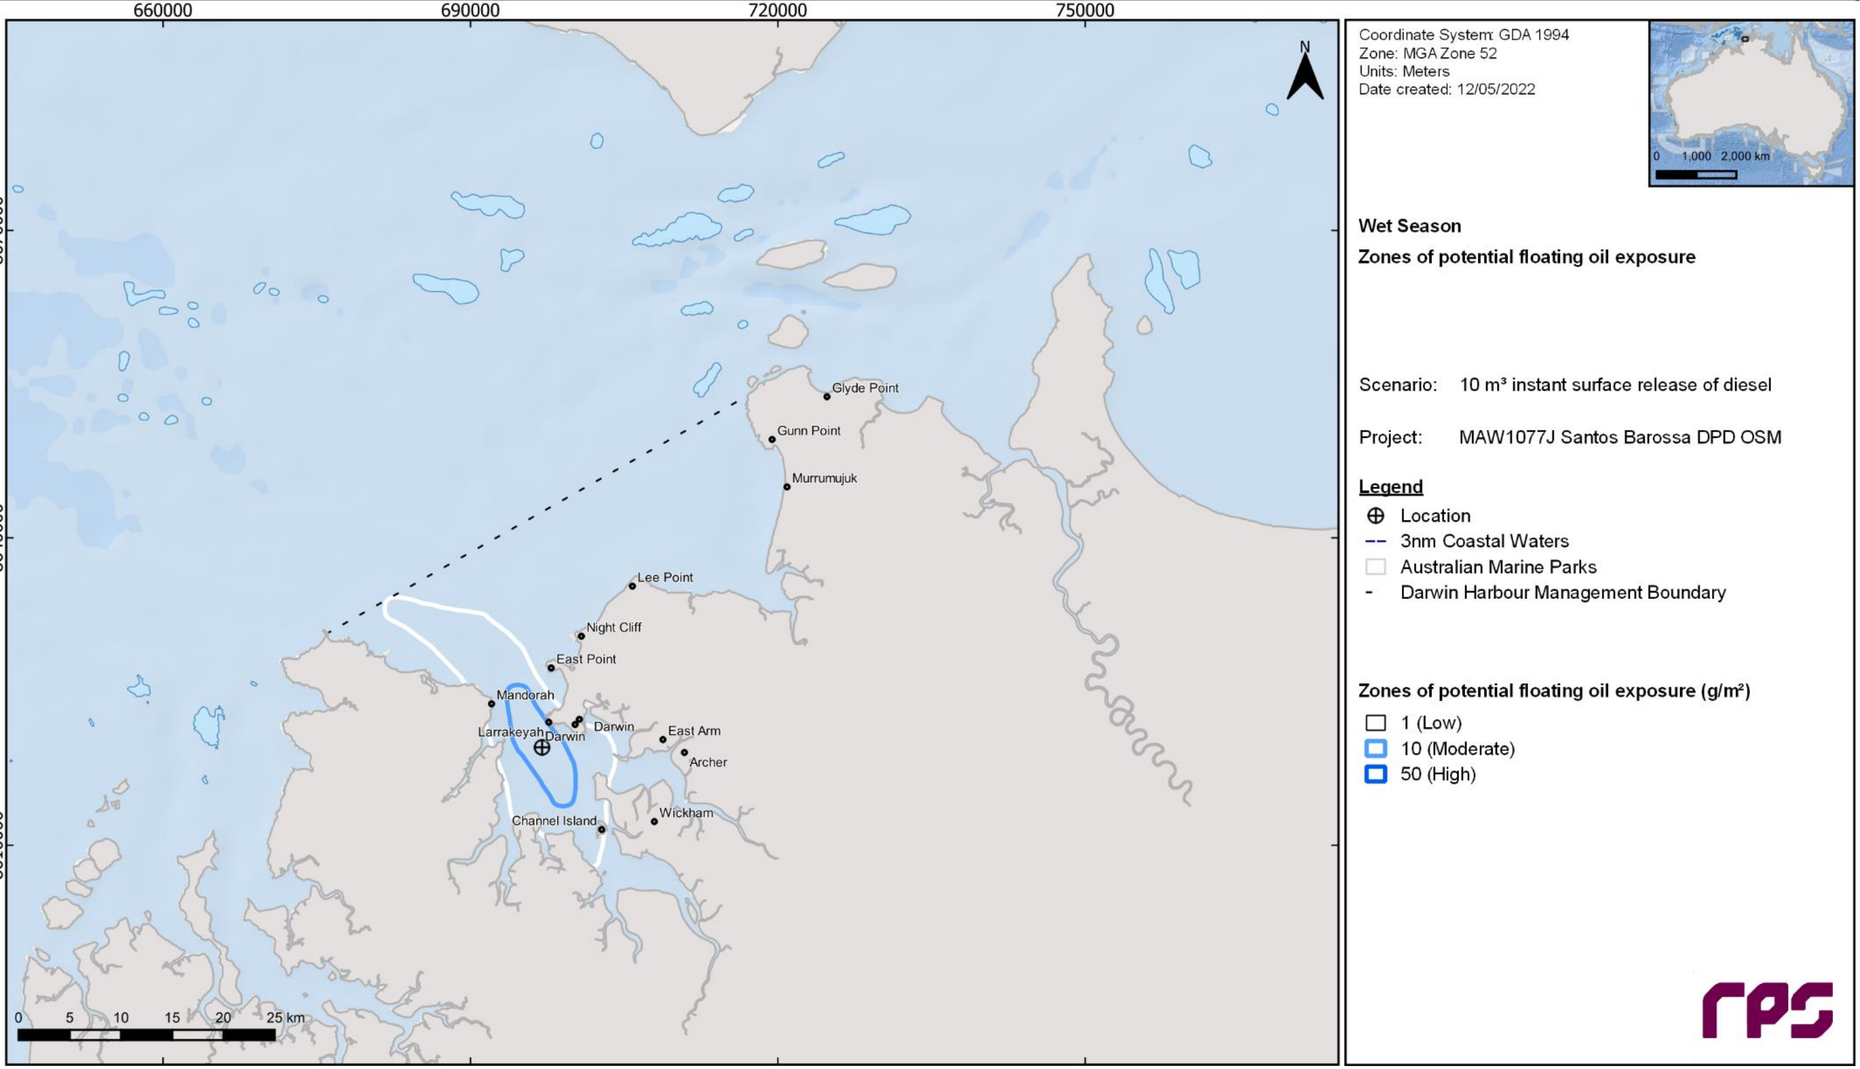

Figure 14.3 Zones of potential floating oil exposure from a vessel to vessel refuelling incident at KP114 during wet season conditions. The results were calculated from 100 spill simulations.

14.2.2 Shoreline Accumulation

Table 14.3 summarises the predicted oil accumulation on any shoreline during each season. The probability of oil accumulation at, or above, the low threshold (10 g/m^2) was 58% during the dry and wet season. The minimum time before oil accumulation at, or above, the low threshold was 0.25 days and 0.29 days for the dry and wet seasons, respectively. The maximum volume ashore for a single spill ranged between 3.9 m^3 (dry season) and 4.3 m^3 (wet season). The maximum length of shoreline contacted at the low threshold was 9 km for the two seasons. The maximum lengths of oil accumulation on shorelines at, or above, the moderate (100 – 1,000 g/m^2) threshold was 2 km during wet season conditions. There was no oil accumulation predicted for the high threshold (≥1,000 g/m^2).

Table 14.4 and Table 14.5 summarise the oil accumulation on individual shoreline receptors for each season. The maximum potential shoreline loading for the specified thresholds for each season are presented in Figure 14.4 and Figure 14.5.

The greatest probabilities of oil accumulation at, or above, the low threshold was predicted for the West Arm (49% dry and 28% wet conditions) and East Arm (8% dry and 26% wet seasons) shorelines. The minimum time before the accumulation was 0.29 days (Middle Arm and West Arm) during the dry season and 0.25 days (East Arm and Wickham Point) during the wet season conditions.

The greatest volume (peak) of oil accumulation during the dry and wet seasons occurred along the West Arm (3.9 m^3) and Wickham Point (4.1 m^3) shorelines, respectively.

Table 14.3 Summary of oil accumulation on any shoreline from a vessel to vessel refuelling incident at KP114 during each season. Results were calculated from 100 spill simulations per season.

14.2.3 In-water exposure

14.2.3.1 Dissolved Hydrocarbons

There was no dissolved hydrocarbon exposure predicted for any spills during this scenario at or above the low threshold ((≥ 10 ppb).

14.2.3.2 Entrained Hydrocarbons

Table 14.6 summarises the maximum distances and directions travelled by entrained hydrocarbons within the 0 – 10 m depth layers for the low (≥ 10 ppb) and moderate (≥ 100 ppb) thresholds, which ranged between 32 km and 18.9 km northwest from the release location during dry season conditions and 31.9 km and 19.6 km northwest from the release location during wet season conditions.

Table 14.7 summarises the potential exposure to receptors from entrained hydrocarbons in the 0-10 m depth layer for each season. Figure 14.6 to Figure 14.7 illustrate extent of entrained hydrocarbon exposure for each season in the 0 – 10 m depth layer.

During both seasons the Charles Point Wide RFPA and three Restricted Areas (4, 5 and 6) were predicted to be exposed at the low threshold with probabilities ranging from 8 – 50% and 4 – 29% during the dry and wet seasons, respectively. During both seasons Restricted Area 6 was predicted to have the greatest probability of low threshold exposure (50% dry season and 29% wet season).

Exposure for the low threshold was predicted at 15 shipwreck receptors during both seasons, with probabilities ranging from 2% (Ellengowan and Middle Arm unidentified wreck) and 61% (Ham Luong) during the dry season and 2% (Ellengowan, Mandorah Unidentified wreck 1 and Middle Arm unidentified wreck) and 64% (Mauna Loa USAT) during the wet season. The maximum entrained concentrations were also predicted Ham Luong (745 ppb) and Mauna Loa USAT (639 ppb) shipwrecks for the two seasons.

Four WQ Zones were predicted to be exposed to entrained hydrocarbons at the low threshold during both seasons with probabilities ranging from 6% (East Arm) and 36% (Outer Harbour) during the dry season and 7% (Middle Arm) and 30% (Outer Harbour) during the wet season. The maximum entrained concentrations were predicted at Outer Harbour during both the dry (265 ppb) and wet (301 ppb) seasons.

Table 14.6 Maximum distances and directions travelled by entrained hydrocarbons (0 – 10 m depth layer) from the release location for a vessel to vessel refuelling incident at KP114 during each season during each season. Results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential entrained hydrocarbon exposure	
		Low 10 ppb	Moderate 100 ppb
Dry	Maximum distance (km) from release location	32.0	18.9
	Maximum distance (km) from release location (99th percentile)	30.9	18.7
	Direction	NW	NW
Wet	Maximum distance (km) from release location	31.9	19.6
	Maximum distance (km) from release location (99th percentile)	30.5	19.0
	Direction	NW	NW

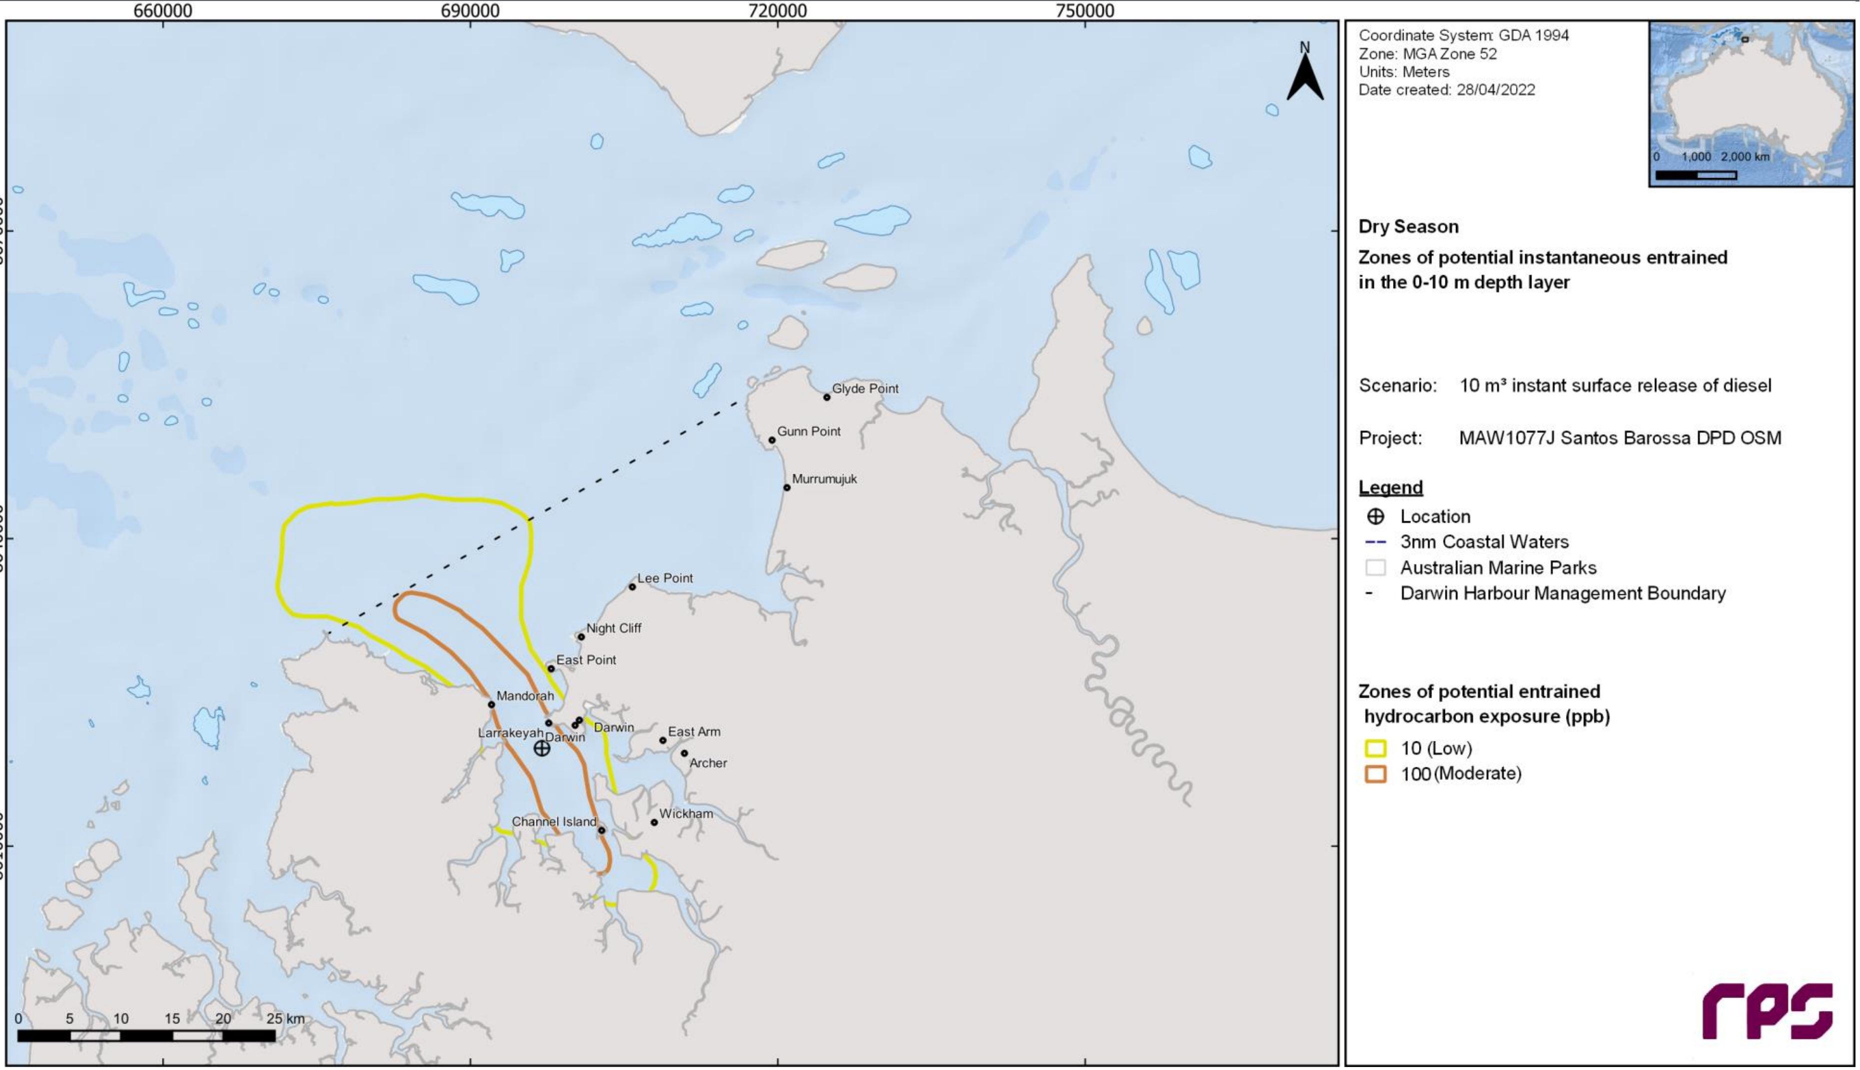

Figure 14.6 Zones of potential entrained hydrocarbon exposure at 0 – 10 m below the sea surface from a vessel to vessel refuelling incident at KP114 during dry season conditions. The results were calculated from 100 spill simulations.

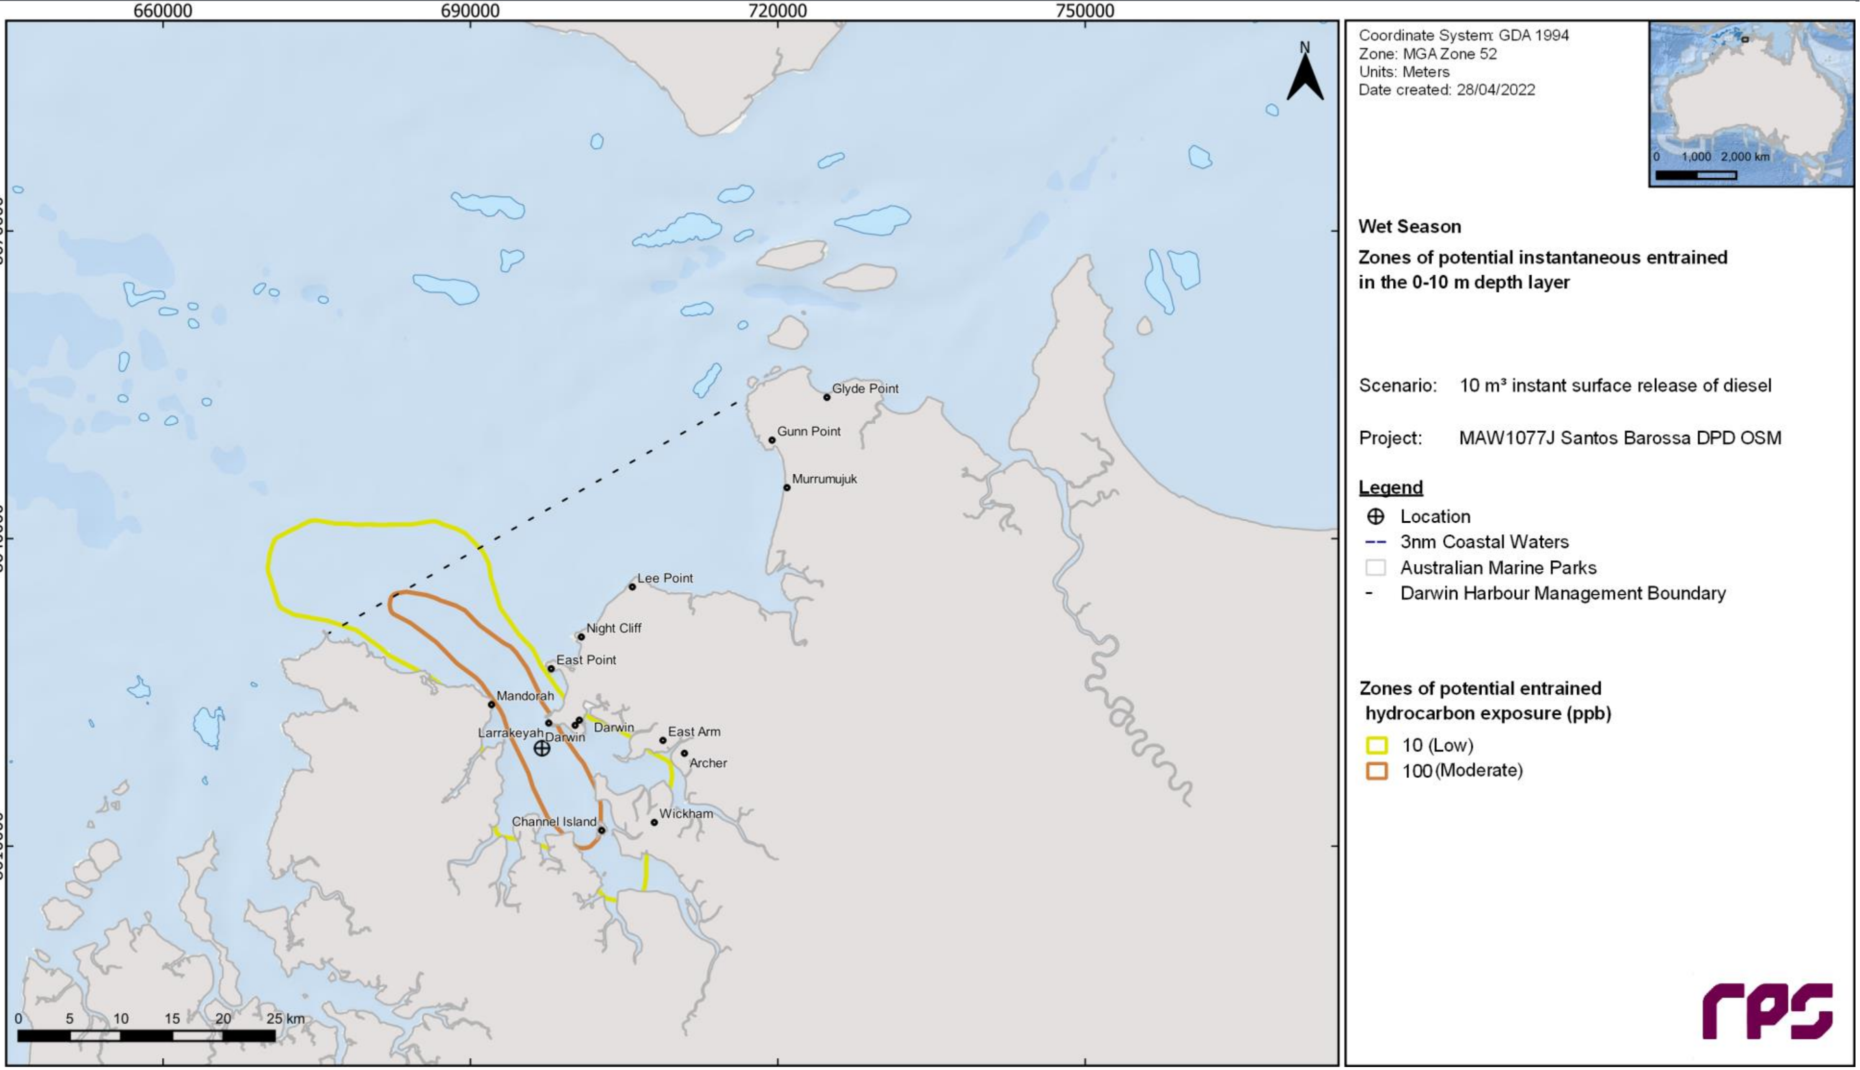

Figure 14.7 Zones of potential entrained hydrocarbon exposure at 0 – 10 m below the sea surface from a vessel to vessel refuelling incident at KP114 during wet season conditions. The results were calculated from 100 spill simulations.

14.3 Deterministic Analysis

The stochastic modelling results were assessed and the deterministic simulation resulting in the largest volume ashore (4.3 m^3) was identified as run 69, which commenced at 6 pm 25 November 2019 during the wet season.

Zones of exposure on the sea surface (swept area) and shoreline accumulation over the entire 10-day simulation are presented in Figure 14.8. The spill had drifted south-southeast from the release from the release location and the oil was predicted to accumulate on the shoreline at Wickham.

No zones of entrained and dissolved hydrocarbon exposure were predicted above the minimum reporting thresholds or the simulation.

Figure 14.9 and Figure 14.10 show time series of the area of floating oil exposure and the volume of oil ashore for each threshold during the 10-day simulation.

Figure 14.11 presents the fates and weathering for the corresponding single spill trajectory. At the conclusion of the simulation, approximately 8 m^3 (80%) of oil had evaporated and 2 m^3 (20%) had accumulated on the shoreline.

15 SCENARIO 4 RESULTS – VESSEL FUEL TANK RUPTURE AT KP114

This scenario examined the potential exposure following a 300 m^3 surface release of MDO over 6 hours in the event of a vessel fuel tank rupture at KP114. A total of 200 spill trajectories were simulated (i.e., 100 spills per season) and tracked for 30 days.

Section 15.1 presents the low threshold environment that may be affected (EMBA), resulting from the 200 spill simulations. Section 15.2 shows the seasonal (or stochastic) analysis, while Section 15.3 presents in more detail the results for the simulation resulting in the largest volume of oil ashore.

15.1 EMBA

Figure 15.1 shows the full geographic EMBA derived by overlaying the results from all 200 spill simulations at the low (≥1 g/m^2) exposure thresholds.

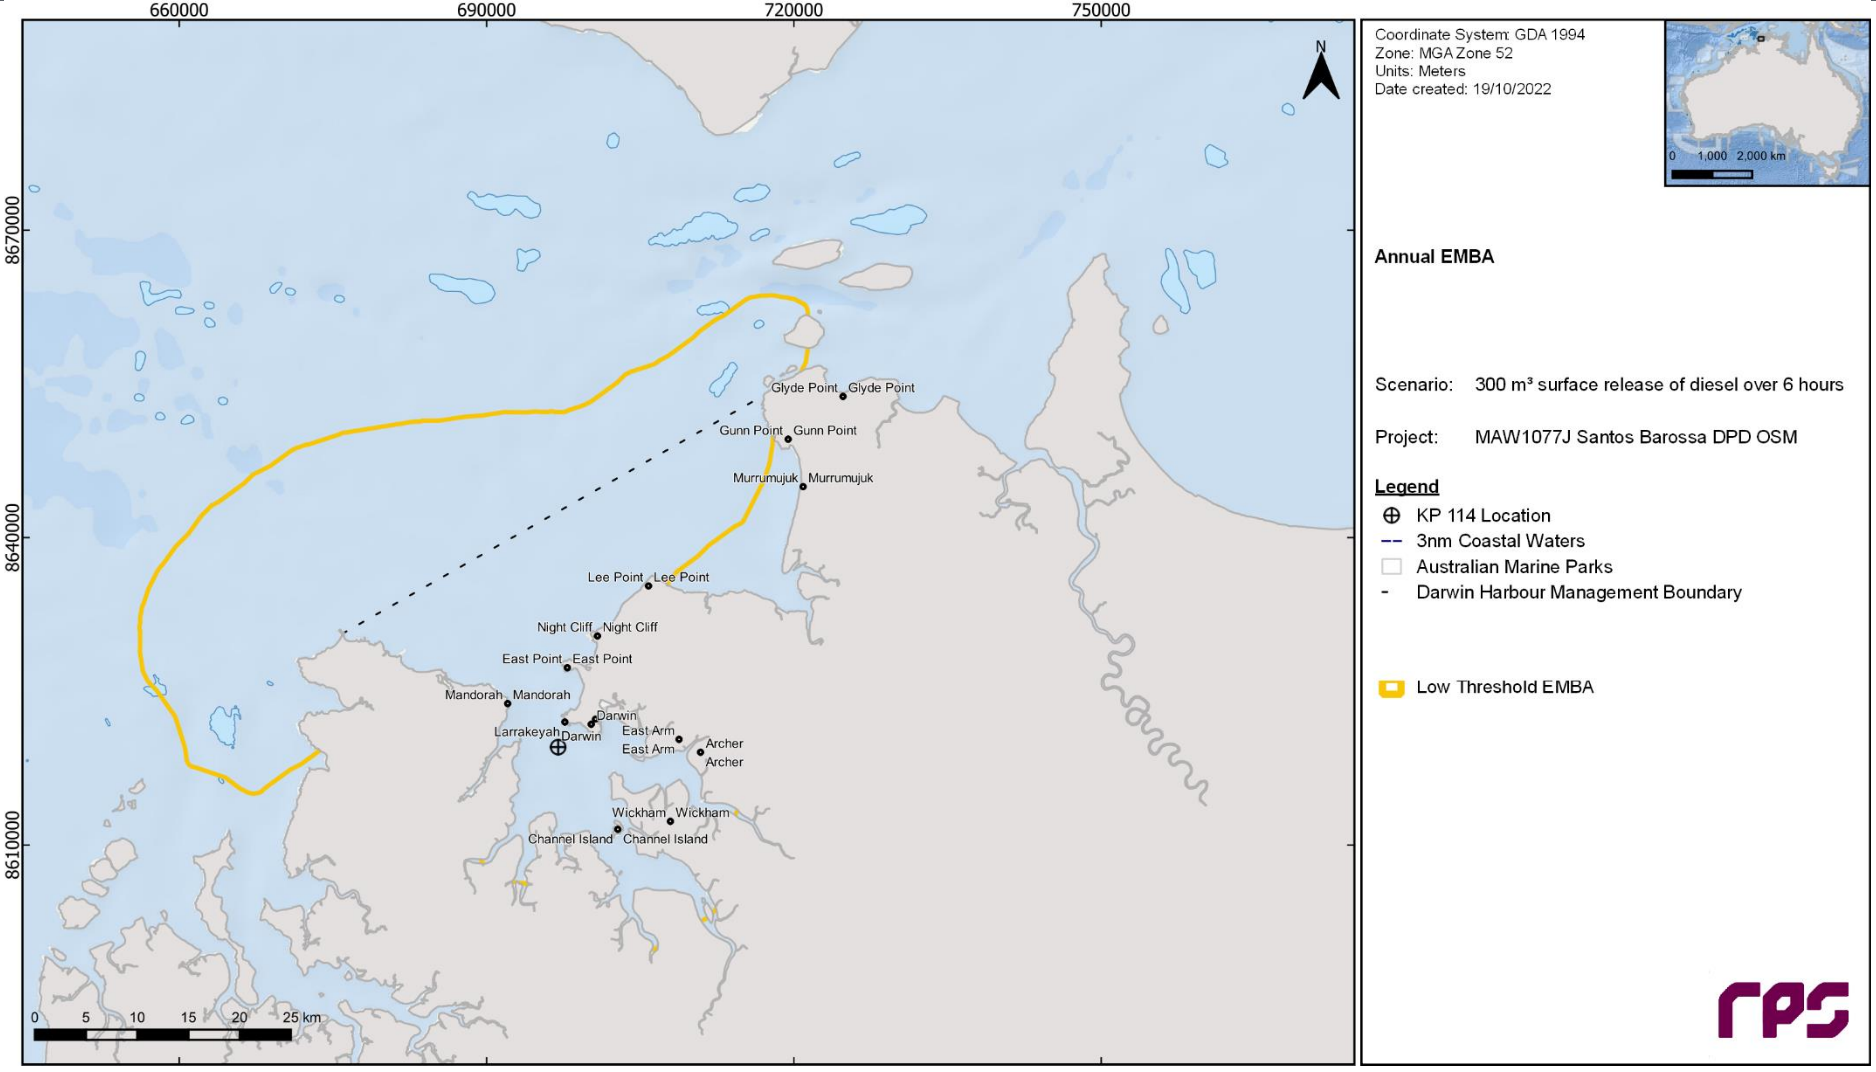

Figure 15.1 Predicted low threshold risk EMBA from a vessel fuel tank rupture at KP114. The annualised results were calculated from 200 spill simulations.

15.2 Stochastic Analysis

15.2.1 Floating Oil Exposure

Table 15.1 summarises the maximum distances and directions travelled by the floating oil from the release location at each threshold for each season. The maximum distances to the low (≥1 g/m^2), moderate (≥10 g/m^2) and high (≥ 50 g/m^2) exposure zones were 24.2 km (northwest), 19.6 km (northwest) and 10.2 km (north-northwest), respectively, during dry season conditions and 33.4 km (northwest), 18.9 km (northwest) and 8.4 km (north-northwest), respectively during wet season conditions. Table 15.2 summarises the potential floating oil exposure to individual receptors for each season and Figure 15.2 and Figure 15.3 illustrate the extent of floating oil exposure for each season.

During both the dry and wet seasons, floating oil exposure at the low threshold was predicted at Restricted Areas 1, 4, 5 and 6 with probabilities ranging between 1 – 60% and 1 – 30%, during the dry and wet season, respectively. Additionally, floating oil exposure at the moderate threshold was predicted at Restricted Areas 4 and 6 with probabilities of 10% and 4%, respectively during the dry season and 8% and 5%, respectively during the wet season. No high exposure was predicted for any Restricted Area.

Only the two simulation during wet season conditions (2% probability) triggered the low threshold exposure within Charles Point Wide RFPA, with a minimum time of exposure of 0.96 days.

During the dry season five WQ Zones recorded floating oil exposure at the low threshold with probabilities ranging between 13% (Middle Arm) and 100% (Middle Harbour). In comparison, during the wet season six WQ Zones recorded floating oil exposure at the low threshold with probabilities ranging between 1% (Elizabeth River) and 100% (Middle Harbour, see Table 15.2).

Table 15.1 Maximum distances and directions travelled by floating oil from vessel fuel tank rupture at KP114 at each threshold for each season. Results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Dry	Maximum distance (km) from release location	24.2	19.6	10.2
	Maximum distance (km) from the release location (99th percentile)	21.2	18.7	9.9
	Direction	NW	NW	NNW
Wet	Maximum distance (km) from release location	33.4	18.9	8.4
	Maximum distance (km) from release location (99th percentile)	31.7	17.5	8.3
	Direction	NW	NW	NNW

Table 15.2 Summary of the potential exposure by floating oil to individual receptors from a vessel fuel tank rupture at KP114 for each season. Results were calculated from 100 spill simulations per season.

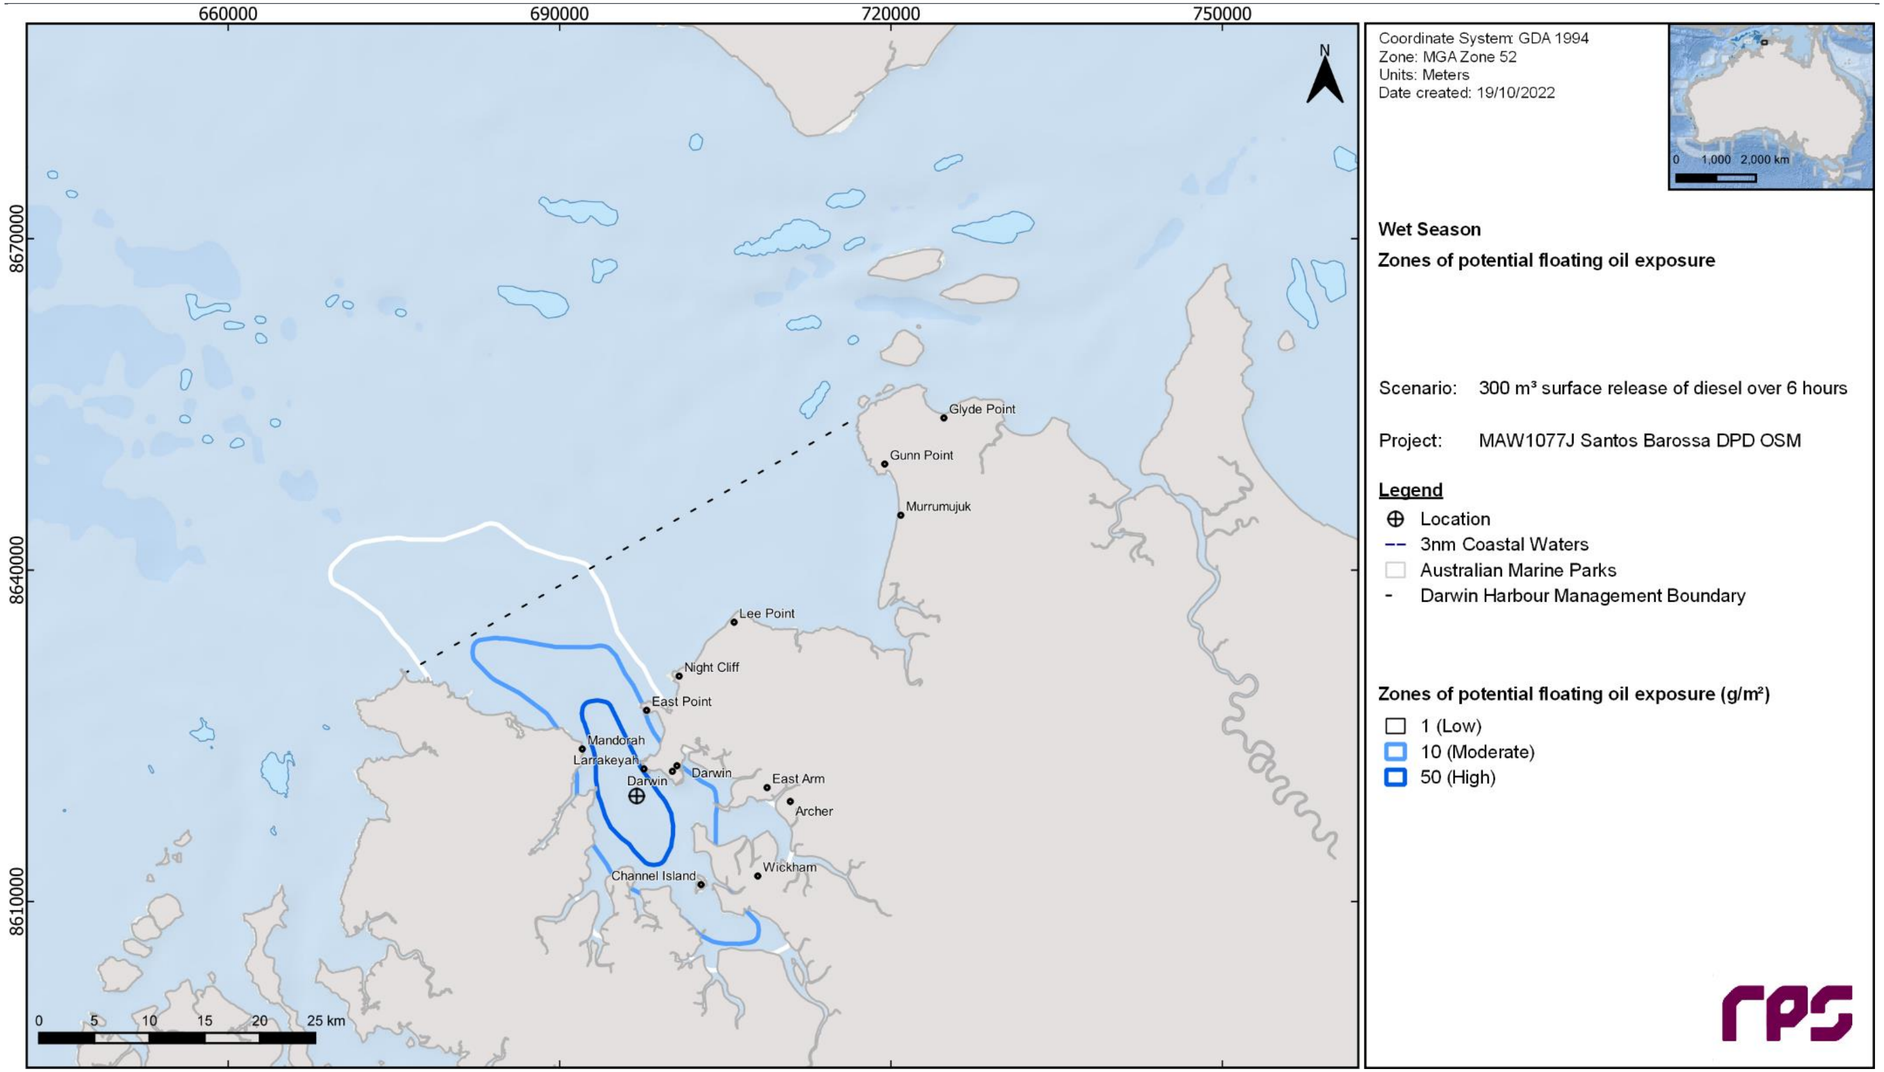

Figure 15.3 Zones of potential floating oil exposure from a vessel fuel tank rupture at KP114 during wet season conditions. The results were calculated from 100 spill simulations.

15.2.2 Shoreline Accumulation

Table 15.3 summarises the predicted oil accumulation on any shoreline during each season. The probability of shoreline accumulation at, or above, the low threshold (10 g/m^2) was 100% (dry season) and 91% (wet season). The minimum time before oil accumulation at, or above, the low threshold was 0.21 days during the dry and wet seasons. The maximum volume ashore for a single spill during the dry and wet season was 114.8 m^3 and 115.5 m^3, respectively, and the maximum length of shoreline contacted at the low threshold was 57.7 km (dry season) and 54.2 km (wet season). The maximum lengths of oil accumulation on shorelines at, or above, the moderate (100 – 1,000 g/m^2) and high (≥1,000 g/m^2) thresholds was 21.1 km (dry season) and 19.1 km (wet season), and 2.0 km (dry season) and 2.5 km (wet season), respectively.

Table 15.4 and Table 15.5 summarise the oil accumulation on individual shoreline receptors for each season. The maximum potential shoreline loading for the specified thresholds for each season are presented in Figure 15.4 and Figure 15.5.

The highest probability of oil accumulation at the low threshold was predicted along the West Arm (88% dry and 49% wet seasons) and East Arm (44% dry and 60% wet conditions) shorelines. The highest volume of oil accumulation during the dry and wet seasons occurred along the West Arm shoreline (103.5 m^3 (dry season) and 111.7 m^3 (wet season)). The minimum time before oil accumulation at the low threshold was 0.21 days (East Arm) for the dry season and 0.21 days (Wickham Point) during the wet season conditions.

Table 15.3 Summary of oil accumulation on any shoreline from a vessel fuel tank rupture at KP114 during each season. Results were calculated from 100 spill simulations per season.

15.2.3 In-water exposure

15.2.3.1 Dissolved Hydrocarbons

Table 15.6 summarises the maximum distances and directions travelled by dissolved hydrocarbons from the release location to the low (≥ 10 ppb) and moderate (≥ 50 ppb) thresholds in the 0 – 10 m depth layer. No exposure was predicted for the high (≥ 400 ppb) threshold. The maximum distances from the release location to the low exposure zone was 12.8 km (dry season) and 20.0 km (wet season), whilst distances were reduced to 0.6 km (dry season) and 7.3 km (wet season) for the moderate exposure threshold.

Table 15.7 summarises the potential exposure to receptors from dissolved hydrocarbons in the 0 – 10 m depth layer for each threshold and season. Figure 15.6 and Figure 15.7 illustrate the extent of dissolved hydrocarbon exposure for each season in the 0 – 10 m depth layers.

During both the dry and wet seasons, exposure at the low threshold was predicted at the Anson Beagle IMCRA during the dry and wet seasons with probabilities of 11% and 19%, respectively.

Dissolved hydrocarbon exposure at the low threshold was also predicted at shipwreck receptors during the dry (3) and wet seasons (5), with probabilities ranging from 1 – 10% and between 2 – 17%, respectively. The greatest probability of low threshold exposure during the dry and wet season was predicted for Ham Luong and Mauna Loa USAT, respectively.

Only a single simulation during dry season conditions (1% probability) triggered the low threshold exposure within Restricted Area 6 with a minimum time of exposure of 0.67 days.

During the dry season, 2 WQ Zones recorded exposure at the low threshold with probabilities of 2% (Outer Harbour) and 11% (Middle Harbour), whilst during the wet season, 3 WQ Zones recorded exposure with probabilities ranging between 1% (Middle Arm) and 19% (Middle Harbour, see Table 15.7).

The highest dissolved hydrocarbon concentration was 93 ppb during the wet seasons predicted for Beagle Gulf-Darwin Coast, Anson Beagle IMCRA and Middle Harbour WQO Zone.

Table 15.6 Maximum distances and directions travelled by dissolved hydrocarbons (0 – 10 m depth layer) from a vessel fuel tank rupture at KP114 during each season. Results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential dissolved hydrocarbon exposure		
		Low 10 ppb	Moderate 50 ppb	High 400 ppb
Dry	Maximum distance (km) from the release location	12.8	0.6	-
	Maximum distance (km) from the release location (99th percentile)	12.3	0.6	-
	Direction	NW	NW	-
Wet	Maximum distance (km) from the release location	20.0	7.3	-
	Maximum distance (km) from the release location (99th percentile)	18.2	7.3	-
	Direction	NW	NNW	-

Table 15.7 Summary of dissolved hydrocarbon exposure for each receptor in the 0 – 10 m depth layer from a vessel fuel tank rupture at KP114 during each season. Results were calculated from 100 spill simulations per season.

Receptor		Dry							Wet						
		Maximum instantaneous concentration (ppb)	Probability of instantaneous dissolved hydrocarbon exposure			Minimum time (days) before instantaneous dissolved hydrocarbon exposure			Maximum instantaneous concentration (ppb)	Probability of instantaneous dissolved hydrocarbon exposure			Minimum time (days) before instantaneous dissolved hydrocarbon exposure

15.2.3.2 Entrained Hydrocarbons

Table 15.8 summarises the maximum distances and directions travelled by entrained hydrocarbons within the 0 – 10 m depth layers at the low (≥ 10 ppb) and moderate (≥ 100 ppb) thresholds. The maximum distances from the release location to the low exposure zone was 41.7 km (dry season) and 48.3 km (wet season), whilst distances were reduced to 30.3 km (dry season) and 32.4 km (wet season) for the moderate exposure threshold. Exposure was limited to the 0 – 10 m depth layer.

Table 15.9 summarises the potential exposure to receptors from entrained hydrocarbons in the 0 – 10 m depth layer for each season. Figure 15.8 and Figure 15.9 illustrate the extent of entrained hydrocarbon exposure for each season in the 0 – 10 m depth layer.

During both seasons the Charles Point Wide RFPA and four Restricted Areas (1, 4, 5 and 6) were predicted to be exposed at the low threshold with probabilities ranging from 14 – 99% and 50 – 94% during the dry and wet seasons, respectively. During both seasons Restricted Area 6 was predicted to have the greatest probability of exposure (99% and 94%, respectively).

Anson Beagle IMCRA was also predicted to experience exposure at the low threshold with probabilities of 100% during the dry season and 96% during the wet season.

Only a single simulation during dry season conditions (1% probability) triggered the low threshold exposure within the Middle Reef and Kelleway Reef RSB receptors. Additionally, only a single simulation (1% probability) was also predicted to trigger the low threshold exposure at Vernon Islands Conservation Reserve during the wet season with a corresponding time of exposure of 12.21 days.

Exposure at the low threshold was predicted at 18 and 19 shipwreck receptors during the dry and wet season, respectively with probabilities ranging from 5% (East Arm Vietnamese Refugee Boat 1) and 100% (Ham Luong, Mauna Loa USAT and Yu Han 22) during the dry season and 4% (Elizabeth River - unidentified wreck) and 95% (Ham Luong) during the wet season.

Furthermore, 8 WQ Zones were predicted to be exposed at the low threshold during the dry and wet season with probabilities ranging from 2% (Myrmidon Creek) and 100% (Middle Harbour) during the dry season. Whilst, under wet season conditions probabilities throughout the 8 WQ Zones ranged from 14% (Myrmidon Creek) and 96% (Middle Harbour, see Table 15.9).

The highest entrained hydrocarbon concentration was 6,826 ppb predicted for Beagle Gulf-Darwin Coast, Anson Beagle IMCRA and Middle Harbour WQO Zone during the wet season.

Table 15.8 Maximum distances and directions travelled by entrained hydrocarbons (0 – 10 m depth layer) from the release location vessel fuel tank rupture at KP114 during each season. Results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential entrained hydrocarbon exposure	
		Low 10 ppb	Moderate 100 ppb
Dry	Maximum distance (km) from release location	41.7	30.3
	Maximum distance (km) from release location (99th percentile)	40.3	29.3
	Direction	WNW	NW
Wet	Maximum distance (km) from release location	48.3	32.4
	Maximum distance (km) from release location (99th percentile)	43.7	31.2
	Direction	NW	NW

Table 15.9 Probability of entrained hydrocarbons exposure to receptors in the 0 – 10 m depth layer from a vessel fuel tank rupture at KP114 during each season. Results were calculated from 100 spill simulations per season.

Receptor		Dry					Wet

15.3 Deterministic Analysis

The stochastic modelling results were assessed and the deterministic simulation resulting in the largest volume ashore (115.5 m^3) was identified as run 55, which commenced at 9 am 20 April 2020 during the wet season.

Zones of exposure on the sea surface (swept area) and shoreline accumulation over the entire 30-day simulation are presented in Figure 15.10. The spill drifted predominately south and west from the release location and the oil was predicted to accumulate on the western shoreline up to Mandorah.

Zones of entrained hydrocarbon exposure within the 0 – 10 m depth layer (surface layer) over the 30-day simulation are presented in Figure 15.11.

Figure 15.12 and Figure 15.13 show time series of the area of floating oil and the volume of oil ashore exposure for each threshold during the 30-day simulation.

Figure 15.14 presents the fates and weathering for the corresponding single spill trajectory. At the conclusion of the simulation, approximately 214 m^3 (71%) of the spilled oil was lost to the atmosphere through evaporation and ~75 m^3 (25%) remained on the shoreline. In addition, ~8 m^3 (3%) was predicted to have decayed by the end of the simulation, while there was no oil predicted to remain on the surface.

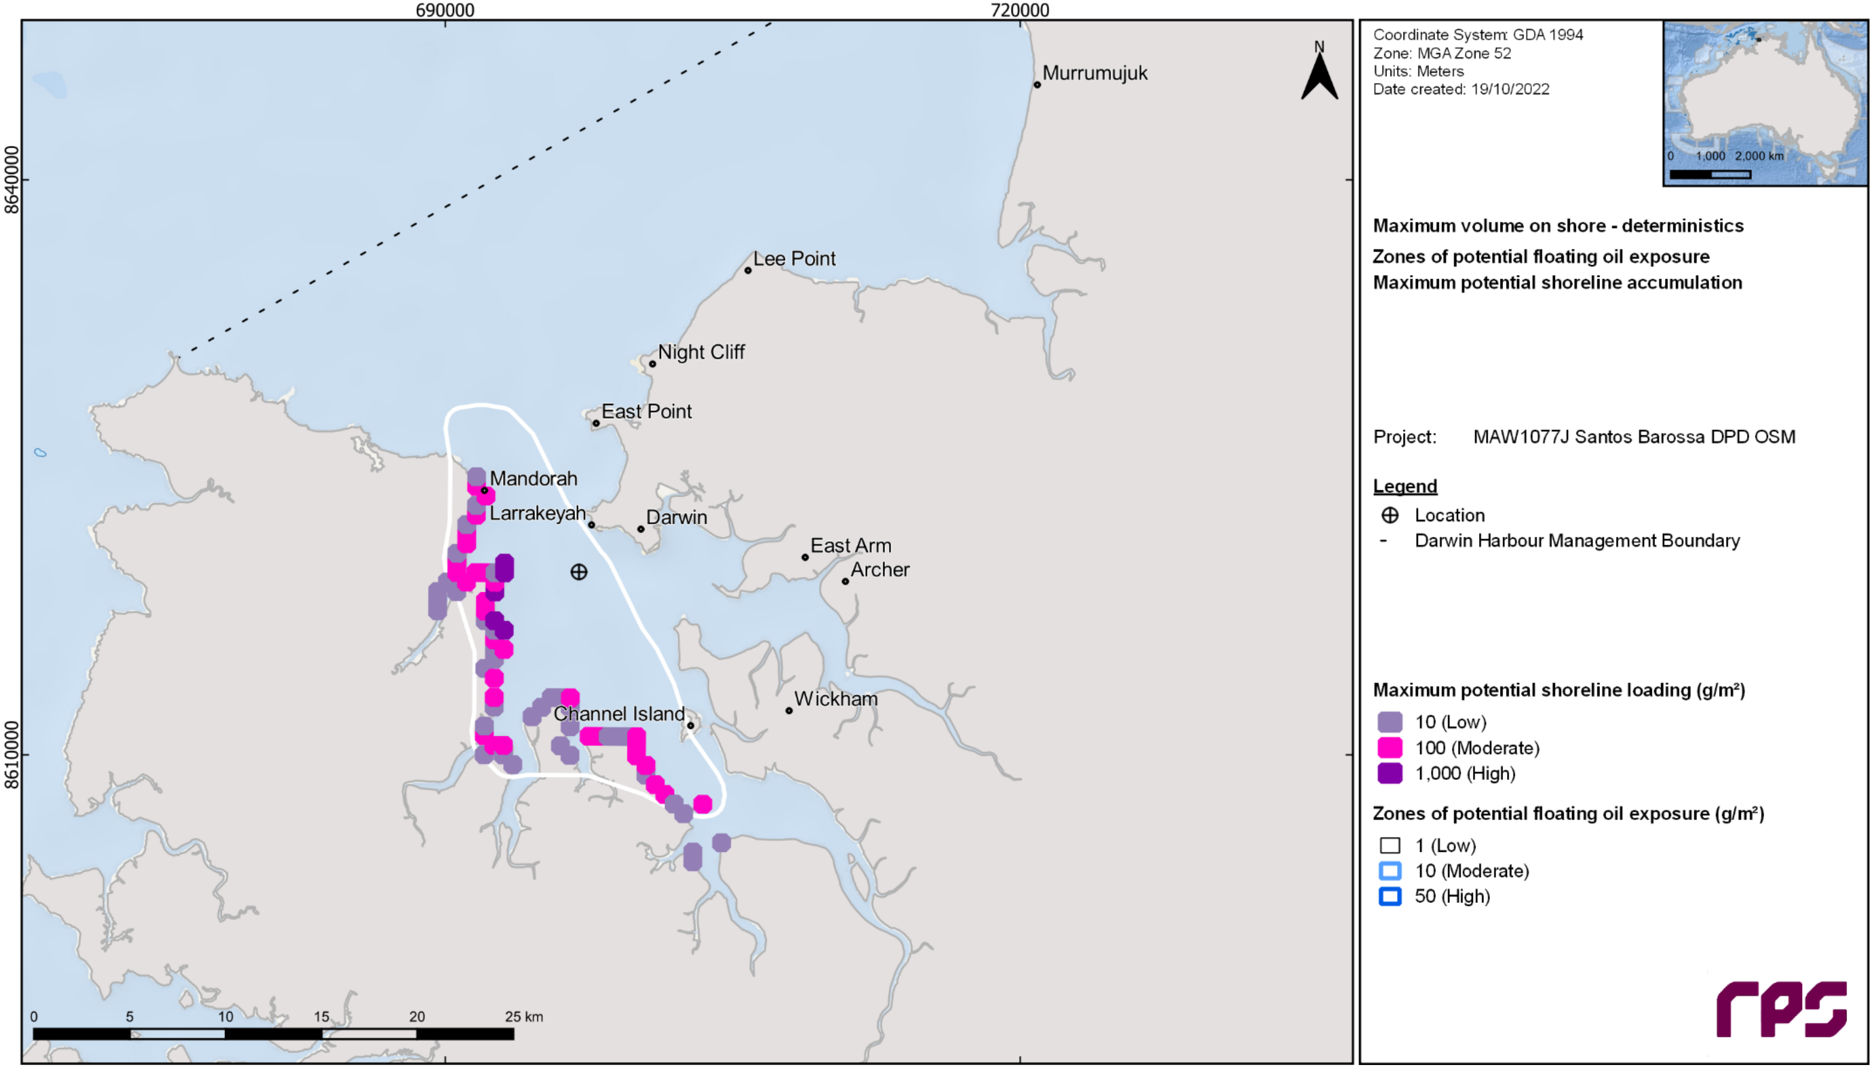

Figure 15.10 Zones of potential exposure on the sea surface and shoreline accumulation (over the 30-days) for the simulation resulting in the maximum volume of oil ashore starting at 9 am 20 April 2020 during the wet season.

EXECUTIVE SUMMARY

Santos Pty Ltd is proposing to install a gas export pipeline (GEP) off the northwest coast of the Northern Territory (NT). The proposed GEP begins at the Barossa gas field, north of the Tiwi Islands, and extends south to feed the Darwin LNG plant, located in Middle Arm, Darwin Harbour. Two stages are proposed for the GEP. The first stage is a GEP from the Barossa gas field to a point at the existing Bayu-Undan to Darwin pipeline southwest of Bathurst Island. The second stage is to extend the GEP from this point to the Darwin LNG plant. This maritime archaeological heritage assessment (MAHA) examines the second stage, with the first stage being the subject of a separate report.

A review of historical sources, databases and marine geophysical information has found that within the study area, Larrakia and Tiwi people conducted maritime travel and subsistence activities – likely concentrated in coastal environments. Macassan trepang fishing and trade occurred throughout the 18th to early 20th centuries.

British exploration and surveying began in the early 19th century, following which a wide range of colonial shipping including Government and commercial cargo and passenger transport, fishing and pearling industry trade and transport, and recreational shipping occurred, from the establishment of colonial settlement in Darwin in the 1860s to present. In the 1870s and 1880s, three subsea telegraph cables were laid. Quarantine and leper station transport and service supply were established in Middle Arm throughout the late 19th to early 20th century.

The study area saw significant military action during World War II, including air and sea combat between Allied and Japanese forces, which resulted in the sinking of numerous ships and aircraft within Beagle Gulf and Darwin Harbour. Areas near and adjacent to the study area have been designated as live-fire ranges, and the pipeline route enters a gazetted air-to-air range, though it is unknown if live fire exercises have been undertaken.

There are seventeen located shipwrecks, six instances of maritime infrastructure, and five instances of UXO within the study area. There are no known aircraft wrecks or sea dumping sites within the study area. There are twenty-nine unlocated shipwrecks recorded to have wrecked within the vicinity of the study area. Any of these could possibly be wrecked within the study area. There are twenty-five known, but unlocated, aircraft wrecks in Beagle Gulf and Darwin Harbour that could potentially occur within the study area based on historical accounts of the wreck event and general wreck location.

The remains of these vessels, and their contents and fittings, are automatically protected under the Cwlth *Underwater Cultural Heritage Act 2018*. Remains within the coastal waters boundary (3nm seaward from the Territorial Sea Baseline 'TSB' – see Section 3.1) are protected under the NT *Heritage Act 2011,* and United States military shipwrecks and aircraft wrecks are protected under the US *Sunken Military Craft Act 2004.*

Side scan sonar data and MBES data from a marine geophysical survey conducted by Fugro in 2021 were reviewed, as well as 1 m resolution MBES data collected between 2011 and 2015, published by Geosciences Australia, covering the entirety of Darwin Harbour. Thirty-nine sonar and magnetometer contacts were identified from the Fugro survey data as being possibly cultural and hence of potential cultural heritage significance. These anomalies could be natural features, remains of anti-submarine defences, 19th century telegraph cables, shipwrecks, possible aircraft wreckage, debris fields, or isolated instances of debris and/or discard.

Santos has advised that an 1800 m wide corridor, located between KP 91.5 and the GEP terminus, has been proposed for anchoring of work vessels during GEP installation. Because this corridor is wider than the Fugro geophysical survey corridor, CA conducted a review of the Geosciences Australia MBES data to cover this gap. Clear evidence of eight shipwrecks were identified within the anchoring corridor. Two of these wrecks, USAT *Mauna Loa* and USAT *Meigs,* are protected under the NT *Heritage Act 2011* and may be protected under the

US *Sunken Military Craft Act 2004.* The remaining six shipwrecks identified during review of geophysical survey data are not protected under statutory regulations. No aircraft wrecks were identified within the anchoring corridor. In addition to the geophysical targets and Fugro geophysical survey targets identified, an additional 135 targets were identified within the gap between the geophysical survey corridor and the anchoring corridor. 90 of these targets are between KP 107 and 108, known to be the location of the WWII anti-submarine boom net moorings. It is believed that most, if not all, of these are large cement mooring blocks. The remaining 45 targets have been identified as most likely debris, with some instances of isolated discard and possible cable remains. These targets are scattered along the length of the anchoring corridor.

An ROV survey was conducted in June 2022 on 16 geophysical targets located within 50m of the proposed GEP route. Additionally, three transects were conducted on the likely location of WWII anti-submarine boom net moorings. The ROV survey identified three anti-submarine net mooring trots, Trots 16, 17, and 18. Trot 17 directly crosses the path of the proposed GEP route. The northern-most clump of Trot 16, identified as a repurposed ship's anchor, is located approximately 37m from the proposed GEP route, and the southernmost chain section of Trot 18 is located 32m from the proposed GEP route. The location of Clump 1, Trot 18, if still extant would likely be located within 25m of the proposed route.

In addition to the anti-submarine net trots, four isolated objects were observed during ROV surveys. Target MA_007 is located 6m from the proposed GEP route. Targets 174, MA_001, and NCL_SC_016 are located 15-35m from the proposed GEP route. While Target MA_001 was determined to be the remains of a modern buoy mooring, of minimal heritage significance. Targets 174, MA_007, and NCL_SC_016 could not be conclusively identified through ROV survey. Target 174 appears to be a ship's bollard with rope attached and MA_007 is a rectangular metal structure consisting of metal beams. NCL_SC_016 appears to be a subsea cable of unknown provenance but is not believed to be part of a DP&W or Telstra cable between Mandorah and Darwin, as the object is disarticulated and severed at both ends.

The identity, and hence cultural heritage significance of targets MA_007, 174, and NCL_SC_016, as well as other uninspected anomalies is not known. If identified geophysical anomalies and cultural heritage objects cannot be avoided, then a detailed heritage impact assessment will need to be conducted, consistent with the Heritage Branch of the Northern Territory Government (NT Heritage Branch) Archaeological Scope of Works.[1] This would inform a Maritime Heritage Management Plan, that would include specific mitigation measures and management recommendations for each anomaly, such as, but not confined to, archaeological recording, clearance, removal, and/or recovery. For example, any clearance of cultural material from the seabed should be recorded by a maritime archaeologist on-site. For the INPEX project, this involved maritime archaeologists with suitable diving qualifications embedded with the commercial dive teams.

It is recommended that if further remote sensing surveys of the proposed GEP are undertaken – i.e., to fill in data gaps or assess the risk of UXO – the additional survey data should be reviewed by a qualified maritime archaeologist.

In the unlikely event of significant maritime archaeological remains being discovered during the construction phase, an Unexpected Maritime Archaeological Finds Protocol to responsibly manage such finds should be prepared and implemented. If a Maritime Heritage Management Plan is deemed necessary, this would be a component of such a plan.

Based on the findings above, the recommendations made in this report are as follows:

[1] **NT Heritage Branch, 2021,** Archaeological Scope of Works: Gas export pipeline Barossa gas field to Middle Arm, Darwin Harbour.

Recommendation 1	***If feasible, the proposed GEP alignment be altered to avoid the WWII anti-submarine net mooring Trot 17 as well as cultural heritage objects identified at Target MA_007.***
Recommendation 2	***If potentially cultural anomalies and objects identified in this assessment are likely to be impacted, undertake a detailed heritage impact assessment by a qualified maritime archaeologist.***
Recommendation 3	***Establish no-anchoring zones around protected shipwreck locations, the anti-submarine net moorings, and unverified geophysical anomalies within the anchoring corridor.***
Recommendation 4	***If additional remote sensing data is collected for the proposed GEP it should be reviewed by a qualified maritime archaeologist.***
Recommendation 5	***Prepare and implement an Unexpected Maritime Archaeological Finds Protocol.***
Recommendation 6	***Review of this assessment if proposed alignment of pipeline changes.***

1 INTRODUCTION

1.1 Background

Cosmos Archaeology (CA) has been commissioned by Santos Pty Ltd to undertake a maritime archaeological heritage assessment (MAHA) for the proposed installation of a gas export pipeline (GEP) off the northwest coast of the Northern Territory. The proposed GEP begins at the Barossa gas field, north of the Tiwi Islands, and extends south to feed the Darwin LNG plant, located in Middle Arm, Darwin Harbour. The first proposed route is a GEP from the Barossa gas field to a point at the existing Bayu-Undan to Darwin pipeline southwest of Bathurst Island. Cosmos Archaeology prepared and delivered a maritime heritage assessment for this offshore GEP route, issued for use 30 June 2022.[2]

The second proposed route is to extend the GEP to the Darwin LNG plant. This will include an additional 123 km of seabed pipeline, running through the harbour to the Darwin LNG plant, parallel to the existing Bayu-Undan pipeline.

This MAHA assesses only the second stage, the proposed new pipeline parallel with the existing Bayu-Undan pipeline from Beagle Gulf to the Darwin LNG plant. A MAHA for the first stage will be presented in a separate report.

1.2 The Maritime Archaeological Study Area

A project survey area has been provided by Santos Pty Ltd. This area has been subject to a marine geophysical survey, which will be discussed further in Section 6. The survey area consists of a corridor of variable width, between 700 and 180 m across, primarily around the centreline of the proposed pipeline alignment. The maritime archaeological study area defined by CA for this report is larger than the marine geophysical or project survey area. This is because the exact positions of many of the documented shipwrecks and aircraft wrecks in Beagle Gulf are not known, and some could potentially be located within a wider area. Historical or estimated positions for some wrecks could have a margin of error of a few kilometres. The maritime archaeological study area has been defined as a 1000 m buffer on either side of the proposed GEP centreline (Figure 1). The proposed pipeline route has been provided with markers (KPs) at each kilometre along the length from KP 0 at the junction with the GEP from proposal 1, to KP 122.475 where the pipeline terminates at the Darwin LNG plant.

[2] **Cosmos Archaeology, 2022,** *Santos (Barossa) Gas Export Pipeline, Original Barossa GEP Stage (Timor Sea and Tiwi Islands): Maritime Heritage Assessment.* Prepared for Santos Ltd (BAS 210-0017).

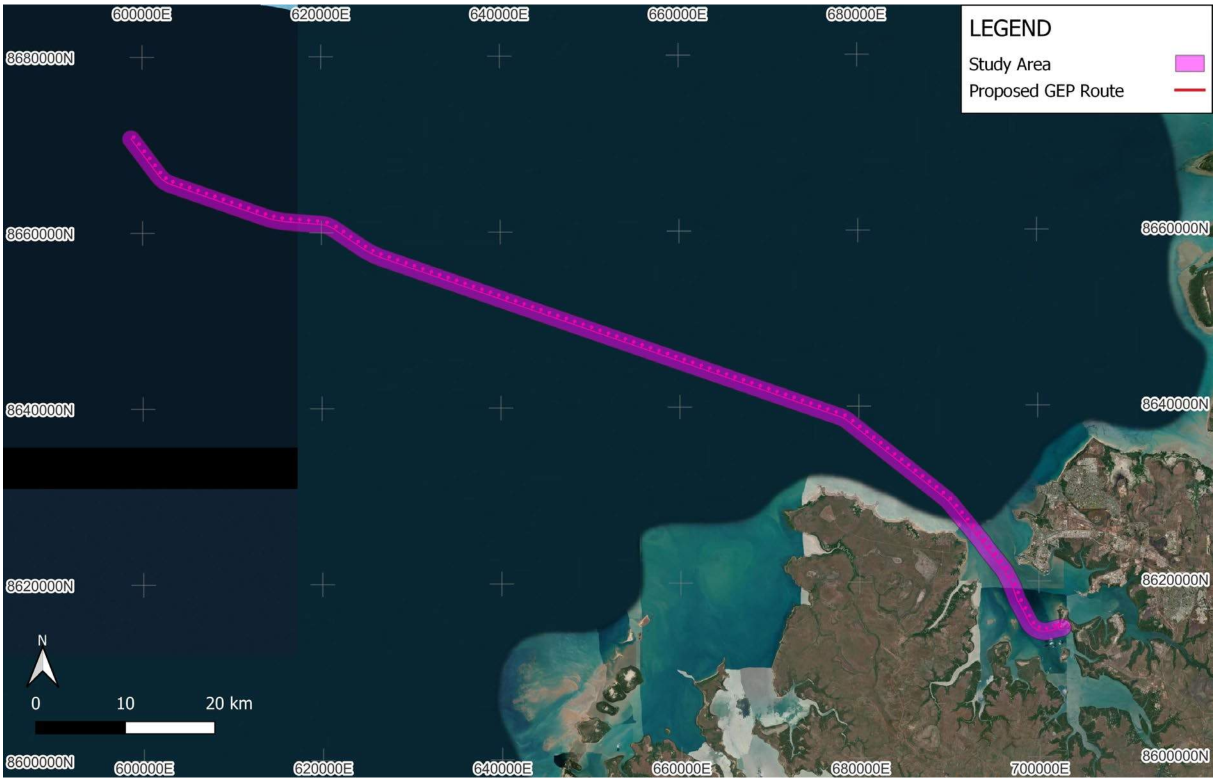

Figure 1: Maritime archaeological study area, 1000 m either side of pipeline centre route.

The coordinates for the survey area were provided by Santos Pty Ltd in the Geophysical survey reports for the Barossa Pipeline.[3] A .kmz file was provided by Santos displaying the centreline of the proposed pipeline route along with geotiff and shapefiles of the geophysical survey data. Additionally, the coordinates for the pipeline routes were provided by Santos Pty Ltd in the same report.[4]

1.3 Scope of the Study

This study addresses the Archaeological Scope of Works for the GEP Barossa Gas Field to Middle Arm, Darwin Harbour, prepared by the NT Heritage Branch in November 2021 and includes the following:

- Provide a list of located and potential maritime archaeological sites (including shipwrecks, aircraft wrecks and dump sites) known to be, or possibly located, within the study area
- Provide an outline of potential impacts from the pipeline installation.
- Provide a description of the different types of potential maritime archaeological sites on the seabed.
- Provide an expert analysis of geophysical survey data in regard to anomalies indicating potential maritime archaeological remains.
- Review of relevant legislative requirements.
- Provide mitigation measures for potential impacts on maritime archaeological remains.

This study examines maritime archaeological sites which are defined as wrecks (ship or aircraft) and associated material, dumped material, maritime infrastructure, and associated deposits on or under the seabed below the highest astronomical tide. While this report

addresses only the potential cultural heritage aspects of dumped and spent munitions, more information about unexploded ordnance (UXO) should be obtained from a suitably qualified UXO specialist or the Department of Defence. This heritage assessment should not be considered a UXO assessment.

1.4 Previous Work

CA has undertaken previous maritime cultural heritage surveys and assessments of the study area as part of the Darwin INPEX project between 2010 and 2014. The following is a list of reports previously completed by CA with a focus on the study area:

Cosmos Archaeology, 2011, *Ichthys Gas Field Development Project: Nearshore Development Area, Assessment of Marine Heritage Survey Methods,* report prepared for INPEX Browse Ltd.

Cosmos Archaeology, 2012, *Ichthys Project Darwin Harbour, East Arm Gas Export Pipeline: Assessment of Heritage Impact of 7 side scan targets.* Prepared for Tek Ventures Pty Ltd.

Cosmos Archaeology, 2014, *INPEX Ichthys LNG Project: Nearshore Development – Dredging. East Arm, Darwin Harbour, Northern Territory. Relocation of Heritage Objects and Removal of debris.* Prepared for Tek Ventures Pty Ltd.

Cosmos Archaeology, 2016, *INPEX Ichthys Project, Catalina Flying-Boat Monitoring 2012 to 2015,* Prepared for Tek Ventures Pty Ltd.

Cosmos Archaeology, 2022, *Santos (Barossa) Gas Export Pipeline, Original Barossa GEP Stage (Timor Sea and Tiwi Islands): Maritime Heritage Assessment.* Prepared for Santos Ltd.

2 METHODOLOGY

This desktop study has used various sources to prepare a list of known and potential shipwrecks, as well as other maritime archaeological sites in the study area (Table 1). Research is confined to what is available online and in the consultant's extensive library. Additionally, the Northern Territory Department of Heritage has been consulted for the location of sites which may not be publicly available.

Table 1: Historic resources consulted in this report.

Source	Description
Australasian Underwater Cultural Heritage Database (AUCHD)	The Australasian Underwater Cultural Heritage Database, maintained by the Commonwealth Department of Agriculture, Water and the Environment, is an online database of known and potential shipwrecks, aircraft wrecks and other maritime heritage sites and objects in Australian and Commonwealth waters.
Australian Government Department of Defence and Australian Hydrographic Service – Sea Dumping in Australia (AHS SD)	This database of sea dumping sites is managed by the Australian Government Department of Defence with information supplied by the Australian Hydrographic Service. http://www.hydro.gov.au/n2m/dumping/dumping.htm
NT Heritage Register	The NT Heritage Register is a register of all declared heritage places and objects (as declared under Part 2.2 of the NT *Heritage Act 2011*), and all heritage places and objects that have been nominated to the register. The register includes places and objects within NT waters. However, the public NT Heritage Register does not include heritage places and objects that are automatically declared under Part 2.1 of the NT *Heritage Act 2011*, including Aboriginal and Macassan places and objects.
Northern Territory Heritage Branch	Direct consultation with the Heritage Branch of the Northern Territory to determine the location of located heritage sites within the study area. *Email received from Heritage Branch on 28/3/2022 with recommendations for potential heritage items that might be located within study area.
Archival sources and heritage reports	A review of a wide range of primary and secondary historical sources held by NT Library and Archives, the National Library of Australia, the National Archives of Australia, and various published and unpublished heritage reports and articles was undertaken.
Previous reports completed by Cosmos Archaeology	A review of numerous reports on projects Cosmos Archaeology has conducted within the Northern Territory in Darwin Harbour and surrounds.

In addition to the heritage inventories, databases, historical resources, and previous reports, a detailed review of available geophysical survey data was also conducted. Section 6 details the results of the geophysical survey review and includes a table of targets identified to be potentially cultural in origin.

2.1 General Statements on site locations

Locations are known for 17 shipwrecks, six instances of maritime infrastructure, and four instances of UXO, however, there are many more sites that are known from the historical record but have not been located. At least 29 shipwrecks and 25 aircraft wrecks are known to have occurred within Beagle Gulf and Darwin Harbour but have not been located. The location data for these wrecks provided by heritage inventories and historical records are not always accurate.

As for the wrecks which have been located, designating accurate positions was not always possible as, in most cases, it is not known how their positions were recorded, such as with global positioning systems (GPS) or a compass/sextant. Furthermore, positions of known wrecks may have been taken off the charts and, therefore, reductions in precision due to plotting and scaling could be expected. Coordinates provided in some databases could also have been inferred from vague historical accounts which in fact could place the site within a relatively large area. This issue is proportionately compounded for sites that are lost at increasingly greater distances from the coast of Australia.

GPS coordinates have become increasingly reliable, but it must be noted that positions recorded with GPS in the 1980s to 1990s had accuracies of 100-300 metres. Those sites found and recorded by GPS closer to shore are likely to have had their location updated over time, but sites further from the coast and/or less accessible may still be listed with old and inaccurate coordinates. There are also different geodetic datums used by GPS units, but if datum is not recorded with the coordinates this can lead to errors when using the same coordinates with a different datum. User error can also occur when a recorder, or someone copying the location records, interprets the coordinates in the wrong style, such as reading coordinates in degrees, minutes, seconds rather than degrees and decimal minutes, for example. Based on these scenarios, it is safe to assume that there is always a degree of inaccuracy with the provision of site coordinates.

Australasian Underwater Cultural Heritage Database (AUCHD) [5]

Information presented in the AUCHD is compiled from each of the State and Territory historic shipwreck agencies or supplied by collecting institutions holding historic shipwreck objects. The integrity or source of the information held by these agencies is unknown. The size of the area in which an individual wreck could be found varies depending on the historical information available. Some wrecks which have been found have a latitude and longitude position, but the accuracy of that position could not be determined as the method used in obtaining the position is not known.

Department of Defence and Australian Hydrographic Service – Sea Dumping in Australia (AHS SD) [6]

The locations of sea dumped materials are provided by the Department of Defence Australian Hydrographic Service. Dumped materials of heritage value can include abandoned vessels and historic munitions, such as WWII-era aircraft components and Lend-Lease material.[7] It is unclear where the Australian Hydrographic Service obtained the positions of the dumped materials. It is important to note that these locations are where the materials were designated to be dumped, but it has been found that those dumping the materials may not have been particular about the final location. An example of this was identified in a previous CA study that found the Narrabeen Dumping Ground, Sydney (a ships graveyard), despite having a high concentration of wrecks within its boundary, also had a dense concentration of sites between four to five kilometres to the east, outside of the designated dumping area.[8]

3 LEGISLATION

The proposed subsea pipeline route passes through Northern Territorian waters. The NT Heritage Branch administers both the NT *Heritage Act 2011* and the Commonwealth *Underwater Cultural Heritage Act 2018* (under delegation from the Commonwealth Department of Agriculture, Water and the Environment). Both the *Heritage Act 2011* and the *UCH Act 2018* apply to NT waters including harbours, rivers, and estuaries.

3.1 Commonwealth *Underwater Cultural Heritage Act 2018*

The Commonwealth *Underwater Cultural Heritage* (UCH) *Act 2018* (replacing the *Historic Shipwrecks Act 1976*) provides for the protection, conservation, and management of Australia's historic shipwrecks, sunken aircraft, and other types of underwater cultural heritage. The Act is also designed to enable the cooperative implementation of national and international maritime heritage responsibilities, and to promote public awareness, understanding, appreciation, and appropriate use of Australia's underwater cultural heritage.

Under Part 1, Division 2 of the *UCH Act 2018*, underwater cultural heritage is defined as "any trace of human existence that has a cultural, historical or archaeological character; and is located under water." Traces of human existence are considered to be located under water whether they are located partially or totally under water, and whether they are under water periodically or continuously. A "trace of human existence" is further defined to include:

(a) sites, structures, buildings, artefacts and human and animal remains, together with their archaeological and natural context; and

(b) vessels, aircraft and other vehicles or any part thereof, together with their archaeological and natural context; and

(c) articles associated with vessels, aircraft or other vehicles, together with their archaeological and natural context.

Seabed pipelines and cables, and other installations that are placed on the seabed and are still in use, are not considered to be underwater cultural heritage under the Act.

Different articles of underwater cultural heritage are, or can be, protected under the *UCH Act 2018*, depending on the kinds of articles, their heritage significance, and their location. Part 2, Division 1 of the Act provides that certain articles of underwater cultural heritage are automatically protected, including:

(a) all remains of vessels that have been in Australian waters for at least 75 years;

(b) every article that is associated with a vessel, or the remains of a vessel, and that has been in Australian waters for at least 75 years;

(c) all remains of aircraft that have been in Commonwealth waters for at least 75 years;

(d) every article that is associated with an aircraft, or the remains of an aircraft, and that has been in Commonwealth waters for at least 75 years.

These articles of underwater cultural heritage are automatically protected whether or not the existence or location of the article is known, and even if the article is or has been removed from Australian or Commonwealth waters – after the passage of 75 years.

The term "associated with" is defined under Part 1, Division 2 of the Act whereby an article is considered to be associated with a vessel, aircraft, or other vehicle if the article:

(a) appears to have formed part of the vessel, aircraft or other vehicle; or

(b) appears to have been installed or carried on the vessel, aircraft or other vehicle; or

(c) is remains of humans or animals that appear to have been on board the vessel, aircraft or other vehicle; or

(d) appears to have been constructed or used by a person associated with a vessel.

"Australian waters" and "Commonwealth waters" have different meanings under the *UCH Act 2018* (Part 1, Division 2), whereby "Australian waters" extend from the seaward limits of a State to the outer limit of Australia's continental shelf, and "Commonwealth waters" extend from waters 3 nautical miles seaward of the Territorial Sea Baseline adjacent to the States and the NT – i.e., beyond State or Territory coastal waters – to the outer limit of Australia's continental shelf. Specifically, under Part 1, Division 2 of the Act:

"Australian waters" means:

(a) any waters on the landward side of the territorial sea of Australia that are not within the limits of a State; and

(b) the territorial sea of Australia; and

(c) the sea above the continental shelf of Australia; and

(d) the seabed and subsoil beneath any such sea or waters.

"Commonwealth waters" means:

(a) the territorial sea of Australia, other than coastal waters of a State or the Northern Territory; and

(b) the sea above the continental shelf of Australia; and

(c) the seabed and subsoil beneath any such sea or waters.

The Territorial Sea Baseline generally corresponds with the low water line along the coast, measured to the level of Lowest Astronomical Tide. However, in some cases, straight baselines have been established in areas where the coastline is deeply indented and cut into, or where there is a fringe of islands along the coast in its immediate vicinity.

The Territorial Sea Baseline in the region of the current study area incorporates straight baselines that connect the mainland to the Tiwi Islands. As such, the Beagle Gulf forms part of the coastal waters of the NT – see Figure 2.

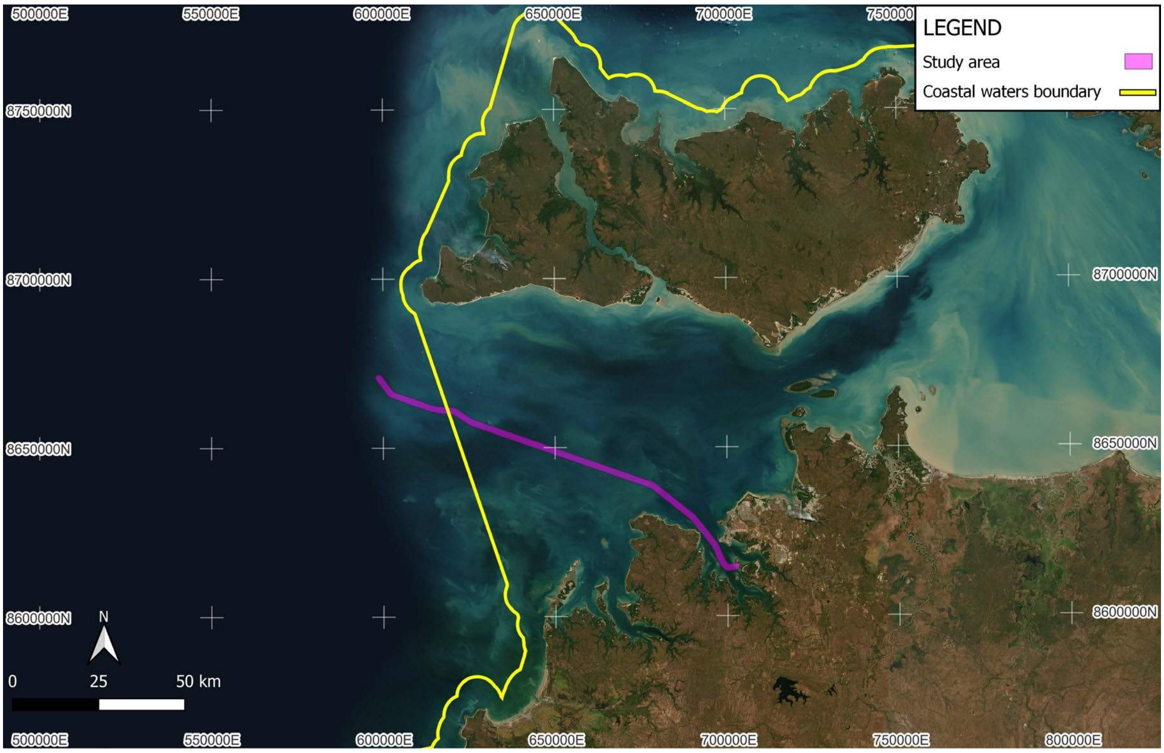

Figure 2: Boundary of NT coastal waters around Darwin and Tiwi Islands.[9]

[9] **Australian Government Geoscience Australia**. **2022.** *Coastal Waters (State / Territory Powers) Act 1980.* Australian Marine Spatial Information System (AMSIS).

These definitions of Australian and Commonwealth waters in the *UCH Act 2018* have been carried over from the *Historic Shipwrecks Act 1976.* In its original form, the *Historic Shipwrecks Act 1976* applied to waters adjacent to a State's coasts upon Commonwealth proclamation and applied automatically to waters adjacent to a Territory's coast. In 1980, the Act was amended to apply to waters adjacent to a State only with the consent of the State, however, the automatic application to waters adjacent to a Territory's coast remained.

As such, NT waters – including coastal waters, bays, rivers, and bodies of water within the jaws of the land and inland waters, below the low water mark – i.e., all waters on the landward side of the NT coastal water boundary shown above in Figure 2.

The study area is situated within "Australian waters" as defined in the *Underwater Cultural Heritage Act 2018*, and as such, shipwrecks and all associated articles that have been in the water for over 75 years are automatically protected, and other forms of underwater cultural heritage sites can be declared protected.

Part 3, Division 2 of the *Underwater Cultural Heritage Act 2018* provides for the regulation of activities relating to protected underwater cultural heritage. Specifically, any conduct that has or is likely to have an adverse impact on protected underwater cultural heritage is prohibited unless carried out in accordance with a permit granted under the Act. Conduct is considered to have an adverse impact on protected cultural heritage if it:

(a) directly or indirectly physically disturbs or otherwise damages the protected underwater cultural heritage; or

(b) causes the removal of the protected underwater cultural heritage from waters or from its archaeological context.

3.2 Sunken Military Craft Act 2004 (USA)

The United States (US) *Sunken Military Craft Act* enacted in 2004 (as Title XIV of the "Ronald W. Reagan National Defense Authorization Act for Fiscal Year 2005") provides for the protection of sunken US military vessels and aircraft and the remains of their crews from unauthorized disturbance, salvage, or recovery. The Act applies to sunken US military ships and aircraft wherever located around the world and preserves the sovereign status of sunken US military vessels and aircraft by codifying both their protected sovereign status and permanent US ownership, regardless of the passage of time.

Under Section 1408 of the *Sunken Military Craft Act*, the term "sunken military craft" is defined as:

(A) any sunken warship, naval auxiliary, or other vessel that was owned or operated by a government on military non-commercial service when it sank;

(B) any sunken military aircraft or military spacecraft that was owned or operated by a government when it sank; and

(C) the associated contents of a craft referred to in subparagraph (A) or (B), if title thereto has not been abandoned or transferred by the government concerned.

"Associated contents" are defined as:

(A) the equipment, cargo, and contents of a sunken military craft that are within its debris field; and

(B) the remains and personal effects of the crew and passengers of a sunken military craft that are within its debris field.

Under Section 1402 of the *Sunken Military Craft Act* it is prohibited for any person to engage in or attempt to engage in any activity directed at sunken military craft that disturbs, removes, or injures the craft, or possess any articles of sunken military craft, except in accordance with prior permission from the US Department of the Navy. As authorised by the Act, the Department of the Navy has established a permitting program to allow for controlled site disturbance of sunken military craft for archaeological, historical, or education purposes.

However, as sunken military craft and their associated contents represent a collection of non-renewable and significant historical resources that often serve as war graves, carry unexploded ordnance, or contain oil or other hazardous materials, it is the overall policy of the Department of the Navy that its sunken military craft remain in place and undisturbed, and non-intrusive *in situ* research is preferred. Sunken military craft that serve as the maritime grave sites of lost crew in particular are accorded the highest respect and protection by the Department of the Navy.

The Naval History and Heritage Command's (NHHC) Underwater Archaeology Branch (UAB) manages sunken military craft and research permit applications on behalf of the US Department of the Navy.

> This Act is of relevance to this study as a number of US military craft – planes and vessels – were lost in the Northern Territory during WWII. As a matter of precedence, the INPEX project obtained a permit from the NHHC to relocate the remains of sunken USN Catalinas that were to be impacted by dredging off Blaydin Point.

3.3 Northern Territory *Heritage Act 2011*

The NT *Heritage Act 2011* (replacing the *Heritage Conservation Act 1991)* provides for the conservation of the Territory's natural and cultural heritage, including places and objects within NT waters.

The aim is achieved under the Act by:

(a) declaring places and objects of heritage significance to be heritage places and objects; and

(b) declaring classes of places and objects of heritage significance to be protected classes of heritage places and objects; and

(c) establishing the Heritage Council; and

(d) providing for heritage agreements to encourage the conservation, use and management of heritage places and objects; and

(e) regulating work on heritage places and objects; and

(f) establishing enforcement and offence provisions.

Under Part 2.1 of the NT *Heritage Act 2011*, all Aboriginal and Macassan archaeological places and objects are provided automatic protection under the Act, regardless of whether their existence or location is known.

An Aboriginal or Macassan archaeological places is defined under the Act as a place that:

(a) relates to the past human occupation of the Territory by Aboriginal or Macassan people; and

(b) has been modified by the activity of those people.

An Aboriginal or Macassan archaeological object is defined as a relic that:

(a) relates to the past human occupation of the Territory by Aboriginal or Macassan people; and

(b) is:

(i) in an Aboriginal or Macassan archaeological place; or
(ii) stored in a place in accordance with Aboriginal tradition, including, for example, in an Aboriginal keeping place.

A relic is defined under the Act as:

(a) an artefact or thing given shape by a person; or
(b) human or animal skeletal remains; or
(c) something else prescribed by regulation.

Under Part 2.2. of the NT *Heritage Act 2011,* other places and objects – i.e., non-Aboriginal and non-Macassan places and objects – can be declared by the Minister as protected heritage places and objects.

A place is defined as an area of land, and includes:

(a) a building or, a part of a building, on the place; and
(b) an item historically or physically associated with the place if the primary importance of the item derives (completely or partly) from that association; and
(c) equipment, furniture, fittings and articles on, or historically or physically associated with, the place.

Examples of places, as provided in the Act, include

1. A reef or a cliff, cutting, gorge, spring or other landform
2. A plant or animal community
3. Fossil beds
4. A park or garden
5. A lighthouse, church, homestead, railway station or gaol
6. A stock well
7. A cemetery, burial site or grave
8. An airstrip, magazine, storage tunnel or other military installation
9. The site of a shipwreck or aircraft crash.

The process for declaring heritage places and objects involves a nomination or Heritage Council initiation for assessment of the heritage significance – including aesthetic, historical, scientific, and social significance of a place or object. The Heritage Council then considers whether the place or object is of heritage significance and make a decision whether or not to recommend that the Minister declare the place or object to be a protected heritage place or object.

Under Part 5.5 of the Act, it is an offence to knowingly engage in conduct that results in damage to a heritage place or object, removes a part of the place, or removes a heritage object from the NT, unless the conduct is carried out in accordance with a relevant heritage agreement, work approval, repair order, or exemption.

3.4 UNESCO 2001 *Convention on the Protection of Underwater Cultural Heritage*

The United Nations Educational, Scientific and Cultural Organization (UNESCO) 2001 *Convention on the Protection of the Underwater Cultural Heritage* is an international treaty that was developed to provide a common framework for States Parties on how to better identify, research, and protect underwater heritage whilst ensuring its preservation and sustainability. The UNESCO 2001 *Convention* consists of a main text that sets out basic principles for the protection of underwater cultural heritage and provides a detailed State cooperation system, and an Annex that outlines widely recognised practical rules for the treatment and research of underwater cultural heritage. The UNESCO 2001 *Convention* entered into force in 2009.

The Commonwealth of Australia supported the principles and drafting of the UNESCO 2001 *Convention* and is currently considering ratification of the Convention in accordance with requirements under Australia's *Treaty Making Guidelines.* The *Underwater Cultural Heritage Act 2018* was also developed specifically to align with the UNESCO 2001 Convention.

In 2010, the Commonwealth, States, and the NT signed the *Australian Underwater Cultural Heritage Intergovernmental Agreement* that would enable the Australian Government to ratify the UNESCO Convention 2001, should it so choose. The Agreement establishes the roles and responsibilities of Commonwealth, State and NT governments for the identification, protection, management, conservation, and interpretation of Australia's underwater cultural heritage. One of the key aims of the Agreement is for all parties to meet internationally recognised best practice management of Australia's underwater cultural heritage as outlined in the Rules in the Annex to the UNESCO 2001 *Convention*.

The main principles of the UNESCO 2001 Convention are as follows:

- Obligation to Preserve Underwater Cultural Heritage – States Parties should preserve underwater cultural heritage and take action accordingly. This does not mean that States would necessarily have to undertake archaeological excavations; they only have to take measures according to their capabilities. The Convention encourages scientific research and public access.
- *In Situ* Preservation as first option – The *in situ* preservation of underwater cultural heritage (i.e., in its original location on the seafloor) should be considered as the first option before allowing or engaging in any further activities. The recovery of objects may, however, be authorized for the purpose of making a significant contribution to the protection or knowledge of underwater cultural heritage.
- No Commercial Exploitation – The 2001 Convention stipulates that underwater cultural heritage should not be commercially exploited for trade or speculation, and that it should not be irretrievably dispersed. This regulation is in conformity with the moral principles that already apply to cultural heritage on land. It is not to be understood as preventing archaeological research or tourist access.
- Training and Information Sharing – States Parties shall cooperate and exchange information, promote training in underwater archaeology and promote public awareness regarding the value and importance of underwater cultural heritage.

The general principles concerning activities directed at underwater cultural heritage as contained in the Annex of the UNESCO 2001 *Convention* are

Rule 1. The protection of underwater cultural heritage through in situ preservation shall be considered as the first option. Accordingly, activities directed at underwater cultural heritage shall be authorized in a manner consistent with the protection of that heritage, and subject to that requirement may be authorized for the purpose of making a significant contribution to protection or knowledge or enhancement of underwater cultural heritage.

Rule 2. The commercial exploitation of underwater cultural heritage for trade or speculation or its irretrievable dispersal is fundamentally incompatible with the protection and proper management of underwater cultural heritage. Underwater cultural heritage shall not be traded, sold, bought or bartered as commercial goods.

Rule 3. Activities directed at underwater cultural heritage shall not adversely affect the underwater cultural heritage more than is necessary for the objectives of the project.

Rule 4. Activities directed at underwater cultural heritage must use non-destructive techniques and survey methods in preference to recovery of objects. If excavation or recovery is necessary for the purpose of scientific studies or for the ultimate protection of the underwater cultural heritage, the methods and techniques used must be as non-destructive as possible and contribute to the preservation of the remains.

Rule 5. Activities directed at underwater cultural heritage shall avoid the unnecessary disturbance of human remains or venerated sites.

Rule 6. Activities directed at underwater cultural heritage shall be strictly regulated to ensure proper recording of cultural, historical and archaeological information.

Rule 7. Public access to in situ underwater cultural heritage shall be promoted, except where such access is incompatible with protection and management.

Rule 8. International cooperation in the conduct of activities directed at underwater cultural heritage shall be encouraged in order to further the effective exchange or use of archaeologists and other relevant professionals.

4 KNOWN AND POTENTIAL MARITIME ARCHAEOLOGY

4.1 Environment and Morphology

The proposed GEP route is planned to cross through Beagle Gulf, between the Tiwi Islands and the Northern Territory mainland, before turning south into Darwin Harbour to terminate at the Darwin LNG plant. Based on this route, the environment can generally be separated into two sections, Beagle Gulf and Darwin Harbour.[10]

4.1.1 *Beagle Gulf*

Beagle Gulf is characteristic of an offshore marine environment. The seabed in the vicinity of the proposed GEP route is composed of clay/silts and is featureless, though sand waves in places can reach 4.9m in height.[11] Geophysical surveys conducted confirm this characterisation of the area as a flat, featureless seabed at depths ranging 53 – 20m.

Beagle Gulf is exposed to greater swells and localised wind-generated waves than in Darwin Harbour. Relatively protected to the east and to some extent from the north by the Tiwi Island, the greatest fetch is from the western quadrants. Highest ambient wave activity takes place in the summer months when westerly winds are constant.[12] Wave heights during this season vary between 1 to 2m. Cyclones can increase wave heights by 50% to 100% with accompanying increases in current velocities.

Water temperature in the area is a constant 23.5°C with salinity close to the global average of 35 ppt.[13]

4.1.2 *Darwin Harbour*

Darwin Harbour is subject to large diurnal tidal variations (macrotidal). The difference between low and high tide during springs can be up to 7.5m.[14] This can result in current velocities between 2 to 2.5m/s (4 to 5kts). The tidal flows are the strongest in the narrowest sections of the harbour; the area most relevant to this study being the stretch of water between Tale Head and Emery Point (Larrakeyah).

The waters of Darwin Harbour are relatively well protected. The greatest fetch is to the northwest, from Beagle Gulf, thereby making the coastline around the western side of Wickham Point the most exposed within the study area. Having noted this, the ambient wave height in the harbour in the summer months can reach around 1m.[15] Waves generated by localised cyclonic activity can be much higher. It has been modelled that some waves reached heights of 4.5m in the harbour during Cyclone Tracy but were substantially lower – 0.7m – within the inner parts of the harbour.[16] During such events, tidal heights can potentially increase up to 9.1m LAT, which is around 2m higher than the highest annual spring high tide.[17]

Water temperatures in the near shore development area of Darwin Harbour are typically high, ranging from 23.5°C to 32.7°C.[18] Salinity varies within the harbour during the year. The large influx of fresh water from adjacent streams during the wet season is responsible for this variation. During the months of February and March, salinity levels can be as low as 19 parts per thousand (ppt), while during the dry season levels rise to around 37 ppt.[19] The global

[19] *Op. Cit.* **INPEX, 2010:**62.

average for salinity is 35 ppt. During the wet season, water stratification can occur where freshwater intrusions from the adjoining streams can form a layer over the denser saline waters of the harbour.

The large tidal variations within the harbour result in the waters remaining well oxygenated, ranging from 74 to 96%.[20] There are some differences in dissolved oxygen levels from the mouth of the harbour where they are the highest, to waters closer to the streams at low tide where they are the lowest. Higher dissolved oxygen levels are also found closer to the water surface than at the base of the water column.

Darwin Harbour is well known for its poor visibility for diving due to suspended sediments in the water. Turbidity is at its highest during wet season spring tides due to the capacity of the spring water flows to mobilise sediments that have been flushed into the harbour from the land.[21] During these times, light levels at the bottom of the harbour can be 1% of that at surface levels.

The strong tidal flows coupled with the large volumes of water flowing out from the streams entering the harbour, have had a scouring effect on the seabed, creating and/or enlarging relatively deep channels, which are drowned Pleistocene river courses.

The main channel through Darwin Harbour mostly ranges between 15-25m deep, with a maximum depth of 36m. At Wickham Point the channel forks, with the western and shallower channel/tributary trending southwards into the Middle Arm. A smaller channel separates Channel Island from Wickham Point.[22] The eastern and deeper channel shapes a course to the southeast between East Arm to the north and Wickham and Blaydin Points to the south.

The sides of the main drainage channels are mostly rocky and the sediments within the study area are coarse sands with some gravels, silt and clay.[23] In the portion of the study area between Larrakeyah and Mica Beach, the seabed is more gravelly and provides a thin covering over sandstone and phyllite formations of which large weathered sand veneered expanses are also exposed in the form of relatively flat/level pavements. [24] At the entrance to Darwin Harbour there are numerous cemented ridges.[25] The thickness of the sediments over the sandstone and phyllite substrate varies. In the same area, where there are extensive areas of exposed sand veneered bedrock, there are pockets of sediments up to 6m thick.[26]

A sandbank is also located in the study area between Channel Island and the Darwin LNG plant on Wickham Point.[27] The bank is over 1.5km long, 12m high and has a minimum of 0.6 m of water over it.

Sand waves are also present throughout the northern part of the entrance to Darwin Harbour.[28] Silty to sandy seabed is present in the study area close to the landfall of the proposed pipeline with coarser sediments covering shallower waters towards the south.[29]

Silty seabed surfaces are found in the shallower waters adjacent to the mangrove flats around Wickham Point; their occurrence signifying sheltered waters not greatly affected by strong tidal currents.[30] More carbonate (shell) based sediments mixed with sand and gravels

are situated in the spits and shoals close to the entrance to the harbour.[31] Mudflats are also present, adjacent to the western shore of Wickham Point. [32]

4.2 Cultural Activities in Darwin Harbour and Beagle Gulf

4.2.1 *Larrakia*

The Darwin region was traditionally occupied by the Larrakia people, whose country stretches along the NT coast from Finniss River and Fog Bay in the west to Gunn Point and Adelaide River in the east and extends inland along the Charlotte River. The waters of Darwin Harbour, Bynoe Harbour, Shoal Bay, Adam Bay, and parts of Beagle Gulf also form part of Larrakia country. Larrakia people refer to themselves as “Saltwater People,” and traditional society and subsistence was largely centred around their coast and sea country.

Regional archaeological evidence suggests that Larrakia people have occupied the NT coastal region for at least 7-8,000 years, throughout the early to recent late Holocene, and likely further back through periods of lower sea level during the terminal Pleistocene when Darwin Harbour would have been a down-cut river valley.[33]

Various ethno-historical accounts dating back to the 19th century describe extensive Larrakia knowledge of the marine environment and a long tradition of the use of bark canoes and dugout canoes for estuarine and coastal subsistence fishing and hunting of dugong and turtles. Canoes were also used to travel throughout the waters of Larrakia sea country, and occasionally to travel and trade with neighbouring groups along the NT coast and across the Beagle Gulf to the Tiwi Islands.[34]

4.2.2 *Macassan traders*

In the early to mid-1700s, Indonesian traders began visiting parts of the northern coast of Australia to fish for trepang – sea cucumber or *bêche-de-me*r – prized for its culinary and medicinal values in Chinese markets. The term “Macassan” – originally denoting people from Macassar, the major fishing port in south-west Sulawesi, is generally used to apply to all the trepangers who came to Australia, even though some were from other islands in the Indonesian Archipelago, including Timor, Rote and Aru.

Throughout the latter 1700s to early 1900s, fleets of Macassan *perahus* or *praus*, timber multi-hulled sailing vessels, travelled to the north Australian coast with the north-westerly winds during the tropical wet season, and departed with the south-easterly winds of the dry season. A single fleet could be composed of thirty or more vessels, and in some periods up to 200 *perahus,* amounting to over 2,000 men, were estimated to be fishing the coastline from Cobourg Peninsula to south-eastern Arnhem land.

The sea route from the Indonesian archipelago took the Macassans through the Timor Sea and along the north coast of the Tiwi Islands and on to the Cobourg Peninsula. There is no clear evidence in historical accounts that Macassan trepangers travelled into Beagle Gulf or Darwin Harbour; however, artefacts believed to be of Macassan origin have been found on beaches in the wider Darwin region, including a cast iron swivel gun collected from an

unknown location on the shoreline of Darwin Harbour in 1908, and a bronze swivel gun found at Dundee Beach, south-west of Darwin in 2010.[35]

4.2.3 *European exploration*

The first documented European exploration of Darwin Harbour and Beagle Gulf occurred in 1839 by a British Admiralty survey expedition led by Royal Navy Commander John Clements Wickham and Lieutenant John Lort Stokes aboard the HMS *Beagle.*

The harbour and surrounding coastline were surveyed in detail (see Figure 3) and numerous features named – Wickham named the harbour Port Darwin after famed naturalist Charles Darwin, with whom he had sailed on earlier expeditions of HMS *Beagle,* Beagle Gulf was named after the vessel itself. Wickham and Stokes both wrote of the advantages of the protected nature of the "splendid stretch of water" of Port Darwin; however, the area saw little further visitation for several decades.[36]

4.2.4 *Initial colonial settlement at Port Darwin*

In the late 1850s, the beginnings of a network of telegraph lines linking capital cities across Australia was being established, and speculation soon arose regarding a possible international connection between Australia and the new telegraph line from Europe to the East Indies. Competition between the Australian colonies over the route was fierce, with both the Victorian and South Australian governments organising expeditions to cross the continent from south to north and identify potential overland telegraph routes. In 1863, following John McDouall Stuart's successful expedition from Adelaide to Chambers Bay (east of Darwin), the SA Government annexed the Northern Territory – an area that had previously been a nameless part of New South Wales, with the aim of securing the land as a potential telegraph bridge to Asia and thence Europe. In 1865, the Australian Parliament authorised the construction of a telegraph line between Adelaide and Port Augusta (322km north of Adelaide), strengthening SA's position in the race for the cross-country telegraph connection.

In the meantime, SA Government surveyors were sent to the north coast of the NT to select a potential landing site for the telegraph and establish a supporting settlement. The first site, selected in 1864 by Surveyor Boyle Travers Finniss at Escape Cliffs near the mouth of the Adelaide River, was abandoned in 1867. After examination of several other suggested areas, a settlement was finally laid out by Surveyor-General George Goyder at Fort Point headland in Port Darwin in 1869. The township was named "Palmerston" after the then British Prime Minister Lord Palmerston.

The final telegraph contract was secured in 1870 when the SA Government proposed to extend the line from Port Augusta to Palmerston and the British-Australian Telegraph Company agreed to lay the undersea cable from Java to Port Darwin.[38]

The undersea cable was constructed in 1871 by a team of marine engineers and electricians from the British Telegraph Construction and Maintenance Company (Telcon) and the British-Australian Telegraph Company (BAT). The cable was first landed at Palmerston, at Fort Point – considered the most suitable site for the telegraph buildings – before being laid out across the seabed to Banjowangie, Java. The landward-end of the cable was carried from cable-ship SS *Hibernia* to the shore in bights held up by boats, hauled up the beach to the cable-house and buried in a shallow trench (see Figure 5 and Figure 6). Hibernia then commenced paying the cable out along the seabed; travelling north-east to east around Point Emery, then northwards past Fannie Bay and gradually veering north-east towards the entrance to the harbour (see Figure 4). The cable consisted of seven small copper wires – including a central wire with six twisted around it – insulated by gutta-percha latex and tarred hemp, covered with a sheathing of galvanised iron wire and another outside covering of tarred hemp. The cable was ¾" (19 mm) in diameter in the deep-sea sections, 1" (25 mm) in diameter in the intermediate sections and 3" (76 mm) in diameter at the shore end.[39]

In 1879, a duplicate telegraph cable was laid between Darwin and Java, which allowed for increased telegraph capacity and the establishment of a day and night service between Australia and Britain. The second cable was again laid by Telcon, this time under contract to the Eastern Extension Australasia and China Telegraph (EEACT) Company, which had absorbed BAT in 1873. The duplicate cable was of the same composition as the original

1871 cable, and was laid out in the same manner; this time with the majority of the work being carried out by cable ship SS *Siene.*[40] The duplicate cable was laid to the west of the 1871 cable within Darwin Harbour, before crossing over the 1871 cable towards the harbour entrance and then running along the northern side of the 1871 cable through Beagle Gulf (see Figure 4).

In 1884, EEACT decided to renew the eastern end of the original 1871 Darwin to Java telegraph cable. EEACT had found that this section of cable, particularly where it passed through shallow waters, was being frequently damaged by marine borers – namely teredo worm (*Teredo navalis*). A new cable was thus designed with a patent brass ribboned core to prevent teredo attack and was laid out by cable ship SS *Siene* in early 1884. The replacement cable was laid between the 1871 cable and the 1879 duplicate cable through Darwin Harbour, crossing over near the harbour entrance and then running along the southern side of the 1871 cable (see Figure 4). Some broken sections of the original 1871 cable were recovered by *Siene* during the process, however, most of the original cable appears to have been left on the seabed.[41]

4.2.5 *Late 19th - early 20th century development*

Throughout the 1870s, Palmerston developed from a telegraph constructor's camp to a small township and the landing at Fort Point served as the focus of trade and transport to supply the new settlement. Early growth was spurred by the discovery of gold near Pine Creek (225 km south of Darwin) in 1871 during the construction of the overland telegraph, sparking a gold rush in surrounding areas that attracted thousands of prospectors and pioneers to the NT. Development was further facilitated throughout the 1880s by the establishment of a railway line between Palmerston and the Pine Creek goldfields, and the construction of a railway jetty at Stokes Hill. The population continued to expand and regional industries, including tin mining, cattle rearing, coastal fishing, and pearling, began to emerge – the latter attracting fleets from Japan, Timor, Malaysia, and the Philippines.[45]

Port Darwin was described during this period as one of the safest and best in the world; with a wide entrance and large port doubly sheltered by the outer headlands of East Point and West Point and the inner headlands of Point Emery and Talc Head. Shipping was centred around the port facilities at Fort Hill and Stokes Hill – see Figure 7. The maritime economy during this period was dominated by coastal sailing vessels and steam ships, with a wide range of smaller craft used in the fishing and pearling industry, regional trade and transport, and recreational vessels (see Figure 8 and Figure 9).

Figure 9: steam ships and sailing vessels moored alongside the Port Darwin railway jetty, 1892.[48]

A number of vessels were wrecked in Darwin Harbour in the late 19th century to early 20th century – most consisting of small to moderate timber sailing vessels and composite steam and sail vessels lost in sudden squalls and strong monsoons during the tropical wet season. A single event of devastating loss occurred in January 1897, when Port Darwin was hit with one of the worst cyclones ever recorded at the time. Palmerston township was torn apart with almost every building destroyed or severely damaged, and at least thirteen people killed. The cyclone also wreaked havoc in the harbour, coinciding with high tide and causing massive storm surges. Vessels of all types were wrecked or blown ashore and a further fifteen people were killed. Eighteen pearling luggers, three steam launches, a cutter, and three sampans are amongst the vessels recorded as lost. Many of these vessels were swept off their moorings in Port Darwin and found driven into mangroves at the mouths of East Arm and Middle Arm; several were never recovered.[49]

In 1911, a decade after Australian Federation, the NT was separated from SA and transferred to Commonwealth control as a result of the *Northern Territory Surrender Act 1908* in South Australia and the Federal *Northern Territory Acceptance Act 1910.* The township of Palmerston was subsequently officially renamed "Darwin." Around this time, the importance of Port Darwin as a potentially valuable naval strategic position began to be realised; although there were no immediate plans to establish military facilities due to the still relatively small size and isolation of the Darwin settlement. A 1911 Royal Navy recommendations report stated that once the north to south transcontinental railway line was completed, Port Darwin should be developed into a Naval Fleet secondary base, complete with reserves of coal, oil and naval stores and provisions, and docks capable of receiving the largest ships and machine shops adequate for carrying out repairs to warships. Such plans were put into abeyance following the advent of World War I, during which Darwin was only periodically used as an anchorage and coaling station.[50]

Middle Arm and Middle Point, far removed from the centre of the Palmerston settlement and Port Darwin facilities, saw little use during the late 19th and early 20th centuries. In 1884, Channel Island in Middle Arm was declared by the Government as a site for a quarantine

station – see Figure 10. No permanent structures were established on the island until the early 1900s, however, and throughout the late 19th century most quarantine patients were held onboard quarantine hulks moored in an anchorage set up around Channel Island. One of these hulks, schooner rigged steamship *Ellengowan,* sank at its moorings in 1888, and the wreck – situated to the south of the current study area – is the oldest known shipwreck in Darwin Harbour.[51]

In 1889, a small spit of land extending from the tip of Middle Point was proclaimed as a leper station – see Figure 10. The station, known as Mud Island Lazaret – or colloquially as Living Hell Lazaret due to the exceedingly poor living conditions – was in operation from the 1880s through to the early 1930s. The lazaret consisted of a single galvanised iron building and treatment consisted of weekly visit from a health officer who travelled by vessel to Mud Island.[52] In 1931, the quarantine station at Channel Island was converted into a leprosarium and Mud Island Lazaret was permanently closed. Several new accommodation buildings, and medical clinic, and associated facilities were constructed at Channel Island, and a twice-weekly supply service via launch from Darwin was established. The Channel Island Leprosarium remained in operation until 1955, when a new leprosarium was established at East Arm.[53]

4.2.6 *World War II*

In the aftermath of World War I, and particularly following the demise of the Anglo-Japanese Alliance in 1921, the British Empire began to evolve a series of war plans crafted for various predicted contingencies. A British Imperial Conference in 1923 led to the development of the Royal Navy "Singapore Strategy," which made Singapore the pivot of British defence against potential aggression from the Empire of Japan. Under this strategy, Darwin was seen as the southern end of the Singapore-Australia defence line. Following subsequent recommendations made by the Royal Australian Navy, plans were put in place to develop Port Darwin as a naval refuelling depot and support base. Throughout the 1920s to early 1930s, naval fuel tanks were constructed at Stokes Hill and development of a coastal defence battery commenced at East Point. By the mid-1930s, a worsening international situation, particularly in Europe and Japan, led to further increases in Port Darwin's defences and the establishment of a Royal Australian Air Force (RAAF) base, an Australian Army barracks, and Royal Australian Navy (RAN) depot. Naval infrastructure within was further expanded, including the construction of additional naval fuel tanks at Stokes Hill, a battery at Emery Point, and establishment of additional shipping, mooring and maintenance facilities.[55]

In 1938, following harbour defence advice from the British Admiralty, plans were drawn up by the RAN to construct an anti-submarine boom net across the entrance to Port Darwin between East Point and Dudley Point (see Figure 11), along with anti-submarine indicator loop installations that would operate in conjunction with the coastal defence batteries. The Australian Naval Board initiated the construction of two boom working vessels required to lay the boom net, and the establishment of a boom depot yard at Fort Hill to manufacture and assemble components for the boom net and indicator loop systems. The boom net was designed by the British Admiralty and consisted of high tensile wire rope mesh floating nets supported by a series of trots consisting of cylindrical buoys that were anchored to the seabed via concrete mooring clumps. A gate was set into the middle of the net that could be opened to allow passage of friendly vessels. The indicator loops – designed to provide magnetic sensing of enemy vessels whereby an induced current was passed through each loop that triggered a signal when a ship or submarine passed overhead – were formed of steel and copper cable linked to an onshore indicator loop hut erected at Dudley Point.

In late 1940, transit markers for the anti-submarine boom net were erected at Dudley Point and West Point, and marker buoys, moorings for boom gate vessels and net trot moorings began to be laid out, and two indicator loops were laid to the seaward side of the net. The construction of the net was initially scheduled to be completed by the end of 1940. However, due to delays in the assembly of the net and difficulties in laying the moorings due to strong tides, the net was not fully installed until late 1942.[56]

In September 1940, Japan entered the World War II "Axis" military alliance with Germany and Italy, and in late 1941, launched direct attacks on British holdings in Malaya, Singapore and Hong Kong and the United States military base at Pearl Harbour, Hawaii. These actions led Britain, America, and Australia to formally declare war on Japan, initiating the Asia-Pacific War. Over the following few months, Darwin underwent a significant metamorphosis.

Organised evacuation programs of women and children from Darwin and surrounding areas quickly commenced under the orders of the Commonwealth War Cabinet and the township rapidly emptied of civilians. Australian and Allied forces were sent to defend Australia's northern coastline and by early 1942, almost 15,000 troops were stationed in Darwin. Port

aerial strike force of 188 bomber and fighter aircraft launched from a Japanese Imperial Navy fleet stationed approximately 350 km north-west of Darwin in the Timor Sea. The second raid comprised fifty-four land-based aircraft launched from the newly acquired Imperial Japanese Navy bases and Kendari and Laha, Ambon, Netherlands East-Indies. The raids attacked port facilities and shipping in Darwin Harbour, Darwin township, military installations, and aerodromes. The two raids killed at least 243 people and 300-400 were wounded. Eight Allied military vessels were sunk in the harbour – including United States Army Transport (USAT) *Mauna Loa*, USAT *Meigs*, and United States Navy destroyer USS *Peary*, situated within the current study area. Twenty-seven Allied military aircraft were also destroyed, and most civil and military facilities in Darwin suffered extensive damage. This raid was the first of many; during the course of World War II, Darwin and surrounds endured a total of sixty-four airborne Japanese attacks and several attempted submarine attacks. [60]

Following a Commission of Inquiry into the events of 19 February 1942 held by Commissioner Sir Charles John Lowe that concluded Darwin could not be defended without substantial reinforcements, the Commonwealth Government decided to place Darwin and the portion of the NT north of Alice Springs, under direct military administration. Extensive military re-organisation took place and substantial strengthening of military units and construction of new military bases occurred around Darwin Harbour.[61]

Extensions and improvements to the anti-submarine boom net and indicator loop system were conducted throughout 1942. By this time, it had been ascertained that the high variation and strength of the tides in Darwin was causing unforeseen problems in the maintenance of the boom net, and the current alignment left a strip of unprotected water at both ends of the net during high tide that would be deep enough to allow enemy vessels to pass around the boom and gain entrance to the harbour. A series of pylons were subsequently erected across the shallow and reefs at Dudley Point and West Point, connecting the boom directly to land (see Figure 15 and Figure 16). It had also been determined that the two indicator loops installed seaward of the boom net were giving frequent cable faults due to the rough seabed on which they were laid and the force of the changing tides. Following seabed surveys conducted by the Royal Australian Navy, a decision was made to replace these loops with a set of five positioned approximately 3 nm further north, between Midway on the western side of the entrance and Nightcliff on the East, and to move the Indicator Loop Control Station from East Point to Nightcliff. Works on these modifications to both the boom net and the indicator loops commenced in mid to late 1942, however, would not be completed for almost two years.[62]

An expansion of coastal defences around Darwin Harbour in 1943 saw the construction of several military facilities at Middle Point. In early 1943, an anti-aircraft search light station was established at the northern tip of Middle Point. In mid-1943, construction of a heavy anti-aircraft gun station and a satellite training camp for the Lugger Maintenance Section of the Allied Intelligence Bureau Services Reconnaissance Department commenced at Peak Hill on Middle Point. The Lugger Maintenance Section, established at East Arm in 1942, was an advance base for covert espionage, intelligence gathering, and raiding operations against Japanese forces throughout Indonesia, Timor, and the Philippines. By mid-1944, both the anti-aircraft gun station and Services Reconnaissance Department training camp were established and operational.[63]

Figure 17: Middle Point anti-aircraft gun emplacement.[67]

From mid-1944, the Australian military was largely relegated to subsidiary fronts and the NT force was reduced in strength. However, work on some of Darwin's defence installations, including the extensions to the anti-submarine boom net and laying of the second set of indicator loops, continued throughout late 1944. These installations were finally fully operational in December 1944 – just over eight months before Allied victory and the end of World War II in 1945.[68]

4.2.7 *Post war*

After the end of World War II, control of the NT was handed back to the Commonwealth and the military units stationed in Darwin began to be demobilised and disbanded. By the late 1940s to early 1950s, most military structures and facilities were either removed or converted to civilian use. The NT economy shifted back towards pastoral, fishing, and mining industries. By the early 1960s, the Darwin population had increased over five-fold and commercial expansion and development had led to a significant increase in exports and shipping in the harbour.

The most significant event in the history of post-war Darwin was the destruction of the town by Cyclone Tracy on Christmas morning, 1974. Cyclone Tracy was the most compact cyclone on record in the Australian basin, with winds officially recorded at 217km per hour prior to the Bureau of Meteorology anemometer being destroyed. Waves in Darwin Harbour reached up to 4.5m in height. Seventy-one people were killed during the cyclone, including sixteen lost at sea. More than 70% of Darwin buildings were destroyed, all public services, including communications, power and water, were severed and the overall damage caused has been estimated at $837 million (1974 value). At least twenty-six vessels in Darwin Harbour, including a RAN patrol boat, a pilot boat, a fuel tanker, several prawn trawlers, traders, work boats, and passenger vessels, were wrecked or lost without a trace. A further twenty-one vessels were damaged.[69] Three of the known Cyclone Tracy wrecks – the Northern Research prawner *NR Diemen*, and passenger ferries *Darwin Princess* and *Mandorah Queen* – are situated within the current study area.

4.2.8 *Summary of cultural activities within the study area*

From the review of the known history of the study area the following activities can be identified:

- Larrakia and Tiwi people maritime travel and subsistence activities – although these activities would likely be concentrated closer to coastal environments;
- Macassan trepang fishing and trade throughout the 18th to early 20th centuries;
- British exploration and surveying in early 19th century;
- A wide range of colonial shipping including Government and commercial cargo and passenger transport, fishing and pearling industry trade and transport, and recreational shipping, from the establishment of colonial settlement in Darwin in 1860s to present;
- Laying of subsea telegraph cables (x 3) in 1870s and 1880s;
- Quarantine and leper station transport and service supply in Middle Arm throughout late 19th to early 20th century;
- Military shipping – transport and mooring – throughout World War II;
- Air and sea combat between Allied and Japanese forces during World War II;
- Installation of anti-submarine boom net and indicator loops during World War II;
- A wide range of post war commercial, industrial, and recreational shipping activities.

4.3 Known Maritime Archaeological Sites in the Study Area

4.3.1 *Shipwrecks*

There are seventeen known shipwrecks located within the study area – refer to Table 2 and Figure 18 to Figure 20.

Four of these shipwrecks are military vessels sunk during battle in World War II, including three Allied vessels lost during the first Japanese air raid on Darwin on 19 February 1942 – United States Army transport vessels USAT *Mauna Loa* and USAT *Meigs*, and United States Navy destroyer USS *Peary*, and an Imperial Japanese Navy submarine *I-124* sunk by Allied forces on 20 January 1942. All of these shipwrecks are protected under the *Underwater Cultural Heritage* (UCH) *Act 2018*, and USAT *Mauna Loa*, USAT *Meigs*, and USS *Peary* are also protected under the NT *Heritage Act 2011.*

Three shipwrecks within the study area were lost in Cyclone Tracy, 25 December 1975, including passenger ferries *Darwin Princess* and *Mandorah Queen*, and a Northern Research prawn trawler *NR Diemen.*

Five vessels were intentionally scuttled in the 1970s and 1980s, including Taiwanese fishing vessel *Yu Han 22*, Thai fishing vessel *Medkhanun 3*, Vietnamese refugee vessels *Ham Luong* and *Song Saigon*, and workboat *John Holland Barge.*

The remaining five shipwrecks include a World War II LVT Buffalo amphibious tracked landing craft sunk in the 1960s, and three unidentified wrecks including three timber hulled vessels, and a steel barge.

Table 2: Known shipwrecks within the study area. Shipwrecks with names highlighted in gold located within proposed anchoring corridor.[70]

Name	Type	Year lost	Wreck event	Location (WGS84)	Approx. distance from proposed GEP	Statutory heritage protection
Barge - Unknown No. 1	Steel barge; likely WWII era	Not known	Not known	-12.44830° 130.81038°	1700 m	N/A
Buffalo Amphibian	Steel LVT Buffalo amphibious tracked landing craft – 16.5 tons, 7.95 m in length	1960s	Foundered whilst being used as support vessel for Mandorah Ferry	-12.41033° 130.80294°	1380 m	N/A
Darwin Harbour Unidentified Wreck 2	Timber hulled vessel – 30 m in length, carrying 10 tons of steel cargo	Not known	Not known	-12.48333° 130.83333°	2000 m	N/A
Darwin Princess	Steel motor vessel passenger ferry – 22.8 m in length	1974	Wrecked in Cyclone Tracy	-12.39815° 130.76535°	1300 m	N/A
NR Diemen	Motor vessel prawn trawler – 124 tons, 20.4 m in length	1974	Wrecked in Cyclone Tracy	-12.42660° 130.76528°	700 m	N/A
Ham Luong	Steel Vietnamese refugee motor vessel – 15 m in length	1983	Scuttled to form an artificial reef	-12.47509° 130.80067°	1140 m	N/A
John Holland Barge	Steel work barge – 18 m long by 12 m wide	1982	Scuttled to form an artificial reef	-12.47386° 130.80139°	930 m	N/A
Medkhanun 3	Steel Thai fishing motor vessel – 25 m in length	2007	Scuttled to form an artificial reef	-12.47870° 130.80236°	850 m	N/A
Mandorah Queen	Steel and aluminium motor vessel passenger ferry – 22 m in length	1974	Wrecked in Cyclone Tracy	-12.442722° 130.778306°	690 m	N/A
Mandorah Unidentified Wreck 1	Timber hull motor vessel	Not known	Not known	-12.446660° 130.766950°	2000 m	N/A
Mandorah Unidentified Wreck 2	Timber hull motor vessel	Not known	Not known	-12.448100° 130.766100°	2000 m	N/A
Song Saigon	Steel Vietnamese refugee motor vessel – 200 tons, 38 m in length	1982	Scuttled to form an artificial reef	-12.474722° 130.801278°	755 m	N/A
USAT *Mauna Loa*	Steel single screw steamship, former passenger cargo vessel commissioned as a United States Army transport during World War II. 5436 tons, 125 m in length	1942	Sunk by enemy action during first Japanese air raid on Darwin Harbour on 19 February 1942	-12.49704° 130.81936°	15 m*	*UCH Act 2018* and *NT Heritage Act 2011* – 100 m radius (under *NT Heritage Act 2011*)
USAT *Meigs*	Steel single screw steamship, former cargo vessel commissioned as a United States Army transport during World War II. 12568 tons, 131.3 m in length	1942	Sunk by enemy action during first Japanese air raid on Darwin Harbour on 19 February 1942	-12.48765° 130.81838°	270 m*	*UCH Act 2018* and *NT Heritage Act 2011* – 100 m radius (under *NT Heritage Act 2011*)

[70] All data obtained from the Australian Underwater Cultural Heritage Database (AUCHD)

Name	Type	Year lost	Wreck event	Location (WGS84)	Approx. distance from proposed GEP	Statutory heritage protection
USS *Peary*	Steel twin screw steamship, United States Navy Clemson Class destroyer – 1190 tons, 95.8 m in length	1942	Sunk by enemy action during first Japanese air raid on Darwin Harbour on 19 February 1942	-12.47533° 130.82982°	2000 m*	*UCH Act 2018* and *NT Heritage Act 2011* – 100 m radius (under *NT Heritage Act 2011*)
Yu Han 22	Timber Taiwanese fishing motor vessel – 25 m in length	1975	Partially burned and scuttled	-12.5175° 130.82166°	730 m	N/A
I-124	Steel Imperial Japanese Navy I-121 Class minelaying submarine – 1470 tons, 85.2 m in length	1942	Sunk during counterattack by Allied forces on 20 January 1942.	-12.120091° 130.106561°	100 m*	*UCH Act 2018* – 800 m radius (under *UCH Act 2018*)

Note – distances with asterisk are measured from closest boundary of heritage protection zone to GEP route. Locations highlighted in yellow have been determined by examination of MBES data and differ from locations provided on AUCHD.

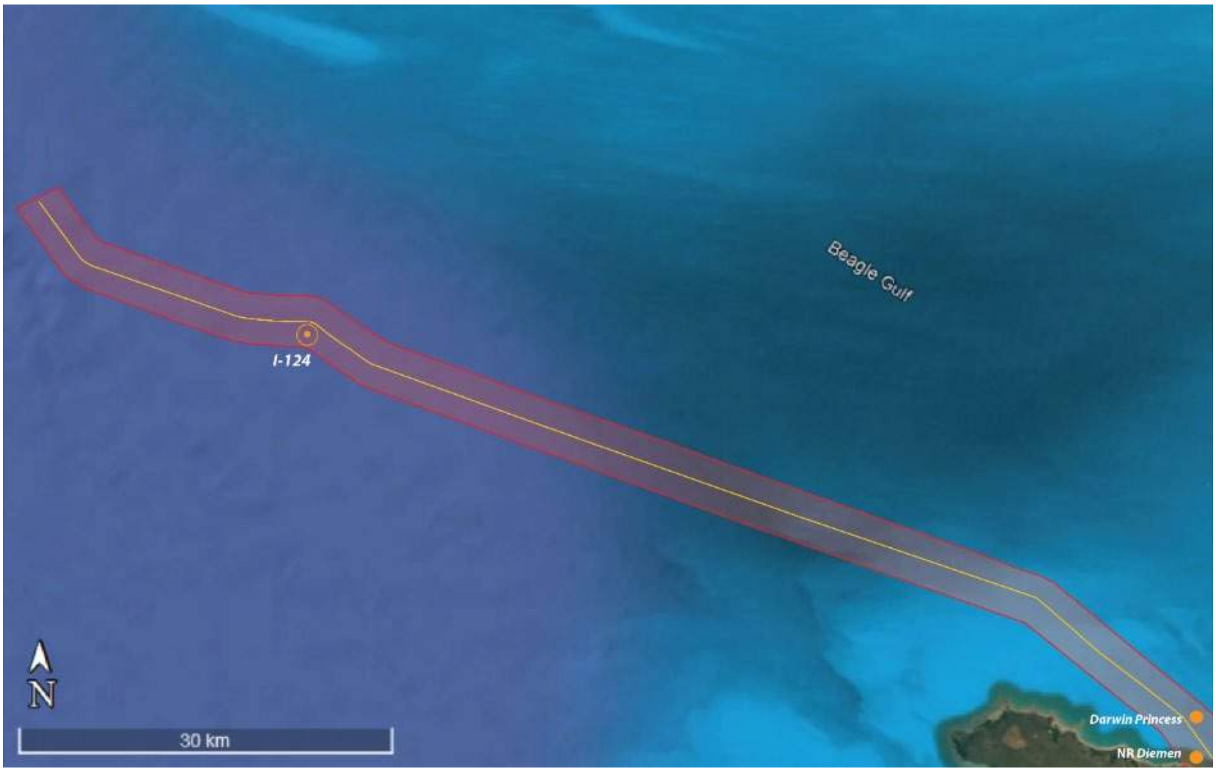

Figure 20: Location of known shipwrecks in study area – Beagle Gulf.

Figure 21: USAT Mauna Loa.[71]

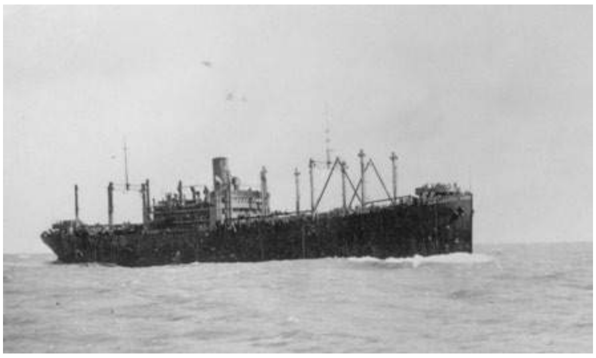

Figure 22: USAT Meigs.[72]

Figure 23: Darwin Princess.[73]

Figure 24: Song Saigon being scuttled.[74]

4.3.2 *Aircraft wrecks*

There are no known aircraft wrecks located within the study area. The closest known aircraft wreck is the wreck of a Douglas C-47 Dakota, RAAF A65-115, that was forced to ditch into the harbour due to engine failure during a test flight in 1946. The wreck of the C-47 is situated in Fannie Bay, approximately 2km north-east of the study area.

4.3.3 *Maritime infrastructure*

Six historical maritime infrastructure installations are known to occur within parts of the study area, including three 19th century subsea telegraph cables, a World War II anti-submarine boom net installation, and two groups of World War II indicator loops – see Table 3, Figure 25 and Figure 26.

Table 3: Known historical maritime infrastructure within the study area.[75]

Name	Type	Year built	Statutory heritage protection
Subsea telegraph cable - original	First installation of an approximately 1,561 km long subsea telegraph cable linking Darwin cable station to Banjoewangi cable station, Java, Indonesia. The cable consists of seven stranded copper wires, insulated with gutta-percha latex, sheathed in galvanised iron wire armour, and an outside covering of tarred hemp. The cable ranges in diameter from 3” at shore ends, 1” in intermediate portions, and ¾” in deep sea portions.	1871	The subsea cable landing at Darwin is protected under the NT *Heritage Act 2011*.

Name	Type	Year built	Statutory heritage protection
Subsea telegraph cable - duplicate	Duplicate subsea telegraph cable linking Darwin cable station to Banjoewangi cable station, Java, Indonesia. The duplicate cable was of the same composition as the original 1871 cable.	1879	The subsea cable landing at Darwin is protected under the NT *Heritage Act 2011*.
Subsea telegraph cable - replacement	Replacement subsea telegraph cable linking Darwin cable station to Banjoewangi cable station, Java, Indonesia. Cable is of similar composition to the earlier two but contained an additional layer of brass tape around the core to protect the cable from marine borer (namely *teredo navalis)* attack.	1884	The subsea cable landing at Darwin is protected under the NT *Heritage Act 2011*.
Anti-submarine boom net	A 6km-long anti-submarine boom net constructed between Dudley Point and East Point, across the entrance to Port Darwin. The boom consisted of high tensile wire rope (1-2" diameter), 8' mesh floating nets. The nets were supported by a series of trots laid out 195' (60 m) apart, each consisting of three cylindrical buoys anchored via 1 ½ - 2"chain cable to eight 5-8 ton reinforced steel concrete mooring clumps laid on the seabed – four on the seaward side of the net, four on harbour side. A total of 265 clump moorings were laid. A permanently guarded gate was set into the net within the Port Darwin shipping channel. The boom net and buoys were largely cleared at the end of World War II; however the concrete clump moorings and chains were left *in situ*. ***Anti-submarine boom net mooring trots were located and identified during ROV survey. Refer to Section 7 and Annex A for details.**	1940-1942	N/A
Indicator loops – original (x2)	Initial installation of two indicator loops between Dudley Point and West Point, across the entrance to Port Darwin on the seaward side of the anti-submarine boom net. The loops provided magnetic sensing of enemy vessels, whereby an induced current was passed through each loop that triggered a signal when a ship or submarine passed overhead. The loops were formed of 33 mm diameter cable consisting of a single core of tinned copper wire, insulated with India rubber, hessian tape, tarred jute yarn, steel armour wires, hot pitch and resin coating. Each loop was typically 5000 yards long by 400 yards wide, with a central cable running the length of the loop, connected to a 25 mm diameter tail cable linked to the onshore indicator loop hut. The loops were dismantled and lifted following the end of World War II, however, it is not known if all components were recovered.	1940	N/A
Indicator loops - replacement (x 5)	Following several breakages of the initial two indicator loops due to strong tides and rough seabed, a replacement set of five indicator loops was installed ca. three miles further seaward, stretching between Midway and Nightcliff. The loops were of the same design and construction as the original set. The loops were dismantled and lifted following the end of World War II, however, it is not known if all components were recovered.	1943	N/A

4.3.4 *Sea dumping*

Other than the intentional scuttling of vessels and UXO located during INPEX surveys – discussed in Section 4.3.1 and 4.3.5 respectively – no known episodes of sea dumping are located within the study area.

4.3.5 *Unexploded Ordnance*

*** This section looks at UXO only from a heritage perspective. It is not intended to provide UXO specialist advice or to constitute a detailed UXO risk assessment.*

Documented unexploded ordnance (UXO) is known to occur at four shipwrecks located within the study area – see Table 4.

In each instance, this UXO consists of munitions cargo and unfired / unexploded naval ordnance payload associated with World War II military vessels wrecked in 1942. All items of UXO associated with these four shipwrecks are protected under the *UCH Act 2018.*

Table 4: Known UXO within the study area.[81]

Shipwreck	UXO type	Wreck location (WGS84)	Approx. distance to proposed GEP*	Statutory heritage protection
USAT *Mauna Loa*	.303 calibre and .45 calibre ammunition, and 3" mortars	-12.49704° 130.81936°	15 m	*UCH Act 2018* and *NT Heritage Act 2011* – 100 m radius (under *NT Heritage Act 2011*)
USAT *Meigs*	.303 calibre ammunition and possible depth charges or land mines	-12.48765° 130.81838°	270 m	*UCH Act 2018* and *NT Heritage Act 2011* – 100 m radius (under *NT Heritage Act 2011*)
USS *Peary*	3" and 4" artillery shells	-12.47533° 130.82982°	2000 m	*UCH Act 2018* and *NT Heritage Act 2011* – 100 m radius (under *NT Heritage Act 2011*)
I-124	5.5" artillery shells and 21" torpedoes	-12.120091° 130.106561°	100 m	*UCH Act 2018* – 800 m radius (under *UCH Act 2018*)
Contact 2	Mechanical time fuses and fuse cones	-12.416111° 130.762500°	175 m	No statutory protection, no heritage protection radius.
***Note – distances highlighted in yellow are measured from closest boundary of heritage protection zone to GEP route.**

Additionally, one location of dumped UXO was recorded during the INPEX GEP survey conducted by CA in 2012.[84] This consisted of a collection of dumped mechanical time fuses and fuse cones located near KP 105 at 691614 m E and 8626792 m N, approximately 175 m from the proposed GEP route (see Section 6.4.1.2, Figure 34).

Figure 34: Collection of mechanical time fuses and fuse cones located at Contact 2, on the alignment of the INPEX GEP. Contact 2 is located approximately at location of KP 105 along proposed Barossa GEP route. (Source: CA 2012).

4.4 Potential Maritime Archaeological Sites in the Study Area

4.4.1 *Shipwrecks*

There are twenty-nine known but unlocated shipwrecks in Darwin Harbour and Beagle Gulf that could potentially occur within the study area based on historical accounts of the wreck event and wreck location – see Table 5.

The majority of these shipwrecks comprise small timber-hulled sailing vessels lost during the late 19th to early 20th centuries – in many cases due to extreme weather events, such as nine pearling luggers and a Chinese junk wrecked during a major cyclone that struck Darwin in January 1897, two sailing vessels lost in strong gales during the 1880s, and a launch lost in a cyclone that hit Darwin in March 1915. The remainder includes a composite clipper ship / Royal Australian Navy (RAN) coal hulk scuttled in 1932, three workboats lost during World War II, mid-20th century wrecks of a motor launch and a barge, and a timber-hulled motor vessel sloop lost in Cyclone Tracy in December 1974.

There is also potential for shipwrecks not documented in the historical record to be located within the study area, including Aboriginal, Macassan, and early colonial watercraft.

Any shipwreck within the study area that dates prior to 1947 – whether located or not – is automatically protected under the *UCH Act 2018*.

Table 5: Potential shipwrecks within the study area. [85]

Name	Type	Year lost	Wreck event	General location
Ark	Timber pearling lugger	1897	Wrecked in 1897 cyclone	Darwin Harbour
Astraea	Timber barque	1886	Disappeared on voyage	Between Darwin and Queensland.
Bear Sing	Timber sailing vessel	1886	Wrecked in a strong gale	Darwin Harbour
Black Jack	Timber pearling lugger	1897	Wrecked in 1897 cyclone	Darwin Harbour
Charity	Timber lugger	1897	Disappeared on voyage	Between Darwin and WA

[84] *Op. Cit.* **Cosmos Archaeology, 2012**:11.
[85] All data obtained from the Australian Underwater Cultural Heritage Database (AUCHD)

Name	Type	Year lost	Wreck event	General location
Darwin Harbour Unidentified Chinese Junk 1	Timber junk	1897	Wrecked in 1897 cyclone	Darwin Harbour
Darwin Harbour Unidentified Lugger 1	Timber lugger	1939	Destroyed by fire after stove explosion	Darwin Harbour
Darwin Harbour Unidentified Lugger 2	Timber lugger	1910	Scuttled	Darwin Harbour
Dawn	Timber ketch; 51 tons	1893	Broken up	Darwin Harbour
Eileen	Timber ketch; 13 tons	1939	Foundered	Near Charles Point, Beagle Gulf
Good Intent	Timber ketch	1892	Foundered	Between Darwin and Charles Point, Darwin Harbour – Beagle Gulf
Gertrude	Timber pearling lugger	1897	Wrecked in 1897 cyclone	In shoal water on Middle Point, Darwin Harbour
Gunyana	Timber motor vessel sloop	1974	Disappeared in Cyclone Tracy	Darwin Harbour – Beagle Gulf
HMAS *Hankow*	Composite clipper ship, coal hulk, 1249 tons, 223 m in length	1932	Scuttled with demolition charges	Outside entrance to Darwin Harbour / west of East Point
Harbour Tug	Tug	1942	Foundered	Beagle Gulf – Timor Sea
Hibernia	Timber ketch, 13 tons	1882	Foundered	Darwin Harbour, within the fairway to the anchorage
Jack	Timber pearling lugger	1897	Wrecked in 1897 cyclone	Darwin Harbour
Karalee	Timber lighter, 117 tons	1943	Foundered	Darwin Harbour
Lighter No. 2	Steel lighter, 86 tons	1943	Lost by enemy action	Near Darwin
Olga	Timber motor vessel launch	1926	Sunk after onboard chemical explosion	Ca. 48 km from Darwin, towards Bathurst Island, Beagle Gulf
Olive	Timber pearling lugger	1897	Wrecked in 1897 cyclone	South-west of Fort Hill, Darwin Harbour
Peron	Motor launch	1948	Disappeared	Near Darwin; Darwin Harbour – Beagle Gulf
Pinafore	Timber sailing vessel	1881	Wrecked in a gale	Darwin Harbour, ca. 4 km out of Fannie Bay
Revenge	Timber pearling lugger	1897	Wrecked in 1897 cyclone	Darwin Harbour
Roebuck	Timber pearling lugger	1897	Wrecked in 1897 cyclone	In mangroves, one mile south of Middle Point, Darwin Harbour
Scout	Timber pearling lugger	1897	Wrecked in 1897 cyclone	On eastern side of Middle Point, Darwin Harbour
Spray	Timber launch	1915	Wrecked in 1915 cyclone	Darwin Harbour
Triumph	Steel barge	1954	Foundered	Off Darwin, Darwin Harbour - Beagle Gulf
Zulieka	Timber sailing vessel	1897	Wrecked in 1897 cyclone	On a reef off Channel Island, Middle Arm, Darwin Harbour

4.4.2 *Aircraft wrecks*

There are twenty-five known but unlocated aircraft wrecks in Darwin Harbour and Beagle Gulf that could potentially occur within the study area based on historical accounts of the wreck event and general wreck location – see Table 6.

All of these wrecks are military combat aircraft, including eleven Imperial Japanese Navy (IJN) and Navy Air Force (IJNAF) aircraft, seven United States Army Air Force (USAAF) aircraft, six Royal Australian Air Force (RAAF) aircraft, and one Royal Air Force (RAF) aircraft. All but one of these aircraft – an RAAF fighter wrecked in 1961 – were lost during World War II.

Any of these World War II aircraft wrecks that are situated within Commonwealth waters (from waters 3 nm seaward of the territorial sea baseline) are automatically protected under the *UCH Act 2018.* All USAAF aircraft wrecks are also automatically protected under the US *Sunken Military Craft Act 2004.*

Table 6: Potential aircraft wrecks within the study area.

Aircraft type / number	Operator	Wreck event	Year Lost	General location
CAC Sabre A94-360 (military fighter); pilot Irvine	Royal Australian Air Force (RAAF) – 81 Wing	Failure of port wing caused catastrophic mid-air explosion.	1961	Darwin Harbour, near Talc Head
Curtiss P-40E Kittyhawk (military fighter); pilot Andrew	United States Army Air Force (USAAF) - 7th Squadron, 49th Pursuit Group	Damaged during dogfight with incoming IJNAF attack, forcing pilot to bail out and aircraft to crash into sea.	1942	West of Charles Point, Beagle Gulf
Curtiss P-40E Kittyhawk (military fighter); pilot Drake	USAAF - 7th Squadron, 49th Fighter Group	Damaged during dogfight with incoming IJNAF attack, forcing pilot to bail out and aircraft to crash into sea.	1942	Off West Point, Darwin Harbour
Curtiss P-40E Kittyhawk (military fighter); pilot Fish	USAAF - 8th Squadron, 49th Pursuit Group	Shot down by IJNAF A6M2 “Zero” fighters.	1942	Approximately 3 km S-SE of Swires Bluff, Darwin Harbour
Curtiss P-40E Kittyhawk (military fighter); pilot McComsey	USAAF - 9th Squadron, 49th Pursuit Group	Damaged during dogfight with incoming IJNAF attack, forcing pilot to bail out and aircraft to crash into sea.	1942	Off West Arm, southern side of Darwin Harbour
Curtiss P-40E Kittyhawk (military fighter); pilot Pell	USAAF - 33rd Pursuit Squadron	Damaged during dogfight with incoming IJNAF attack, forcing pilot to bail out and aircraft to crash into sea.	1942	Camerons Beach, Shoal Bay, Darwin Harbour
Curtiss P-40E Kittyhawk (military fighter); pilot Strauss	USAAF - 8th Squadron, 49th Pursuit Group	Shot down by IJNAF A6M2 “Zero” fighters.	1942	Approximately 2.7 km north-west of Emery Point, Fannie Bay, Darwin Harbour
Curtiss P-40E Kittyhawk (military fighter); pilot Wiecks	USAAF - 33rd Pursuit Squadron	Shot down by IJNAF A6M2 “Zero” fighters.	1942	Darwin Harbour; near harbour entrance
Kawanishi H6K4 "Mavis" (military bomber); pilot Mirau	Imperial Japanese Navy (IJN) - Toko Ku Southwest District Fleet	Shot down by USAAF 3rd Pursuit Squadron P-40 Kittyhawk.	1942	South / south-west of Melville Island, Beagle Gulf – Timor Sea
Lockheed Hudson A16-137 (ex 41-23207) (military bomber)	RAAF - No. 13 Squadron	Disappeared after departing Darwin for an attack mission on Kupang, Indonesia.	1942	Possibly Beagle Gulf - Timor Sea
Lockheed Hudson A16-170 (ex 41-23607) (military bomber)	RAAF - No. 13 Squadron	Disappeared after departing Darwin for an attack mission on Kupang, Indonesia.	1942	Possibly Beagle Gulf - Timor Sea
Mitsubishi A6M2 "Zero" (military fighter); pilot Murakami	Imperial Japanese Navy Air Force (IJNAF) - 3 Ku, 23rd Koku Sentai	Shot down by USAAF 7th Squadron, 49th Pursuit Group P-40 Kittyhawks. .	1942	ca. 32 km north-west of Darwin, Beagle Gulf
Mitsubishi A6M2 "Zero" (military fighter); pilot Tajiri (m/n 6540)	IJNAF - 202 Ku, 23rd Koku Sentai	Shot down by RAAF / RAF No. 54 Squadron Spitfire.	1943	Darwin Harbour; immediately south of West Point
Mitsubishi G4M1 "Betty" (military bomber); pilot Asahiro	IJNAF - Takao Ku, 23rd Koku Sentai	Shot down by USAAF P-40 Kittyhawks.	1942	Beagle Gulf
Mitsubishi G4M1 "Betty" (military bomber); pilot Fujiwara	IJNAF – 753 Ku, 23rd Koku Sentai	Shot down by RAAF 457 Squadron Spitfires.	1943	West / north-west of Charles Point, Cox Peninsula, Beagle Gulf
Mitsubishi G4M1 "Betty" (military bomber); pilot Inada	IJNAF - Takao Ku, 23rd Koku Sentai	Shot down by USAAF 49th Pursuit Group P-40 Kittyhawks and / or 14 HAA anti-aircraft battery Darwin.	1942	In sea north-west of Darwin, Beagle Gulf.

Aircraft type / number	Operator	Wreck event	Year Lost	General location
Mitsubishi G4M1 "Betty" (military bomber); pilot Kato	IJNAF - Takao Ku, 23rd Koku Sentai	Shot down by USAAF 49th Pursuit Group.	1942	North-west of Darwin; Beagle Gulf - Timor Sea
Mitsubishi G4M1 "Betty" (military bomber); pilot Kirino	IJNAF - Takao Ku, 23rd Koku Sentai	Shot down by USAAF 49th Pursuit Group.	1942	North-west of Darwin; Beagle Gulf - Timor Sea
Mitsubishi G4M1 'Betty" (military bomber); pilot Ozaki	IJNAF - Takao Ku, 23rd Koku Sentai	Shot down by USAAF 49th Pursuit Group.	1942	North-west of Darwin; Beagle Gulf - Timor Sea
Mitsubishi G4M1 "Betty" (military bomber); pilot Tomohara	IJNAF - Takao Ku, 23rd Koku Sentai	Shot down by USAAF 49th Pursuit Group.	1942	North-west of Darwin; Beagle Gulf - Timor Sea
Mitsubishi G4M1 "Betty" (military bomber); pilot Unohara	IJNAF - Takao Ku, 23rd Koku Sentai	Shot down by USAAF 49th Pursuit Group.	1942	North-west of Darwin; Beagle Gulf - Timor Sea
Supermarine Spitfire A58-6 (ex AR563) (military fighter)	RAAF - No. 452 Squadron	Engine failure during formation practice flight caused pilot to force land in intertidal mangroves.	1943	Middle Arm, Darwin Harbour
Supermarine Spitfire A58-34 (ex-BR525) (military fighter)	RAAF - No. 452 Squadron	Damaged during dogfight with incoming IJNAF attack, forcing pilot to bail out and aircraft to crash into sea.	1943	Approximately 48 km north-west of Darwin, Beagle Gulf.
Supermarine Spitfire A58-86 (ex-BS221) (military fighter)	Royal Air Force (RAF) - No. 54 Squadron	Engine failure during flight to intercept incoming IJNAF attack forced pilot to bail out and aircraft crashed into sea.	1943	Approximately 48 km north-west of Darwin, Beagle Gulf.
Supermarine Spitfire A58-89 (ex-BS225) (military fighter)	RAAF - No. 452 Squadron	Damaged during dogfight with incoming IJNAF attack, forcing pilot to bail out and aircraft to crash into sea.	1943	North-west of Darwin, Beagle Gulf - Timor Sea

4.4.3 *Maritime infrastructure*

The study area passes through some historical anchorages within Darwin Harbour, including a late 19th to mid-20th century quarantine anchorage, and 1930s to 1940s naval anchorages. It is possible that permanent moorings were established in some areas of these anchorages, and that remnants of such moorings, most likely large clump anchors or concrete mooring blocks and associated chains, remain on the seabed.

4.4.4 *Sea dumping*

Previous maritime archaeological investigations have found substantial evidence of sea dumping of World War II era military material within Darwin Harbour: including aircraft parts, armament and ammunition, automotive parts and accessories, camp furniture and equipment, power and electrical equipment, fuel storage containers, and manual tools. Much of this material has been found in piles or clusters across the seabed, suggesting discrete dumping events from a barge or similar vessel. It was concluded that this material most likely represents post-war disposal of surplus and / or unserviceable military equipment.[86]

There is a potential for similar evidence of post-World War II sea dumping of military material to occur within the study area.

4.4.5 *UXO*

*** This section looks at UXO only from a heritage perspective. It is not intended to provide UXO specialist advice or to constitute a detailed UXO risk assessment.*

[86] **Cosmos Archaeology Pty Ltd. 2014.** INPEX Ichthys LNG Project, Nearshore Development – Dredging, East Arm, Darwin Harbour, Northern Territory – Relocation of Heritage Objects and Removal of Debris. Report prepared for Tek Ventures Pty Ltd.

There is a potential for various types of UXO – namely World War II era UXO – to occur within the study area, including:

- Crashed Allied and Japanese military aircraft ordnance payloads;
- Japanese air-delivered munitions;
- Japanese sea-delivered munitions;
- Allied artillery munitions from coastal defences and anti-aircraft bases, and;
- Sea dumping of surplus military ammunition.

The Department of Defence maintains a record of sites confirmed as, or reasonably suspected of, being affected by UXO.[87] These records show that various areas of Darwin Harbour and Beagle Gulf have historically been used for military training – see Figure 35. The study area passes through the location of a former air to air weapons range; however, Defence records do not confirm whether this area was used for live firing, and UXO or explosive ordnance fragments have not been recovered from the area.

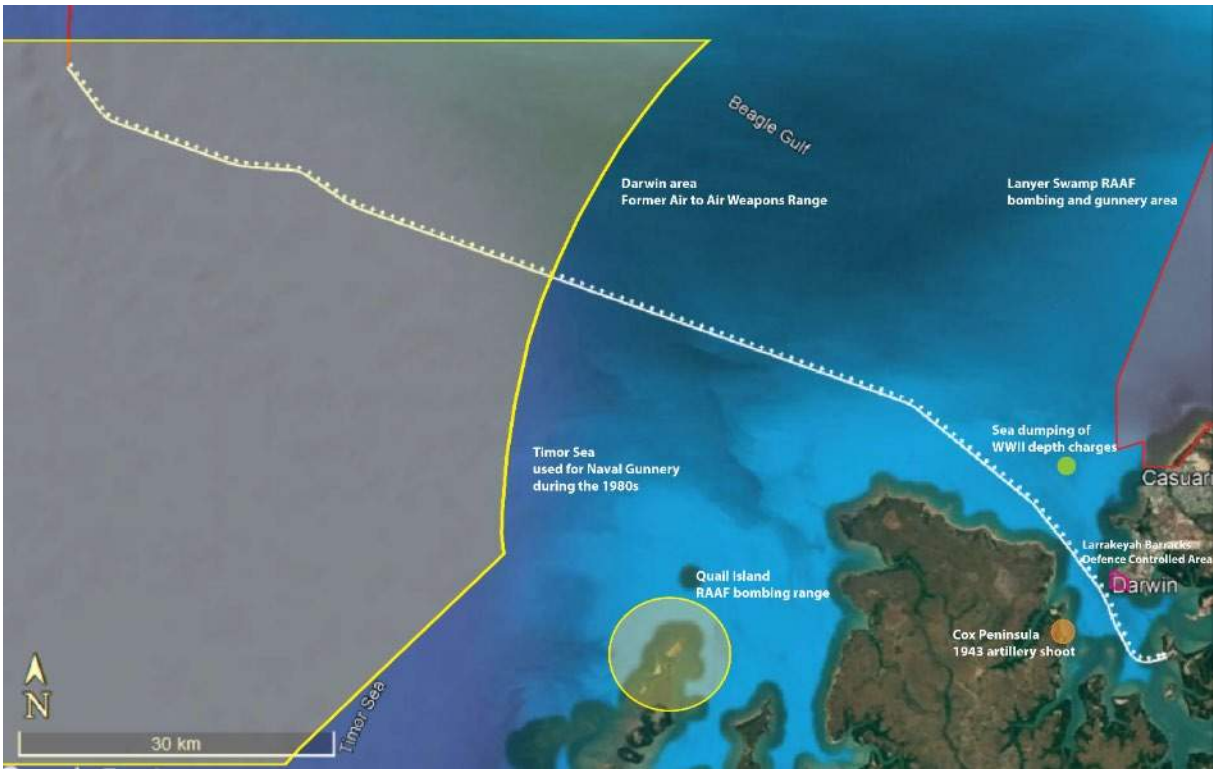

Figure 35: Areas where UXO may occur based on Department of Defence records.[88]

[88] **Australian Government Department of Defence. 2022**.

5 PREDICTED CONDITION OF MARITIME ARCHAEOLOGICAL SITES

5.1 Introduction

The condition of any maritime archaeological resource is affected by environmental and cultural factors as well as the nature of the seabed.

With regards to the study area, the following factors will have the greatest impact on site formation processes:

- Type of event leading to presence on seabed;
- Soft marine sediments;
- Mechanical damage caused by waves;
- Salvage;
- Anchor and trawl drags;
- Chemical and biological degradation.

5.2 Site Environment

As discussed in Section 4.1, the seabed is primarily sandy and featureless along most of the Beagle Gulf portion of the proposed GEP route. From KP 0 to KP 100, the seabed appears to be primarily flat and almost featureless sand, crossed in several places by gullies. Around KP 105, where the GEP route enters Darwin Harbour, the flat sand gives way to rock outcrops and other hardgrounds. Between Larrakeyah and Mica Beach, the seabed becomes more gravelly and forms a thin cover over flat sandstone and phyllite pavements. The hardgrounds within Darwin Harbour are punctuated by isolated deposits of thick sediments, before giving way to sand and mudflats as the GEP approaches its terminus at Wickham Point.

5.3 Shipwrecks

The wrecking event is the first factor that influences site formation. Depending on the reasons or forces behind wrecking, the ship may be mostly complete or extensively broken up. A vessel rarely falls or sinks as a result of little or no damage; it is more likely that a vessel would run aground, cause damage to the hull, and then sink with part of the vessel intact and part damaged. Often the force of initial impact is sufficient to break the vessel and cause considerable damage. The vessel would then sink in large pieces, depending on the damage, or remain stuck until it is broken up by physical or human forces. Another reason for a wrecking event is fire which, depending on the extent, can cause a considerable amount of breaking up and scrambling of the ship material before it reaches the seabed.

It is reasonable to assume that a large majority of potential shipwrecks within the study area foundered or were forced ashore. In this scenario, the vessel's structural remains would remain highly intact, although if run ashore it may have been salvaged for key parts before discard and therefore would have less artefactual remains.

The seabed upon which a shipwreck lies has the greatest effect on site formation processes, in particular with wooden hulled vessels, with other factors also having contributory effects.

With regards to vessels coming to rest on a sandy seabed, the archaeological site will usually be formed in the following manner:

- Vessel comes to rest on the seabed.

- The wreck will settle into the seabed up to a certain depth, dependent on the resistance of the sediments and the weight of the vessel. It is a general rule, especially with iron hulled vessels, that wrecks sink into softer sediments up to their waterline.
- Parts of the vessel which protrude above the water may be salvaged for re-use. Non-perishable, accessible and high value parts of the vessel situated underwater may also be removed. It is a general rule that the deeper the water in which a vessel sinks and the more remote the location, the less likelihood of it being salvaged at the time of loss. Rapidly changing technology in recent times, however, has allowed salvage at greater depths.
- Biological processes will commence immediately on a timber wreck, attacking the exposed timbers and other organic elements of the wreck. This will lead to a weakening of the hull's integrity and eventually organic elements above the seabed will disappear.
- If it is in shallow water, wind generated waves would act upon the broader surfaces of a wreck thereby breaking down exposed components into sections. These sections will orientate themselves to prove the least resistance to the direction from which the waves are more commonly generated.
- Large waves will raise sediments into suspension, thereby resulting in cultural objects, including the hull of the wreck, sinking further into the marine sediments. The older the wreck the deeper it would be buried, unless a hard-alluvial substrate is present close to the surface of the seabed against which the wreck will rest.
- Cultural behaviour will have the effect of scrambling wreck sites and masking their presence. Dragging anchors, scallop dredgers and trawling will spread wreck material and may also result in the 'ploughing up' of buried cultural material.
- Salvaging will have a destructive effect on the hull and organic elements that have survived below the seabed, as well as by removing artefacts and creating a scatter of remaining material around the wreck site.

A wreck coming to rest on a rocky bottom would eventually collapse under its own weight as it would not be able to sink into the seabed. With such a collapse the integrity or coherence of the wreck begins to dissipate. Pockets of surviving structure and other artefacts can remain well preserved amongst boulders, gullies and depressions.

Assessing the condition or, more precisely, the structural integrity of the shipwrecks is of relevance because this can provide an indication of the nature and scale of the obstacle that could affect the pipeline installation process. Shipwreck condition also relates to its 'detectability'. A number of factors influence the condition of shipwrecks, the primary ones being the materials used in the construction of the vessel, the bottom type upon which the wreck rests, the depth of the wreck and its age.

With regards to detecting wreck sites, the two most common remote sensing techniques that are applied would be magnetometer and side scan sonar surveys. The side scan sonar would be more useful in detecting high- and low-profile wreck sites while the magnetometer is best employed in searching for sites with a high ferrous content which are partially buried or resting on a rocky bottom.

Generally speaking, the 'younger' the wreck is, and the deeper it sank in the water column, the better preserved it would be. Also, a wreck resting on a sandy bottom would be better preserved than if it was resting on a rocky bottom. In conjunction with these factors, the method and type of construction of the vessel is the most important variable when it comes to assessing the condition of a wreck.

Iron/Steel Hulled Wrecks

If resting on a sandy bottom it could be expected that the hull integrity of the wreck would be relatively intact. The hull along midships may have collapsed but the stern and bow sections may still be upright or heeled to one side. The engine components, if any, would be largely intact and *in situ*. Such vessels on a rocky bottom would be relatively disarticulated, though the components of the vessel would still be present. Iron/steel wrecks on either bottom type can be detected using a magnetometer. Locating such a wreck site on a rocky bottom with side scan sonar would be difficult but the opposite is true with such wrecks on a sandy seabed.

Wooden Hulled Wrecks with Engines

In most cases the hulls of such wrecks would have disappeared. In situations, however, where the wreck rests on a sandy bottom, sections of the hull may have been preserved under the sand. The engine components of such wrecks would be visible. A magnetometer can detect such wrecks on either bottom type. Such wrecks on a rocky bottom would be difficult to detect with side scan sonar but the opposite can be true with such wrecks on a sandy seabed. However, engine components can be partially or completely covered by sediments and would appear as scattered dumped debris or a linear mound.

Large Tonnage (> 100 ton) Wooden Hulled Wrecks (Sail)

In most cases the hulls of such wrecks would have disappeared. In situations, however, where the wreck rests on a sandy bottom, significant sections of the hull may have been preserved under the sand. There would be enough ferrous material present, such as anchors, chain and winches, for such wreck sites to be detected using a magnetometer. The identification of such wreck sites using side scan sonar would be difficult as it could appear as scattered dumped debris, unless the cargo was non-perishable, in which case a linear mound may be visible.

Small Tonnage (< 100 ton) Wooden Hulled Wrecks (Sail)

The same as for large tonnage vessels except that the size of the target and the amount of ferrous material present would be considerably less. It would be difficult to detect using a magnetometer and may be mistaken for dumped material debris from side scan sonar imaging.

5.4 Aircraft Wrecks

There are significant differences between the site formation of underwater aircraft wrecks and shipwrecks due to the vastly different construction, in terms of both shape and material used, as well as the depositional process, i.e., the wrecking event. These are two key determining factors that will influence site formation.[89] The wrecking event for aircraft is the first factor affecting site formation, and can take many forms, from deliberate scuttling on the water's surface and dumping of material to high impact crashes and slower, more controlled ditching events. Aircraft dumping was considered 'fairly commonplace' following WWII, and significant dump sites exist near Sydney and Greencape in NSW, along with sites near Brisbane, and Rottnest Island in WA.[90] Aircraft wrecked as a result of military combat may have sustained significant damage before crashing into the water. Aircraft sitting on the

[89] **Burgess, A., 2013**, *Underwater Aviation Archaeology: What is its Place and Value Within Archaeology, and in Particular Maritime Archaeology?*, Masters thesis, Faculty of Humanities, University of Southampton, United Kingdom.
[90] **Smith, T., 2004,** Plane Sailing: The archaeology of aircraft losses over water in NSW, Australia. *Bulletin of the Australasian Institute for Maritime Archaeology.* Vol. 28:113-124.

surface of the water may have also been attacked and sunk through military action.[91] The initial integrity of the aircraft hull depends largely on the wrecking incident, and is influenced by numerous factors, such as the speed and angle of impact upon entry.

Upon entering the water, the shape of the aircraft and the depth of the water column will determine how the aircraft comes to rest on the seafloor. Aircraft hulls and wings are typically made of lightweight material, such as aluminium or even wood and fabric, while machinery and components such as engines will weigh significantly more and contain more ferrous elements. This disparity in weight will cause some aircraft to invert on descent, coming to a rest on their back. Other aircraft, such as single engine WWII fighter planes built with engines at the front, will sink to the bottom nose first. As the aircraft sinks in the water column, it may break up further, with the loss of wings or tail sections being sometimes noted.[92] Once on the seafloor, the combination of increased weight and galvanic corrosion due to differing metals means that larger components, such as engines, may detach and fall away from the rest of the structure. The depth of the wreck has a significant role in its deterioration, as aircraft sunk in shallower waters are more at risk from wave surge and corrosion due to warmer water temperature and increased oxygen levels.[93]

The seafloor composition will determine the burial environment for a sunken aircraft which in turn will have a large impact on the survival and condition of the aircraft. Aircraft are generally lighter than ships and are therefore less likely to penetrate the seabed, and less of the hull may be buried. As with shipwrecks, it is assumed that aircraft that are quickly buried in an anaerobic, stable environment, deep underwater will be better preserved than those in shallow inshore environments, particularly those with hard seabed and heavy surf.[94]

The composition of alloys used in aircraft construction can have a significant impact on the rate of deterioration once an aircraft has sunk. Aluminium, the primary material used in aircraft construction, is highly reactive. When alloyed with metals like copper, its corrosion rate is accelerated. This leads to a phenomenon known as 'pitting,' where perforations appear as the aluminium corrodes.[95] Water with a higher acidity will cause more rapid deterioration.

Direct cultural impacts can also play a role in site formation, especially on sites located in areas of high boat traffic. Fishing nets have frequently become entangled with aircraft wrecks, resulting in damage and fragmentation.[96] Impacts and damage by anchors was frequently noted on PBY Catalina wrecks in Darwin Harbour, including some anchors that remained embedded in the aircraft.[97] Further damage can occur from propeller jet turbulence in shallow water. Due to the lightweight construction of aircraft, these anchor and fishing net collisions can easily move pieces of a sunken aircraft from one location to another, resulting in highly fragmented wreck sites.[98] Aircraft parts can be light enough that even recreational fishing line has been known to snag and disturb sites. Seafloor dredging has also been shown to have a significant negative impact on aircraft crash sites.[99] Other cultural impacts include salvaging, which can include initial salvaging efforts shortly after the wrecking event, as well as looting, illicit salvage, and souvenir taking. Sunken aircraft may become popular with recreational divers and can be damaged by careless visitors.

Although the site formation processes for sunken aircraft display large variation between sites, a general flow of deposition can be summarized:

- An aircraft enters the water, either through a violent and high-impact uncontrolled crash, slower deliberate bailout, or through dumping/scuttling on the surface. Aircraft may have sustained damage prior to entering water, such as those suffering mid-air explosions and aircraft shot down in combat.
- As the aircraft sinks, its orientation and hull integrity will change depending on its construction. Wings and tail may separate, and heavier components may invert an aircraft.
    - It has been noted on Catalina wrecks that the tails and wings are very rarely found with the rest of the fuselage, indicating that they have potentially broken off and drifted away as the aircraft sunk.[100]
- The aircraft will settle on the sea bottom. Aircraft deposited on hard substrate may not be buried, while those settling on sandy, muddy, or silty bottoms may partially sink into the seafloor.
- In certain cases, salvaging operations may take place immediately, including the removal of high value components. In other cases, illicit salvaging, looting, treasure hunting, and souvenir taking can damage wrecks.
- Aircraft materials will begin to deteriorate over time, due to corrosion as well as natural and cultural external factors.
    - Corrosion will cause deterioration of metals, particularly aluminium, and may cause heavier ferrous components to detach.
    - Surf and surge can further disarticulate aircraft and spread material around a larger area.
    - Human activities such as dredging, fishing and recreational boating can further disperse sites by dragging fishing nets and anchors across sunken aircraft.

5.5 Sea dumping and UXO

Ordnance from WWII

Generally, ordnance resting on rocky seabeds in high energy environments will corrode and disintegrate at a more rapid rate while those in lower energy environments or completely buried will retain their integrity for much longer.[101] Such objects will appear as scattered low relief and highly reflective debris on the seabed.

Ballast mounds

Ballast mounds are usually composed of rock and occasionally of scrap iron. They will present as high relief and highly reflective on the seabed.

5.6 Maritime Infrastructure

Moorings

Moorings are selected for their durability and therefore remain in a solid condition, whether they be anchors or concrete blocks. They tend to become buried over time in sandy/silty seabeds. Associated chain can also become buried, with exposed sections eventually corroding to a point where they become brittle and break easily. The length of time required

---

[100] *Op. Cit.* **Cosmos Archaeology, 2016**.
[101] **G-tek Australia, 2010:6.**

for chain to reach this state of deterioration depends very much on its thickness, but it can be expected that such material in Darwin Harbour will still retain some tensile strength.

Cable and nets

On a sandy/silty seabed, wire and netting can become partially buried. Similarly, to chain, exposed sections eventually corrode to a point where they become brittle and break easily, but the length of time required to reach this state of deterioration depends very much on the object's thickness. Given that these objects are around 70 years old, they can be expected to still retain tensile strength. They would appear as meandering low relief and highly reflective linear anomalies. The associated 'clumps' would appear as round or square low relief and highly reflective objects.

6 REVIEW OF GEOPHYSICAL SURVEY DATA

6.1 Introduction

Geophysical data was provided by Santos in the form of high-resolution geo-tiffs for side scan sonar (SSS) and multi-beam echosounder (MBES) survey data. Magnetometer data was provided as georeferenced feature points. Additionally, a detailed geophysical survey report was provided to supplement the raw data.[102] The proposed anchoring corridor for vessels installing the GEP is wider than the geophysical survey corridor conducted by Fugro. Therefore, an additional MBES dataset published by Geosciences Australia was consulted to cover this data gap.

Of relevance to this assessment in particular was the SSS. Additionally, MBES and magnetometer data was used as a second and third data source to support the selection of targets from SSS. SSS data was provided as geo-tiffs at 0.5m resolution which were imported into QGIS software and laid over basemaps. This provided highly accurate coordinates of seabed anomalies as well as their dimensions. The 0.5m resolution allowed for the selection of small, isolated anomalies due to the high resolution.

SSS and MBES data adequately covered the proposed pipeline route, with no discernible gaps in coverage. Magnetometer data, though useful in identifying cultural objects, was provided only as feature points, and raw data was not provided.

6.2 Geophysical survey data provided

6.2.1 *Side Scan Sonar survey*

SSS data was provided as 0.5m resolution black and white geo-tiffs covering the entirety of the proposed GEP route (see Figure 36 and Figure 37). Additionally, targets identified by FUGRO during geophysical survey reporting were provided. These were assessed against the available raw SSS and MBES data to assess their potential historical significance and cultural origin (see Table 7).

[102] **Fugro, 2022,** *Barossa Pipeline to Shore Project – Survey Results Report – Offshore Geophysical Survey – (Work Package 1) North Route 2*, provided for Santos Pty Ltd. (BAS-200 0629).

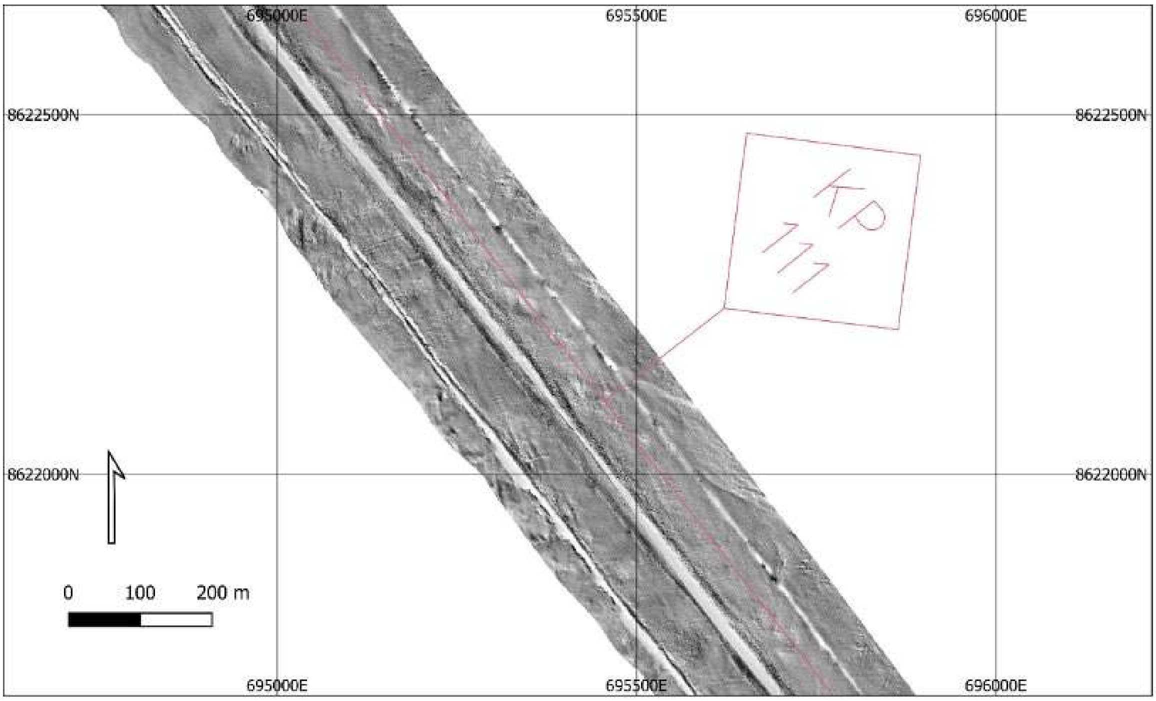

Figure 36: Detail example of SSS data at KP 111.

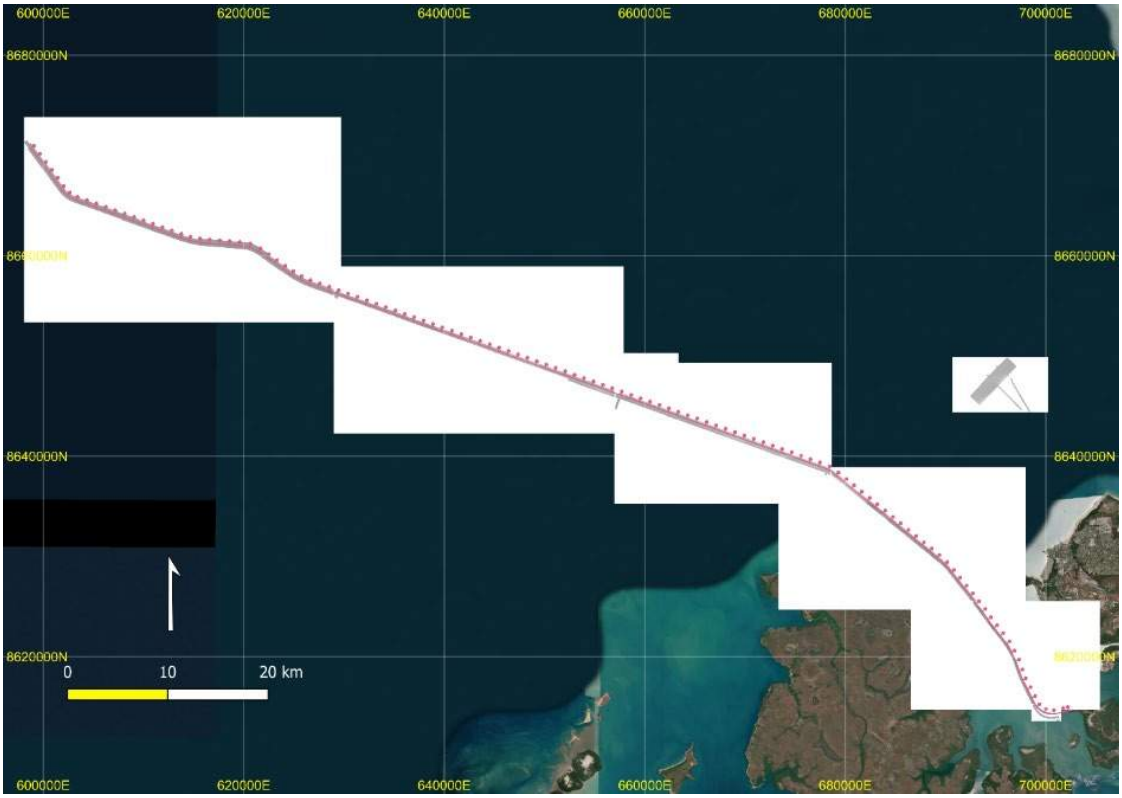

Figure 37: Overview of SSS data provided. Isolated survey location at upper right is proposed spoil dumping ground and has not been assessed as part of this study.

Table 7: SSS targets identified by FUGRO.

6.2.2 *Multi-beam sonar*

Multi-beam bathymetry for the entire route was provided as high-resolution geo-tiffs with colouring and shading to designate elevation changes. MBES resolution was 0.5m.

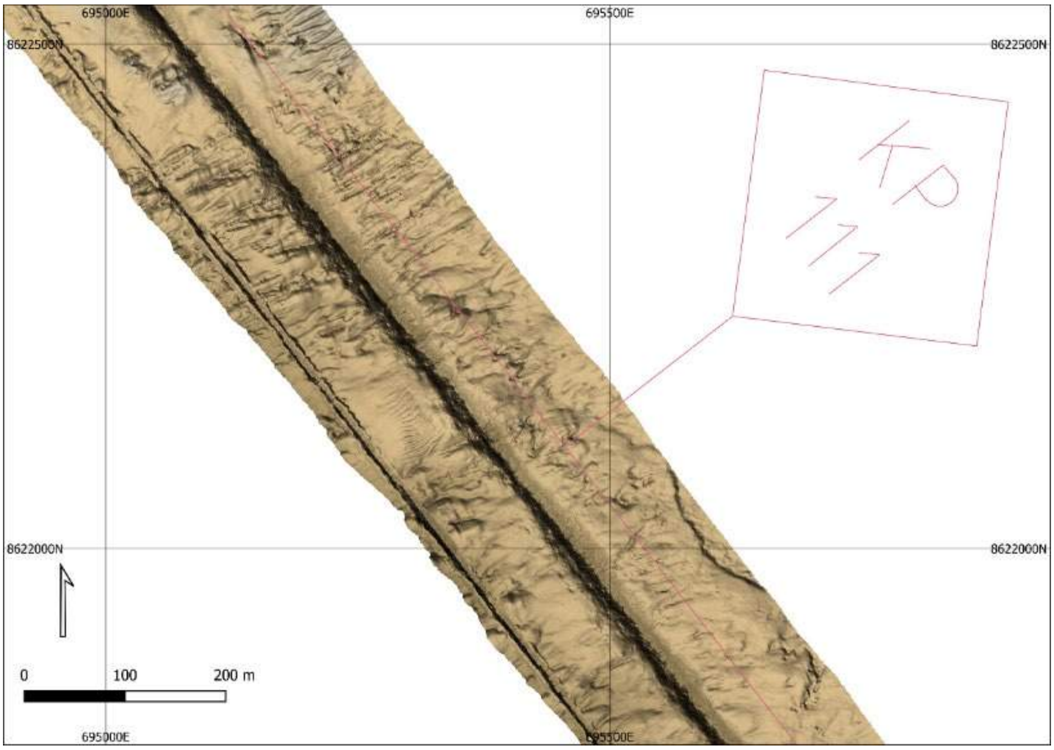

Figure 38: Example of MBES data provided at KP 111. Note INPEX GEP and Bayu-Undan pipeline clearly visible.

A second set of multi-beam data was provided 13 April 2022 as an XYZ data file. This second set of data was recorded by FUGRO in 2021 and is higher resolution (0.25m). The second MBES data set covers roughly the last third of the proposed pipeline route, from approximately KP 87 to the terminus.

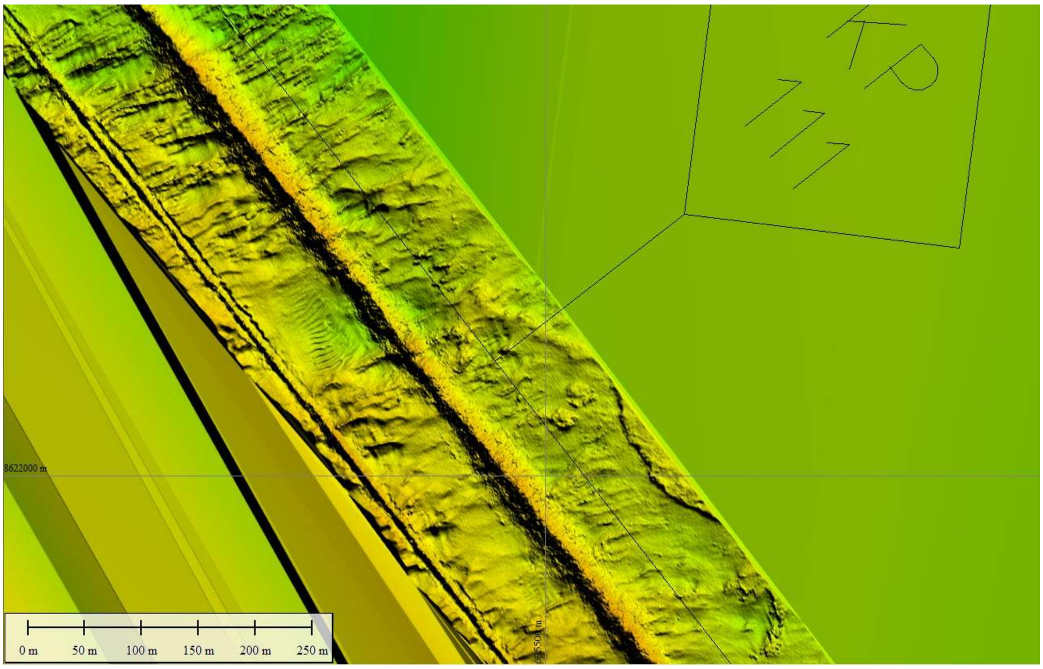

Figure 39: Example of 2022 MBES data with higher resolution (0.25m) in approximately the same location as previous figure.

The anchoring corridor for the proposed works, located between KP 91.5 and the terminus, is wider than the geophysical survey corridor. Therefore, public MBES data covering the entirety of Darwin Harbour was examined to identify underwater cultural heritage located in the area between the Fugro survey corridor and the anchoring corridor (see Figure 40 and Figure 41). This publicly available dataset is published by Geoscience Australia and consists of 1 m resolution gridded MBES data.[103]

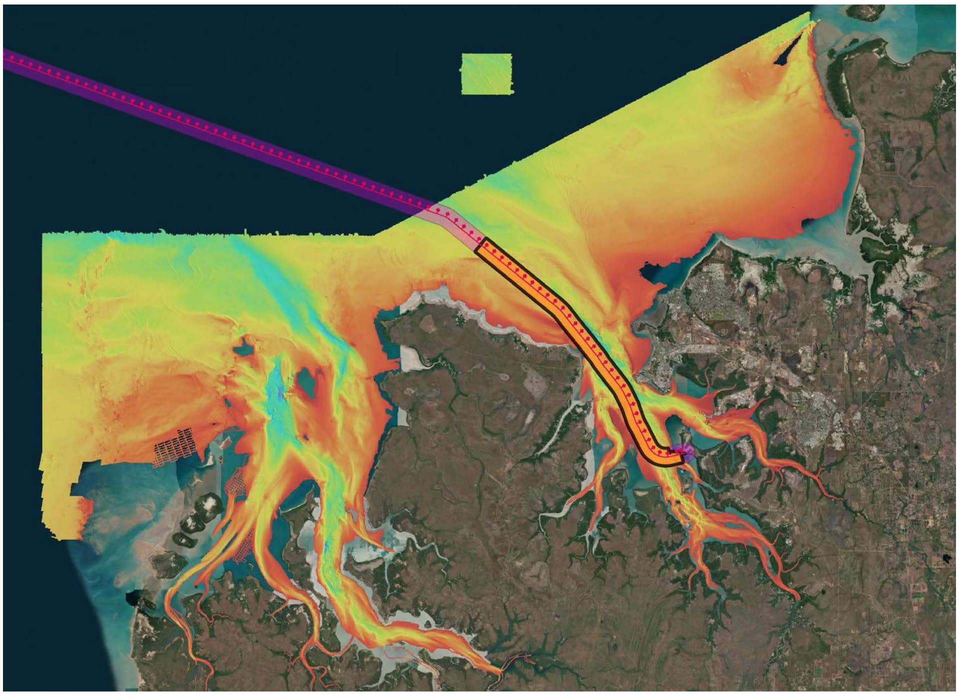

Figure 40: Overview of total coverage of public Darwin Harbour MBES data. Study area in purple, anchoring corridor in orange.

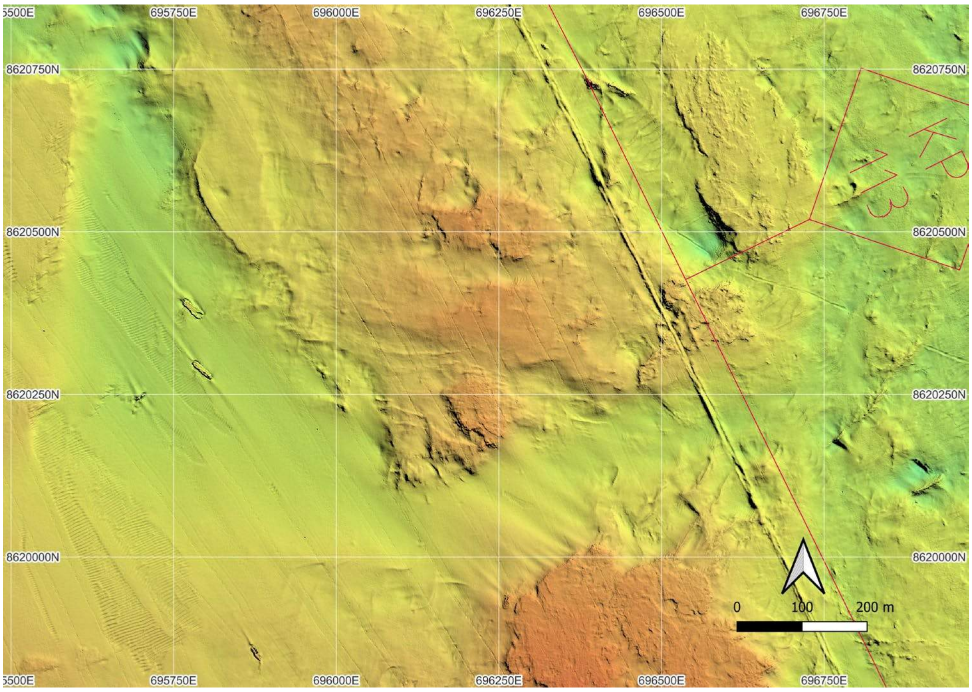

Figure 41: Detail of same dataset at KP 113, showing GEP route and several shipwrecks at left.

6.2.3 *Magnetometer*

Magnetometer data was collected from a single channel mag and provided as a shapefile of georeferenced points. Additionally, the same magnetic anomaly contacts were provided as part of a report delivered by FUGRO in April 2022 (see Table 8).[104]

Magnetometer data was collected using a SeaSpy magnetometer deployed behind the combined SSS/SBP system via an 11m long cable. Altitude of the magnetometer was approximately 1.5m lower than that of the SSS/SBP, and therefore achieved results at elevations less than ~10m above the seafloor.[105]

Due to the tow height and line spacing of the MAG survey, actual locations of magnetic contacts given are approximate and may not be located directly below survey lines. Their locations are proportional to the distance of the magnetic sensor to detected object. Therefore, actual magnetic contacts may be laterally offset to the magnetic survey lines.[106]

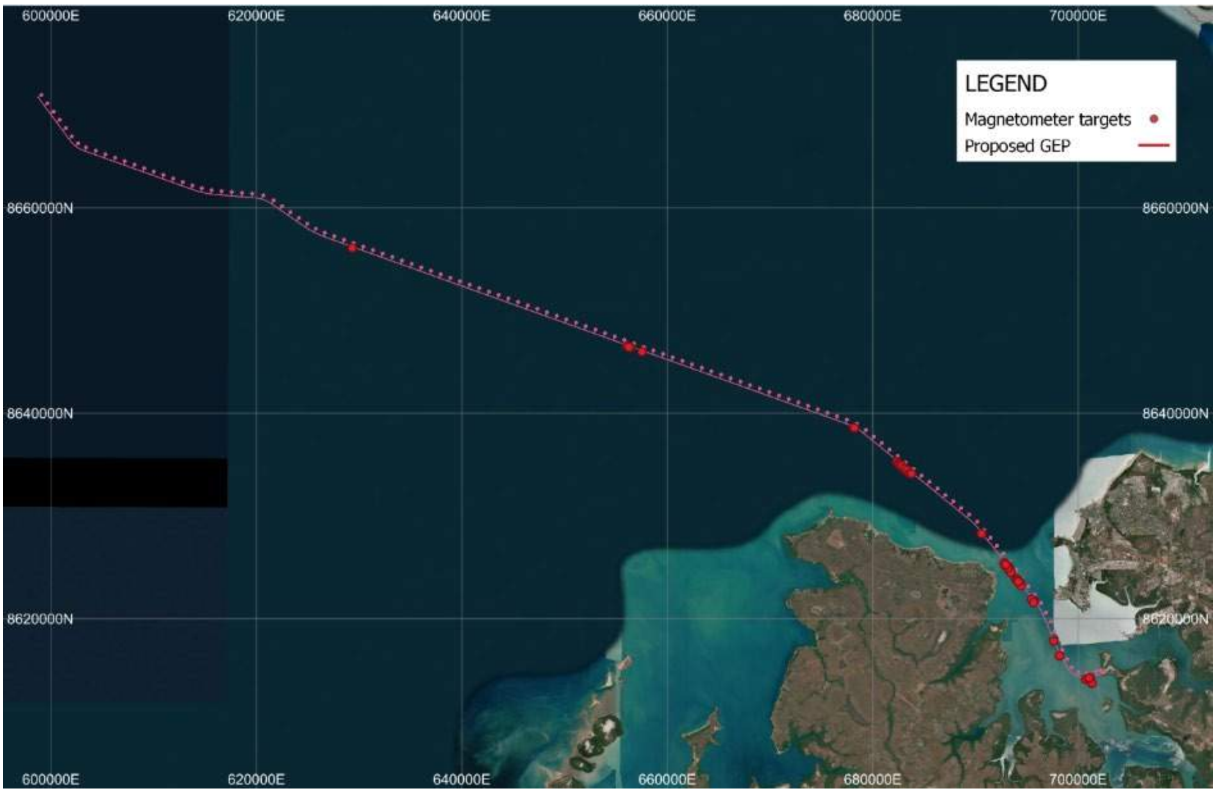

Figure 42: Locations of magnetometer targets provided by FUGRO survey.

Table 8: List of magnetometer strikes provided by FUGRO.

6.3 Anomaly Identification

The following table shows the identified geophysical targets, arranged in their priority level for visual survey. The priority level is defined as:

A = Primary – Identified as most likely cultural (unlikely but possibly natural), significance determined by dive survey or ROV

B = Secondary – Possibly cultural, possibly natural, significance determined by dive survey or ROV

C = Low priority – Identified features determined to be not culturally significant

All images are oriented with north at the top. Where available, imagery from the 2022 MBES survey is used. Targets identified by CA are correlated with targets identified by FUGRO where appropriate. Targets surveyed during ROV surveys have IDs marked with *.

6.3.1 *Targets within survey corridor*

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
A	112	623 013.42	8 659 220.00			No	Single object of high relief. Possible debris related to I-124.	Length: 8m Width: 6m	46m	68m
A	138	686 407.37	8 632 159.33			No	Mound associated with anchor scars	Length: 13m Width: 16m	17m	59m

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
A	149	691 670.76	8 626 677.01			No	Unknown, may be related to pipeline or another cultural feature.	Total length: 258m Total Width: 19m Ind. Diameter: 5m	19m	200m
A	164*	693 038.56	8 625 231.53			Yes, MA_002	Possible 1879 subsea cable remains or anti-sub defences/ net. Likely connected to Target ID: 167 FUGRO ID: NCL_SC_026	Total length: 209m Width: 2m	16m	30m
A	166*	693 399.74	8 624 898.55			No	Series of high relief single objects with connecting line. Possible 1879 subsea cable remains or anti-sub defences. FUGRO ID: NCL_SC_017, 018, 019	Length: 73m Width: 5m	21m	41m

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
A	167*	693 085.69	8 625 121.75			No	Series of high relief single objects with connecting line. Possible 1879 subsea cable remains or anti-sub defences. Likely connected to Target ID: 164	Length: 3m Width: 3m	16m	76m
A	191	696 438.36	8 620 800.13	N/A		No	Single object of high relief. Possible small boat.	Length: 8m Width: 3m	19m	73m
A	210	701 140.90	8 613 958.61			No	Possible aircraft wreck or natural feature.	Length: 12m Width: 7m	17m	389m

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
A	234	647 746.21	8 649 692.16			No	Single mound, indicating lone discarded object.	Length: 5m Width: 4m	43m	173m
A	238	696 581.70	8 620 537.67	N/A		No	Possible scattered debris.	Length: 70m Width: 10m	21m	78m
A	239	697 710.77	8 617 774.90	N/A		Yes, MA_001	USAT *Mauna Loa*	Length: 124.97m Width: 16.46m	19m	90m

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
A	240	691 578.22	8 626 925.25			No	Possible mooring block for anti-submarine defences	Length: 4m Width: 2m	16m	122m
A	242	691 589.94	8 626 799.20			No	Steel wire rope and chain associated with anti-submarine defences. (boom net), UXO including mechanical fuses and fuse cones. (See Section 6.4)	Length: 23m Width: 13m	17m	186m
A	243	693 188.00	8 624 746.00	N/A		No	Possible mooring block related to anti-submarine defences.	Length: 2m Width: 2m	15m	216m

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
A	244*	693 196.00	8 625 167.00			No	Series of high relief single objects with connecting line. Possible 1879 subsea cable remains or anti-sub defences. FUGRO ID: NCL_SC_022, 023, 024, 025	Total Length: 120m Width: 5m (at arrow)	22m	50m
C	245*	693 161.00	8 625 121.00			Yes, MA_012	Rocks	Length: 38m Width: 22m	16m	0m
C	246*	693 260.86	8 625 002.53			Yes, MA_011	Boulders FUGRO ID: NCL_SC_021	Length: 31m Width: 15m	23m	0m

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
A	247*	693 281.16	8 624 939.53			Yes, MA_003	No cultural material found	Length: 18m Width: 6m	23m	23m
A	248	693 131.66	8 624 925.53			Yes, MA_028	Debris scatter, or possible anti-submarine net remains	Length: var. Width: var.	16m	150m
B	NCL_SC_002*	698 297.94	8 616 489.78			No	Single isolated object, possible debris or natural feature	Length: 1m Width: 0.4m	17m	11m

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
B	NCL_SC_010	694 982.00	8 622 822.59	N/A		No	Linear debris, likely cable remains.	Length: 17m Width: 0.5m	20m	70m
B	NCL_SC_016*	694 168.64	8 623 820.49			No	Possible cable support, or isolated non-ferrous object.	Length: 3.5m Width: 1.6m	24m	40m
B	NCL_SC_031*	691 780.61	8 626 909.95			No	Single isolated non-ferrous object, likely debris.	Length: 1.4m Width: 0.7m	16m	26m

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
B	115	649 361.40	8 649 116.46			No	Shallow depressions with low relief object.	Length: 8m Width: 4m	44m	86m
B	130	665 465.07	8 643 481.67	N/A		No	Possible debris scatter.	Length: 18m Width: 8m	29m	208m
B	135	621 286.34	8 660 259.37			No	Likely natural feature, closest proximity target to I-124	Length: 62m Width: 58m	48m	143m

	Target ID	Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
B	136	622 455.26	8 659 969.89			No	Possible debris scatter or natural feature.	Length: 98m Width: 32m	49m	214m
B	141	690 574.96	8 628 606.67			No	Debris or rocks FUGRO ID: NCL_SC_043, 044, 045, 046	Length: 53m Width: 20m	30m	137m
C	142*	690 511.00	8 628 469.00			No	Boulders FUGRO ID: NCL_SC_042	Length: 15m Width: 12m	29m	0m

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
A	174*	694 194.43	8 623 696.01			Possibly associated with MA_010	Windlass or winch from vessel with rope FUGRO ID: NCL_SC_013	Length: 5m Width: 4m	24m	16m
C	175*	694 295.02	8 623 601.00			Possibly associated with MA_009	Natural ridge	Length: 24m Width: 5m	24m	2m
B	192	696 253.89	8 620 643.48			No	Possible debris	Length: 24m Width: 22m	14m	147m

	Target ID	Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
B	196	696 859.94	8 619 902.39			No	Debris or rocks	Length: 9m Width: 6m	19m	53m
B	233*	639 844.98	8 652 470.81			No	Triangular depression, Likely natural feature.	Length: 39m Width: 8m	41m	34m
C	140	689 653.25	8 629 488.15			No	Darwin Harbour Lateral Buoy 5 mooring FUGRO ID: NCL_SC_047, 050	Length: 89m Width: 42m	24m	28m

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
C	201	697 153.77	8 618 442.04	N/A		No	Spud marks from BU pipeline construction	Total length: 129m Total Width: 19m Ind. Diameter: 4m	16m	188m
C	235	685 698.53	8 632 788.44			No	Anchor drag	Length: 170m Width: 6m	14m	95m
C	236	686 460.34	8 632 164.86			No	Anchor drag	Length: 89m Width: 7m	18m	72m

	Target ID	Datum: GDA94 CRS: UTM Zone 52S		Image MB	Image SSS	Mag Target	Interpretation	Dimensions	Depth	Distance from pipeline
		Easting	Northing							
C	241*	691 796.25	8 626 930.15			No	Depression on seabed, possibly cultural, anchor drag. FUGRO ID: NCL_SC_032	Length: 9m Width: 8m	20m	46m

6.3.2 *Targets within anchoring corridor*

Table 9: Targets within anchoring corridor identified from Darwin Harbour public MBES data.

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Interpretation	Dimensions (m)			Depth (m)	Distance from pipeline (m)
		Easting	Northing			Length	Width	Height		
A	500	697,615.17	8,618,840.23		USAT Meigs	121.00	20.00	3.30	20	369
A	501	695,875.84	8,619,850.01		Medkhanun 3	25.00	8.00	7.00	19	847

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Interpretation	Dimensions (m)			Depth (m)	Distance from pipeline (m)
		Easting	Northing			Length	Width	Height		
A	502	695,698.81	8,620,246.53		Ham Luong	18.00	5.00	3.00	25	832
A	503	695,794.02	8,620,287.72		Song Saigon	40.00	10.00	5.00	24	728
A	504	695,778.93	8,620,381.31		John Holland Barge	38.00	15.00	5.00	25	700

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Image MB	Interpretation	Dimensions (m)			Depth (m)	Distance from pipeline (m)
		Easting	Northing			Length	Width	Height

6.3.3 *WWII anti-submarine net moorings*

Targets located between KP 107 and 108 have been identified as the remains of World War II anti-submarine net moorings. Targets listed in Table 10 omit geophysical survey images, as well as target dimensions, because all targets are highly uniform in size and shape.

Table 10: Location of potential WWII anti-submarine boom net moorings, identified from Fugro survey data and Darwin Harbour public MBES data.

6.4 Summary of Fugro Geophysical Survey Data Review

In total, 39 potentially cultural anomalies were identified from a review of the Fugro geophysical data, including three magnetic anomalies with no sonar or multibeam presence (see Figure 43). Of these 39, 21 were classed as category A, 15 as category B, and 3 as category C, with the three magnetic anomalies unranked. The distribution of targets increases with the approach into Darwin Harbour, with the highest concentration between KP 101 and KP 116 (see Figure 43).

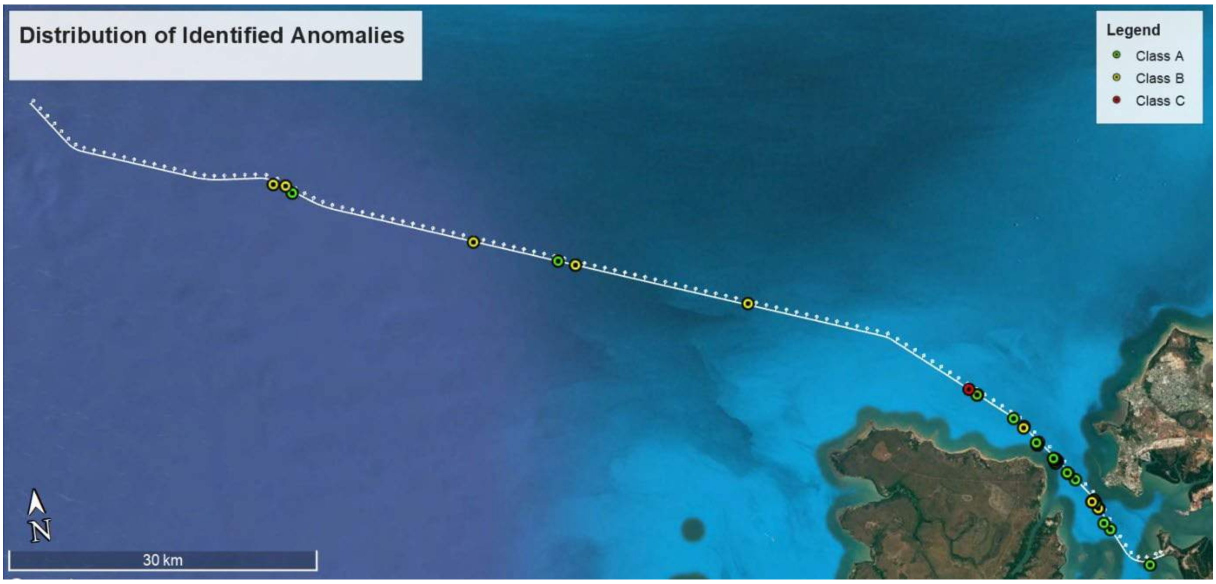

Figure 43: Overview of identified geophysical survey anomalies, colour coded by category type.

Figure 44: Identified geophysical anomalies within Darwin Harbour and approach, approx. KP 93 to 122 (terminus).

6.4.1 *Clusters of geophysical anomalies*

This section reviews five clusters of potential cultural heritage anomalies, and include mostly Class A anomalies, associated Class B anomalies, and associated magnetometer strikes.

6.4.1.1 Cluster 1: KP 25 – 28 (anomalies near I-124)

A cluster of targets was identified between KP 22-28 in the section of the proposed pipeline route that curves around the protected zone of the wreck of the Japanese submarine I-124 (see Figure 45). While the location of the wreck is well documented, and no evidence of I-124 was identified from the geophysical survey, the existence of geophysical anomalies in the area indicates a small likelihood that cultural material associated with the wreck may be present in the area. Of the three identified anomalies between KP 25 and 28, two are ranked in category B, and one is ranked category A. The category B targets cannot be positively identified as cultural or natural based on the available geophysical data. The single category A target, anomaly 112, appears to be a single object of relatively high relief, measuring approximately 8m by 6m. It is located over 2.5 km from the centre of the I-124 protected zone, indicating a very remote chance that it is associated with the Japanese submarine.

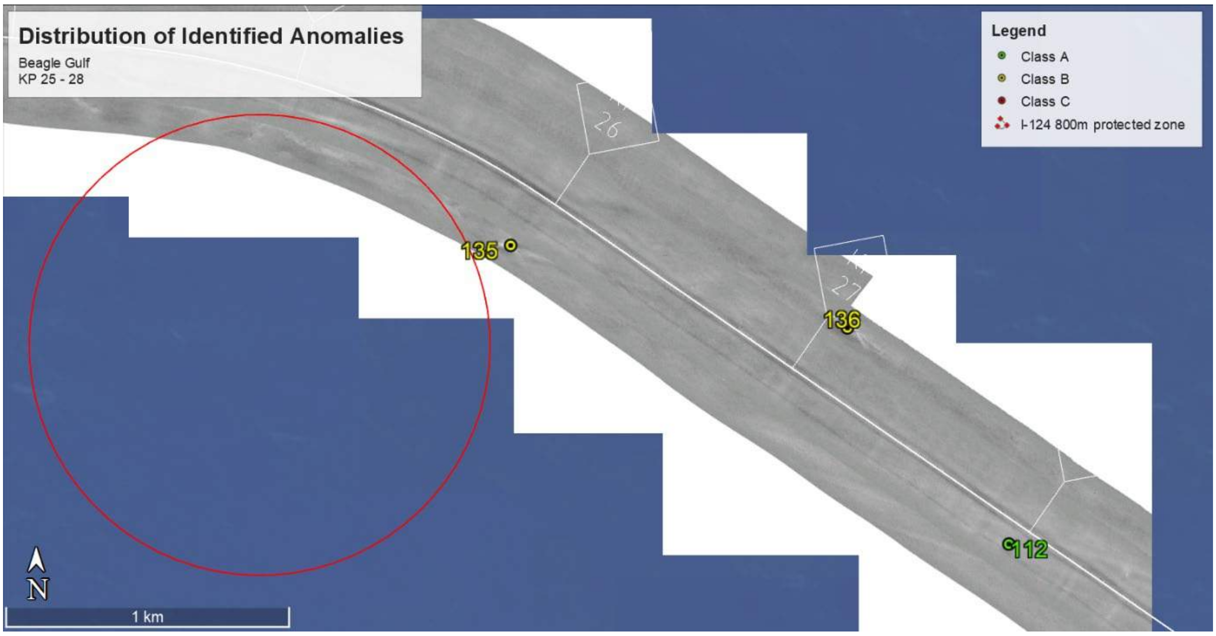

Figure 45: Cluster of geophysical survey anomalies between KP 25 and KP 28. 800m protection zone for I-124 indicated by red circle.

6.4.1.2 Cluster 2: KP 104 – 106 (anti-submarine defences/indicator loop remains)

A second cluster of targets was located between KP 104 and 106. Four geophysical anomalies were identified by SSS and MBES at KP105, three were categorised as A and one as category B.

Previous surveys by CA identified the remains of anti-submarine netting and mechanical time fuses and fuse cones located at 691614 m E and 8626792 m N (see Figure 48 and Figure 49). These remains, labelled Contact 2 in the CA report, are located within the immediate vicinity of anomaly 242, approximately 25m away at a bearing of 286 degrees:

> *Contact 2 consists of a large collection of steel wire rope and chain associated with the WWII anti-submarine boom net* [Figure 48]. *Also located were the remains of at least 4 boom net float buoys and what appear to be supporting frames for the boom net. On the south eastern side of the site is a collection of UXO consisting of mechanical time fuses and fuse cones* [Figure 49]. *These fuses and cones are most likely from artillery shells. A total of 15 fuses were identified but it is likely that more are buried beneath the sediment. The fuses and use cones were most likely stored together in a box but this has deteriorated and spilt the fuses and cones onto the sea floor. Contact 2 covers an area of approximately 25 metres by 30 metres.*[107]

This survey also identified the remains of an underwater telephone cable at 692023 m E and 8626266 m N, designated Contact 3 in the same report:

> *Contact 3 consists of two lengths of underwater telephone cable. There are two parallel sections of cable that run for 30m in approximately an east west orientation* [Figure 51]. *The two cables are set 300 mm apart. The western end of the cable has been cut while the eastern end disappears into the sea floor sediment and is most likely still in situ. The cable is approximately 25 mm across and consists of a six core copper wire encased in black rubber that is then encased in grey rubber. The outside is bound in canvas with steel wire armour* [Figure 52]. *Approximately 5 metres south west of the in situ cables is a jumbled collection of broken telephone cable that appears to have been dumped in a pile.*[108]

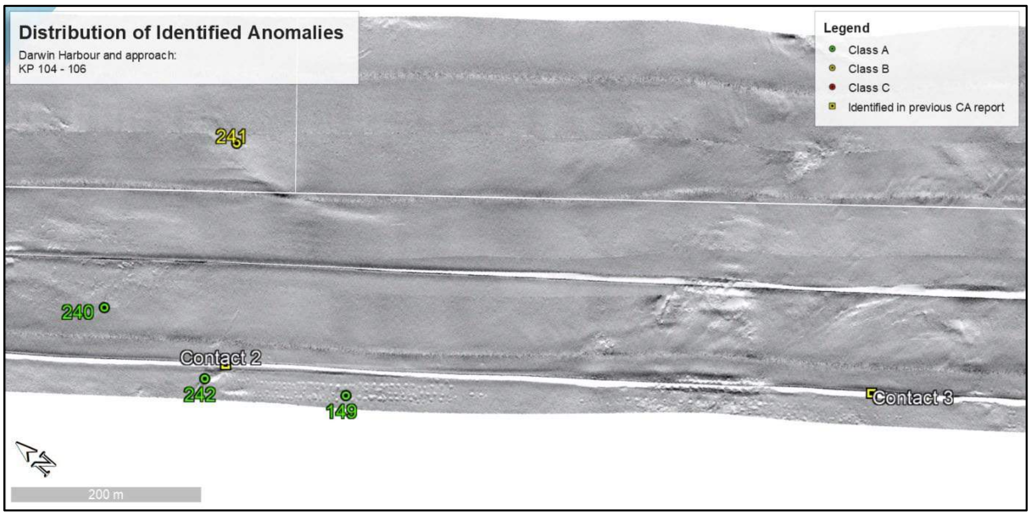

Figure 46: Cluster of geophysical anomalies from KP 104 – 106. Contact 2, associated with anti-submarine netting, and Contact 3 is indicated by yellow square.

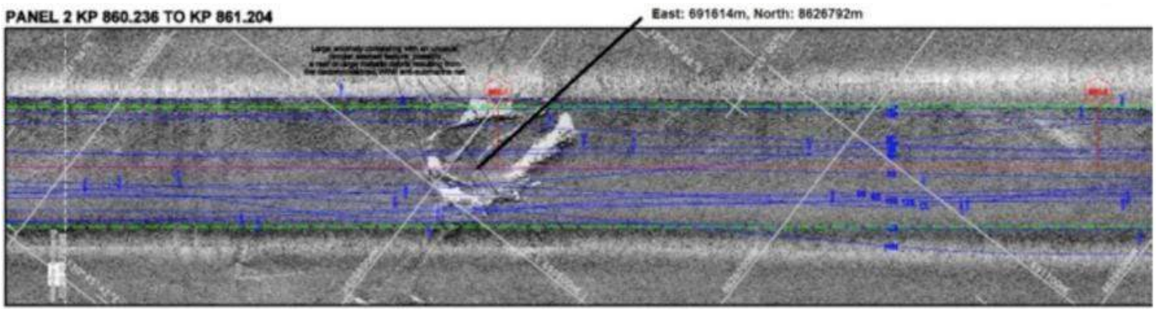

Figure 47: SSS image of Contact 2, taken during 2012 geophysical surveys for INPEX GEP. (Source: CA 2012).

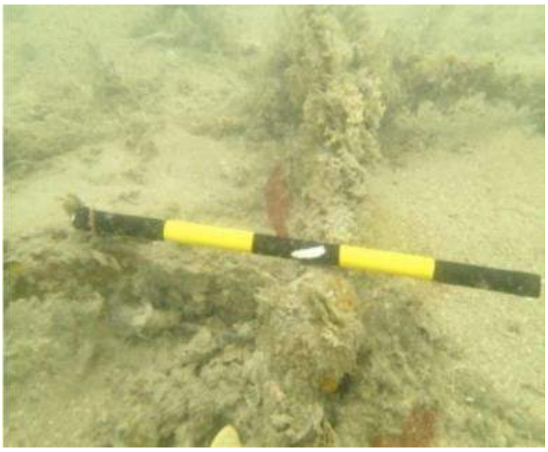

Figure 48: Remains of anti-submarine netting recorded at contact 2. (Source: CA 2012).

Figure 49: Collection of mechanical time fuses and fuse cones located at Contact 2. (Source: CA 2012).

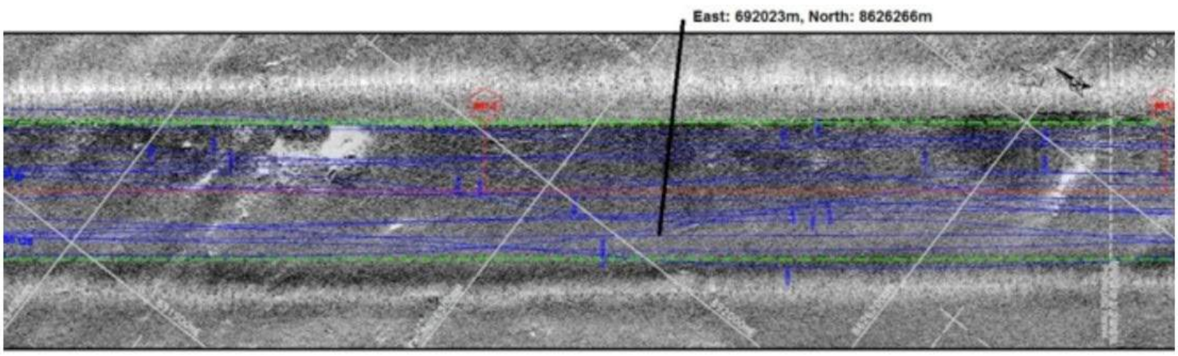

Figure 50: SSS image of Contact 3, taken during 2012 geophysical surveys for INPEX GEP. (Source: CA 2012).

Figure 51: Image of the two parallel lies of communication cable laying on sea floor. (Source: CA 2012).

Figure 52: Cross section of broken communication cable. (Source: CA 2012).

It appears from comparison of the SSS data from 2012 and 2018, that Contact 2 and Anomaly 242 are the same object, however new surveys show the INPEX GEP directly crossing the location (see Figure 47 and Figure 53). Adjacent to 242 is a series of small circular depressions, regularly spaced in several rows and uniform in size, 3-4m in diameter (Anomaly 149). The identity of these depressions is unknown, they may be related to either the anti-submarine defences or to the laying of the INPEX pipeline (see review of Anomaly 210 below). Despite the known location of ferrous material at Contact 2, no magnetometer strike was reported in the vicinity. Anomaly 240 is a high relief object rectangular in shape, potentially a mooring block related to the anti-submarine defences.

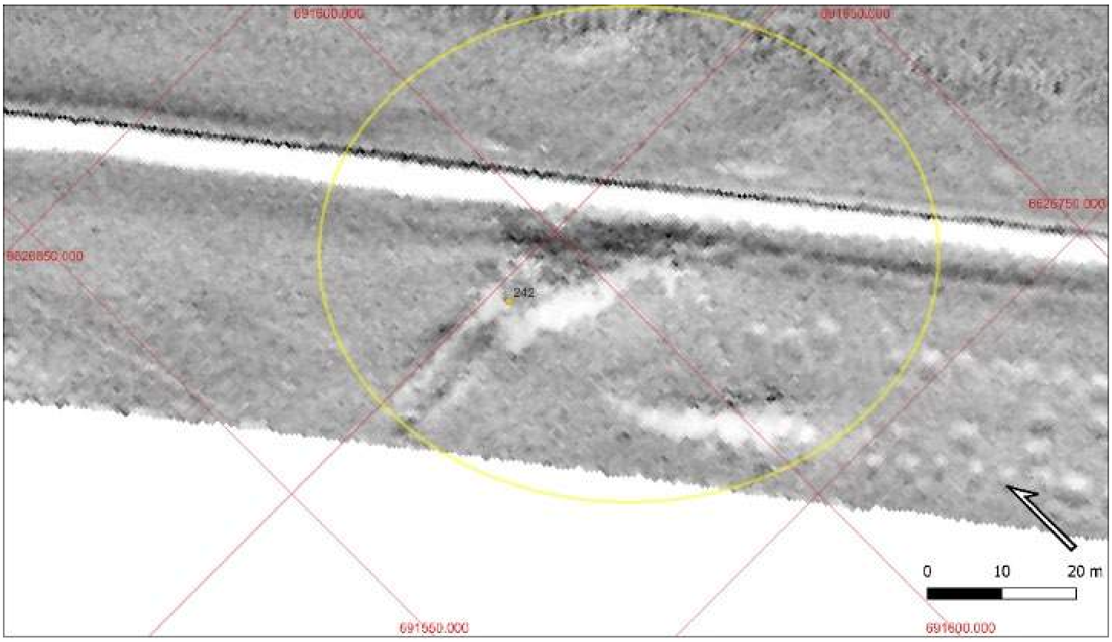

Figure 53: Anomaly 242 (circled in yellow). Note INPEX GEP crossing the target. Note circular depressions in lower right, designated Anomaly 149.

6.4.1.3 Cluster 3: KP 107-108 (anti-submarine boom net moorings)

Of particular interest is a cluster of targets located between KP 107 and 108 at a point directly between Mandorah and Dudley point at the entrance of Darwin Harbour (see Figure 54). A total of nine targets were identified within this 1km section of the proposed pipeline route, with five of those also registering as magnetometer targets, indicating the presence of ferrous materials. It was believed initially that some of these were related to WWII anti-submarine nets, identified by historical sources (see Section 4.3.3) and during CA investigations related to the INPEX project.[109] This conclusion was confirmed by ROV surveys conducted in June 2022 (see Section 7 and Annex A for summary of these surveys).

ROV surveys were conducted along three transects and identified a total of 11 moorings, including 10 large concrete clump weights and one ship's anchor (Target 164), repurposed as a mooring. These moorings were connected by heavy gauge chain and spaced roughly 60m apart. Three "trots", lines of mooring weights connected by chain, were identified within the geophysical survey corridor, and were visually inspected during ROV surveys.

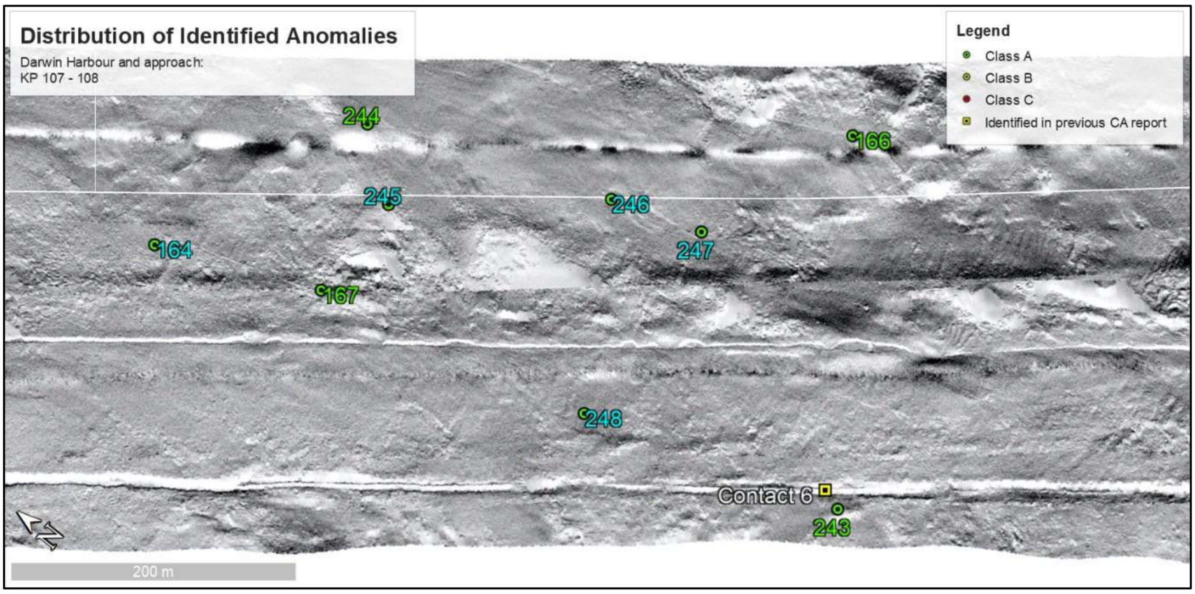

Figure 54: Identified geophysical survey anomalies between KP 107 and 108, overlaid on SSS data. Targets with blue labels are also magnetometer strikes. Contact 6 identified with yellow square.

Target 243 is approximately in the close vicinity of a mooring block (Contact 6) surveyed by CA in 2012. Contact 6, located at 693193 m E and 8624761 m N, was determined to be a structure related to an anti-submarine boom net installed during WWII (see Figure 55-56):

> *Contact 6 is a section of the mooring system for the WWII anti-submarine boom net. On the southern end of the site is a large concrete mooring block approximately 1.6 metres long, 1.4 metres wide and 0.8 metres high* [Figure 56]. *The block is sitting proud of the sea floor and there is some minor scouring around the base. On the north and the south sides of the mooring block are two large iron loops approximately 200mm from the bottom. Connected to these loops are stud link chains (350mm long, 230mm wide and 70mm across) leading off on a north and south axis* [Figure 57]. *The northern side of the chain extends for approximately 5 metres before disappearing into the sea floor. The southern side of the chain extends for approximately 7 metres before disappearing into the sediment. Although there would have originally been chain and wire rope that*

[109] *Op. Cit.* **Cosmos Archaeology, 2012**:14.

connected this mooring system to the anti-submarine net there is no indication of the chains or net left in this area. [110]

The high presence of ferrous material in this location, not associated with the existing pipelines, and sonar contacts supports the theory that most, if not all, of these targets are cultural in origin. Anomaly 245 presents as a magnetometer strike in an area of extensive rocky material. Lines seen on sonar running NW to SE are possibly remains of undersea cables installed during the 1870s (see Section 4.3.3). Note similarity in SSS image of Contact 6 (Figure 55) and Anomaly 166 (Figure 58). These two targets are approximately 250 m apart in a straight line between Mandorah and Dudley's Point.

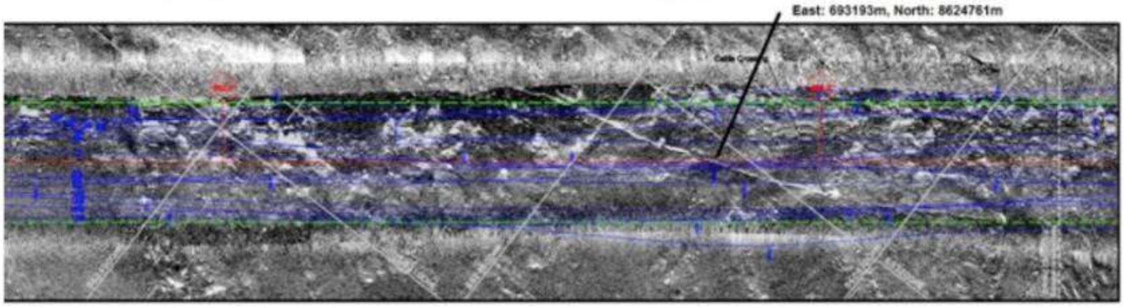

Figure 55: SSS image of Contact 6 taken during 2012 geophysical survey. Location 693193 m E and 8624761 m N.

---

[110] Op. Cit., Cosmos Archaeology, 2012, p.14.

6.4.1.4 Cluster 4: KP 108 – 110 (magnetic anomalies)

Centred at KP 109 is a cluster of magnetometer targets potentially unrelated to the existing Bayu-Undan and INPEX GEPs. Although only two geophysical anomalies were identified by review of SSS and MBES, there are an additional 10 magnetometer strikes located at least 20m away from the existing pipelines. Faint lines seen on the seabed indicate that these magnetometer strikes are possibly the remains of undersea cables, anti-submarine defences, or debris associated with the pipelines (Figure 59). Anomaly 174 was designated class A and listed as potentially associated with a magnetometer strike. ROV survey was conducted on Target 174, and identified the target as a possible winch, windlass or ship's bollard with rope still coiled around the object (see Section 7.2).

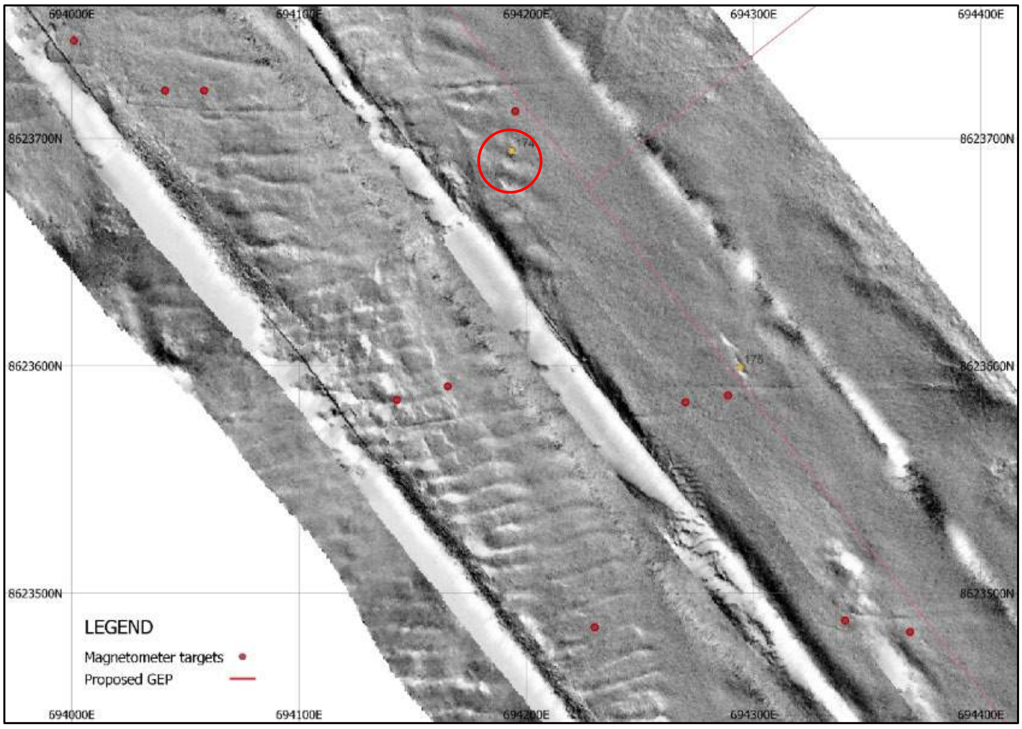

Figure 59: Location of magnetometer strikes and geophysical survey anomalies around KP 109. Note linear features along magnetometer targets. Anomaly 174 circled in red.

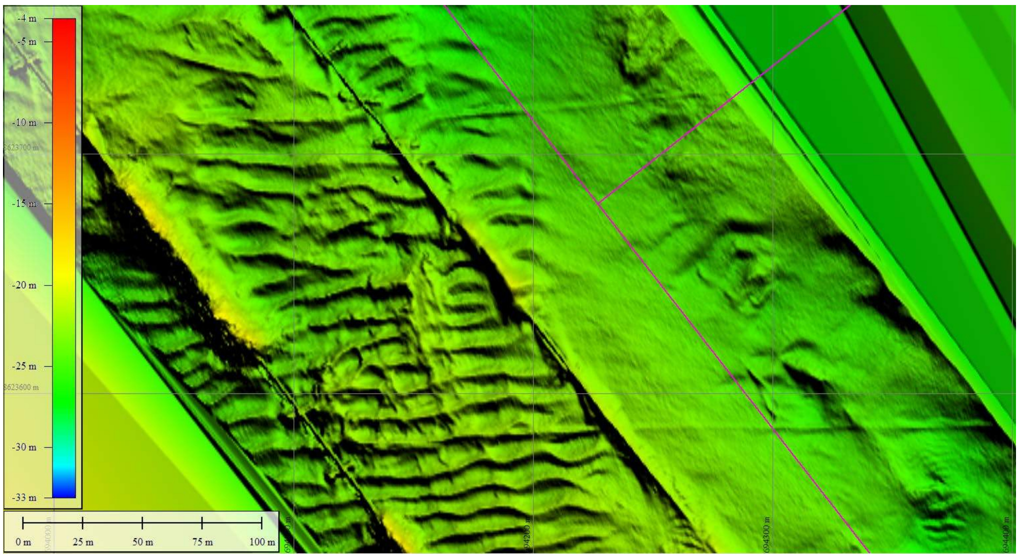

Figure 60: High resolution MBES data of same area, showing linear features near KP 109.

6.4.1.5 Cluster 5: KP 112 – 114 (debris scatters)

Around KP 113, between KP 112 and 114, is a cluster of six geophysical survey anomalies. Three are classed as category A and three are classed as category B, and no magnetometer strikes were recorded in the vicinity. One anomaly, 191, presents as a single high relief object approximately 8m in length and roughly the shape of a small boat. The remaining four targets appear to be either debris scatters or natural features.

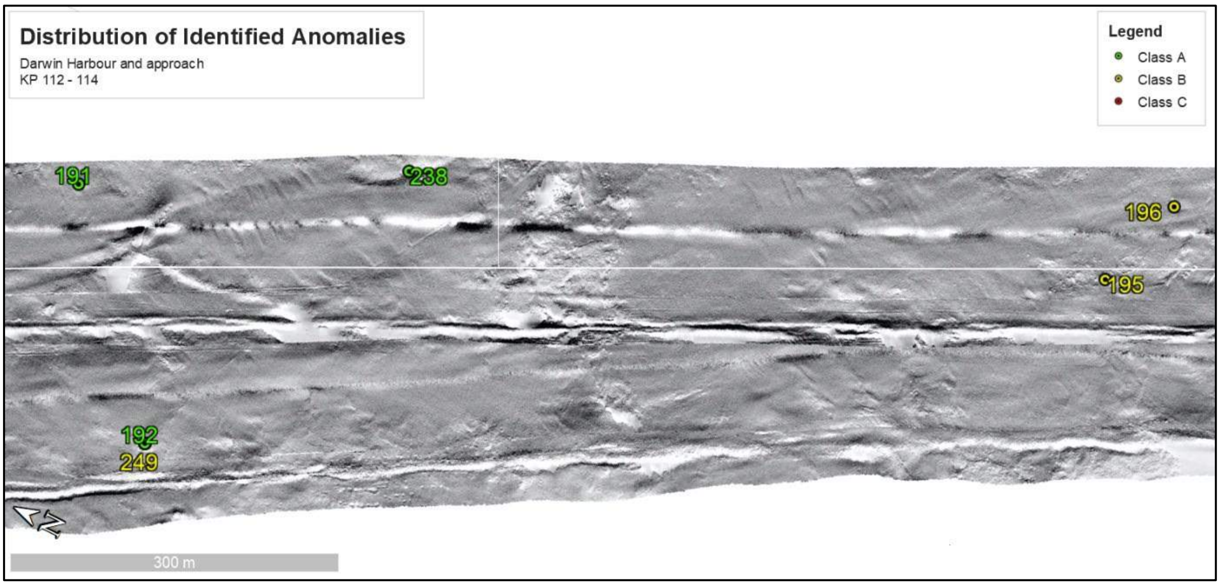

Figure 61: Cluster of geophysical survey anomalies between KP 112 and KP 114.

6.4.2 *Isolated Class A anomalies*

Anomaly 234: KP 54 – 55 (single mound, low relief)

Anomaly 234 appears to be, from SSS, a small mound of low relief, approximately 5m x 4m. It is in the general area of the known location of the 1871 subsea cable and may be related. Anomaly 234 is approximately 173m from the centreline of the proposed GEP route.

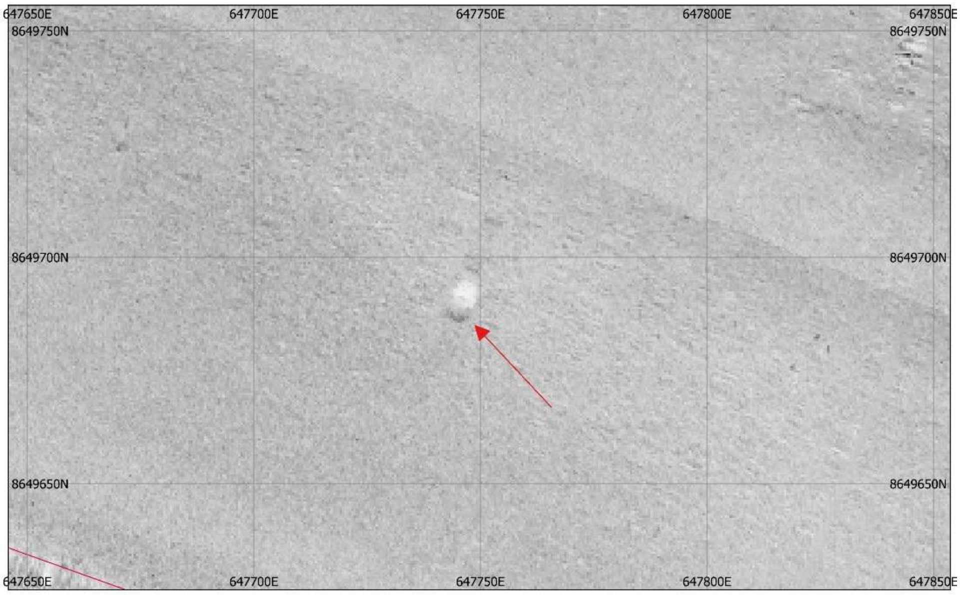

Figure 62: SSS view of anomaly 234.

Anomaly 138: KP 97 – 98 (mound in proximity to anchor scars)

Anomaly 138 appears on SSS to be a relatively large mound, measuring 13m by 16m, and is in close proximity to a pair of gouges on the seabed, crossing in an "X" pattern, identified as C Class anomaly 236. It is believed that these gouges are likely anchor scars. Both gouges are approximately 75m long and 6m wide.

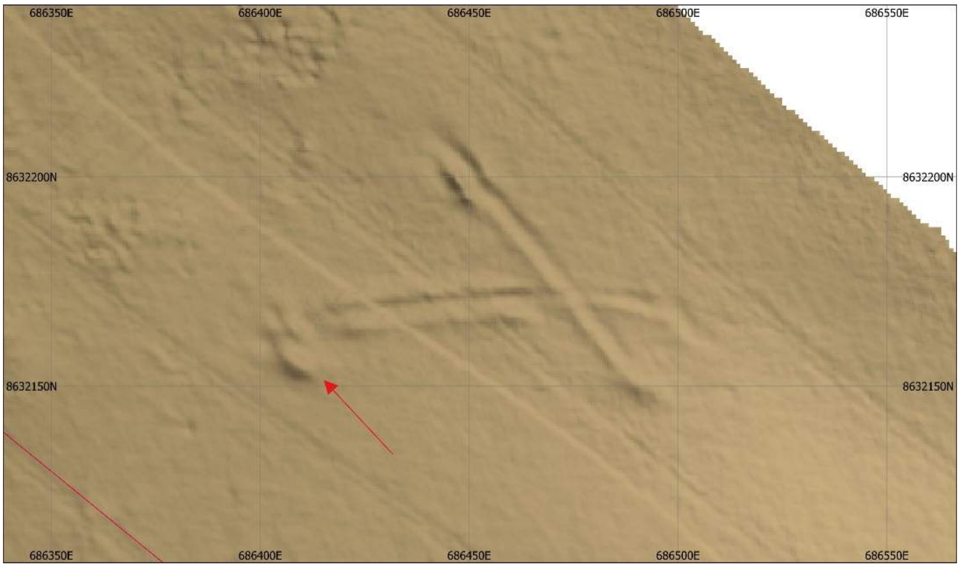

Figure 63: MBES image of Anomaly 138 with associated seabed gouges in X pattern. Anomaly 138 marked by red arrow.

Anomaly 239: KP 115 – 116 (USAT Mauna Loa)

Anomaly 239 is located at approximately KP 116 and is identified as the wreck site of USAT *Mauna Loa. Mauna Loa* was a steel hulled US military cargo ship, measuring 410 feet in length, 54 feet in depth, and 5,436 tons. The vessel was sunk by Japanese aircraft during a raid on Darwin on February 19, 1942, resulting in five casualties (see Section 4.3.1, Figure 19, and Figure 21).[111] Although the upper portions of the wreck were removed during salvage operations between 1959 and 1960, the lower portion of the wreck, and its cargo, is largely intact. Cargo remains include motorbikes, ammunition, gun carriers, and trucks.[112] The wreck is well known and protected under the *UCHA 2018, Northern Territory Heritage Act 2011,* and may be protected by the *SMCA 2004* (USA).

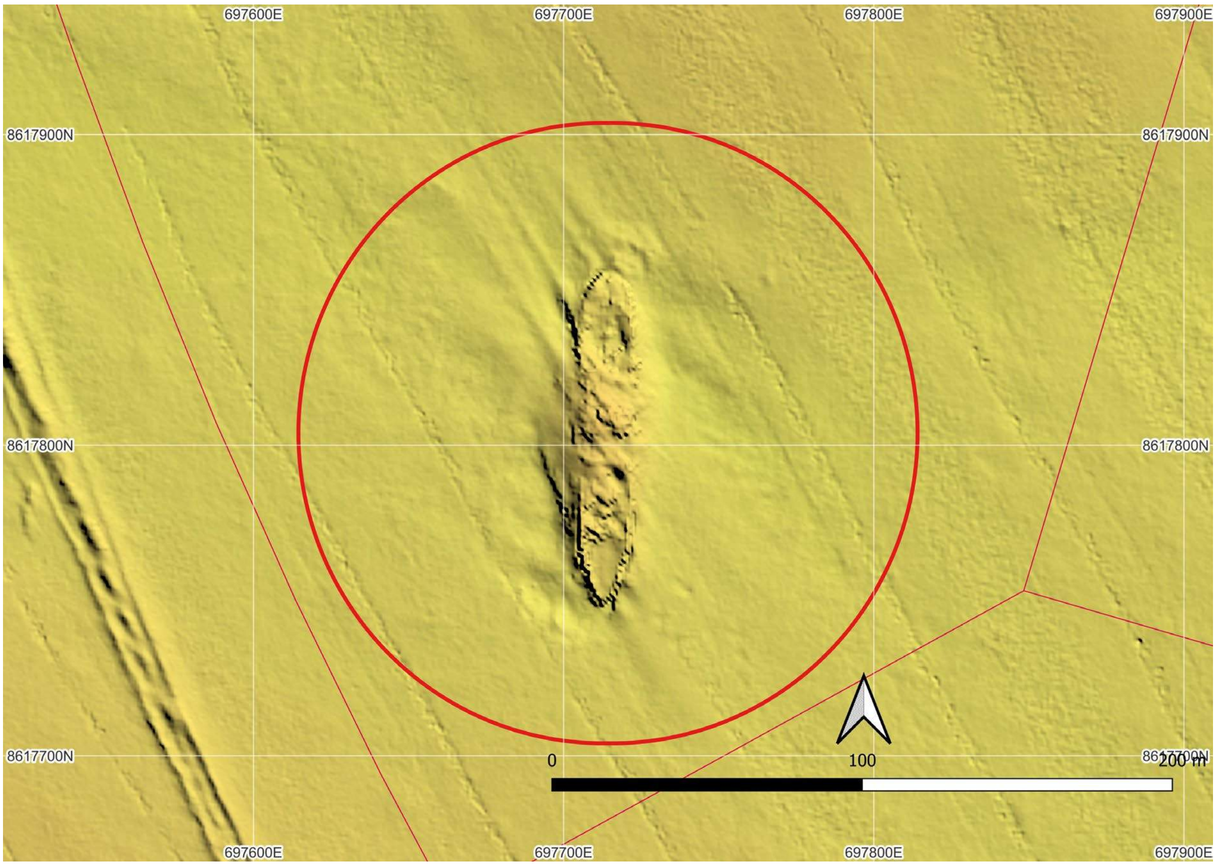

Figure 64: MBES image of anomaly 239, the USAT Mauna Loa. Statutory protection zone represented by red circle.

[111] **AUCHD,** shipwreck ID: 3503.
[112] **AUCHD,** shipwreck ID: 3503.

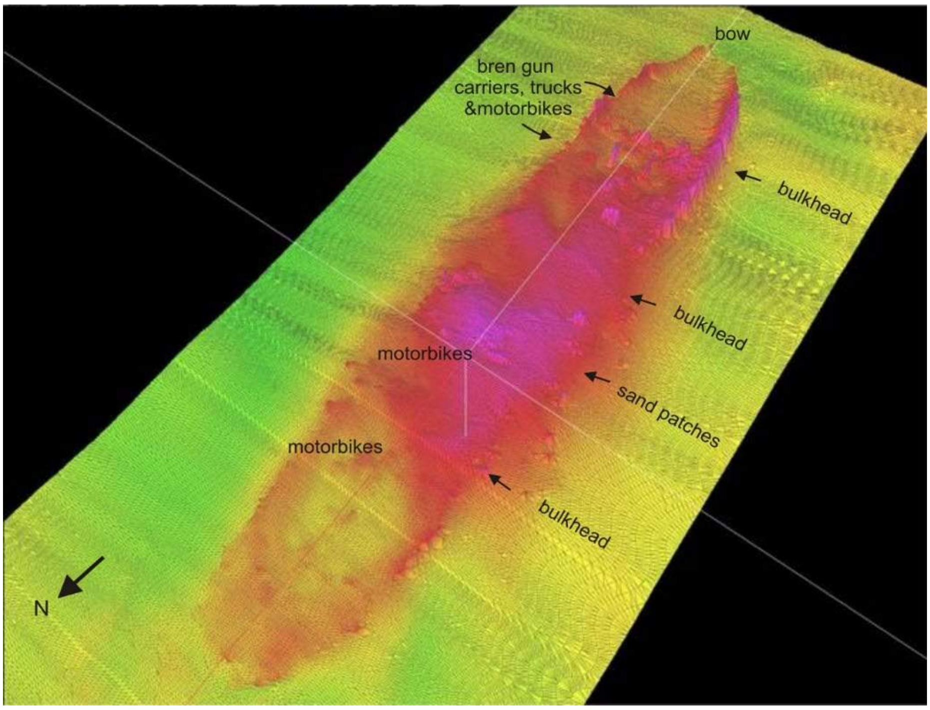

Figure 65: 2012 multi-beam sonar image of USAT Mauna Loa.[113]

Anomaly 210: KP 121 – 122 (unidentified debris)

Anomaly 210 is located between KP 121 and 122, approximately 360 m south of the proposed GEP route. The debris is unidentified, and due to the lack of comprehensive magnetometer data, it is unknown whether any ferrous material is present at the site. The shape of the debris bears a passing resemblance to known aircraft wrecks in the area, including five Consolidated Catalinas wrecked on the opposite side of Wickham Point, East Arm, Darwin (see Figure 67 and Figure 68). The size of the debris is approximately 12m by 7m - closer to the size of military fighter aircraft known to have operated over Darwin during World War II, such as RAAF Supermarine Spitfires (9m long fuselage and 11m wingspan), USAAF Curtiss P-40E Kittyhawks (9.6m long fuselage and 11.4m wingspan) and IJNAF Mitsubishi A6M2 “Zeros” (9m long fuselage and 12m wingspan). There are eight as yet unlocated World War II fighter aircraft wrecks that could potentially be situated within the study area – including six USAAF Kittyhawks, one RAAF Spitfire, and one IJNAF Zero (see Section 4.4.2).

[113] **AUCHD,** shipwreck ID: 3503.

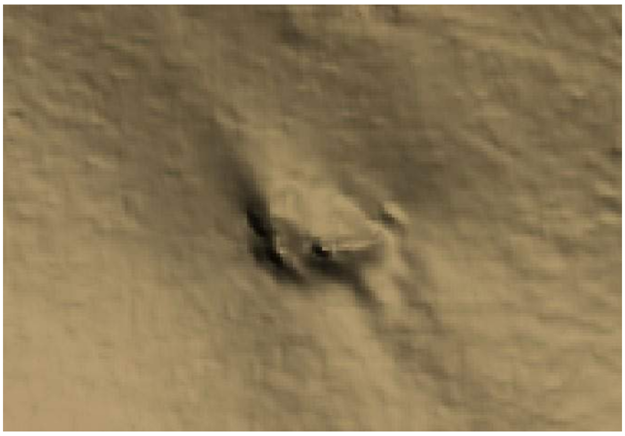

Figure 66: Anomaly 210, unidentified debris.

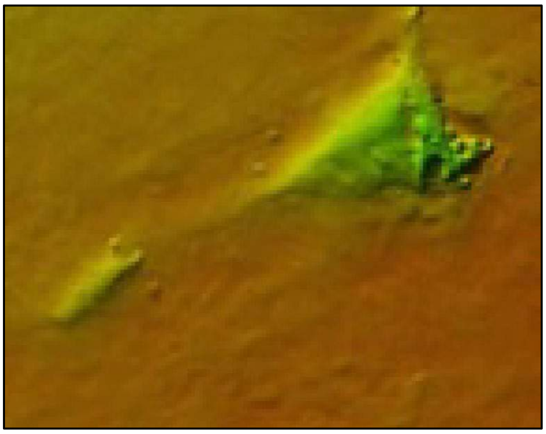

Figure 67: High resolution SSS image of Catalina 3, wrecked at East Arm.[114]

6.4.3 *Isolated Class B & C anomalies*

- *Anomaly 233: KP 46 – 47 (triangular depression)* - Anomaly 233 is a large triangular depression measuring roughly 39m by 8m. It was not identified as a magnetometer target and is likely a natural feature.
- *Anomaly 115: KP 56 – 57 (parallel depressions)* – Anomaly 115 is an isolated set of rectangular depressions measuring approximately 8m by 4m and may represent an area of debris or a natural feature.
- *Anomaly 130: KP 73 – 74 (possible debris field)* – Anomaly 130 is an area of numerous small, low-lying objects across a field approximately 18m by 8m. This likely represents a debris field, possibly of discarded objects, or an area of loose rocky seabed, which is incongruous with the surrounding flat sandy seabed. MBES and magnetometer survey did not cover Anomaly 130.
- *Anomaly 140: KP 101 – 102 (navigational buoy mooring)* – Anomaly 140 was determined to be in the same location as navigational buoy 5, used as a guide for the Port of Darwin shipping lane. Images seen on SSS and MBES are most likely the mooring and mooring line for Buoy 5.
- *Anomaly 141: KP 102 – 103 (possible field of large debris)* – Anomaly 141 is an area of several large, high-profile ridges across a total area measuring 53m by 20m, with each individual portion measuring 6 – 12m across. Objects are likely natural rocks, as similar features become more frequent following KP 113, or are cultural in origin, possibly indicating a dump site.
- *Anomaly 142: KP 102 – 103 (possible debris)* – Anomaly 142 is located approximately 150m southwest of Anomaly 141 and lays on the proposed GEP route. 142 appears similar to 141 on MBES, and on SSS appears as several relatively high-profile objects in a field roughly 13m by 8m.
- *Anomaly 235: KP 96 – 97 (anchor drag)* – Anomaly 235 is an anchor drag, vaguely U-shaped and measuring 244m in total length and 5m in width.

---

[114] **AUCHD,** Aircraft Id: 8072.

6.4.4 Isolated Magnetic Anomalies

Three isolated magnetic anomalies were detected during magnetometer surveys. One is located beyond 50m from the proposed GEP route, one located approximately 35 m from the route, and one is located 6.4 m from the proposed route. These anomalies are inferred to be buried ferrous debris. Thus, these targets may represent buried cultural items.

- *MA_001: KP 115.846* – inferred buried debris, 13.3 nT magnetic intensity, 35.3m from GEP route. This magnetic anomaly was initially thought to possibly be associated with USAT *Mauna Loa,* because it is located approximately 65m from the wreck site. MA_001 was inspected during ROV survey and confirmed to be the remains of a buoy mooring.
- *MA_007: KP 111.508* – inferred buried debris, 21.5 nT magnetic intensity, 6.4m from GEP route. MA_007 was inspected during ROV survey. An unidentified metal structure was seen at the location of MA_007 and was assessed as cultural in origin. This structure may represent wreckage remains or discarded debris.
- *MA_031: KP 117.376* – inferred buried debris, 34.3 nT magnetic intensity, 145.6m from GEP route.

7 ROV SURVEY

7.1 Conduct of field survey

As part of environmental and heritage impact assessments, a geophysical survey was conducted, including multi-beam bathymetry (MBES), side scan sonar (SSS), and magnetometer surveys, to identify locations of potential cultural material (see Section 6). Review of the available geophysical survey data identified forty targets of possible cultural origin (see Section 6.3). Sixteen of these targets were located within 50m of the proposed GEP route and were shortlisted for visual survey to potentially confirm their identity and significance (Figure 69). In addition to these individual targets, three transects were planned solely for heritage purposes in the location of known WWII anti-submarine netting (Figure 70). The sixteen chosen targets were inspected over the course of three days between 6-8 June 2022.

Figure 68: Location of ROV survey shortlisted targets. All targets located between KP 102 and KP 118.

Figure 69: Location of ROV survey heritage transects between KP 107 and KP 108.

The objectives of this ROV survey were to:

> *Visually inspect targets identified through geophysical data for their potential cultural heritage significance and recommend measures to reduce impacts to their cultural heritage values.*

The underwater heritage survey was conducted with the use of an ROV, operated by crew from FUGRO under the direction of the maritime archaeologist. The features believed to be the anti-submarine net mooring trots were surveyed along transects following the features in a linear pattern. Isolated targets were targeted by dropping a clump weight with a buoy attached on the target coordinates while the vessel was moving, and then following the buoy line to the seabed with the ROV once the vessel was anchored. Once on the bottom, the ROV was manoeuvred in cross shaped search patterns, 10m out in each cardinal direction, using the clump weight as a reference point.

The ROV was battery powered and controlled remotely by the pilot from inside the survey vessel cabin. Because the ROV was not equipped with transponders or any location fixing devices, the exact location of the ROV had to be estimated based on identifiable features on the seabed that could be compared to MBES data, course headings, and position relative to the survey vessel.

7.2 Summary of ROV survey findings

In total, 21 ROV dives were attempted to locate and identify potential cultural objects identified in the marine geophysical survey. Of these 21 dives, 3 were aborted due to poor conditions or issues with the ROV. Despite these failed attempts, ROV surveys were conducted on all 16 targets shortlisted for ROV survey.

Remains of historic maritime infrastructure were identified during the ROV surveys (Figure 71). The remains of WWII anti-submarine boom net moorings were clearly identified by the three heritage transects.

Figure 70: ROV survey shortlisted target locations overlaid on map of known historic maritime infrastructure in Darwin Harbour.

Heritage Transects 1, 2, and 3 identified the remains of WWII anti-submarine net moorings near the entrance to Darwin Harbour. It was concluded based on these surveys that the northern and southern mooring trots (Transects 2 and 3) did not cross the proposed GEP route (Figure 72). It was noted that the northern end of the trot surveyed by Transect 2 was anchored with a potentially historical ships anchor.

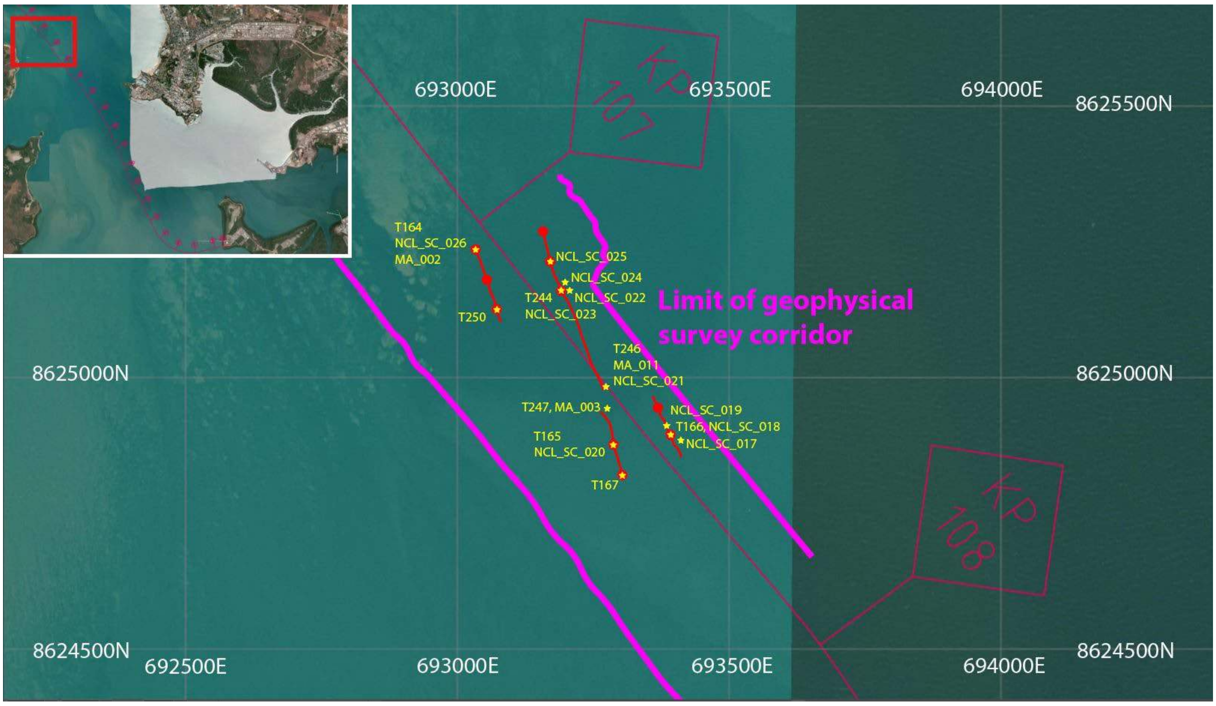

Figure 71: Location of anti-submarine net trots identified during ROV surveys. Circles represent mooring blocks/anchors, lines indicate chains in between blocks, stars represent geophysical survey anomalies, with IDs.

ROV survey of the middle trot (Transect 1) identified mooring chains that did cross the proposed GEP route. However, it was also seen that a gap exists between sections of the chain, southeast of the location of Target 246, which was not located.

Individual dives on 10 isolated heritage targets identified 6 instances of natural features, not considered to be cultural in origin. The remaining four are conclusively cultural. All three heritage transects identified cultural remains. Table 11 summarizes the results of the survey of these features. The full summary of the ROV survey is attached to this report as Annex A.

7.3 Interpretation of survey results

7.3.1 *Anti-submarine net mooring trots (Heritage Transects 1, 2, and 3)*

In response to the threat of a Japanese invasion, a network of anti-submarine infrastructure was constructed around Darwin Harbour. This included the construction of a 6 km-long anti-submarine boom net, between Dudley Point and West Point (see sections 4.2.6, 4.3.3). Indicator loops and sonar systems were also put in place at the entrance to Darwin Harbour to detect any ships moving near the boom gates.

The submarine boom net was anchored to the seabed with 5- and 8-ton concrete clumps. A total of 265 clumps were used for the boom, which were arranged in groups of eight. Each group of eight clumps was called a "trot" and each trot was laid out 195 ft (~60m) apart, perpendicular to the axis of the submarine net. The clumps were connected by 2" chain.

ROV surveys visually identified the locations of nine mooring clumps, and one ship's anchor repurposed as a mooring clump, representing three separate trots. The locations of the three trots located during the ROV survey correspond roughly to trots 16, 17, and 18 shown on historic charts (see Figure 73).

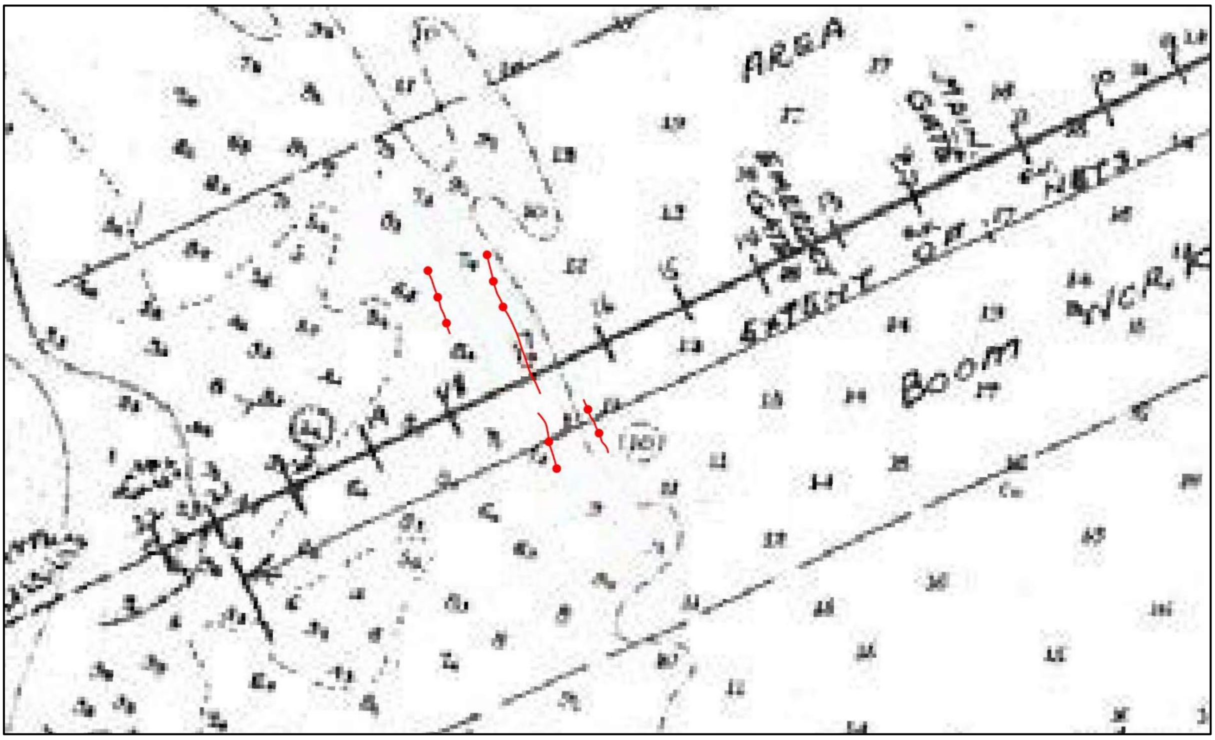

Figure 72: Historic chart of WWII anti-submarine boom net mooring trots overlaid with location of clump weights and chain identified by ROV (in red).

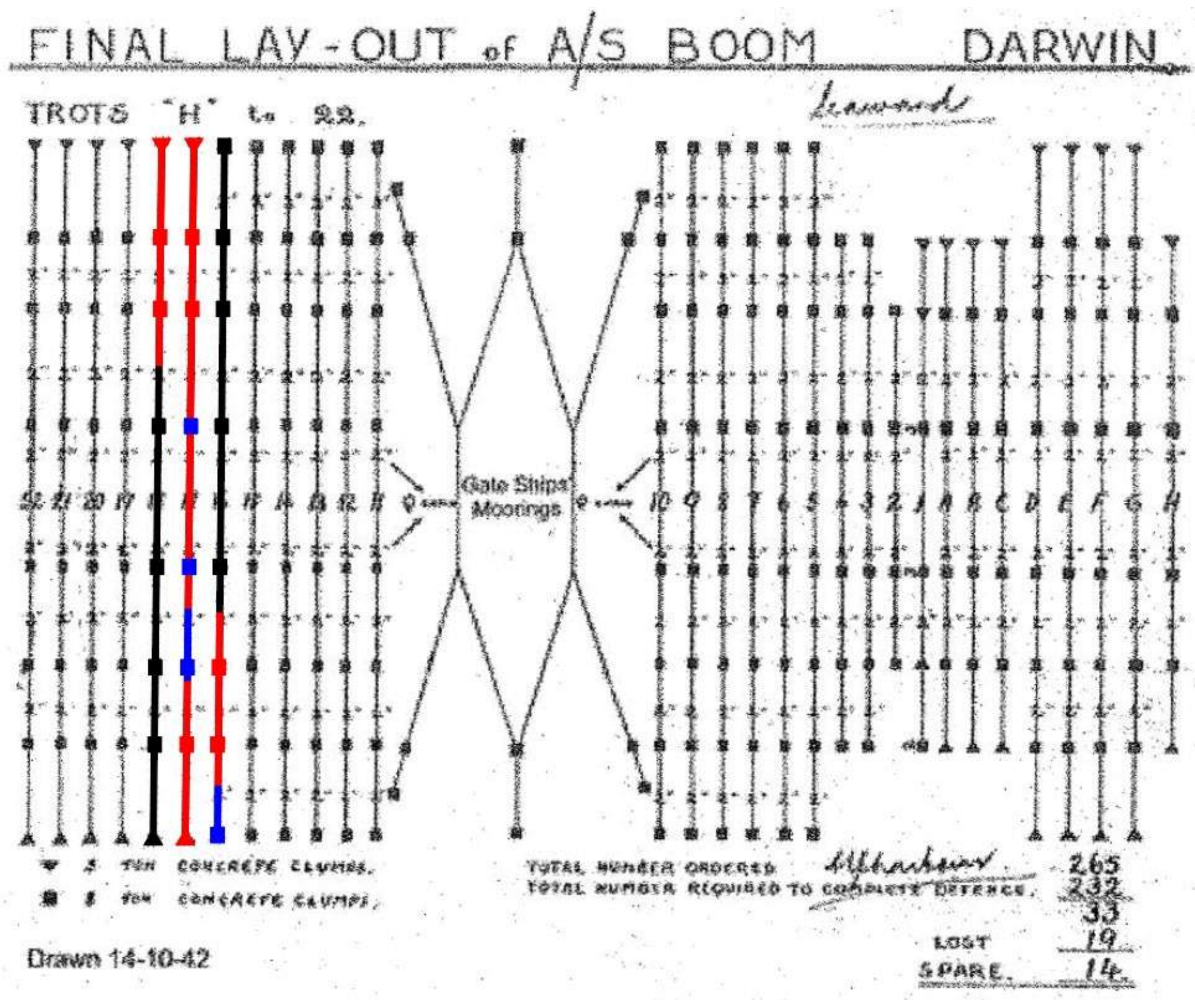

Figure 73: Schematic of anti-submarine net trots, with surveyed net trots highlighted. Clump weights shown by rectangles and triangles and chain shown by lines. Red represents features identified during ROV survey, blue represents features that were missing, and black represents features that were omitted from the survey.

Heritage Transect 1 (Trot 17)

Heritage transect 1 corresponds with the location of trot 17, and is the central trot of the three surveyed. Five mooring clumps were identified along this trot, two on the southern end, including the southernmost clump, and three on the northern end, including the northernmost clump. The location of the other three mooring clumps is unknown. The entire length of the trot is approximately 482m.

The chain ran continuously between the Clump 8 (northernmost) to around the location of where the Clump 4 should have been. At this location, there was a break in the chain, with an array of metal chain branching in multiple directions. The nature of this structure is unknown; however, it is clearly connected to the chain and the northern clump weights. Likewise, the chain from Clump 1 (southernmost) was observed to run from Clump 1 to Clump 2 unbroken before disappearing near the location where Clump 3 should have been. There appears to be a gap between the southern section of the mooring trot and the northern section of approximately 20-30m where no chain or clumps were observed. Between Clumps 5 and 6, a large kink was seen in the chain, indicating that it had perhaps been dragged out of position by an anchor or trawler.

Four of the five clumps observed appeared to be the 8-ton trapezoidal concrete weights shown in Figure 30 in section 4.3.3. Clump 2 appeared on video as a twin set of concrete blocks.

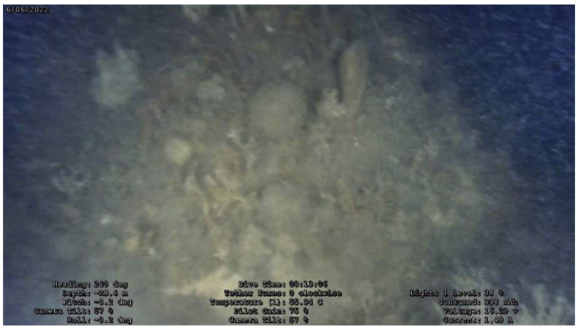

Figure 74: Clump 1 (aka geophysical target 167).

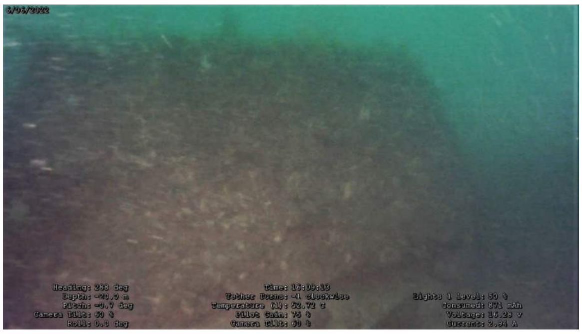

Figure 78: Trot 17, Clump 8 (not identified during geophysical survey).

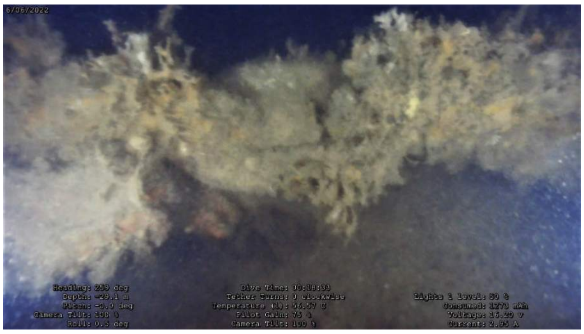

Figure 79: Detail of chain between Clumps 1 and 2.

Heritage Transect 2 (Trot 18)

Heritage Transect 2 corresponds roughly with the location of Trot 18 and is the western trot of the three surveyed. Three mooring clumps were observed by ROV survey comprising most of the northern half of the trot (Clumps 6, 7, and 8). Several of the southern clumps are clearly visible on geophysical survey data. Trot 18 is bisected by the Bayu-Undan GEP, with Clump 5 almost abutting the pipeline as seen on MBES and SSS data. The southern sections of Trot 18 were not surveyed, as their proximity to the existing GEP and their distance from the proposed GEP indicated they are unlikely to be impacted by the proposed works.

The chain ran continuously from Clump 6 to Clump 8, with no breaks or kinks. Clumps 6 and 7 were observed to be the same trapezoidal concrete weights identified in Trot 17, with the same gauge chain connecting them. Clump 8 was unique however, as it consisted of a large ship's anchor that had apparently been repurposed as a mooring for the anti-submarine net. The anchor appeared to be an admiralty pattern style, with a long narrow shank and curving arms with triangular flukes. The anchor laid perpendicular to the seabed, with one arm buried and one arm standing proud from the seafloor. A large rectangular stock was observed, with what appeared to be metal bands wrapped around the sides, indicating that the stock is possibly (but very unlikely) of wooden construction. However, it was impossible to determine from ROV footage precisely what material was used for the stock due to the extensive marine growth covering it. The crown of the anchor was connected to the trot chain with a large D-shackle.

The ROV's depth gauge was used to measure the length of the visible arm by taking a depth reading at the top of the fluke and another at the seabed. The arm measured approximately 1.9m in length, while measurements taken from SSS data indicate that the total length of the shank is approximately 4m.

Figure 85: Trot 18, Clump 8, repurposed ship's anchor. Detail of stock and shackle connecting anchor to mooring trot chain.

Heritage Transect 3 (Trot 16)

Heritage Transect 3 corresponds roughly with the location of Trot 16 and is the eastern trot of the three surveyed. Two mooring clumps were observed by ROV survey, comprising a portion of the southern section of the trot (Clumps 2 and 3). The southernmost clump, Clump 1, was not observed on ROV survey or on geophysical survey data. The chain, running south from Clump 2, was observed to be severely kinked about 15m south of Clump 2 before ending abruptly. Further search of the area with ROV yielded no further evidence of the chain or Clump 1.

The chain ran continuously from Clump 2 to Clump 3 and extended north beyond Clump 3. It was decided to omit any survey of the northern section of the chain due to the distance from the proposed GEP route and the lack of geophysical survey data north of this location (see Figure 72 in section 7.2). Both clumps observed were 8-ton trapezoidal concrete weights.

Trot 16 had clearly been subjected to some disturbance, as the chain connecting Clumps 2 and 3 was heavily kinked and Clump 3 was observed to be upside down.

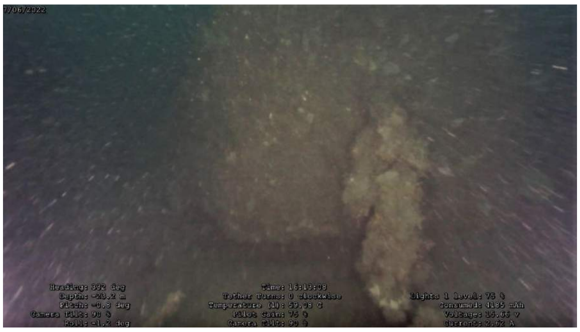

Figure 86: Trot 16, Clump 2 (aka geophysical anomaly 166).

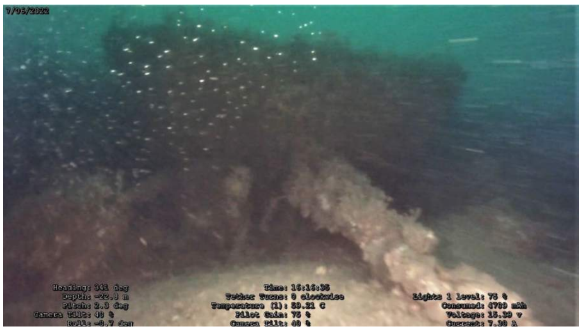

Figure 87: Trot 16, Clump 3. Note block appears to be flipped upside down.

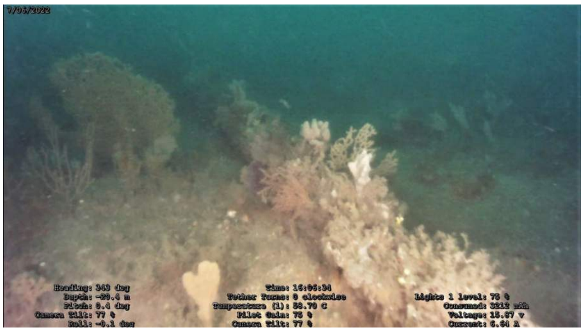

Figure 88: Chain between Clumps 2 and 3, Trot 16.

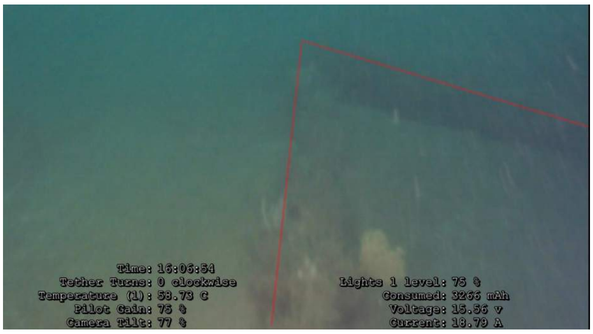

Figure 89: Chain south of Clump 2. Note right angle kink in chain (highlighted in red).

7.3.2 *Target 174 (winch, windlass, or bollard)*

Target 174 was located near KP 109, approximately 15m from the proposed GEP route. Investigation of the target by ROV found a small metal structure, reminiscent of a dumbbell weight, with two vertical protuberances sticking out of the seabed. The seabed around Target 174 was flat and sandy, relatively featureless, and showed no other debris or cultural material within the immediate vicinity of the target. A length of rope was observed wrapped around the centre of the object with a coil underneath one part. Initial identification suggested that the target was a small ship’s winch or windlass, or possibly a bollard. The lack of other identifiable cultural material in the area, i.e., wreckage, suggests that this is an isolated artefact that may have been deliberately discarded or accidentally lost. The exact nature of the cordage is unknown. If the rope is synthetic poly-rope, it would most likely be modern and not historically significant. If the rope is made of natural fibre, it is possible that the object is historic. Flexible steel wire rope has been in use since WWII and could represent historic cultural heritage.

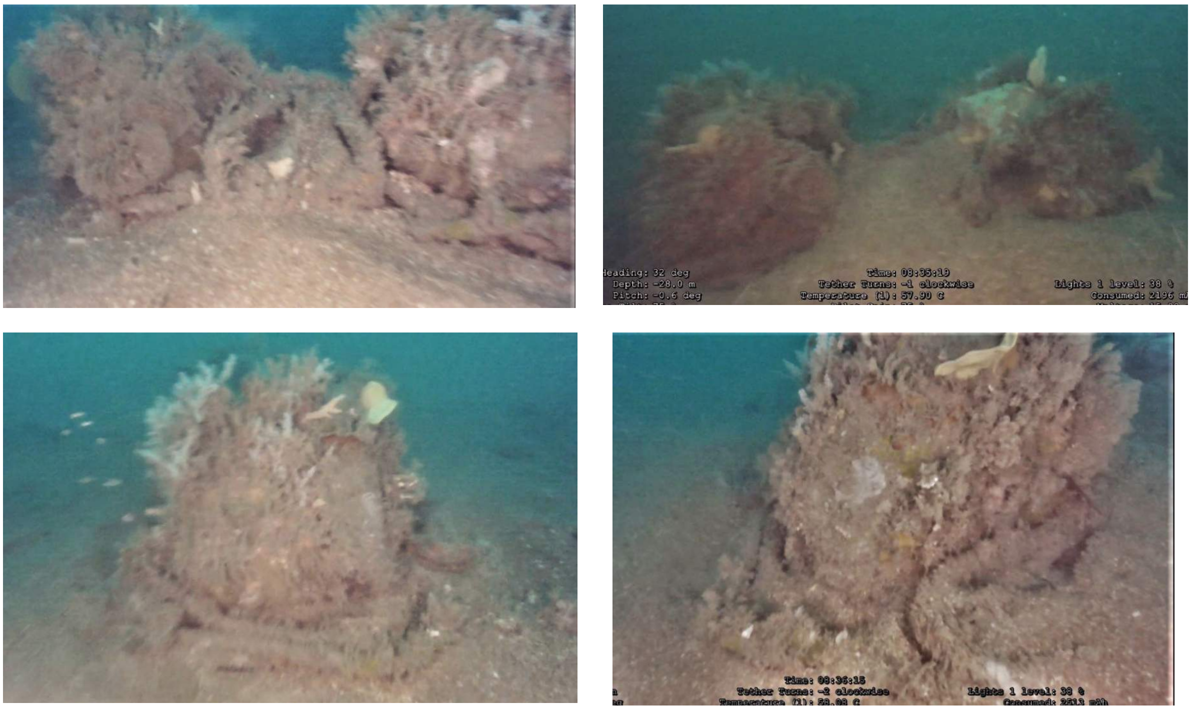

Figure 90: Images of Target 174 taken from ROV survey. Note rope wrapped around middle of structure.

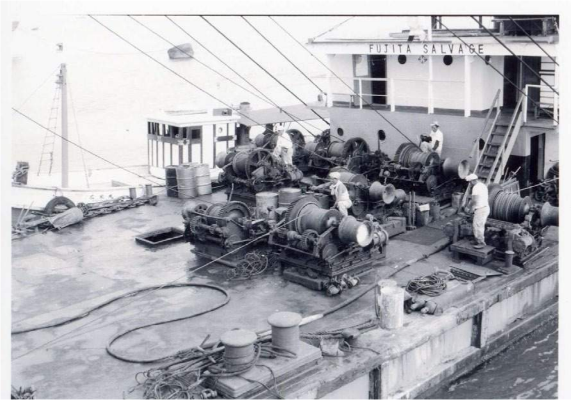

Figure 92: "Winches on the deck of Fujita Salvage Boat." Note bollard at bottom of picture.[116]

Figure 93: Small winch with rope used on Darwin working vessel, 1975.[117]

7.3.3 *MA_007 (unidentified metal structure)*

Target MA_007 was identified during geophysical surveys as a magnetic anomaly, with no discernible images seen on MBES and SSS. The target is located approximately halfway between KP 111 and 112 and is roughly 6m from the proposed GEP route.

ROV survey identified a field of debris located in a mostly sandy seabed. The debris was partially buried and had a low relief above the seabed. The primary artefact observed was a rectangular metallic structure made up of multiple rows of connected small beams. It was not possible to take measurements with the ROV, so the full scale and size of the structure, along with its composition, is unknown. The main structure is estimated to be roughly five metres long and 2 metres wide. Small fragments of apparently associated material were scattered around the primary structure in a debris field.

It is unknown, with the data available, whether Target MA_007 represents the wreckage of a vessel or aircraft, deliberate or accidental discard of materials, or disarticulated maritime infrastructure. The main structure bears some resemblance to historic photographs of small work barges as well as the internal support structures of some aircraft hulls and wings. Further investigation is needed to conclusively identify what the remains are likely to be.

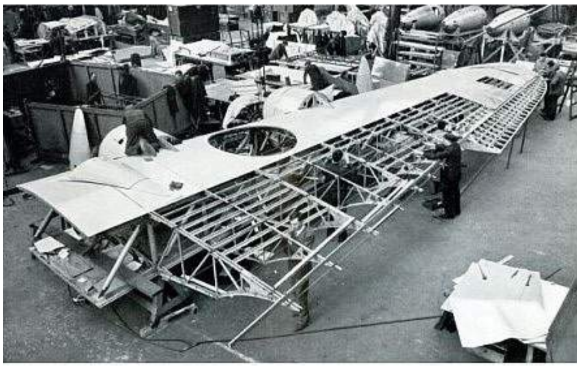

Figure 95: Short Empire flying boat wing under construction, showing structure of internal supports.

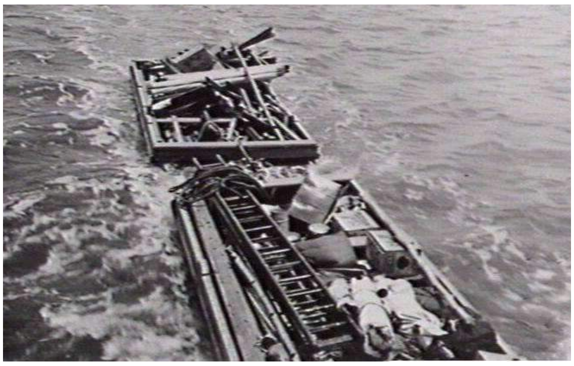

Figure 96: "Barges with materials for leper station being towed across harbour" 1937.[118]

7.3.4 *MA_001 (buoy mooring)*

Target MA_001 was identified during geophysical surveys as a magnetic anomaly, with no discernible images seen on MBES and SSS. The target is located approximately 150m north of KP 116 and is 35m from the proposed GEP route.

ROV survey identified three artefacts of cultural origin in the location of Target MA_001. The first located appeared to be a metal wheel rim and was mostly buried in sandy sediments. A small section of cable was observed protruding from the object. The second object, a length of metal cable with a loop tied in the end, was located a few metres away. It is believed that these two objects are related and represent the remains of a possible buoy mooring. The

[118] **Anon, 1937.** "Barges with materials for leper station being towed across harbour." Library & Archives NT, Australian Department of the Interior Collection, PH0125/0018.

wheel and cable are located within 70m of the wreck of USAT *Mauna Loa* and may be related to a navigational buoy used to identify the wreck site.

The third object noted was a piece of debris, likely concrete or metallic, with several wires protruding from the object. The exact composition of this artefact was impossible to determine by ROV survey, but may represent discard or a piece of wreckage, possibly from *Mauna Loa,* which was extensively salvaged in the 1950s (see section 4.3.1).

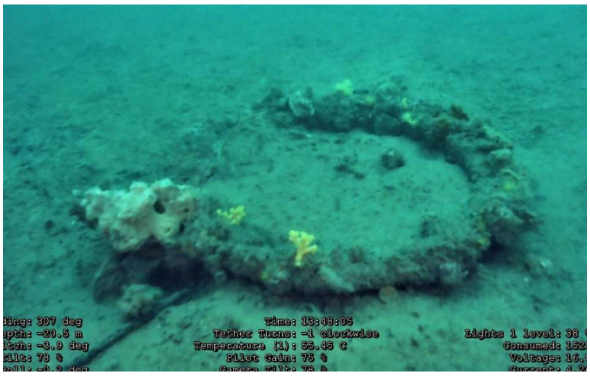

Figure 97: Metal wheel rim with cable protruding.

Figure 98: Mooring cable with loop at right of image.

Figure 99: Unidentified debris located several metres north of wheel rim and cable.

7.3.5 *NCL_SC_016 (cable)*

Target NCL_SC_016 was identified during geophysical surveys as a “likely cable support”, appearing as a small linear feature on SSS and MBES. The target is located approximately 145m north of KP 109 and is 25m from the proposed GEP route.

ROV survey located a section of cable lying on the seabed which appeared to be disarticulated at both ends. The section of cable was approximately 35m in total length with a width of less than 100mm. The precise make up and composition of the cable could not be determined by ROV survey, so its identity cannot be conclusively stated. The object is located in an area known to have contained 19th century telegraph cables (see section 4.3.3) and may represent a section of a cable that was cut or disarticulated.

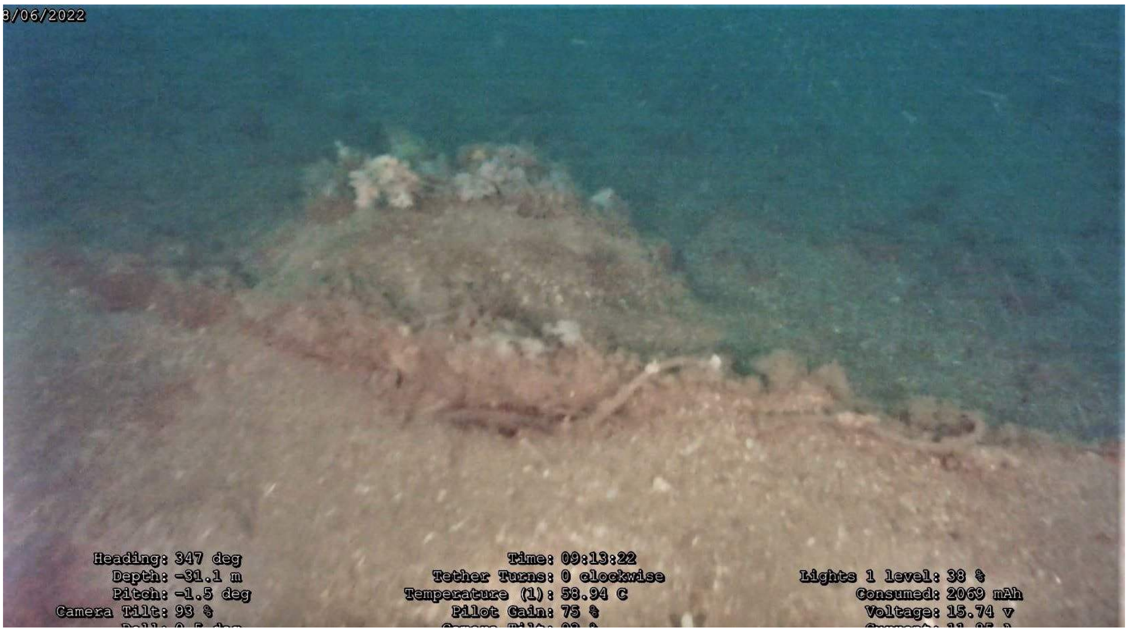

Figure 100: Detail of cable located at Target NCL_SC_016.

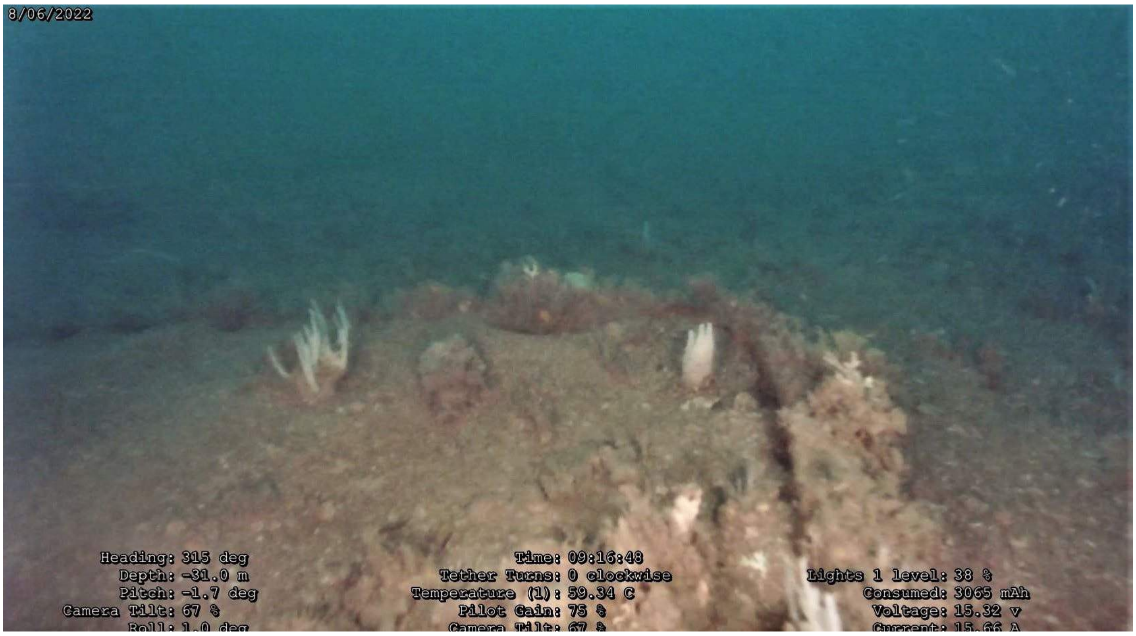

Figure 101: Detail of kink in cable.

8 DISCUSSION

8.1 Assessing cultural significance

Cultural Significance Criteria

All cultural objects have significance. The cultural significance of an object or a group of objects (a 'site') depends on what aspects of cultural activity the community values. In those jurisdictions where there are heritage laws, an established set of criteria is used to assess what objects or sites are eligible to be afforded greater statutory protection.

The Northern Territory *Heritage Act 2011* has provisions to declare a 'Heritage Place' or 'Heritage Object'. Such a declaration regulates activities within the site curtilage, hence protecting the site. To assist in the determination of whether a site, place, or object should be recommended for declaration under Part 2.2 of the Act, heritage assessment criteria (Part 1.2, Division 2, Section 11) have been established. The criteria are listed below.

A. *Whether it is important to the course, or pattern of the Territory's cultural or natural history;*

B. *Whether it possesses uncommon, rare or endangered aspects of the Territory's cultural or natural history;*

C. *Whether it has potential to yield information that will contribute to an understanding of the Territory's cultural or natural history;*

D. *Whether it is important in demonstrating the principal characteristics of a class of cultural or natural places or environments;*

E. *Whether it is important in exhibiting particular aesthetic characteristics;*

F. *Whether it is important in demonstrating a high degree of creative or technical achievement during a particular period;*

G. *Whether it has a strong or special association with a particular community or cultural group for social, cultural, or spiritual reasons, including the significance of a place to Aboriginal people as part of their continuing and developing cultural traditions;*

H. *Whether it has a special association with the life or works of a person, or group of persons, of importance in the Territory's history.*

The threshold for a site or object being declared is whether it can be demonstrated to have '…*special significance in the Territory'.* These cultural significance criteria have been adopted for this survey and all cultural objects found have been assessed against these criteria.

Cultural significance gradings

The Northern Territory heritage assessment criteria have been established to select sites/objects of 'special' significance to be protected. To date, no site/object found in the study area can be considered to have special significance. The significance of a site/object varies mostly depending on their rarity or representativeness and their condition; the latter point referring to the site/object's ability to provide information.

Table 12 provides five grades of cultural significance ranging from Minimal to Special. Identified cultural sites or objects have been assessed according to how well they may be able to contribute to the cultural heritage criteria set out in the Northern Territory Heritage Conservation Regulations.

Sites or objects can be considered of low significance if they are commonplace and recent even if they are associated with a significant individual or event. Such sites/objects, however, which are well preserved and are excellent representative examples can have an elevated level of significance. Higher significance tends to be given to those sites/objects which are older on the basis that such sites are rare and represent extinct or near extinct lifeways and/or technology. they can also be given higher significance because of their association with defining events in Northern Territory history; World War II being a good example.

Assessing the level of significance of each cultural object found will help determine what would be appropriate and proportionate mitigation measures against the proposed impacts. It may be sufficient for sites of low significance to be recorded *in situ* to a certain level before they are impacted. Other sites/objects could be considered significant enough to be excavated, relocated and/or recovered for conservation.

Table 12: Levels of cultural heritage significance.

Degree	Significance
Special	A rare or unique object or site in a relatively good state of preservation that provides an irreplaceable insight on the development of the Northern Territory and Australia. Eligible for listing as a 'Heritage Place' or 'Object'
High	A rare object or site type in a relatively good state of preservation that provides a new insight on the development of the Northern Territory and Australia.
Moderate	A rare object/site in a poor state of preservation or a common object/site in a relatively good state of preservation that provides an insight into the development of the Northern Territory.
Low	A common object or site type in a poor to fragmentary state of preservation that contributes to the understanding of the development of the Northern Territory.
Minimal	A ubiquitous object type, usually of recent manufacture, which provides little new information to the understanding of the development of the Northern Territory.

8.2 Preliminary evaluation

The following preliminary evaluation is based on the cultural significance of each of the 7 sites observed during the ROV surveys rather than individual objects (Table 13). Where the cultural significance of individual objects within a target varies, the significance rating of the target will be set to the highest rating object.

Table 13: Preliminary cultural significance assessments.

Target	Preliminary Significance Statement	Degree
Anti-submarine net Trot 16	WWII was a significant period in Australian and Northern Territory history and the remnants of the boom defence system related directly to the defence of Darwin Harbour during this period. Such items are rare as only a small number of boom defences were established in Australia during WWII. The anti-submarine defences of Darwin during WWII may have been the largest boom defence network in the world at the time. The boom defence mooring clumps and chains are *in situ* on the seafloor and in a good state of preservation. This makes them rare not only in the Northern Territory but in a National Context.	**High**

Target	Preliminary Significance Statement	Degree
Anti-submarine net mooring Trot 17	WWII was a significant period in Australian and Northern Territory history and the remnants of the boom defence system related directly to the defence of Darwin Harbour during this period. Such items are rare as only a small number of boom defences were established in Australia during WWII. The anti-submarine defences of Darwin during WWII may have been the largest boom defence network in the world at the time. The boom defence mooring clumps and chains are *in situ* on the seafloor and in a good state of preservation. This makes them rare not only in the Northern Territory but in a National Context.	**High**
Anti-submarine net mooring Trot 18	WWII was a significant period in Australian and Northern Territory history and the remnants of the boom defence system related directly to the defence of Darwin Harbour during this period. Such items are rare as only a small number of boom defences were established in Australia during WWII. The anti-submarine defences of Darwin during WWII may have been the largest boom defence network in the world at the time. The boom defence mooring clumps and chains are *in situ* on the seafloor and in a good state of preservation. In addition, the substitution of a conventional concrete mooring block with a repurposed ship's anchor increases the diagnostic value of this site by providing a unique display of adaptation and material scarcity during war time. The anchor itself is most likely of higher historic significance depending on its age and rarity. This makes them rare not only in the Northern Territory but in a National Context.	**High**
Target 174	The precise identity and nature of the object located at Target 174 cannot be conclusively determined based solely on a visual ROV survey. Further investigation would be needed to positively identify it within its historical context. However, if the object is a winch, windlass or bollard from a historic vessel its heritage significance could be substantially higher than if it was simply discarded. Target 174 is not believed to be part of a larger buried shipwreck.	Unknown, likely **Low**
MA_007	The precise identity and nature of the object located at Target MA_007 cannot be conclusively determined based solely on a visual ROV survey. Further investigation would be needed to positively identify it within its historical context. However, if the object is part of the wreckage of an historic aircraft or vessel, its heritage significance could be substantially higher than if it is discarded material.	Unknown, likely **Minimal** to **Moderate**
MA_001	The objects located at Target MA_001 are most likely the remains of a buoy mooring. Steel wire rope and steel wheel rims are commonly used as mooring devices across Australia, with numerous examples extant. The use of steel wire rope points to a likely late 20th century historical context. Not considered rare or culturally significant.	**Minimal**
NCL_SC_016	The precise identity and nature of the object located at Target NCL_SC_016 cannot be conclusively determined based solely on a visual ROV survey. Further investigation would be needed to positively identify it within its historical context. If the object is the remains of a 19th century telegraph cable, its cultural significance would be considerably higher than if it is modern material or discard.	Unknown, likely **Minimal** to **Low**

8.3 Potential impacts

Santos has advised that the pipeline will primarily be laid directly on the seabed. It is understood that trenching and placement of rock armour will be undertaken in several sections within Darwin Harbour (see Figure 103). The potential footprint of trenching has been identified as up to 40 m wide at top of batter due to use of cutter suction dredge. These sections include spans between KP 101 and 107, 110 and 114, 119 and 121, and 121 to terminus. It is understood, based on design documents provided by Santos, that five different trenching configurations will be used, types A2, C1b, D1, D3, and E. Cross sections detailing the designs of the five trench types are shown in Table 14.

Table 14: Trench type cross section. NSL - natural seabed level.

Trench Type	Cross Section
A2	C1b	D1	D3	E	

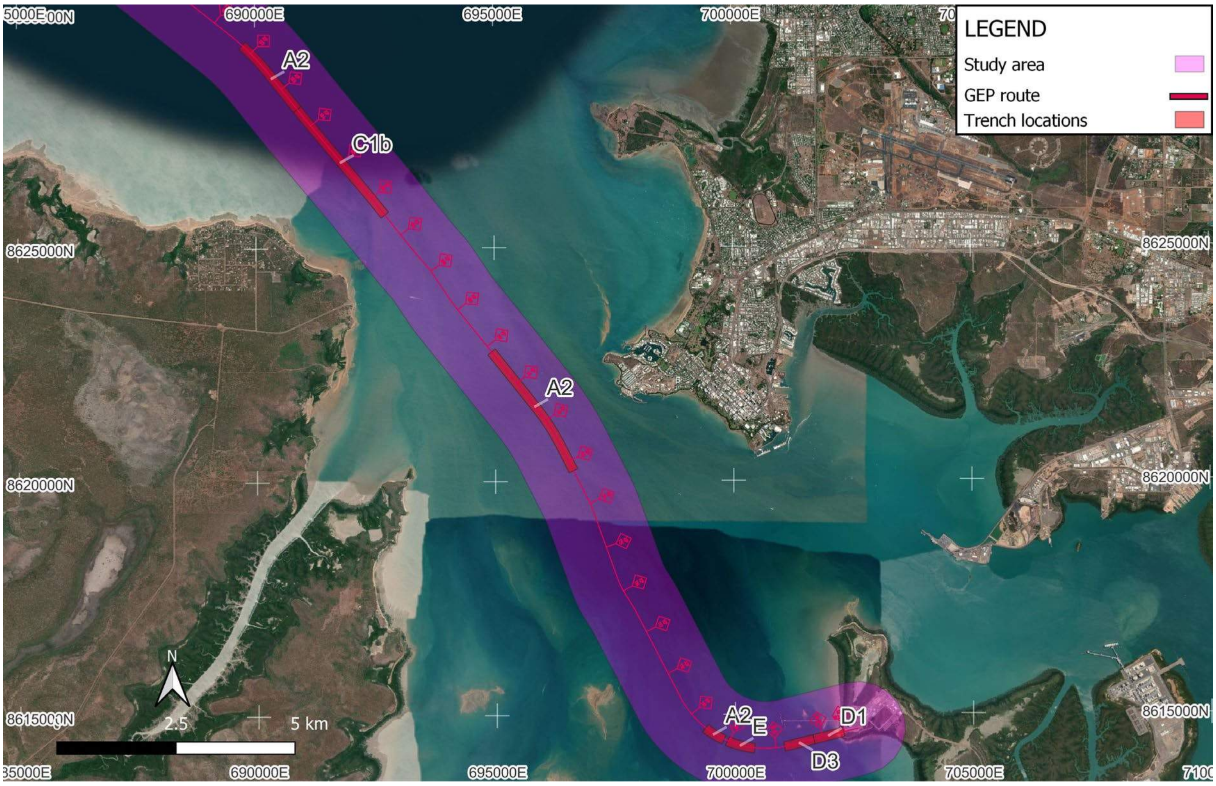

Figure 102: Map of proposed trenching locations with trench type labelled. (Polygons for trench locations are indicative of location only, not to scale by width).

One instance of underwater cultural heritage, Target MA_007, is within the trench extent overview. The target is located within the A2 trench between KP 111 and 113 (see Figure 104).

The laying of a pipe over a wreck site will not destroy such a site but will disturb or impact it. Such an activity, however, may damage and destabilise the site. It is understood that some sections will require the placement of mattresses to address spanning issues. Mattresses would cover parts of a site, which will protect it in the long term, but would negatively impact the site if it is not recorded before partial burial. If the wreck site is legally protected such disturbances could be considered unlawful without appropriate approvals under relevant heritage legislation. Additionally, Santos has identified a 900 m wide corridor on either side of the proposed GEP route between KP 91.5 and the terminus where work vessels may need to anchor. Anchor chains present a significant hazard to maritime cultural heritage sites within their deployment zone, as sweeping chains can damage or move archaeological sites and artefacts.

Within the anchoring corridor there are eight known shipwrecks (see Section 4.3.1, Table 2). Two of these, USAT *Mauna Loa* and USAT *Meigs,* fall under the protection of the NT *Heritage Act 2011* and may be protected under the USA *SMCA 2004.* The remaining six wrecks are under no legislative protection. Three objects of cultural heritage, inspected during ROV surveys, are also within the anchoring corridor, Targets 174, MA_007, and NCL_SC_016 (see Section 6.3.1). Additionally, the anti-submarine net mooring trots 16, 17, and 18 are within this corridor. It is highly likely, based on review of historical sources and geophysical survey data, that many of the remaining trots are also located within the anchoring corridor. In addition to trots 16, 17, and 18, an additional 90 geophysical targets within the anchoring corridor were identified as likely remains of anti-submarine net moorings (see Section 6.3.3).

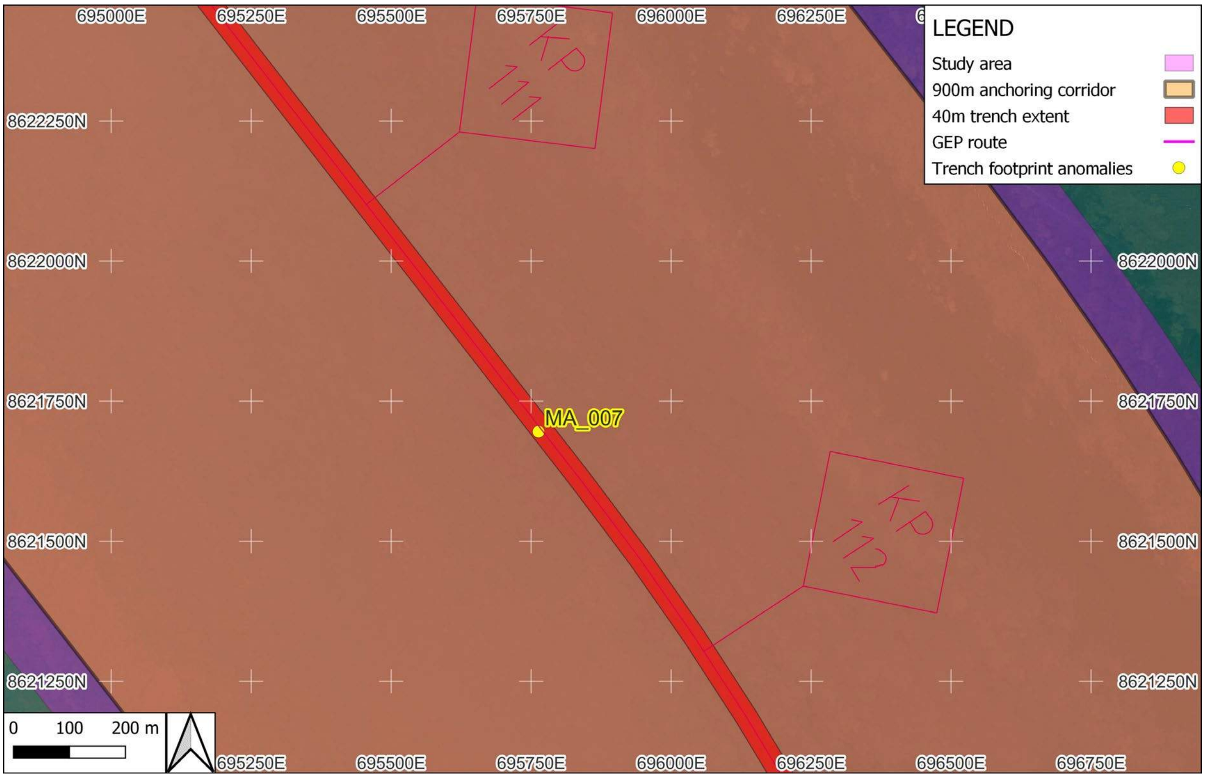

Figure 103: Underwater cultural heritage within trench extent overview.

A further 63 unverified geophysical anomalies, identified during geophysical survey data review but not inspected by ROV, are within the anchoring corridor (Figure 105). 18 of these targets were identified during review of Fugro survey data (see Section 6.3.1) and 45 were identified from review of the Geoscience Australia MBES dataset (see Section 6.3.2).

The location of these additional unverified anomalies, shipwrecks, and known cultural heritage is shown in Figure 105 and Table 15.

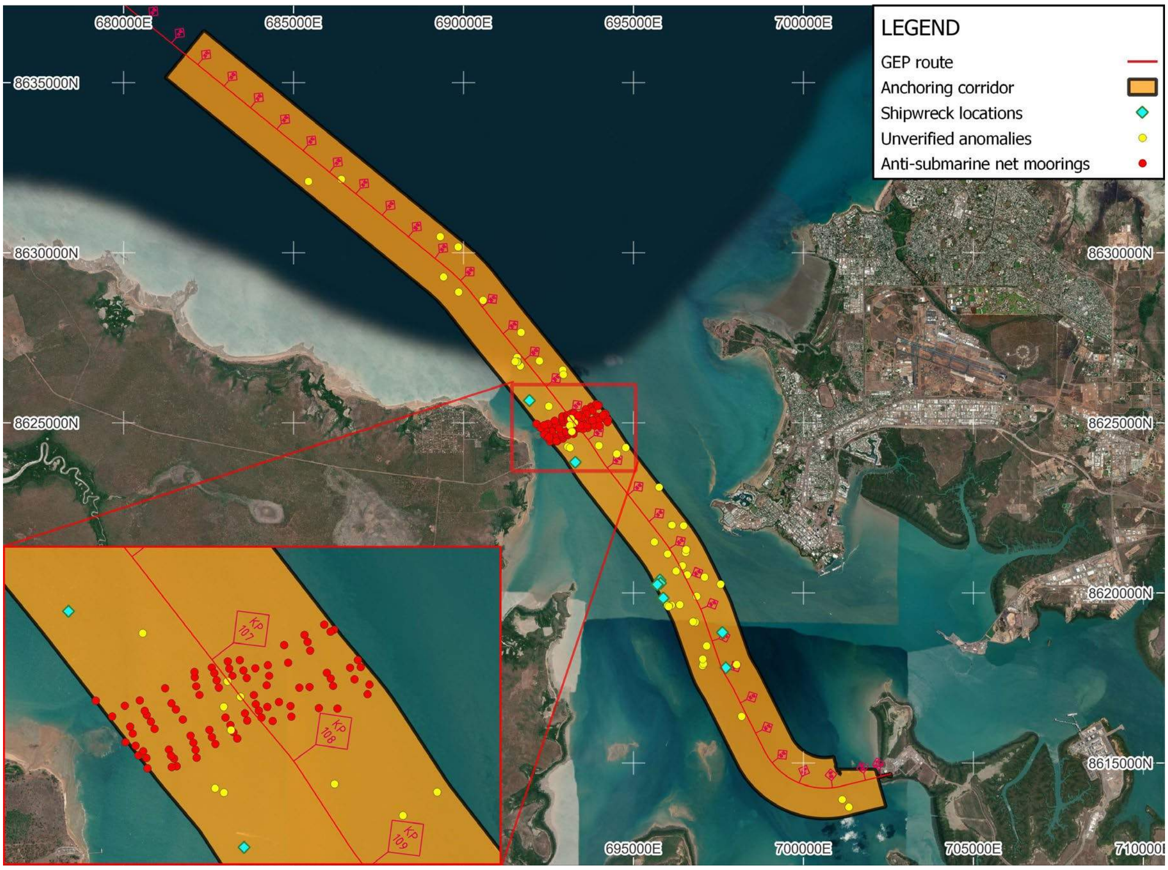

Figure 104: Location of unverified geophysical survey anomalies and other underwater cultural heritage within anchoring corridor.

Table 15: Unverified anomalies, shipwrecks, and known maritime cultural heritage within anchoring corridor.

Four geophysical anomalies were identified within 10m of the proposed GEP route, ID: 142, 175, 245, and 246. Targets 142, 175, 245, and 246 were observed during ROV surveys and determined to be natural. An additional six geophysical anomalies were identified within 50m of the proposed GEP route, ID: 166, 174, 233, 241, 244, and 247. Targets 166 and 244 were identified by ROV survey as part of Trot 18, while 233, 241, and 247 were identified to be natural features by ROV. Target 174 was identified as cultural in origin.

The ROV survey identified three anti-submarine net mooring trots, Trots 16, 17, and 18. Trot 17 directly crosses the path of the proposed GEP route. The northern most clump of Trot 16, identified as a repurposed ship's anchor, is located approximately 37m from the proposed GEP route, and the southernmost chain section of Trot 18 is located 32m from the proposed GEP route. The location of Clump 1, Trot 18, if still extant would likely be located within 25m of the proposed route.

In addition to the anti-submarine net trots, four isolated instances of cultural heritage were observed during ROV surveys. Target MA_007 is located 6m from the proposed GEP route. Targets 174, MA_001, and NCL_SC_016 are located 15-35m from the proposed GEP route.

Table 16: Targets and anomalies located within 50m of proposed GEP route.

Anomaly/Target ID	Target surveyed by ROV	Cultural/Natural	Within 10m of GEP route
Trot 16 (incl. Targets 166, NCL_SC_017, 018, and 019)	Yes	Cultural	No
Trot 17 (incl. Targets 165, 167, MA_011, NCL_SC_020, 021, 022, 023, 024, and 025)	Yes	Cultural	Yes
Trot 18 (incl. Targets 164, 167, 244, and NCL_SC_026)	Yes	Cultural	No
142	Yes	Natural	Yes
174	Yes	Cultural	Yes
175	Yes	Natural	Yes
233	Yes	Natural	No
241	Yes	Natural	No
245	Yes	Natural	Yes
246	Yes	Natural	Yes
247	Yes	Natural	No

Anomaly/Target ID	Target surveyed by ROV	Cultural/Natural	Within 10m of GEP route
MA_001	Yes	Cultural	No
MA_007	Yes	Cultural	Yes
NCL_SC_016	Yes	Cultural	No
NCL_SC_031	Yes	Natural	No

8.4 Legislative compliance

Certain objects may be protected under various local, state, and Commonwealth heritage acts, depending on their historical contexts and assessed heritage significance. Protected objects may require permits to be obtained before they may be disturbed. Noncompliance with heritage legislation may result in fines or criminal charges.

None of the cultural objects identified by ROV survey would be protected under the *NT Heritage Act 2011.*

The *UCH 2018* automatically protects shipwrecks over 75 years of age within all Australian waters (incorporating Territory internal and Commonwealth waters, see section 3.1), including articles associated with these shipwrecks. Although unlikely, if the objects located at Targets 174 and MA_007 are historic ship wreckage, over 75 years old, a permit may be required to disturb them.

The *UCH 2018* automatically protects aircraft wrecks over 75 years of age within Commonwealth waters. This excludes internal state waters, including Darwin Harbour and portions of Beagle Gulf. If the objects located at Target MA_007 are aircraft wreckage, it would **not** be protected under this act.

Installations including maritime infrastructure, such as the WWII anti-submarine boom net moorings and historic telegraph cables, are **not** automatically protected under the *UCH 2018*. Currently, the historic submarine telegraph landings are afforded statutory protection and are listed on the NT Heritage Register. The anti-submarine net moorings are not under statutory protection. Historic maritime infrastructure, especially infrastructure from the 19th century or associated with WWII, is likely of heritage interest and may rate as high heritage significance. Previously, the anti-submarine net moorings have been rated as having 'High' heritage significance.[119]

8.5 Mitigation measures

Mitigation for heritage objects and sites depends on the likelihood of potential impacts as well as the degree of heritage significance. Several of the targets identified as cultural during ROV surveys cannot have their heritage significance assessed due to lack of information. For cultural heritage sites, objects, and unverified anomalies likely to be impacted by proposed works, the first preference for mitigation is avoidance. If not possible, a more detailed investigation may be needed to conclusively identify their historical context and condition, to inform a heritage management plan with specific alternative mitigation measures. Such a management plan would only need to be adopted for those objects deemed likely to be impacted.

Cosmos Archaeology has previously completed impact assessments for anti-submarine net mooring trots that were likely to be impacted by the installation of the Icthys GEP.[120] This

[119] **Cosmos Archaeology, 2012,** *Icthys Project Darwin Harbour, East Arm Gas Export Pipeline: Assessment of Heritage Impact of 7 side scan targets,* Report prepared for Tek Ventures Pty Ltd.
[120] Op. Cit., **Cosmos Archaeology, 2012.**

assessment rated the trots and clump weights as **High** significance, and **Certain** to be impacted by installation of the GEP. Recommended mitigation was as follows:

> *Prior to disturbance undertake video recording of the concrete boom defence mooring blocks and chain. The chain is to be followed to either side of the block to see where they end. The distance between the blocks is expected to range from 30 to 60 m.*
>
> *Each block should be placed in an upright position with the chain laid alongside close – without the possibility of causing a hindrance – to the proposed pipeline route.*
>
> *Once the blocks and chain are in place, video footage, a site map and description, is to be obtained, preferably by a maritime archaeologist.*[121]

For this project, it was determined sufficient that the mooring trots were recorded fully *in situ* before being moved out of the path of the GEP. Once relocated, the trot was recorded again, and its location was documented. The proposed Barossa GEP route directly crosses the path of mooring Trot 17, identified during ROV survey Heritage Transect 1. Ideally, the proposed GEP alignment could be altered to avoid anti-submarine net mooring Trot 17 and Target MA_007 however relocation of chain and mooring blocks from this trot as done for theINPEX project would be acceptable if the GEP route cannot be changed to avoid impacting this site.

All other anomalies, targets, and surveyed cultural heritage is considered unlikely to be impacted by the direct action of GEP installation. However, unassessed cultural heritage, identified significant cultural heritage, and unverified anomalies should be avoided during the works, including during ship anchoring. Establishment of no-anchoring zones around these will help ensure significant maritime cultural heritage is not adversely impacted.

If the identified cultural material cannot be avoided, then a detailed heritage impact assessment will need to be conducted, consistent with the NT Heritage Branch Archaeological Scope of Works.[122] The impact assessment will likely require further inspections, diving would produce best results, to conclusively assess the significance of Target MA_007. A work class ROV may assist with accurate measurements and precise positioning but would not allow the tactile investigation that a diver could do. This would inform a Maritime Heritage Management Plan, which would include specific mitigation measures and management recommendations for each target, such as, but not confined to, archaeological recording, clearance, removal, and/or recovery. For example, any clearance of cultural material from the seabed could be recorded by a maritime archaeologist on-site. For the INPEX project this involved maritime archaeologists with suitable diving qualifications embedded with the commercial dive teams.

It is recommended that any further remote sensing undertaken for the proposed GEP should be reviewed by a qualified maritime archaeologist.

Finally, there is always the possibility of unexpected finds being made during the construction phase. Prior to the commencement of construction an Unexpected Maritime Archaeological Finds Protocol should be prepared by a suitably qualified maritime archaeologist. If a Maritime Heritage Management Plan is deemed necessary, this would be a component of such a plan. This protocol should include:

- Unexpected finds, stop work triggers and notification procedures
- Heritage induction for contractors
- Recording and reporting methods and procedures

9 CONCLUSION

9.1 Summary of findings

A review of historical sources, databases and marine geophysical information has found that;

- Within the study area, Larrakia and Tiwi people conducted maritime travel and subsistence activities – likely concentrated in coastal environments. Macassan trepang fishing and trade occurred throughout the 18th to early 20th centuries.
- British exploration and surveying began in the early 19th century, following which a wide range of colonial shipping including Government and commercial cargo and passenger transport, fishing and pearling industry trade and transport, and recreational shipping occurred, from the establishment of colonial settlement in Darwin in 1860s to present.
- In the 1870s and 1880s three subsea telegraph cables were laid.
- Quarantine and leper station transport and service supply were established in Middle Arm throughout late 19th to early 20th century.
- The study area saw significant military action during World War II, including air and sea combat between Allied and Japanese forces, which resulted in the sinking of numerous ships and aircraft within Beagle Gulf and Darwin Harbour.
- The entrance to Darwin Harbour was the location of numerous anti-submarine defences during WWII, including anti-submarine boom nets and indicator loops, some of which have been located and recorded by previous CA surveys.
- There are seventeen known, located shipwrecks within the study area, along with five known locations of UXO and six instances of maritime infrastructure (including the above-mentioned anti-submarine defences and telegraph cables). Four of five instances of UXO are related to WWII shipwrecks and are protected by statutory legislation. One instance, Contact 2, was identified and disposed of during INPEX heritage investigations. See Section 4.3.5, Table 4 for details and locations.
- There are 29 known but unlocated shipwrecks and 25 known but unlocated aircraft wrecks recorded to have sunk within the vicinity of the study area. Any of these could potentially be located within the study area.
- The remains of these vessels, and their contents and fittings, are automatically protected under the Cwlth *Underwater Cultural Heritage Act 2018*. Remains within the TSB are protected under the NT *Heritage Act 2011,* and United States military shipwrecks and aircraft wrecks are protected under the US *Sunken Military Craft Act 2004.*
- Side scan sonar, magnetometer, and MBES data from a marine geophysical survey conducted by Fugro in 2022 was reviewed, as well as MBES data published by Geosciences Australia.
- Clear evidence of eight shipwrecks was identified within the study area, and no aircraft wrecks were identified. Two of these shipwrecks, USAT *Meigs* and USAT *Mauna Loa* are under statutory heritage protection. Furthermore, there is a possibility that anomaly ID: 210 could potentially be aircraft remains.
- Thirty-nine sonar, MBES, and magnetometer contacts were identified by CA within the Fugro geophysical survey corridor as being probably cultural and hence of potential cultural heritage significance.

- An additional 133 anomalies were identified by CA from publicly available MBES data within the anchoring corridor, but outside of the Fugro geophysical survey corridor. These 133 anomalies were identified as being probably cultural and hence of potential cultural heritage significance. Ninety of these targets were identified as likely WWII anti-submarine net mooring devices located between KP 107 and KP 108.
- These anomalies could be remains of anti-submarine defences, 19th century telegraph cables, possible aircraft wreckage, debris fields, or isolated instances of debris and/or discard.
- An ROV survey was conducted between 6-8 June 2022 on 16 targets identified by the geophysical survey review as being within 50m of the proposed GEP route. Survey included three dive transects conducted on the likely remains of WWII anti-submarine net moorings.
- 11 anti-submarine net moorings, connected by heavy grade chain were identified during ROV survey, located between KP 107 and KP 108. These moorings and chain represent three “trots”, or lines of moorings, used to anchor WWII anti-submarine nets. Based on historic chart overlays, it is believed that heritage transects 1, 2, and 3 corresponded to Trots 17, 16, and 18, respectively. 10 moorings were conventional trapezoidal concrete weights, while one mooring, Target 164, was identified as a large ship’s anchor, repurposed for use as mooring.
- In addition to the anti-submarine net moorings, a further 10 isolated geophysical survey targets were inspected during ROV surveys. Six of these (Targets NCL_SC_002, NCL_SC_031, 142, 175, 241, and 245) were determined to be natural features. The other four targets (Targets MA_001, MA_007; Target NCL_SC_016; Target 174) were determined to be cultural in origin.
- Due to the limitations of a visual ROV survey, the identity of Targets 174, MA_007, and NCL_SC_016 could not be conclusively confirmed. Therefore, their heritage significance, as well as the significance of any other uninspected geophysical anomalies, cannot be properly assessed without further investigation.
- The proposed GEP installation will likely impact the central trot, Trot 17, identified by ROV heritage transect 1, and MA_007. Additionally, vessel anchoring as part of proposed works could impact any anomalies or cultural heritage within a 900 m corridor on either side of the GEP route. Therefore, the establishment of no-anchoring zones around uninspected anomalies and cultural heritage objects and sites within this corridor is recommended. A 15 m radius is considered appropriate for isolated anomalies, while a radius of 50 m is generally considered acceptable for larger sites, such as shipwrecks or aircraft wrecks. It is recommended that a buffer of 15 m is also afforded to the linear space between lines of potential anti-submarine net mooring trots to protect the chain in between moorings.
- If Trot 17 and Target MA_007 cannot be avoided, then a detailed heritage impact assessment will need to be conducted, consistent with the NT Heritage Branch Archaeological Scope of Works. Likewise, if no-anchoring zones cannot be established around other cultural heritage or unverified anomalies within the 900 m anchoring corridor, these will need to be assessed as well. Depending on the identity and historical significance of said objects, permits to disturb may be required under the *UCH 2018* Act.
- It is recommended that if further remote sensing surveys of the proposed GEP are undertaken, the additional survey data should be reviewed by a qualified maritime archaeologist.

- In the event of significant maritime archaeological remains being discovered during the construction phase, an Unexpected Maritime Archaeological Finds Protocol to responsibly manage such finds should be prepared and implemented.

9.2 Recommendations

Recommendation 1 ***If feasible, the proposed GEP alignment should be altered to avoid the WWII anti-submarine net mooring Trot 17 as well as cultural heritage objects identified at Target MA_007.***

Recommendation 2 ***If potentially cultural anomalies objects identified in this assessment are likely to be impacted, undertake a detailed heritage impact assessment by a qualified maritime archaeologist.***

If the identified anomalies cannot be avoided and are likely to be impacted, then a detailed heritage impact assessment would need to be conducted, consistent with the NT Heritage Branch Archaeological Scope of Works.[123] The impact assessment may include further ROV and/or dive inspections to assess significance of the anomalies. This would inform a Maritime Heritage Management Plan, which would include specific mitigation measures – such as relocation of certain objects - and management recommendations.

Recommendation 3 ***Establish no-anchoring zones around shipwreck locations, the anti-submarine net moorings, and unverified geophysical anomalies within the anchoring corridor.***

50 m radius for larger sites such as shipwrecks, 15 m for isolated anomalies and anti-sub net moorings/chains.

Review of Geosciences Australia MBES data with full coverage of Darwin Harbour from the proposed GEP terminus to KP 85 has identified eight shipwrecks within the 900 m anchoring corridor. Two of these wrecks, USAT *Meigs* and USAT *Mauna Loa,* are under statutory heritage protection. No-anchoring zones should be established around all eight wrecks, as well as the anti-submarine net corridor and any unverified geophysical anomalies. This information should be included in a Maritime Heritage Management Plan.

Recommendation 4 ***If additional remote sensing data is collected for the proposed GEP it should be reviewed by a qualified maritime archaeologist.***

Recommendation 5 ***Prepare and implement an Unexpected Maritime Archaeological Finds Protocol.***

Prior to the commencement of the construction phase an Unexpected Maritime Archaeological Finds Protocol should be prepared by a suitably qualified maritime archaeologist. This protocol should include:

- *Unexpected finds, stop work triggers and notification procedures*
- *Heritage induction for contractors*

---

[123] **NT Heritage Branch, 2021,** Archaeological Scope of Works: Gas export pipeline Barossa gas field to Middle Arm, Darwin Harbour.

- *Recording and reporting methods and procedures*
- *Artefact collection and retention policies*

This protocol would form a component of the Maritime Heritage Management Plan referenced in Recommendation 2.

Recommendation 6 Review of this assessment if proposed alignment of pipeline changes.

This review should be undertaken by a suitably qualified maritime archaeologist.

1 INTRODUCTION

1.1 Background

The Santos (Barossa) Gas Export Pipeline is a proposed installation a gas export pipeline (GEP) off the northwest coast of the Northern Territory (NT). The proposed GEP begins at the Barossa gas field, north of the Tiwi Islands, and extends south to feed the Darwin LNG plant, located in Middle Arm, Darwin Harbour. The first proposed route is a GEP from the Barossa gas field to a tie in point into the existing Bayu-Undan to Darwin pipeline, tying in at a point southwest of Bathurst Island. The second proposal is to extend the GEP from Barossa to the Darwin LNG plant. This second proposal traverses through the entrance of Darwin Harbour directly to the Darwin LNG at Middle Arm.

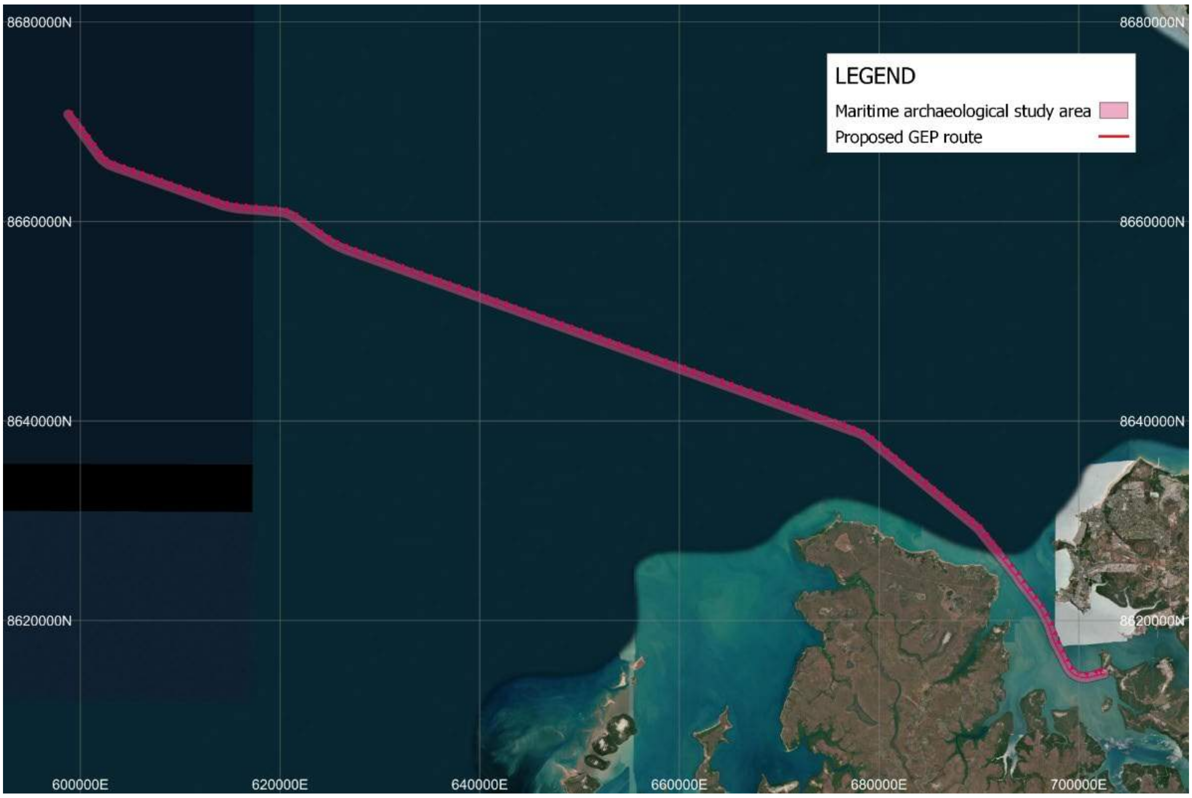

Figure 1: Proposed route of the Barossa GEP in Beagle Gulf and Darwin Harbour.

As part of environmental and heritage impact assessments, a suite of geophysical surveys were conducted including multi-beam bathymetry (MBES), side scan sonar (SSS), and magnetometer surveys to identify locations of potential cultural material. Review of the available geophysical survey identified forty targets of possible cultural origin. Sixteen of these targets were located within 50m of the proposed GEP route and were shortlisted for visual survey to confirm their identity and origin. The sixteen chosen targets were inspected over the course of three days between 6-8 June 2022.

1.1.1 *Objectives*

The objectives of this dive survey were to:

> *Visually inspect targets identified through geophysical data for their potential cultural heritage significance and recommend measures to reduce impacts to their cultural heritage values.*

2 MARITIME ARCHAEOLOGICAL DIVE SURVEY

2.1 Dates and Personnel

The dive survey was carried out over three days: 6-9 June 2022. Connor McBrian from Cosmos Archaeology was the maritime archaeologist supervising the heritage inspections. ROV support was provided by FUGRO in the form of two ROVs, while boat and marine services were supplied by Bhagwan Marine. In addition to this, a representative from Santos Pty Ltd was on board to supervise surveys along with an environmental specialist from RPS. ROV operations were run and supervised by FUGRO. Personnel involved during the inspection are listed in Table 1.

Table 1: Dive inspection personnel

Name	Title	Company
Connor McBrian	Maritime Archaeologist	Cosmos Archaeology
James Clarke	Survey Party Chief	Fugro
Luke Eller	ROV Pilot / Tech	Fugro
Simon Bochow	Skipper	Bhagwan Marine
Pete Ivicevich	Client Representative	Santos NA Barossa Pty Ltd
Garnet Hooper	Environmental Specialist	RPS Group

2.2 Weather and Tide Conditions

Weather and tide conditions are factors when operating an ROV within the study area. Tides were especially considered in relation to the current and visibility, which could limit ROV operations. As much as possible, dives were conducted at slack tides to avoid excessive current and drift. The tide conditions during the surveys are provided in Table 2 and weather conditions during the survey are provided in Table 3.

Table 2: Tides for the days of survey.

06-06-2022	Time	0341	1016	1612	2147
	Height (m LAT)	2.3	6.1	3.3	5.2
07-06-2022	Time	0430	1102	1721	2300
	Height (m LAT)	2.6	5.8	3.4	4.9
08-06-2022	Time	0534	1200	1847	0031 (next day)
	Height (m LAT)	3.0	5.7	3.3	4.9

Note: For ease of identifying high and low tide, low tide is blue and high tide is red.

Table 3: Rain and wind conditions for the day previous to the dive inspections and the days of the inspection.

Date	Rain (mm)	Wind 09:00 (km/h)	Wind 15:00 (km/h)
05-06-2022	0.0	13 ESE	17 N
06-06-2022	0.0	9 SE	13 NW
07-06-2022	0.0	11 E	17 ENE
08-06-2022	0.0	20 E	17 ESE

2.3 Conduct of Survey

The underwater survey was conducted with the use of an ROV, operated by crew from FUGRO under the direction of the maritime archaeologist. Certain features, such as the anti-submarine net mooring trots were surveyed along transects following the features in a linear pattern. Isolated targets were targeted by dropping a clump weight with a buoy attached on the target coordinates while the vessel was moving, and then following the buoy line to the seabed with the ROV once the vessel was anchored. Once on the bottom, the ROV was manoeuvred in cross shaped search patterns using the clump weight as a reference point.

The ROV was battery powered and controlled remotely by the pilot from inside the survey vessel cabin. Because the ROV was not equipped with transponders or any location fixing devices, the exact location of the ROV had to be estimated based on identifiable features on the seabed that could be compared to MBES data, course headings, and position relative to the *Warrigal.*

2.3.1 Target inspection dives

The targeted inspection dives required the ROV pilot and maritime archaeologist to locate and identify seafloor anomalies from existing geophysical data. GPS locations of targets derived from MBES data was used to locate the potential targets and manoeuvre the *Warrigal* into position.

Targets identified within the location of WWII submarine netting were surveyed along three transects, as these consisted of large concrete clump weights connected by thick chain. The chain was easily visible above the seabed, and provided a reliable way of tracking and locating the ROV as it completed the linear transects.

From review of the geophysical survey data, 15 targets were identified for visual investigation, based on their assessed likelihood of being cultural material, and their proximity (within 50m) of the proposed GEP route. These targets were given a priority status for the targeted inspections. These were:

- A = top priority
    - Images appear to be cultural and representative of a ‘site’ such as a small wreck.
- B = secondary
    - Images appear to be cultural but are representative of an individual object, or discard and less likely to constitute a site.
- C = tertiary
    - Targets unlikely to be cultural, or known to be culturally insignificant.

2.4 Findings of the Diving Survey

For organisational purposes, the following list of targets is separated into the three heritage transects, T1, T2, and T3, used to record the anti-submarine net moorings, and isolated targets surveyed individually.

2.4.1 *Heritage Transect 1*

T1 followed a line of concrete clump weights, connected by heavy chain, that were identified as the moorings for the WWII anti-submarine net. This transect was located between KP 107 and KP 108, and ran NNW from a target just south of 165, located at 693309.60 m E, 8624815.60 m N to target 244, located at 693195.40 m E, 8625165.60 m N. The transect continued at the same heading north from Target 244 to a final concrete clump weight located at 693162.30 m E, 8625272.50 m N.

Along this transect, attempts were made to locate two isolated anomalies, Targets 246 and 247, without success.

7 dives were attempted on T1, of which one (T1_5) had to be aborted due to currents overpowering the capabilities of the ROV.

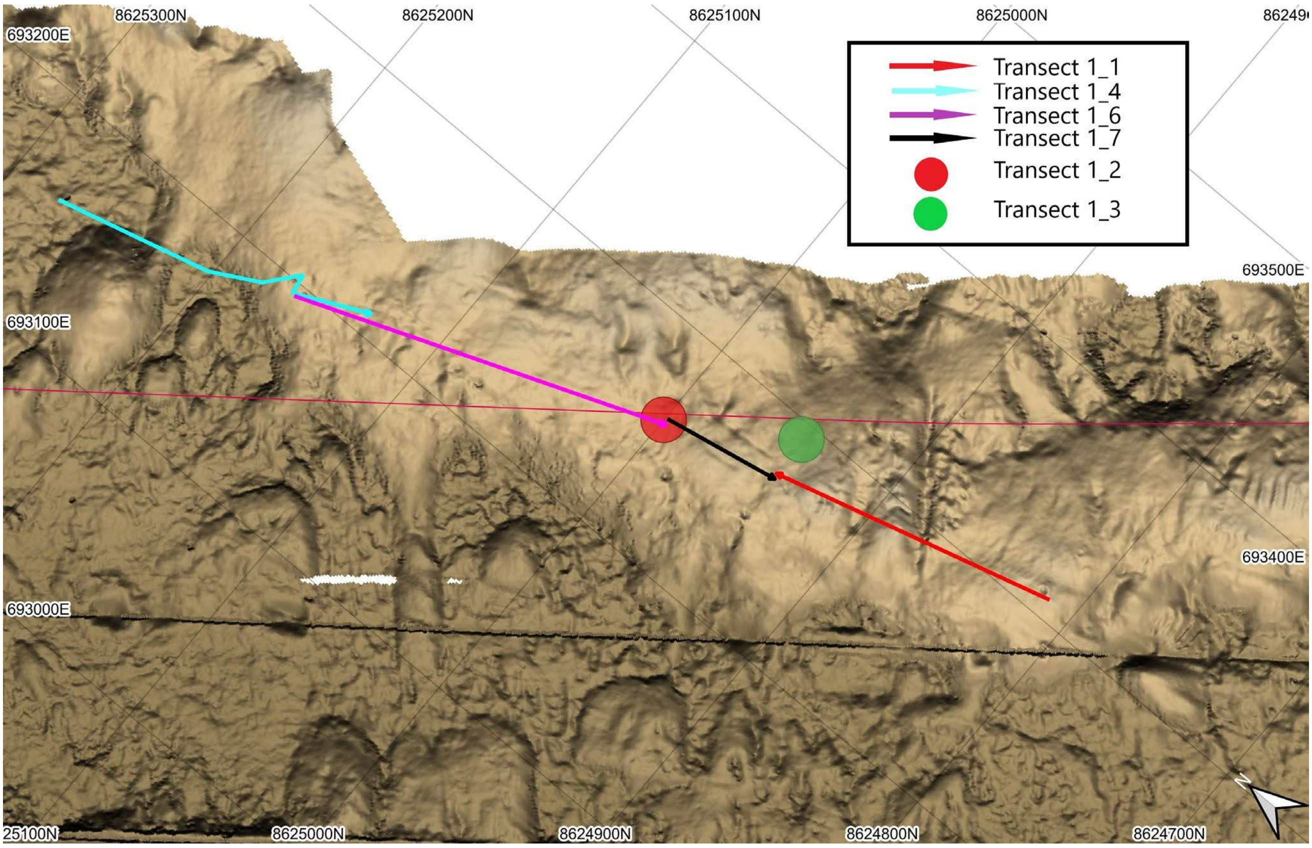

Figure 2: Dive locations for Heritage Transect 1.

The datum for all coordinates for the targets is GDA94.

2.4.1.1 T1_1

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Depth	Distance from GEP route (m)
3	693309.76	8624814.97	Anti-submarine net moorings. Large concrete trapezoidal mooring blocks connected by lengths of thick chain.	Width: 0.00 Height: 0.00 Length: 1.54 Shadow: 0.00	29 m	Variable, from 25 to 80

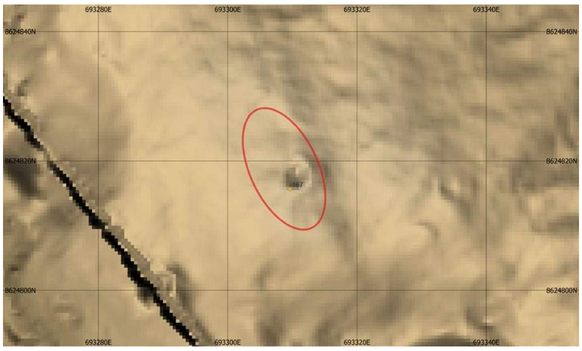

Figure 3: Target 167 MBES image.

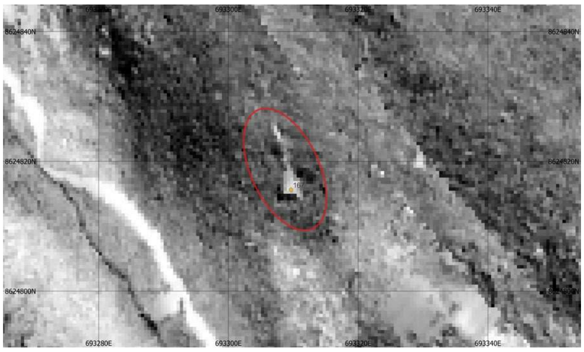

Figure 4: Target 167 SSS image.

Inspection details for T1_1		
Date: 06-06-2022	**Method:** ROV	**Tide:** Slack
Distance and direction: 125 m, 345° NNW		
Swim start (min): 1027	**Swim end (min):** 1138	**Total time (min):** 71
Depth: 14.2 m	**Water visibility:** 1 m	**Seabed visibility:** Poor

Target description: The seabed within the search area was generally rocky with a layer of easily disturbed sediment and large amount of marine growth, including soft corals. Transect 1_1 began by locating Target 167 and following a length of chain extending from Target 167 at a heading of 345° NNW for approximately 125m. Despite low visibility, target 167 was quickly located through the use of the ROV's sonar. 167 was determined to be a large concrete mooring block, used as part of the anchoring system for the anti-submarine nets installed during WWII (Figure 7). A cable connected to the southern end of the block appeared to anchor to the seafloor, while length of thick chain (Figure 8) was attached to the northern face of the concrete block and connected 167 to a twin set of mooring blocks, located at 693294 m E 8624875 m N (Target ID: NCL_SC_020; Figure 9 and Figure 10). Another section of the same chain continued further north from the twin blocks before disappearing into the seabed ~30m further NNW. The ROV's tether ran out before the next mooring block could be positively located.

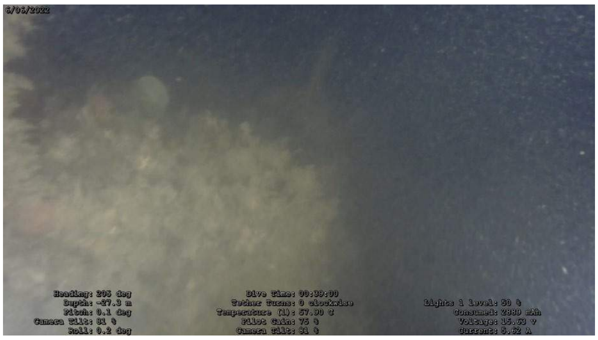

Figure 8: Screen grab of NCL_SC_020, second concrete block. (Video 2022-06-06_10.58.29; 06:01).

2.4.1.2 T1_2

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
4	693286.00	8624946.00	Target 247, aka MA_003	Width: 0.00 Height: 0.00 Length: 7.96 Shadow: 0.00	0	28 m

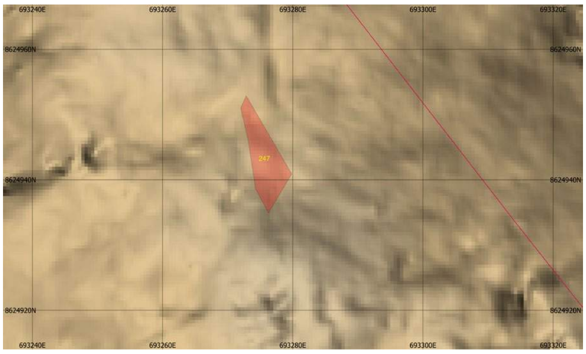

Figure 9: Target 247 MBES image.

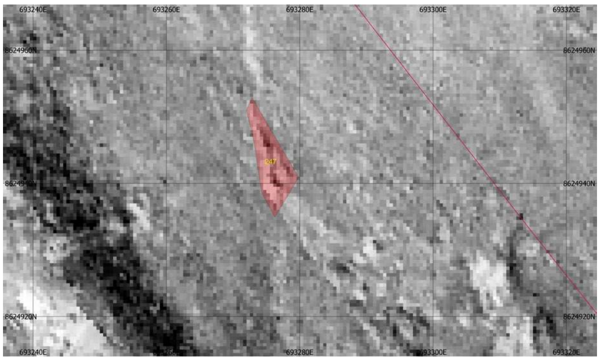

Figure 10: Target 247 SSS image.

Inspection details for T1_2		
Date: 06-06-2022	**Method:** ROV	**Tide:** Ebbing
Distance and direction: Circular search 10 m		
Swim start (min): 1215	**Swim end (min):** 1238	**Total time (min): 13**
Depth: 28 m	**Water visibility:** 0 m – 1 m	**Seabed visibility:** Poor

Target description: This dive was an attempt to locate Target 247, possibly associated with magnetometer target MA_003. In addition to locating 247, an attempt was made to locate the anti-sub net chain that disappeared into the seabed at the end of transect T1_1. The seabed in the search area was similar to Transect T1_1 with fine grain sandy sediment as well as scattered rocks and marine growth. Not cultural features were identified during the dive. While an attempt at a circular 10m search was made, strong current and low visibility meant only a small portion of the seafloor was able to be surveyed before the dive was aborted.

2.4.1.3 T1_3

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
5	693293.00	8624947.00	Debris scatter, or possible anti-submarine net remains FUGRO ID: NCL_SC_021	Width: 0.00 Height: 0.00 Length: 0.59 Shadow: 0.00	10	27 m

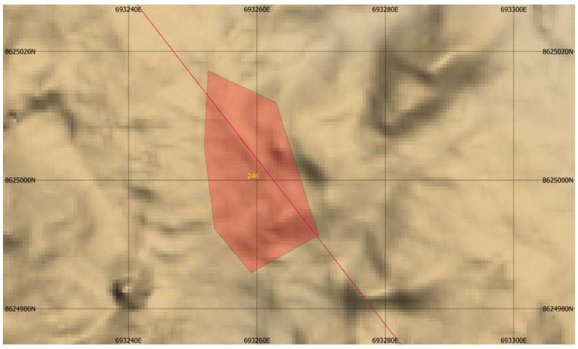

Figure 11: Target 246, MBES image.

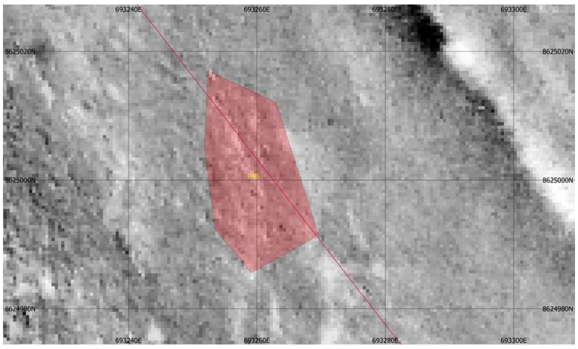

Figure 12: Target 246, SSS image.

Inspection details for T1_3		
Date: 06-06-2022	**Method:** ROV	**Tide:** Ebbing
Distance and direction: Circular search 10 m		
Swim start (min): 1247	**Swim end (min):** 1311	**Total time (min):** 24
Depth: 27 m	**Water visibility:** 0 m – 1 m	**Seabed visibility:** Poor

Target description: This dive was an attempt to locate Target 246 aka NCL_SC_021. In addition to locating 246, an attempt was made to locate the anti-sub net chain that disappeared into the seabed at the end of transect T1_1. The seabed in the search area was similar to Transect T1_1 with fine grain sandy sediment as well as scattered rocks and marine growth. Not cultural features were identified during the dive. While an attempt at a circular 10m search was made, strong current and low visibility meant only a small portion of the seafloor was able to be surveyed before the dive was aborted.

2.4.1.4 T1_4

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
8	693163.04	8625273.25	Anti-submarine net mooring blocks and chain NCL_SC_022 and Target ID: 244 (aka NCL_SC_023, 024, 025)	Width: 2.18 m Height: 0.00 m Length: 6.65 m Shadow: 0.00m	Variable, from 40 to 86	21 m

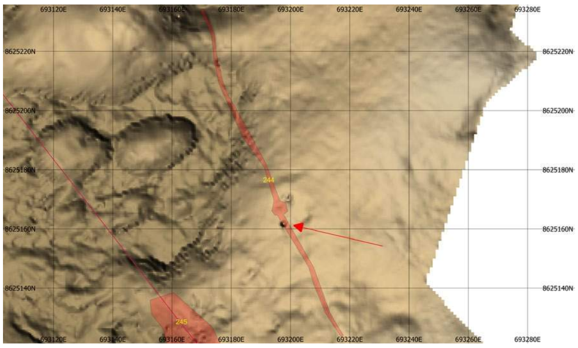

Figure 13: Target 244 (aka NCL_SC_023, 024, 025) MBES image.

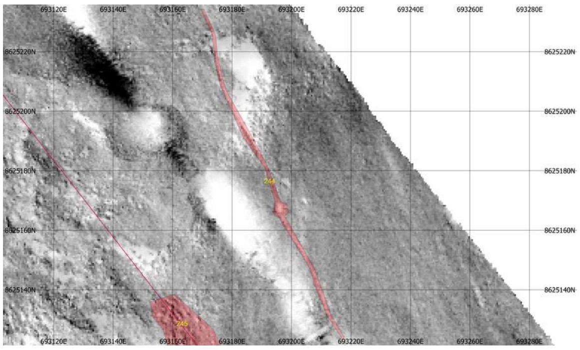

Figure 14: Target 244 (aka NCL_SC_023, 024, 025) SSS image.

Inspection details for T1_4		
Date: 06-06-2022	**Method:** ROV	**Tide:** Slack
Distance and direction: 150 m, 160° SSE		
Swim start (min): 1605	**Swim end (min):** 1644	**Total time (min):** 39
Depth: 21 m	**Water visibility:** 1 – 2 m	**Seabed visibility:** Poor

Target description: The ROV was dropped on a target that appeared on MBES data to be a concrete block mooring used for the anti-submarine netting, located at 693163.04 m E, 8625273.25 m N. The target chosen was not identified previously by FUGRO or CA but was identified immediately upon visual inspection by the ROV. This concrete block was determined to be the northern terminus of the “trot” of moorings (running to the southern terminus at Target 167) because no chain extended from the northern side of the block. After identification, the ROV followed the chain in a SSE course at 160° for approximately 55m until reaching target NCL_SC_022. This target was again identified as a concrete mooring block for the anti-sub netting. Following the chain at roughly the same heading, the ROV was piloted to the location of Target 244 (aka NCL_SC_023, 024, 025), approximately 60m SSE of NCL_SC_022. Between NCL_SC_022 and Target 244, the chain was seen to have several breaks along its length and appeared to have been dragged out of position by an anchor or trawl. A sharp kink in the line of chain was seen immediately north of target 244. The ROV continued following the chain SSE from Target 244 until tether ran out, approximately 50m further SSE.

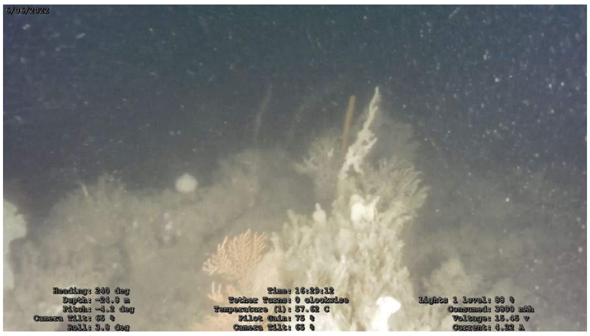

Figure 18: Kinked chain near Target 244. (Video 2022-06-06_16.08.58; 20:11).

2.4.1.5 T1_6

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
14	693212.30	8625132.30	Anti-submarine net mooring blocks and chain	Width: 0.00 Height: 0.00 Length: 0.00 Shadow: 0.00	Variable, from 46 to 0	28 m

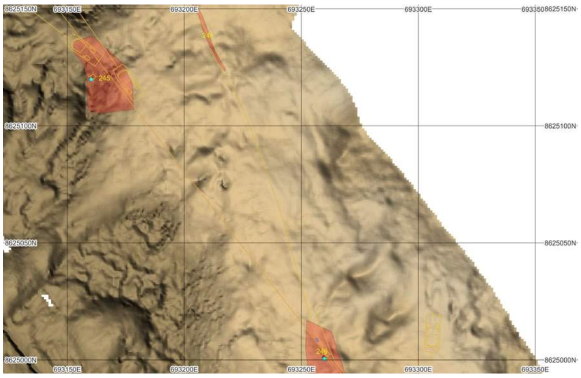

Figure 19: MBES image of general area of T1_6.

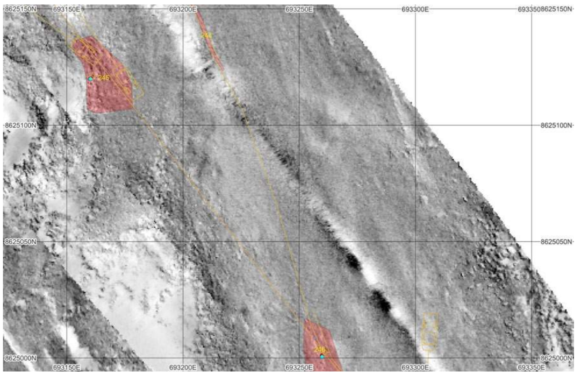

Figure 20: SSS image of general area of T1_6.

Inspection details for T1_6		
Date: 07-06-2022	**Method:** ROV	**Tide:** Slack
Distance and direction: 200 m, 160° SSE		
Swim start (min): 1045	**Swim start (min):** 1106	**Total time (min):** 21
Depth: 28 m	**Water visibility:** 2 – 3 m	**Seabed visibility:** Fair

Target description: Dive 14, transect T1_6, was started approximately 40 metres south-southeast of target 166 at a point close to or overlapping the termination of T1_4. A previous attempt at this transect, Dive 10 (T1_5), had been aborted due to heavy currents preventing the ROV from submerging. The anchor chain was quickly located upon descent and was followed in a similar SSE heading to T1_4, at approximately 160° for around 200 metres until the ROV's tether ran out (Figure 22). Throughout the length of T1_6, the chain was periodically buried under silty sediment, occasionally to the point where no marine growth could be seen above the seabed. At the end of the tether, the chain occurred to have several kinks, and a potential area of debris field or small rocks (Figure 23). Marine growth inhibited identification of the exact nature of these objects. No concrete blocks were seen along the length of the T1_6.

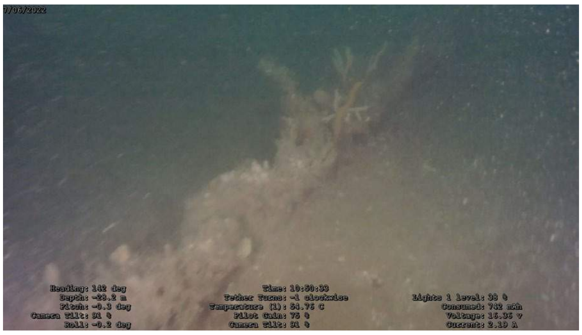

Figure 21: Length of chain southeast of target 166. (Video 2022-06-07_10.46.37; 03:54).

Figure 22: Kink in chain near end of T1_6. (Video 2022-06-07_10.46.37; 14:30).

2.4.1.6 T1_7

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
15	693255.71	8625021.11	Anti-submarine net mooring blocks and chain	Width: 0.00 Height: 0.00 Length: 0.00 Shadow: 0.00	Variable, from 26 to 0	29 m

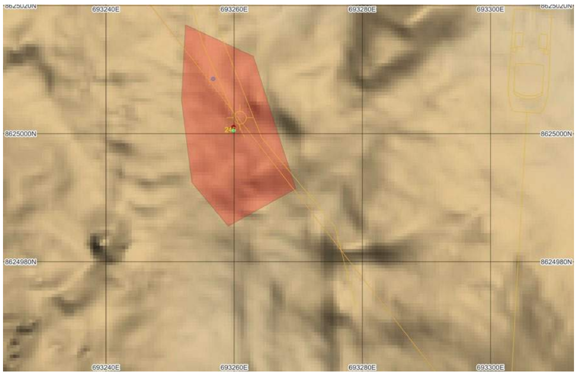

Figure 23: MBES image of general area of T1_7.

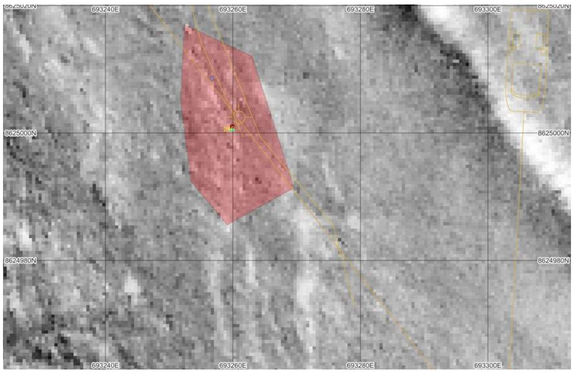

Figure 24: SSS image of general area of T1_7.

Inspection details for T1_7		
Date: 07-06-2022	**Method:** ROV	**Tide:** Ebbing
Distance and direction: 200 m, 160° SSE		
Swim start (min): 1130	**Swim end (min):** 1200	**Total time (min):** 30 min
Depth: 29 m	**Water visibility:** 0 – 1 m	**Seabed visibility:** Poor

Target description: T1_7 was intended to “close the gap” between T1_6 and T1_1, approximately covering the area where Target 246 was thought to be. The ROV was dropped close to the position of 246 and was able to locate the chain identified in T1_6 (Figure 27). Following the chain SSE, the ROV recorded the chain ending at an indeterminate point in the seabed. At this location, a pile of branching metal debris was seen (Figure 28). The debris appeared to be either steel wire rope or cable, not chain, and extended several metres in multiple directions from a central point, near the end of the chain (Figure 29 & Figure 30). Heavy current and low visibility inhibited the ROV from obtaining a clear picture of the area, however, a cross shaped search pattern of 20m east-west-south from the branching cable indicated that a gap existed along the anti-submarine net trot chain, about 20m south of the proposed GEP route.

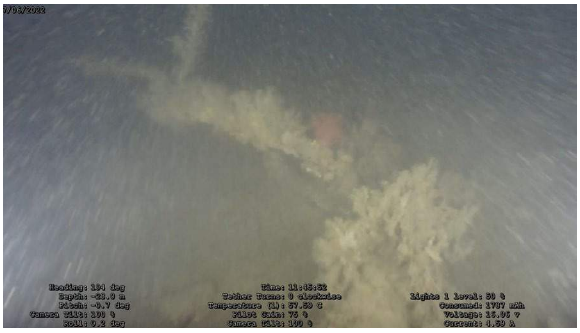

Figure 25: Screen grab of chain at a southern heading, with a large protuberance extending to the west. (Video 2022-06-07_11.30.28; 15:20).

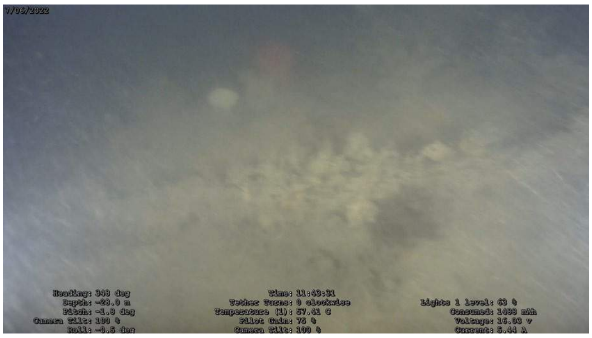

Figure 28: Detail of "cable". (Video 2022-06-07_11.30.28; 12:40).

2.4.2 *Heritage Transect 2*

T2_1 followed a line of concrete clump weights, connected by heavy chain, that were identified as the moorings for the WWII anti-submarine net. This transect was located between KP 107 and 108, adjacent to KP 107 and ran NNW from target 167, located at 693076.70 m E, 8625127.70 m N to target 164 (aka MA_002), located at 693039.84 m E, 8625225.61 m N. It was determined that the northernmost mooring device for the anti-submarine net trot was a large admiralty style anchor. A second dive (T2_2) was conducted on the anchor to take clearer images and aid in identification.

Chain was also seen extending south from Target 167 and targets likely to be mooring blocks were seen on MBES and SSS indicating that the trot extended further south to the Bayu-Undan GEP. It was decided that the proximity of these targets to the existing pipeline, and their distance from the proposed GEP, meant that further investigation in this direction was unnecessary.

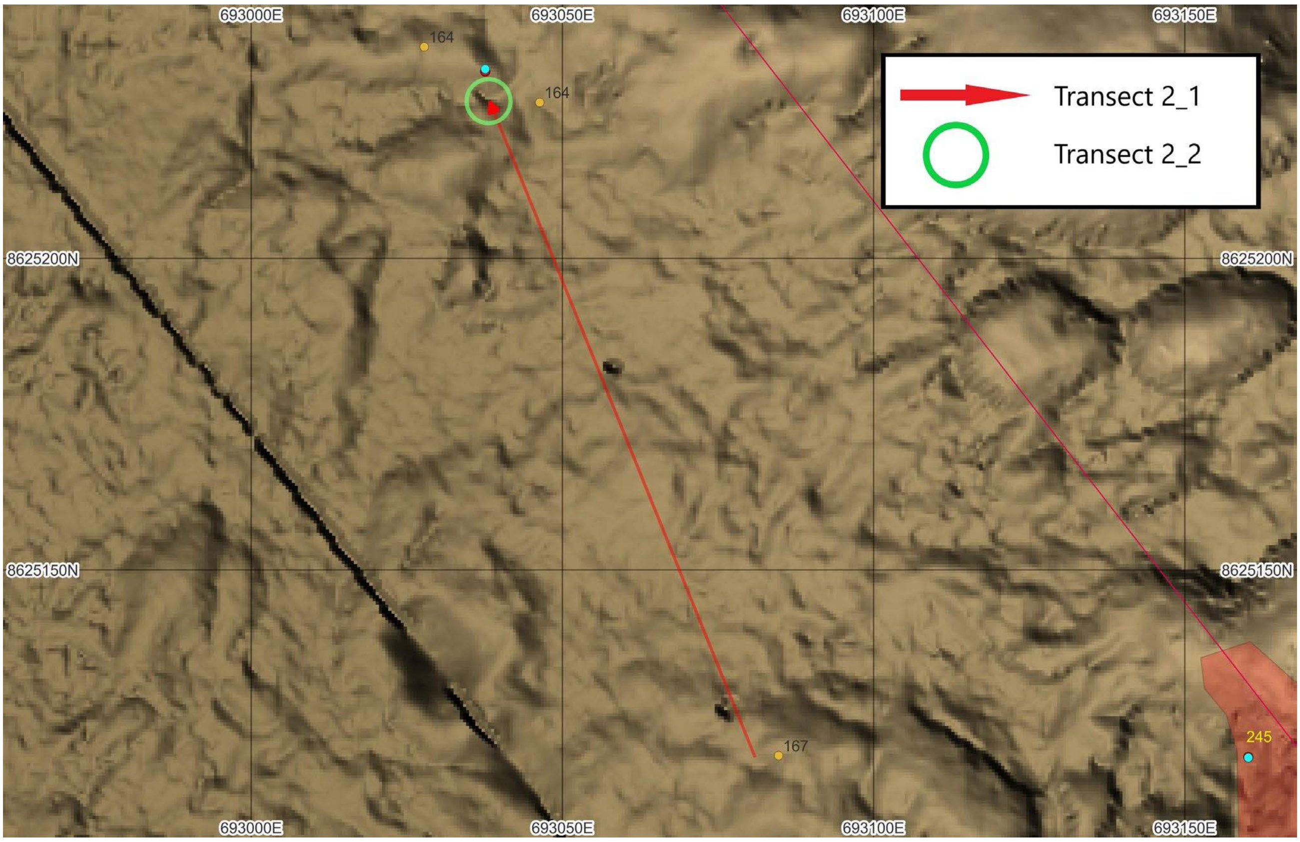

Figure 29: Dive locations for Heritage Transect 2.

2.4.2.1 T2_1

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
16	693077.90	8625120.30	Anti-submarine net mooring blocks and chain.	Width: 0.00 Height: 0.00 Length: 0.00 Shadow: 0.00	Variable, from 33 to 87	20 m

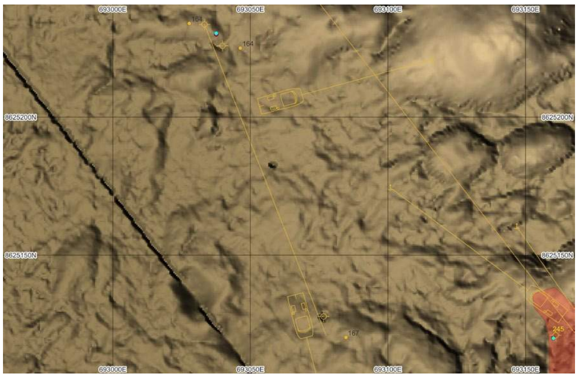

Figure 30: MBES image of general area of T2_1.

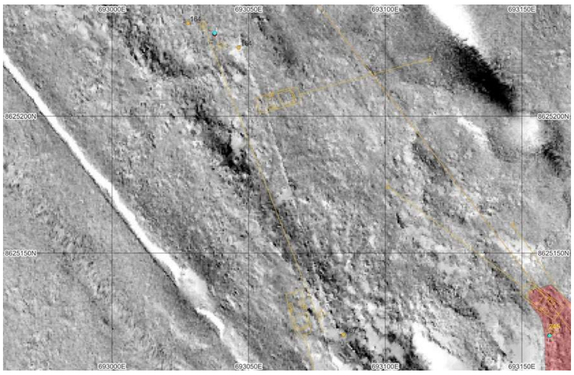

Figure 31: SSS image of general area of T2_1.

Inspection details for T2_1		
Date: 07-06-2022	**Method:** ROV	**Tide:** Ebbing
Distance and direction: 123 m at 345° NNE		
Swim start (min): 1231	**Swim end (min):** 1255	**Total time (min):** 24
Depth: 20 m	**Water visibility:** 0.5 - 1 m	**Seabed visibility:** Poor - Fair

Target description: ROV was dropped almost exactly Target 167, identified as an anti-submarine net mooring block (Figure 34). The ROV confirmed that chain was extant in a southerly direction from Target 167, away from the proposed GEP route. The ROV was then turned at a NNE heading and continued along the line of the chain to the second mooring block located at 693058.40 m E and 8625182.00 m N (Figure 35). The ROV again continued along the chain until reaching Target 164 (aka NCL_SC_026, MA_002). Upon reaching Target 164, it was immediately clear that this target was an anchor adapted for use as a mooring device for the anti-submarine net chain. Due to poor visibility and worsening currents, it was decided to finish the dive at this point and return to investigate Target 164 when a slack tide would provide more favourable conditions.

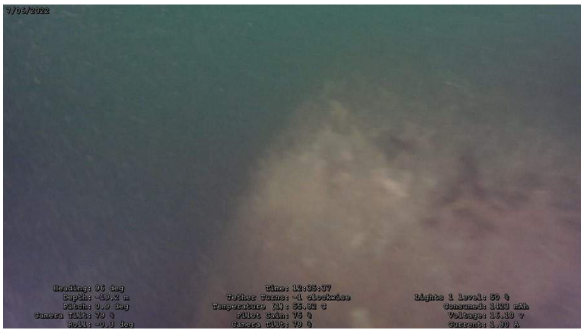

Figure 32: Screen grab Target 167, mooring block. (Video 2022-06-07_12.31.43; 03:35).

Figure 33: Screen grab of second anti-submarine net mooring block and chain, southern side of block. (Video 2022-06-07_12.31.43; 06:46).

2.4.2.2 T2_2

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
21	693036.33	8625230.54	Large ship's anchor, adapted for use as anti-submarine net mooring device.	Width: 4.00 Height: 1.90 Length: 7.00	33	18 m

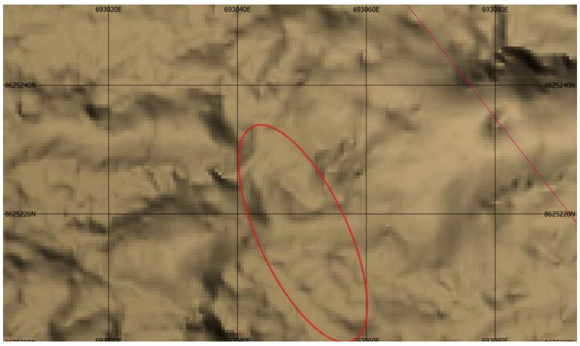

Figure 34: MBES image of Target 164 and chain extending south.

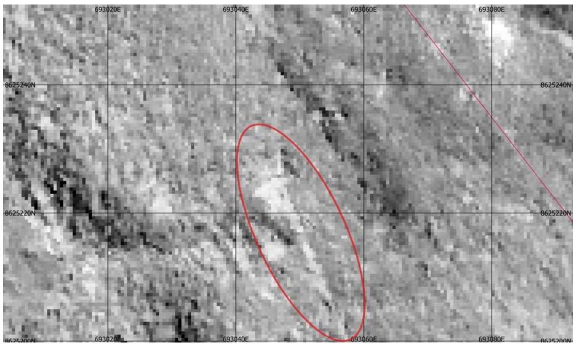

Figure 35: SSS image of Target 164 and chain extending south.

Inspection details for T2_2		
Date: 07-06-2022	**Method:** ROV	**Tide:** Slack
Distance and direction: Investigation of specific feature		
Swim start (min): 1646	**Swim end (min):** 1702	**Total time (min):** 16
Depth: 18 m	**Water visibility:** 3 m - 4 m	**Seabed visibility:** Good

Target description: T2_2 was undertaken specifically to record higher quality images of Target 164 and to determine if any portion of the anti-submarine trot extended north towards the proposed GEP route. Upon relocating the chain, the ROV was manoeuvred north to Target 164, a large anchor, seemingly admiralty pattern in style. The ROV made a full three-dimensional survey of the anchor and determined that the anti-submarine net chain was attached by a large D-shackle to the head of the anchor (Figure 41). The anchor had a large rectangular stock with possible evidence of iron bands, suggesting that the stock may be made of wood (Figure 43). The ROV took measurements of the length of the arm protruding from the seabed by measuring the depth at the tip of the fluke to the crown, determining the arm to be approximately 1.9m in length (Figure 38, Figure 39, and Figure 42). The relatively narrow, round shank extended north from the stock, ending at a fluke and arm protruded at a 90-degree angle from the seabed (Figure 40). No further mooring devices, chain or cable was identified to the north of Target 164, indicating that the anchor was the northern terminus of this trot.

Figure 36: Arm and fluke of anchor, looking west. (Video 2022-06-07_16.47.23; 04:08).

2.4.3 *Heritage Transect 3*

T3_1 followed a line of concrete clump weights, connected by heavy chain, that were identified as the moorings for the WWII anti-submarine net. This transect was located approximately halfway between KP 107 and 108 and ran NNW from a location several metres south of target NCL_SC_017, at 693417.30 m E, 8624861.20 m N to target 166 (aka NCL_SC_018), and beyond before finishing at a location near 693375.80 m E, 8624949.10 m N. The chain was clearly seen extending north from this location, however, it was determined that because this was in the opposite direction from the proposed GEP route, no further investigation was required.

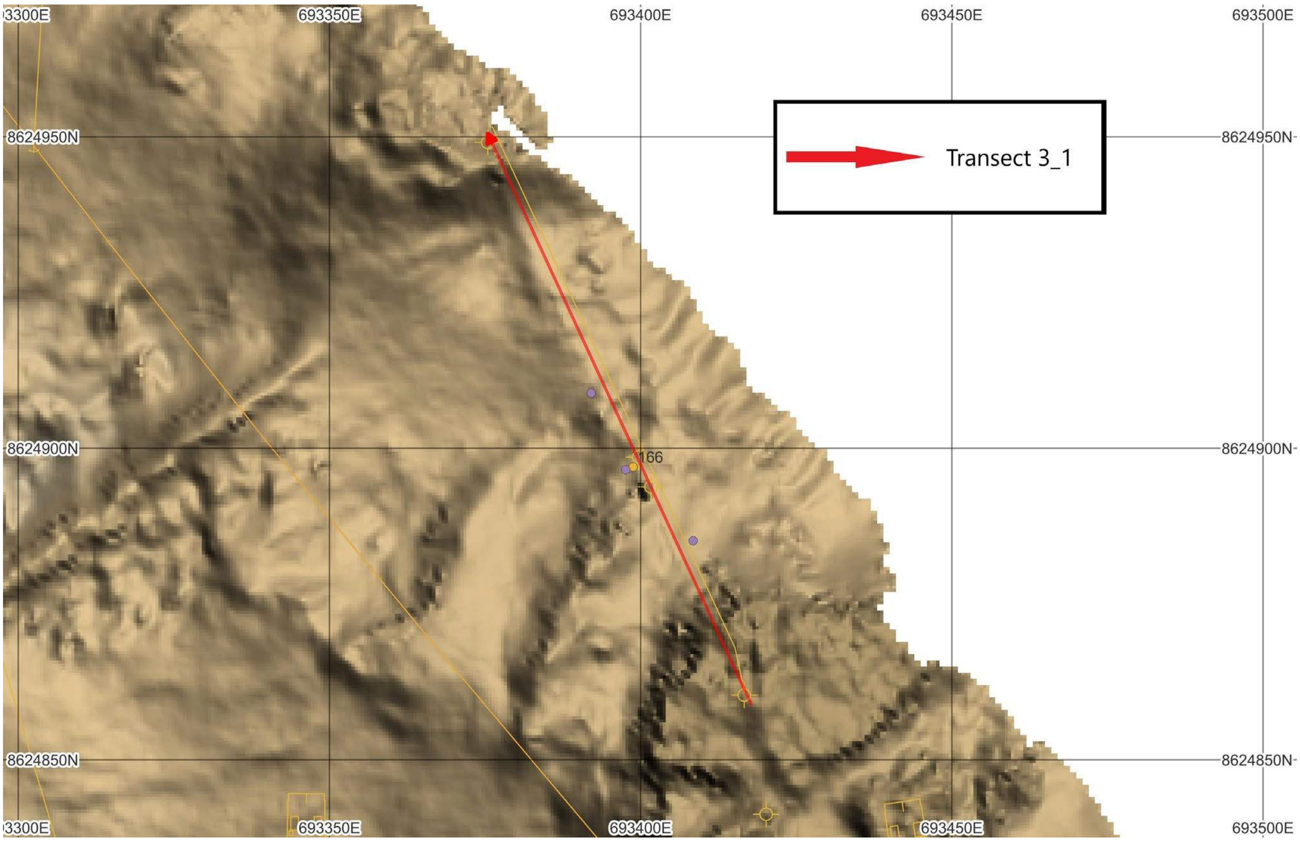

Figure 42 : Dive location for Heritage Transect 3.

2.4.3.1 T3_1

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
20	693416.67	8624860.36	Anti-submarine net mooring blocks and chain.	Width: 0.00 Height: 0.00 Length: 0.00 Shadow: 0.00	Variable, from 21 to 62	20 m

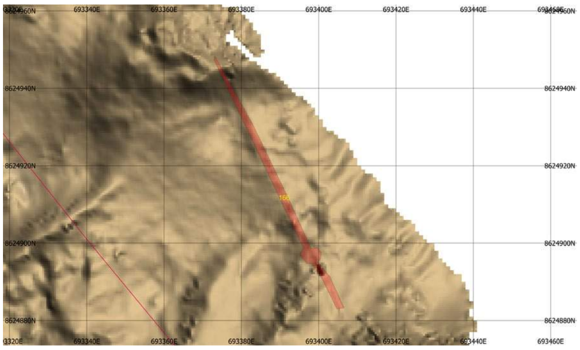

Figure 43: MBES image of general area of T3_1 and target 166.

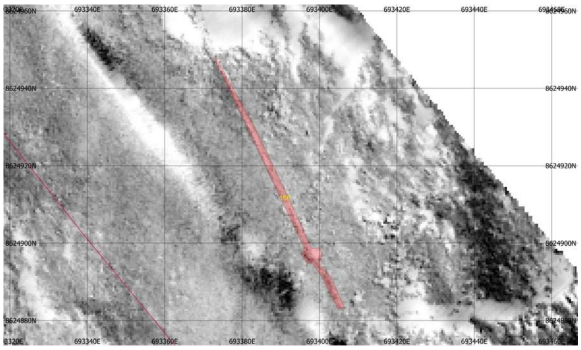

Figure 44: SSS image of general area of T3_1 and target 166.

Inspection details for T3_1		
Date: 07-06-2022	**Method:** ROV	**Tide:** Slack
Distance and direction: 150 m at 336° NNE		
Swim start (min): 1558	**Swim end (min):** 1626	**Total time (min):** 28
Depth: 20 m	**Water visibility:** 2 m – 3 m	**Seabed visibility:** Fair

Target description: The ROV was dropped on an area of seabed that was very rocky, with large rock shelfs and individual pebbles scattered around. This seabed topography made locating the chain and mooring blocks difficult, as potential cultural objects may have been obscured by the rocky seafloor and marine growth. Once the chain was located, the ROV took a southern heading and followed the chain towards the proposed GEP location at a heading of 120° ESE (Figure 47). Approximately 20 m further the chain was kinked at almost a 90-degree angle, with a clear break (Figure 48). Further investigation south found no further sign of the chain or mooring blocks, indicating that the chain had likely been broken and possibly removed or buried in this area. Turning north, the ROV followed the chain at a heading of 325° NW, finding this length of chain broken around the rocks and rock shelfs. Four more sections of broken chain were identified, all oriented on approximately the same heading, before the mooring block at Target 166 was located (Figure 49). The chain continued unbroken NNW from Target 166 for approximately 60 m before a second mooring block was identified (Figure 50). This second block appeared to be flipped upside down and had possible debris trapped under it (Figure 51). The chain continued the same heading from the north side of the second block, but as this was in the opposite direction of the proposed GEP route, it was decided to end investigation.

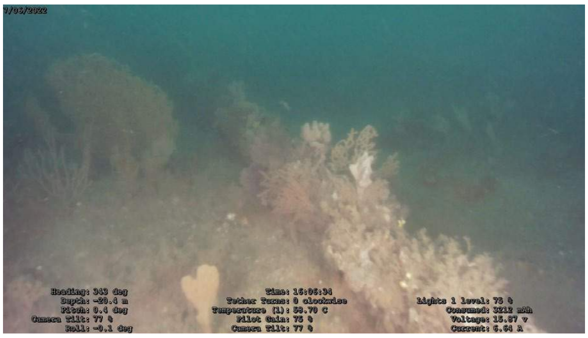

Figure 45: Chain located near ROV drop site. (Video 2022-06-07_15.56.55; 09:37).

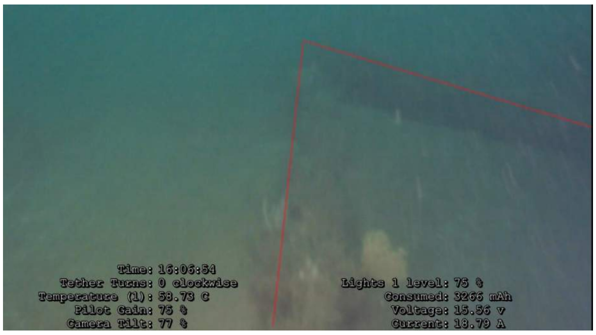

Figure 46: Chain kinked south of drop site. Direction of chain shown by red line. (Video 2022-06-07_15.56.55; 09:56).

2.4.4 *Individual Heritage Targets*

In addition to the three heritage transects undertaken on the anti-submarine net mooring trots, an additional 10 isolated targets located within 50m of the proposed GEP route were investigated.

2.4.4.1 Target 142

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
7	690559.00	8628514.00	Large boulders FUGRO ID: NCL_SC_042	Width: 12.00 Height: 0.00 Length: 15.00 Shadow: 0.00	0	32 m

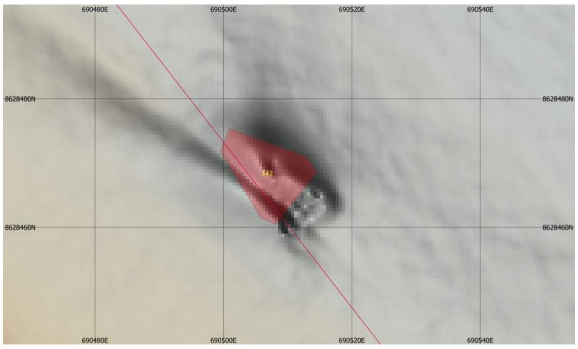

Figure 50: MBES image of Target 142.

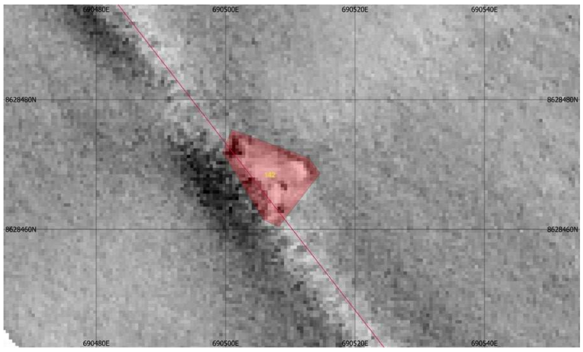

Figure 51: SSS image of Target 142.

Inspection details for Target 142		
Date: 06-06-2022	**Method:** ROV	**Tide:** Ebbing
Distance and direction: Circular search 10 m		
Swim start (min): 1458	**Swim end (min):** 1535	**Total time (min):** 37
Depth: 32 m	**Water visibility:** 0 m – 2 m	**Seabed visibility:** Poor

Target description: The investigation for Target 142 was combined with ecology survey 26_BACI-5P. Target was located and determined to be numerous large boulders, non-cultural. Boulders ranged from 2 – 5 metres in size (Figure 54, Figure 55).

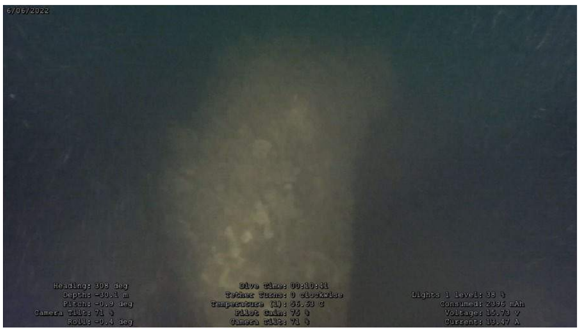

Figure 52: Boulder located at Target 142. (Video 2022-06-06_15.00.03; 05:01).

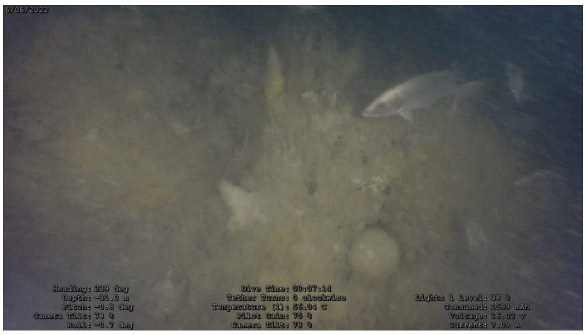

Figure 53: Detail of large boulder at Target 142. (Video 2022-06-06_15.00.03; 04:30).

2.4.4.2 Target 245

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
9	693164.00	8625128.00	Field of pebbles and rocks. Possibly MA_012	Width: 22.00 Height: 0.00 Length: 31.00 Shadow: 0.00	0	21 m

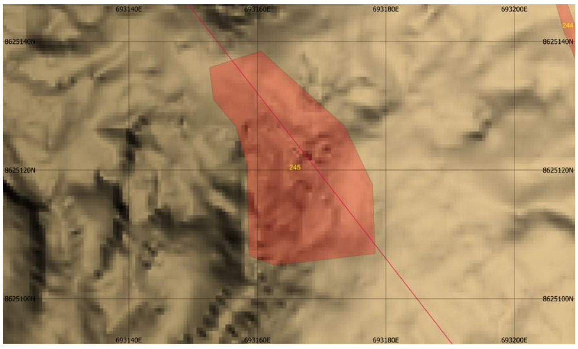

Figure 54: MBES image of Target 245, area of debris field highlighted.

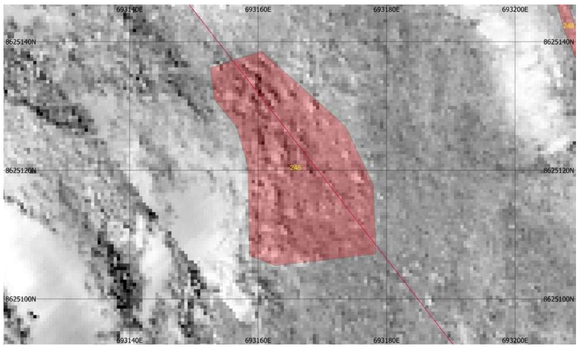

Figure 55: SSS image of Target 245, area of debris field highlighted.

Inspection details for Target 245		
Date: 06-06-2022	**Method:** ROV	**Tide:** Flowing
Distance and direction: Circular search 10 m		
Swim start (min): 1701	**Swim end (min):** 1710	**Total time (min):** 9
Depth: 21 m	**Water visibility:** 0 m – 2 m	**Seabed visibility:** Poor

Target description: Target 245 was located and determined to be a mound or field of rocks and pebbles, ranging in size from several centimetres to 2 metres across (Figure 58, Figure 59).

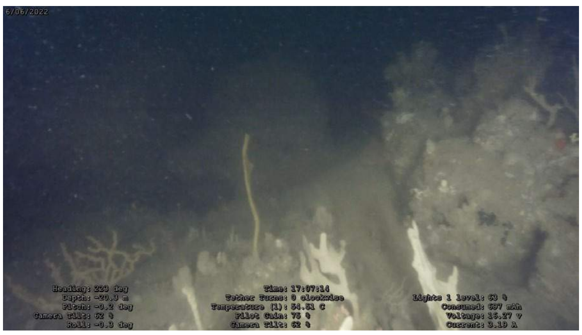

Figure 56: Larger rocks located at Target 245. (Video 2022-06-06_17.02.18; 03:20).

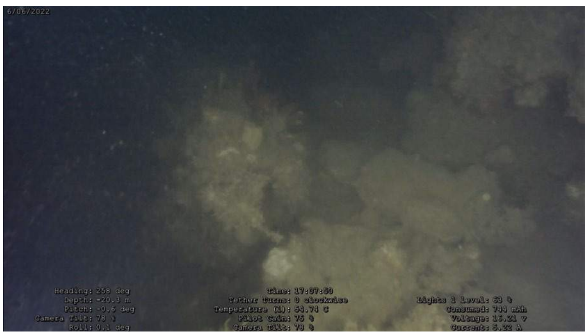

Figure 57: Smaller rocks located at Target 245. (Video 2022-06-06_17.02.18; 05:29).

2.4.4.3 Target 241

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
19	691791.84	8626921.00	Seabed depression FUGRO ID: NCL_SC_032	Width: 8.00 Height: 0.00 Length: 9.00 Shadow: 0.00	42	24 m

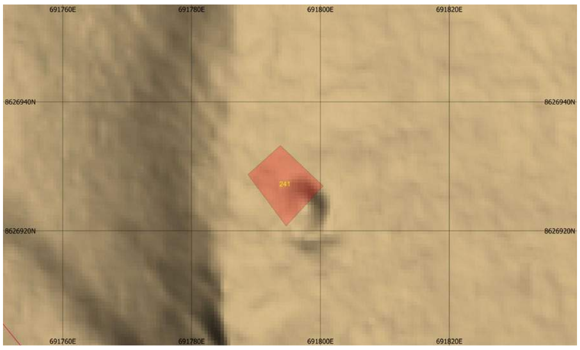

Figure 58: MBES image of Target 241.

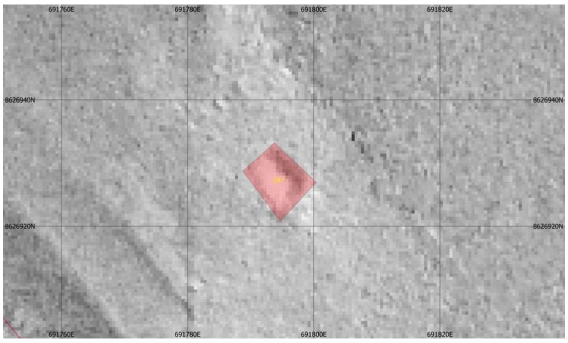

Figure 59: SSS image of Target 241.

Inspection details for Target 241		
Date: 07-06-2022	**Method:** ROV	**Tide:** Ebbing
Distance and direction: Circular search 10m		
Swim start (min): 1453	**Swim end (min):** 1529	**Total time (min):** 36
Depth: 24 m	**Water visibility:** 2 – 3 m	**Seabed visibility:** Fair

Target description: Target 241 was determined to be a shallow depression in the seabed, approximately 1.5m deep with gently sloping sides. Dive for 241 was combined with investigation of NCL_SC_031 and ecology survey 24_BACI-4P.

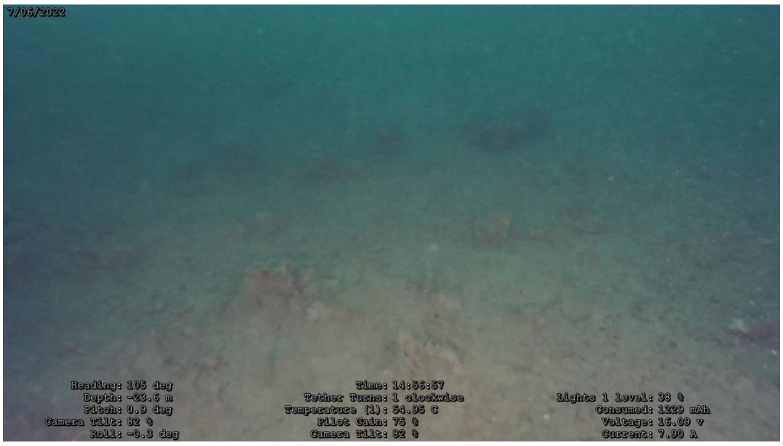

Figure 60: Detail of seabed in depression located at Target 241. (Video 2022-06-07_14.54.13; 02:42).

2.4.4.4 Target NCL_SC_031

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
19	691791.84	8626921.00	Possible debris.	Width: 0.70 Height: 0.00 Length: 1.40 Shadow: 0.00	25	24 m

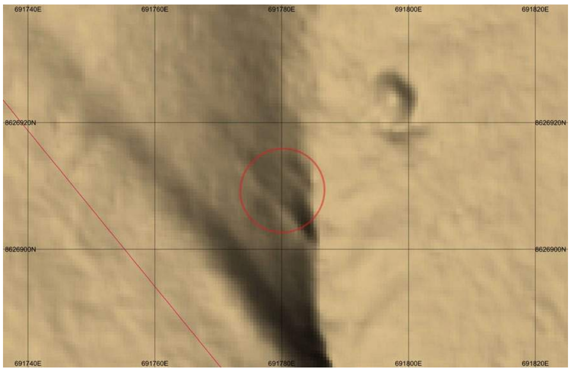

Figure 61: MBES image of Target NCL_SC_031.

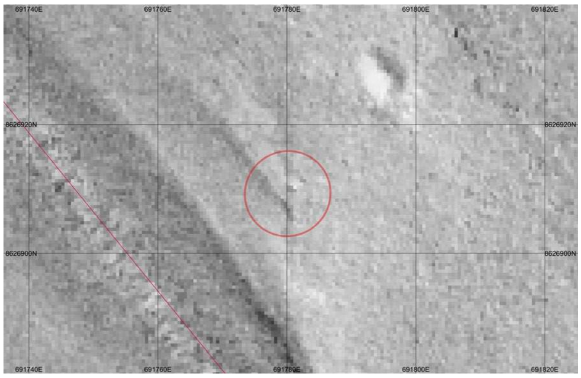

Figure 62: SSS image of Target NCL_SC_031.

Inspection details for Target NCL_SC_031		
Date: 07-06-2022	**Method:** ROV	**Tide:** Ebbing
Distance and direction: Circular search 10m		
Swim start (min): 1453	**Swim end (min):** 1529	**Total time (min):** 36
Depth: 24 m	**Water visibility:** 2 – 3 m	**Seabed visibility:** Fair

Target description: The ROV continued directly from Target 241 to the location of NCL_SC_031 at a bearing of 232° SW. No cultural material was identified at this location. Seabed consisted of fine sand with numerous sand ripples.

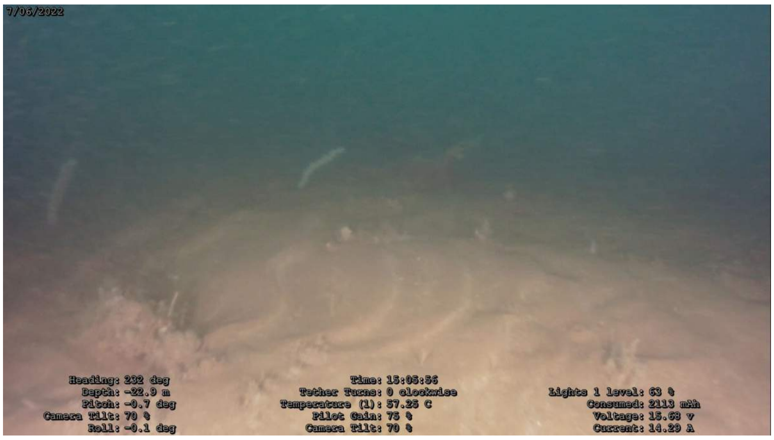

Figure 63: Seabed and sand ripples at NCL_SC_031. (Video 2022-06-07_15.04.06; 01:48).

2.4.4.5 Target 175

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
22, 23	694295.02	8623601.00	Linear ridge. Possibly associated with MA_009	Width: 5.00 Height: 0.00 Length: 24.00 Shadow: 0.00	1.5	28 m

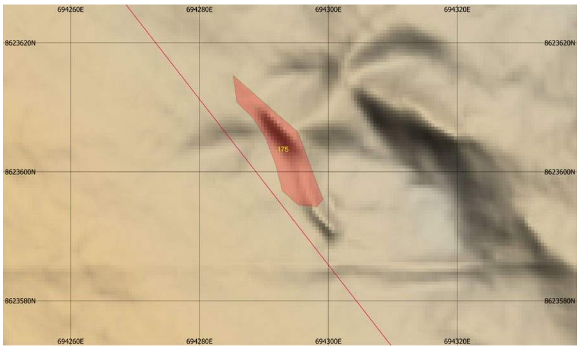

Figure 64: MBES image of Target 175.

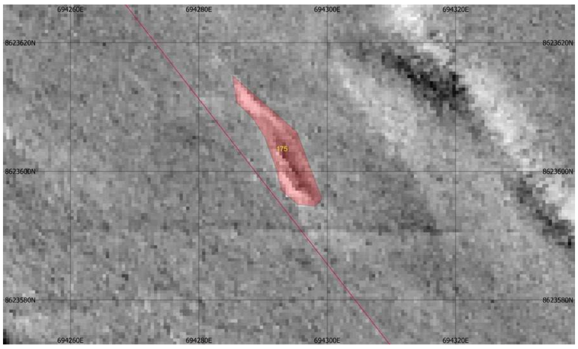

Figure 65: SSS image of Target 175.

Inspection details for Target 175		
Date: 08-06-2022	**Method:** ROV	**Tide:** Flowing
Distance and direction: 25 m at 147° SE		
Swim start (min): 0748	**Swim end (min):** 0810	**Total time (min):** 22
Depth: 28 m	**Water visibility:** 3 m – 4 m	**Seabed visibility:** Good

Target description: Two dives were attempted on Target 175. The first, dive 22, was unsuccessful in finding the target, and was aborted. The second, dive 23, was successful in locating the target.

Target 175 appeared to be a low ridge of rock and coral, rising approximately 1 – 2 m from the surrounding seabed, which was mostly sand. The ridge measured approximately 25 m in total length and 2-3 m in width and was separated in two sections by a small gap about halfway along the ridge. No obvious cultural material was seen during the dive.

Figure 66: North section of ridge, facing northeast. (Video 2022-06-08_07.51.14; 01:05).

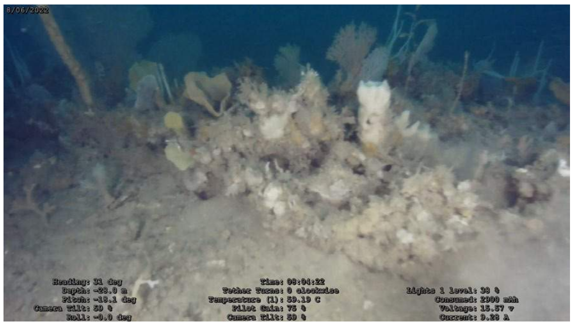

Figure 67: Detail of southern section of ridge. (Video 2022-06-08_07.51.14; 13:04).

2.4.4.6 Target 174

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
24	694194.61	8623695.89	Single discrete object in close location to series of mag strikes across KP 109 FUGRO ID: NCL_SC_013, MA_010	Width: 2.00 Height: 1.00 Length: 3.00 Shadow: 0.00	15	28 m

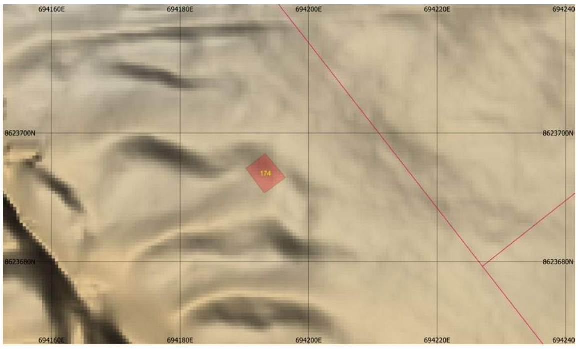

Figure 68: MBES image of Target 174.

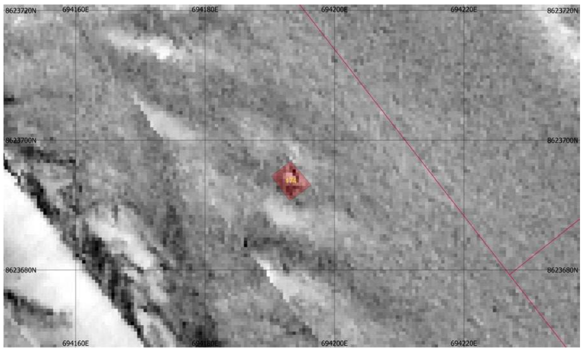

Figure 69: SSS image of Target 174.

Inspection details for Target 174		
Date: 08-06-2022	**Method:** ROV	**Tide:** Flowing
Distance and direction: Cross search pattern, 10m NESW		
Swim start (min): 0826	**Swim end (min):** 0841	**Total time (min):** 15
Depth: 28 m	**Water visibility:** 3 m – 4 m	**Seabed visibility:** Good

Target description: In an improvement on target locating, a clump weight with a line attached to the buoy was dropped on the location of the target while the vessel was moving. Once the vessel was anchored, the ROV used the buoy line as a target reference and descended on the line to the seabed. Once on the bottom, the ROV began a cross shaped search pattern with 10 m transects out from the clump weight in all four cardinal directions.

Target 174 was located a short distance west of the drop weight and appeared as two round mounds protruding from a sandy seabed, similar to a dumbbell in form. A full 360° visual survey of the object was completed. The whole structure was estimated to measure 2-3 m from end to end, 1 m wide, and 1 m above the seabed. The remains of cable or rope appeared to be wrapped around the middle arm connecting the two ends, with a coil wedged underneath the western end. The shape and presence of cable or rope suggests that Target 174 may be a windlass or winch. No other cultural objects were identified in the surrounding area.

Figure 70: Target 174, facing north. (Video 2022-06-08_08.26.18; 08:58).

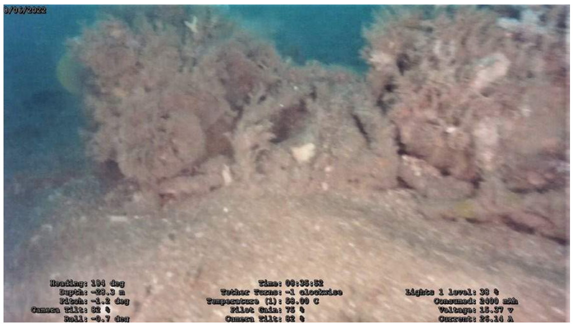

Figure 71: Target 174 facing south. Note possible cable or rope remains wrapped around middle. (Video 2022-06-08_08.26.18; 09:31).

Figure 73: Target 174, facing east. Notice cable coiled underneath. (Video 2022-06-08_08.26.18; 09:35).

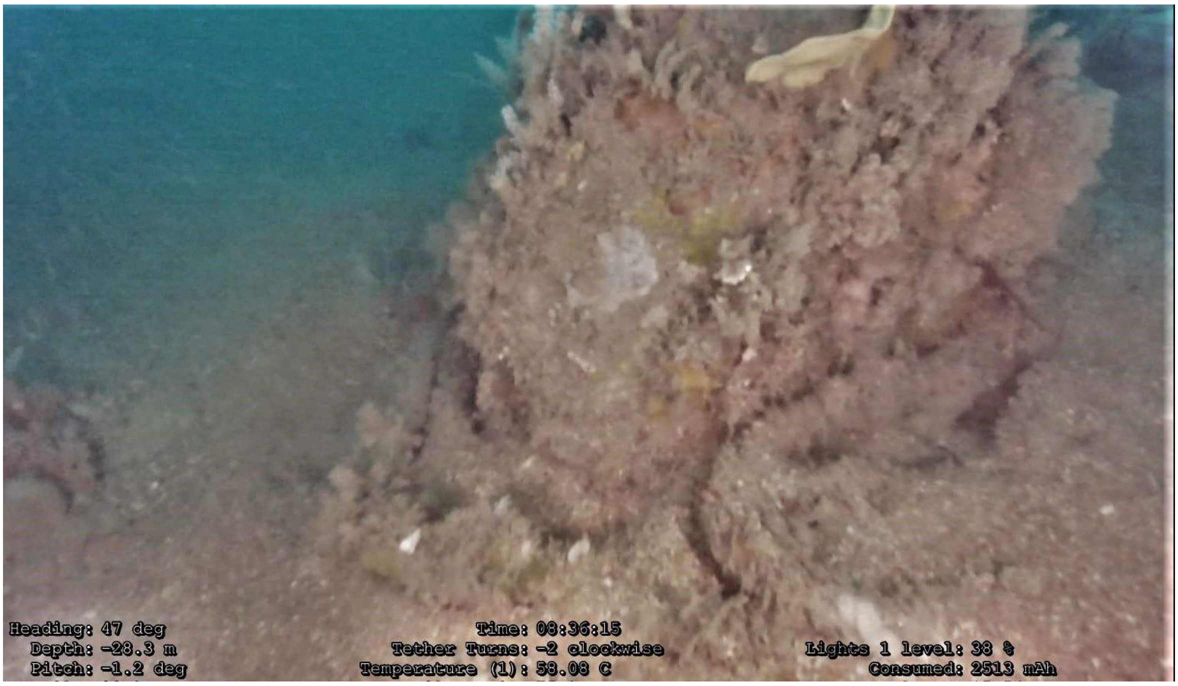

Figure 74: Detail of coil, facing east. (Video 2022-06-08_08.26.18; 09:55).

2.4.4.7 Target NCL_SC_016

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
25, 26	694168.64	8623820.49	Possible cable support or isolated non-ferrous object	Width: 1.60 Height: 0.00 Length: 3.50 Shadow: 0.00	39	30 m

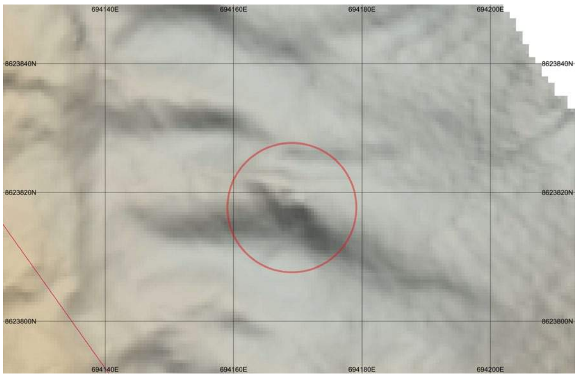

Figure 75: MBES image of Target NCL_SC_016.

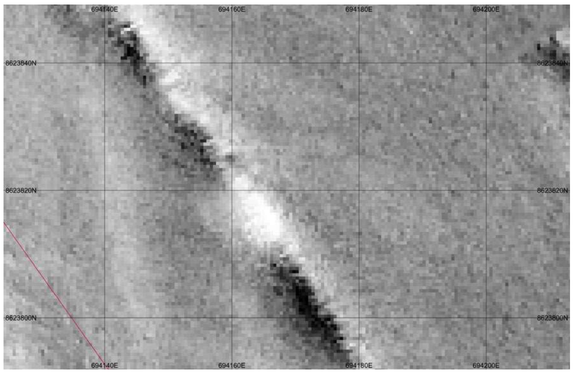

Figure 76: SSS image of Target NCL_SC_016.

Inspection details for Target NCL_SC_016		
Date: 08-06-2022	**Method:** ROV	**Tide:** Flowing
Distance and direction: Cross search pattern, 10m NESW		
Swim start (min): 0907	**Swim end (min):** 0933	**Total time (min):** 26
Depth: 30 m	**Water visibility:** 2 m – 3 m	**Seabed visibility:** Good

Target description: Two dives were attempted on Target NCL_SC_016. The first was aborted because the ROV lost sight of the guide rope. The second dive, 26, was successful in locating the target using the same methodology adopted for dive 24.

Target NCL_SC_016 was located several metres north of the drop weight and appeared to be a length of cable running in a generally east-west orientation (Figure 79). The cable was approximately 70mm in diameter and extended for about 35m in total length. Portions of the cable were buried in the sandy seabed, with both ends disappearing into the sand. Around 20 m west of the drop weight, the cable veered slightly north before turning sharply southwest and a 90-degree dogleg (Figure 80). The portion of the cable at the dogleg was clearly visible above the seabed and appeared to be ferrous (Figure 81). The location of the cable is roughly in the location of the 1879 telegraph cable and may be the disarticulated section of a 19th century telegraph cable.

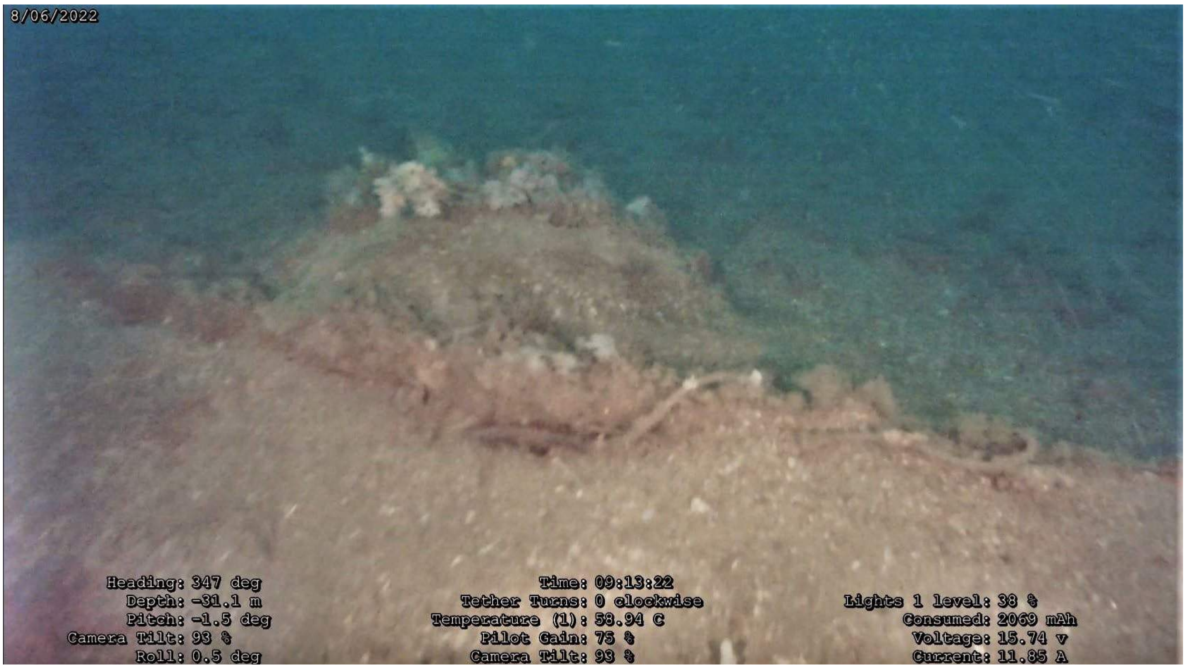

Figure 77: Target NCL_SC_016 just north of drop line. Cable running at heading of 274° W. (Video 2022-06-08_09.06.58; 06:10).

Figure 78: Dogleg in cable. (Video 2022-06-08_09.06.58; 09:47).

Figure 79: Detail of cable at dogleg. Note possible ferrous nature of cable. (Video 2022-06-08_09.06.58; 10:56).

2.4.4.8 Target MA_007

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
29	695763.20	8621695.50	Inferred buried debris	21.5 nT	6	24 m

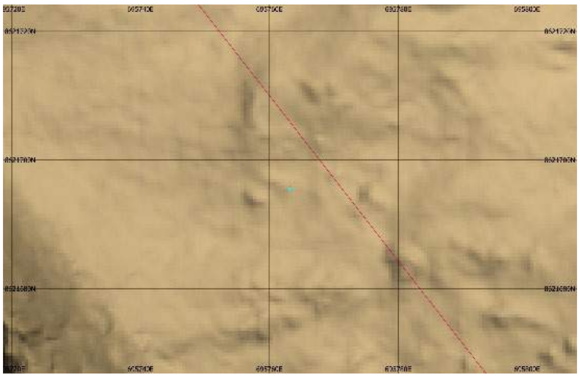

Figure 80: MBES image of the general area of Target MA_007.

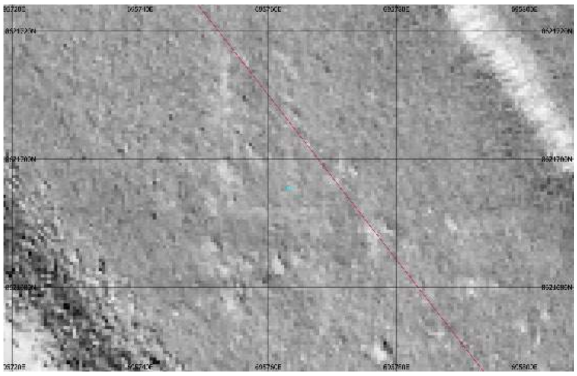

Figure 81: SSS image of the general area of Target MA_007.

Inspection details for Target MA_007		
Date: 08-06-2022	**Method:** ROV	**Tide:** Ebbing
Distance and direction: Cross search pattern, 10m NESW		
Swim start (min): 1256	**Swim end (min):** 1312	**Total time (min):** 16
Depth: 24 m	**Water visibility:** 2 m – 3 m	**Seabed visibility:** Good

Target description: Dive methodology was repeated from previous dives. A clump weight with buoy was dropped on the target from the moving vessel. Once anchored, the ROV was placed in the water and followed the line down to the seabed. Once on bottom, a cross shaped search pattern was conducted, with 10m transects in each cardinal direction from the clump weight.

The clump weight was dropped almost directly on top of Target MA_007, which was located 2m west. The target appeared to be a rectangular structure made of steel I-beams with very low relief above the sandy seabed. The structure consisted of at least 10 beams and possibly more as it was partially buried in the seabed. Three long beams delimited the structure on three sides, with the fourth side buried. Between these several smaller beams extended from one side of the structure, parallel with the other two sides. The main structure is estimated to be roughly five metres long and 2 metres wide. In addition to this contiguous material, there were several isolated and disarticulated beams scattered nearby. MA_007 may represent the remains of a steel barge, or possible discard.

Figure 82: Overview of structure located at Target MA_007, facing south. Note rectangular shape of outer beams, with interior beams. (Video 2022-06-08_12.56.09; 06:23).

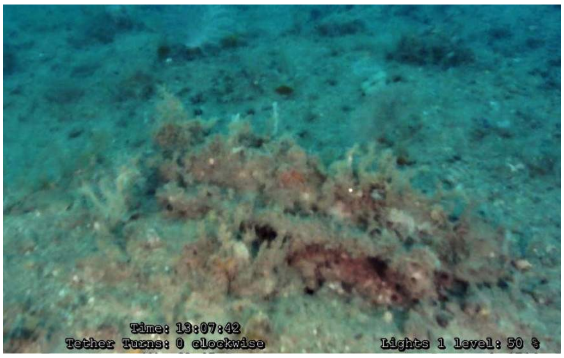

Figure 84: Isolated debris likely associated with the contiguous structure at MA_007. Debris located approximately 5m from structure. (Video 2022-06-08_12.56.09; 11:31).

2.4.4.9 Target MA_001

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
30	697628.20	8617803.70	Inferred buried debris	13.3 nT	35	20 m

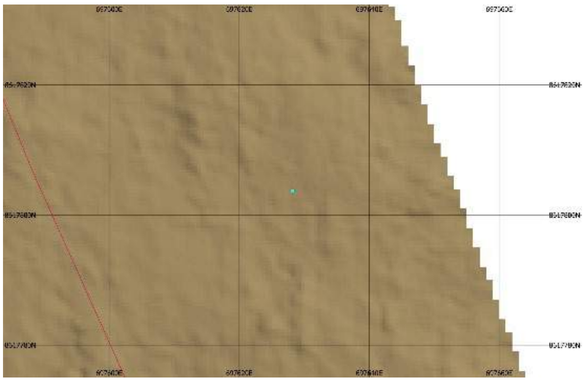

Figure 85: MBES image of the general area of Target MA_001.

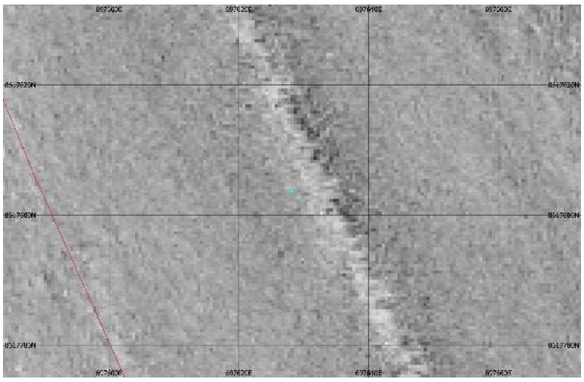

Figure 86: SSS image of the general area of Target MA_001.

Inspection details for Target MA_001		
Date: 08-06-2022	**Method:** ROV	**Tide:** Ebbing
Distance and direction: Cross search pattern, 10m NESW		
Swim start (min): 1338	**Swim end (min):** 1358	**Total time (min):** 20
Depth: 20 m	**Water visibility:** 2 m – 3 m	**Seabed visibility:** Good

Target description: Dive methodology was repeated from previous dives. A clump weight with buoy was dropped on the target from the moving vessel. Once anchored, the ROV was placed in the water and followed the line down to the seabed. Once on bottom, a cross shaped search pattern was conducted, with 10m transects in each cardinal direction from the clump weight.

The cross search found three instances of debris in the search area. A metal wheel rim was located 5m south of the clump weight, mostly buried in soft sediment (Figure 89). Next to the wheel was a length of steel rope, with one end tied in a loop (Figure 90 and Figure 91). These two objects are likely related and may represent a mooring for a buoy or other device.

A third piece of debris was located about 5m north of the clump weight. This object consisted of a cement block or possible metal scrap with two wires protruding (Figure 92). No other debris or cultural objects were seen in the area.

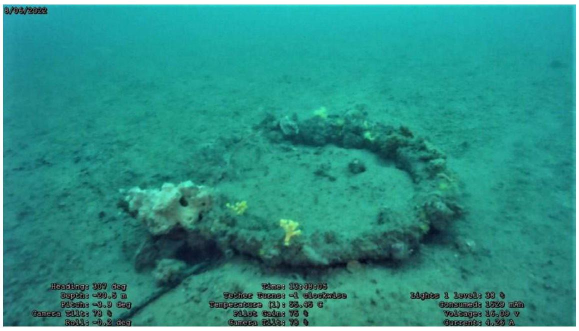

Figure 87: Metal wheel rim located at MA_001. Note wire protruding from side. (Video 2022-06-08_13.43.09; 04:54).

Figure 88: Steel rope or cable located next to the wheel rim. (Video 2022-06-08_13.43.09; 05:56).

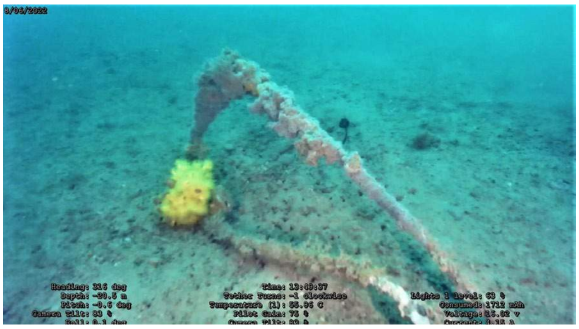

Figure 89: Detail of loop in cable. (Video 2022-06-08_13.43.09; 06:27).

Figure 90: Debris located north of clump weight. (Video 2022-06-08_13.43.09; 07:57).

2.4.4.10 Target NCL_SC_002

ROV dive	Dive Start Easting	Dive Start Northing	Interpretation	Dimensions	Distance from GEP (m)	Depth
31	698297.94	8616489.78	Single isolated object, possible debris or natural feature	Length: 1.00 Width: 0.40	11	14 m

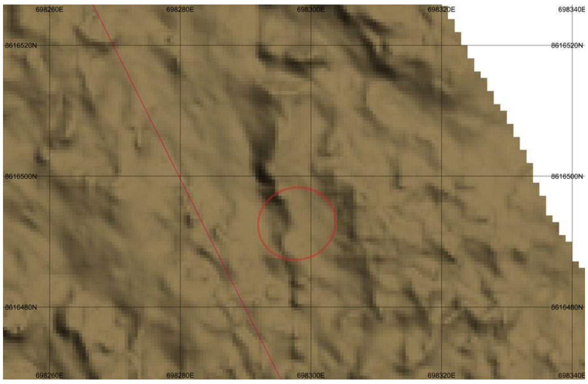

Figure 91: MBES image of Target NCL_SC_002

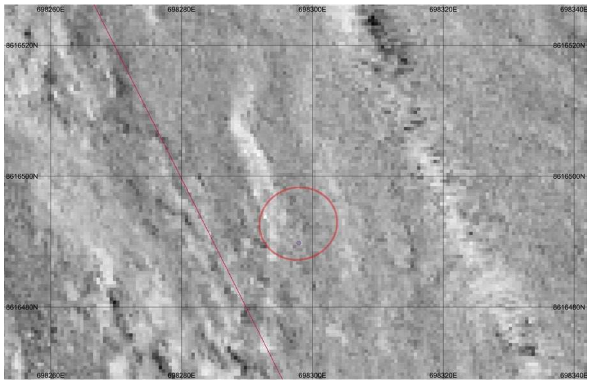

Figure 92: SSS image Target NCL_SC_002.

Inspection details for Target NCL_SC_002		
Date: 08-06-2022	**Method:** ROV	**Tide:** Ebbing
Distance and direction: Cross search pattern, 10m NESW		
Swim start (min): 1420	**Swim end (min):** 1440	**Total time (min):** 20
Depth: 14 m	**Water visibility:** 2 m – 3 m	**Seabed visibility:** Good

Target description: Dive methodology was repeated from previous dives. A clump weight with buoy was dropped on the target from the moving vessel. Once anchored, the ROV was placed in the water and followed the line down to the seabed. Once on bottom, a cross shaped search pattern was conducted, with 10m transects in each cardinal direction from the clump weight.

A small piece of possible debris was located 5m south of the clump weight. The object was long and thin, possibly aluminium if metal. After locating this object, the ROV lost the location of the clump weight and surfaced to locate the target again. After reaching the bottom again, the ROV swam north of the weight, and completed its cross-pattern search. No other cultural material was seen in the area.

Figure 93: Possible debris located south of clump weight. (Video 2022-06-08_14.22.27; 03:23).

Figure 94: Natural feature north of clump weight. (Video 2022-06-08_14.22.27; 15:11).

3 ROV SURVEY SUMMARY

In total, 21 dives were attempted to locate and identify geophysical survey targets. Of these 21 dives, 3 were aborted due to poor conditions or issues with the ROV. Despite these failed attempts, ROV surveys were conducted on all 16 targets shortlisted for ROV survey.

Heritage Transects 1, 2, and 3 identified the remains of WWII anti-submarine net moorings near the entrance to Darwin Harbour. It was concluded based on these surveys that the northern and southern mooring trots (Transects 2 and 3) did not cross the proposed GEP route. It was noted that the northern end of the trot surveyed by Transect 2 was anchored with a potentially historical ships anchor, likely of cultural heritage significance.

ROV survey of the middle trot (Transect 1) identified mooring chains that did cross the proposed GEP route. However, it was also seen that a gap exists between sections of the chain, southeast of the location of Target 246, which was not located.

Individual dives on 10 isolated heritage targets identified 5 instances of natural features, not considered to be cultural in origin. Of the remaining 5, four are conclusively cultural, while one was inconclusive. The table below summarizes the results of the survey of these features.

Target ID	Likely identification	Cultural/Natural
142	Boulders	Natural
245	Rock rubble	Natural
241	Shallow depression	Natural
NCL_SC_031	Sand ripples	Natural
175	Narrow rock/coral ridge	Natural
174	Winch or windlass	Cultural
NCL_SC_016	Telegraph cable	Cultural
MA_007	Remains of barge	Cultural
MA_001	Buoy mooring and cable	Cultural
NCL_SC_002	Metal debris	Inconclusive

11 ANNEX B: CONSOLIDATED TARGET LIST

The table below is a consolidated list of all targets identified as potentially cultural from geophysical survey data review. Additionally, several known shipwrecks within the study area and anchoring corridor are included, as well as targets surveyed during ROV surveys (see main report, Section 7, and Annex A).

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Interpretation	Dimensions (m)			Depth (m)	Distance from pipeline (m)
		Easting	Northing		Length	Width	Height		
B	MA_001 *	697,628.20	8,617,803.70	Likely buoy mooring and cable	1	1	0.25	20	35
A	MA_007 *	695,763.20	8,621,695.50	Metal frame and debris	5	2	0.25	24	6
B	MA_028	693,130.70	8,624,923.90	Buried ferrous object near anti-sub net moorings	N/A	N/A	N/A	21	150
B	MA_031	698,180.90	8,616,372.60	Buried ferrous object	N/A	N/A	N/A	13	146
B	MA_037	701,335.50	8,613,704.20	Buried ferrous object	N/A	N/A	N/A	19	651
A	112	623 013.42	8 659 220.00	Single object of high relief. Possible debris related to I-124.	8	6	N/A	46	68
A	138	686 407.37	8 632 159.33	Mound associated with anchor scars	13	16	N/A	17	59
A	149	691 670.76	8 626 677.01	Unknown, may be related to pipeline or another cultural feature.	Total length: 258m Ind. Diamete r: 5m	19	N/A	19	200
A	164*	693 038.56	8 625 231.53	Part of anti-submarine net mooring trot 18 FUGRO ID: NCL_SC_026	209	2	N/A	16	30
A	166*	693 399.74	8 624 898.55	Part of anti-submarine net mooring trot 16 FUGRO ID: NCL_SC_017, 018, 019	73	5	N/A	21	41

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Interpretation	Dimensions (m)			Depth (m)	Distance from pipeline (m)
		Easting	Northing		Length	Width	Height		
A	167*	693 085.69	8 625 121.75	Part of anti-submarine net mooring trot 17 Likely connected to Target ID: 164	3	3	N/A	16	76
A	191	696 438.36	8 620 800.13	Single object of high relief. Possible small boat.	8	3	N/A	19	73
A	210	701 140.90	8 613 958.61	Possible aircraft wreck or natural feature.	12	7	N/A	17	389
A	234	647 746.21	8 649 692.16	Single mound, indicating lone discarded object.	5	4	N/A	43	173
A	238	696 581.70	8 620 537.67	Possible scattered debris.	70	10	N/A	21	78
A	239	697 710.77	8 617 774.90	USAT *Mauna Loa*	124.97	16.46	N/A	19	90
A	240	691 578.22	8 626 925.25	Possible mooring block for anti-submarine defences	4	2	N/A	16	122
A	242	691 589.94	8 626 799.20	Steel wire rope and chain associated with anti-submarine defences. (boom net), UXO including mechanical fuses and fuse cones. (See Section 6.4)	23	13	N/A	17	186
A	243	693 188.00	8 624 746.00	Possible mooring block related to anti-submarine defences.	2	2	N/A	15	216
A	244*	693 196.00	8 625 167.00	Part of anti-submarine net mooring trot 18 FUGRO ID: NCL_SC_022, 023, 024, 025	120	5	N/A	22	50
A	248	693 131.66	8 624 925.53	Debris scatter, or possible anti-submarine net remains	Var.	Var.	N/A	16	150

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Interpretation	Dimensions (m)			Depth (m)	Distance from pipeline (m)
		Easting	Northing		Length	Width	Height		
B	NCL_SC_002*	698 297.94	8 616 489.78	Debris	1	0.4	N/A	17	11
B	NCL_SC_010	694 982.00	8 622 822.59	Linear debris, likely cable remains.	17	0.5	N/A	20	70
A	NCL_SC_016*	694 168.64	8 623 820.49	Cable, possible telegraph	3.5	1.6	N/A	24	40
B	NCL_SC_031*	691 780.61	8 626 909.95	Single isolated non-ferrous object, likely debris.	1.4	0.7	N/A	16	26
B	115	649 361.40	8 649 116.46	Shallow depressions with low relief object.	8	4	N/A	44	86
B	130	665 465.07	8 643 481.67	Possible debris scatter.	18	8	N/A	29	208
B	135	621 286.34	8 660 259.37	Likely natural feature, closest proximity target to I-124	62	58	N/A	48	143
B	136	622 455.26	8 659 969.89	Possible debris scatter or natural feature.	98	32	N/A	49	214
B	141	690 574.96	8 628 606.67	Debris or rocks FUGRO ID: NCL_SC_043, 044, 045, 046	53	20	N/A	30	137
A	174*	694 194.43	8 623 696.01	Winch or windlass with rope FUGRO ID: NCL_SC_013	5	4	N/A	24	16
B	192	696 253.89	8 620 643.48	Possible debris	24	22	N/A	14	147
B	196	696 859.94	8 619 902.39	Debris or rocks	9	6	N/A	19	53
B	233*	639 844.98	8 652 470.81	Triangular depression, Likely natural feature.	39	8	N/A	41	34
A	500	697,615.17	8,618,840.23	USAT Meigs	121.00	20.00	3.30	20	369
A	501	695,875.84	8,619,850.01	Medkhanun 3	25.00	8.00	7.00	19	847
A	502	695,698.81	8,620,246.53	Ham Luong	18.00	5.00	3.00	25	832
A	503	695,794.02	8,620,287.72	Song Saigon	40.00	10.00	5.00	24	728
A	504	695,778.93	8,620,381.31	John Holland Barge	38.00	15.00	5.00	25	700

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Interpretation	Dimensions (m)			Depth (m)	Distance from pipeline (m)
		Easting	Northing		Length	Width	Height		
A	505	693,287.42	8,623,844.84	Mandorah Queen	12.00	5.00	2.00	20	683
A	506	691,938.35	8,625,657.51	NR Diemen	29.00	5.00	0.00	8	642
A	573	692,508.78	8,625,489.01	Debris	26.00	15.00	0.50	17	295
A	574	691,574.41	8,626,791.47	WWII anti-sub boom net	41.00	21.00	1.00	21	209
A	575	691,518.71	8,626,801.77	Debris	10.00	6.00	0.75	20	245
B	576	689,856.12	8,628,847.08	Mound	7.00	6.50	0.40	25	268
B	577	689,412.76	8,629,288.62	Isolated object	4.00	4.50	0.50	24	263
B	578	685,439.11	8,632,096.37	Mound associated with trawl scar	8.00	4.50	0.40	17	603

1 INTRODUCTION

1.1 Background

Santos Pty Ltd is proposing to install a gas export pipeline (GEP) off the northwest coast of the Northern Territory (NT). The proposed GEP begins at the Barossa gas field, north of the Tiwi Islands, and extends south to feed the Darwin LNG plant, located in Middle Arm, Darwin Harbour. Two stages are proposed for the GEP. The first stage is a GEP from the Barossa gas field to a point at the existing Bayu-Undan to Darwin pipeline southwest of Bathurst Island. The second stage is to extend the GEP from this point to the Darwin LNG plant. The maritime cultural heritage of the second stage has been presented in a previous report.[1]

On 20 March 2023, Santos informed CA that minor route changes within the second stage GEP alignments had been required through consultation with the Darwin Harbour Master office. Under the recommendations of the previous report, any new route changes would need to be properly assessed by a qualified maritime archaeologist.[2] No new targets have been identified, as the assessment of the currently available geophysical survey data is considered complete and the GEP realignment remains within the area of the previous geophysical survey corridor.

The new route largely follows the original proposed GEP route, with seven small deviations in course, two of which avoid the shipping channel in Darwin Harbour. The realignment shifts the proposed pipeline centreline up to 115 metres in sections in Darwin Harbour, crossing the existing Bayu-Undan pipeline to avoid the shipping channel (Table 1).

Table 1: Location of GEP route deviations and deviation distance.

2 IMPACT ASSESSMENT OF NEW GEP ROUTE

2.1 Previously identified impacts

The previous maritime heritage assessment (CA, December 2022) for the original GEP route noted several items identified through geophysical survey data review and ROV surveys that could be potentially impacted by pipeline installation. Three targets, MA_007, NCL_SC_016 and 174 were determined to be within 35 metres of the proposed original GEP alignment. All three targets were observed during ROV surveys in June 2022 and determined to be cultural in origin. The heritage significance of these objects could not be fully assessed; however, they were provisionally assessed to be of minimal to moderate heritage significance.

The previous report assessed that only target MA_007 and the potential remains of anti-submarine net mooring trot 17 were likely to be impacted by the pipeline installation. While the realignment of the proposed GEP route has not changed its proximity to trot 17 or targets 174 and NCL_SC_016, the new route places target MA_007 outside of the range of likely impact.

2.2 Targets with altered distance to GEP

Analysis of the realigned GEP alignment shows 33 targets and anomalies with altered distances from the proposed GEP (Table 2). Of these 33 targets, 18 are now located further away from the GEP route. Included among these 18 is target MA_007, which is now located 83 metres from the GEP route, previously 6 metres. Of the 15 targets that have a closer distance to the realigned GEP route, 10 of these still have distances beyond 100 metres. Two targets, ID 192 and 609, are located within 50 metres at 47 and 42 metres respectively.

Target ID	Distance to original GEP	Distance to realigned GEP	Target in closer proximity?
MA_031	146	117	yes
192	158	47	yes
501	854	772	yes
502	831	721	yes
503	730	617	yes
504	700	589	yes
576	268	251	yes
595	849	844	yes
603	740	704	yes
604	808	768	yes
605	845	800	yes
606	832	792	yes
607	502	491	yes
609	132	42	yes
610	244	154	yes
MA_001	35	39	no
MA_007	6	83	no
NCL_SC_002	12	40	no
141	141	158	no

Target ID	Distance to original GEP	Distance to realigned GEP	Target in closer proximity?
191	77	188	no
196	59	60	no
233	40	56	no
238	88	195	no
239	98	104	no
577	263	265	no
587	853	876	no
589	453	542	no
590	470	559	no
591	727	818	no
592	344	449	no
593	400	499	no
594	520	572	no
597	443	449	no

Table 2: Targets with altered distances to new GEP alignment.

2.3 Adjusted trenching locations

The location of proposed trenching for pipeline installation has been adjusted with the GEP realignment (Figure 1). Previously trenching had been planned between KP 101-107, 110-114, 119-121, and 121 to terminus. The trench between 101-107 has been shortened to 103-107 and the trench from 110-114 has been eliminated. The remaining trenches have not had their lengths altered. Furthermore, a new trenching location has been added between KP 92-95 outside of Darwin Harbour in Beagle Gulf (Figure 2).

Previously one target, MA_007, had been located within an area of proposed trenching works. The adjustment of the trenching locations avoids the impact of trenching on this target.

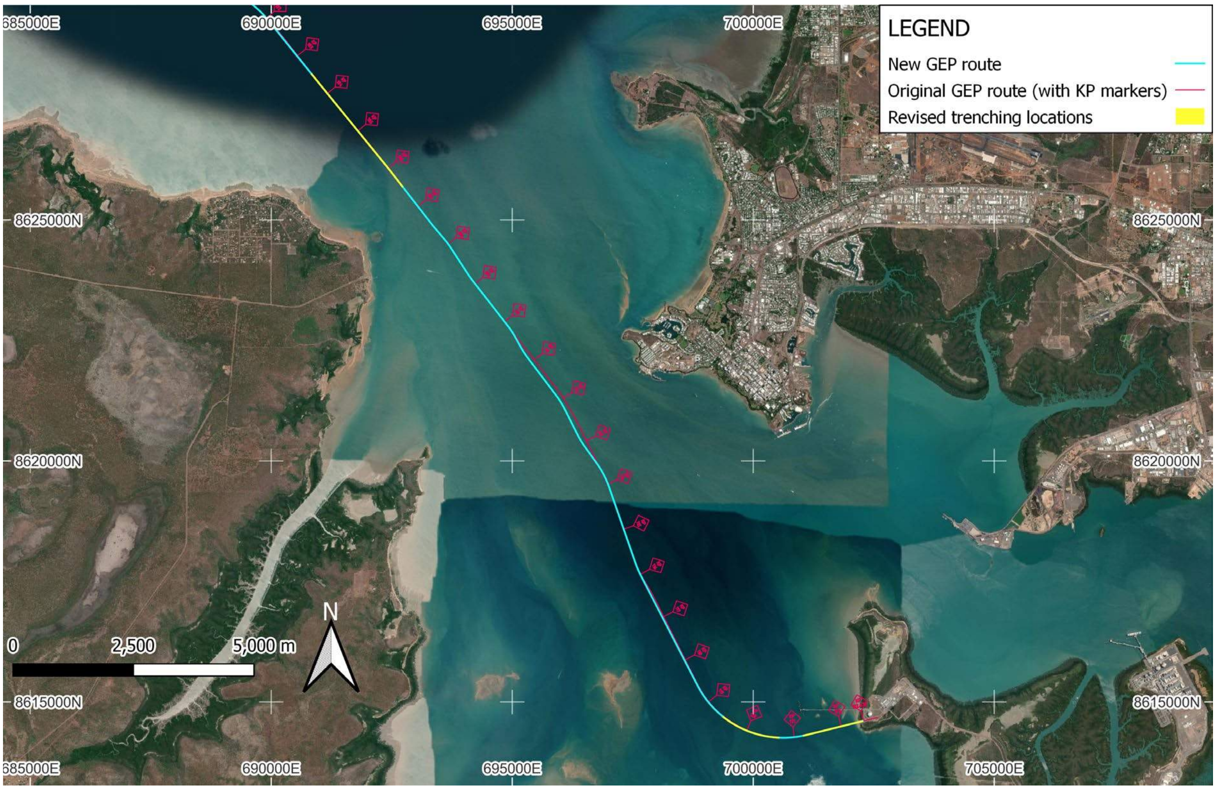

Figure 1: Revised trenching locations in Darwin Harbour.

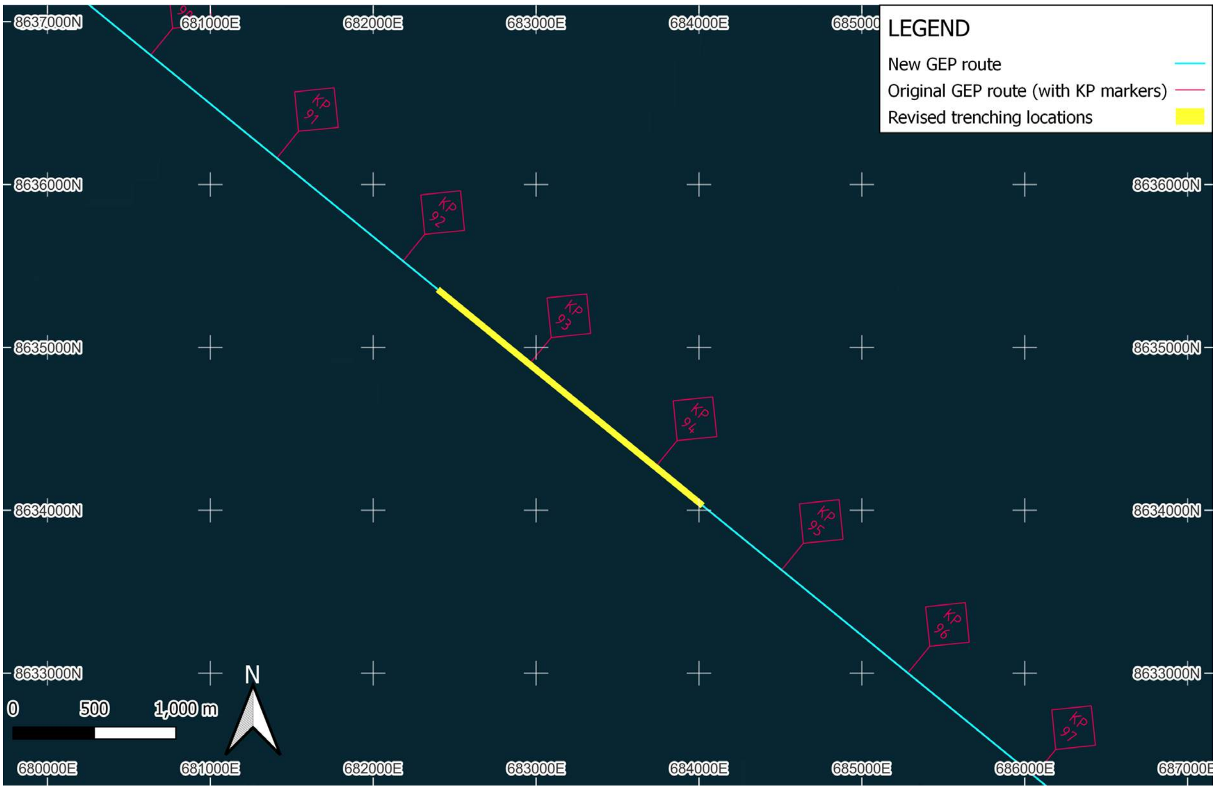

Figure 2: Additional trenching location in Beagle Gulf.

3 UPDATED RECOMMENDATIONS

Realignment of the GEP and proposed trenching locations has altered the potential for identified maritime cultural heritage objects and unverified geophysical anomalies.

3.1 Previous recommendations

Recommendation 1 If feasible, the proposed GEP alignment should be altered to avoid the WWII anti-submarine net mooring Trot 17 as well as cultural heritage objects identified at Target MA_007.

The altered route of the GEP realignment will avoid impacts to Target MA_007. No realignment has been proposed within the area of Trot 17.

Therefore recommendation 1 changed to

Recommendation 1 If feasible, the proposed GEP alignment should be altered to avoid the WWII anti-submarine net mooring Trot 17.

Recommendation 2 If potentially cultural anomalies objects identified in this assessment are likely to be impacted, undertake a detailed heritage impact assessment by a qualified maritime archaeologist.

No further impact assessment recommended for Target MA_007. This recommendation remains for Trot 17.

Recommendation 3 Establish no-anchoring zones around shipwreck locations, the anti-submarine net moorings, and unverified geophysical anomalies within the anchoring corridor.

No change for this recommendation.

Recommendation 4 If additional remote sensing data is collected for the proposed GEP it should be reviewed by a qualified maritime archaeologist.

No change for this recommendation.

Recommendation 5 Prepare and implement an Unexpected Maritime Archaeological Finds Protocol.

No change for this recommendation. Note this protocol has been established in a separate report and been delivered to Santos as part of a heritage induction package for contractors.

Recommendation 6 Review of this assessment if proposed alignment of pipeline changes.

This technical memo satisfies Recommendation 6 in this case, however, further adjustments and changes to the GEP alignment and proposed works should be likewise reviewed by a qualified maritime archaeologist.

3.2 Conclusion

- Realignment of the GEP route has altered the proximity of 33 targets from the pipeline route.
- 18 of these targets are now located further from the proposed alignment, including Target MA_007. No further mitigation beyond the previous recommendations is required for these targets.
- 15 targets are now located closer to the proposed alignment. Two of these targets, ID 192 and 609 are now within 50 metres of the proposed GEP route at 47 and 42 metres distance respectively. This is still considered an acceptable buffer or safety distance to avoid impacts. No further mitigation beyond the previous recommendations is required for these targets.
- The realigned GEP route has not been altered in the location of WWII anti-submarine net mooring trot 17. As this object has been previously assessed as having **High** heritage significance and **Certain** probability of being impacted by proposed works, Trot 17 still requires further mitigation as proposed in CA, December 2022.
- Further alterations to GEP alignment or proposed works should be reviewed by a qualified maritime archaeologist.
- Further remote sensing data collected as part of this development should be reviewed by a qualified maritime archaeologist.
- No-anchoring zones should be established for maritime cultural heritage and unverified geophysical survey anomalies within the proposed anchoring corridor.
- Implementation of the unexpected finds protocol and heritage induction to contractors should be maintained.

4 ANNEX A: UPDATED TARGET TABLE

The table below is a consolidated list of all targets identified as potentially cultural from geophysical survey data review. Additionally, several known shipwrecks within the study area and anchoring corridor are included, as well as targets surveyed during ROV surveys (see main report, Section 7, and Annex A).

Target ID		Datum: GDA94 CRS: UTM Zone 52S		Interpretation	Dimensions (m)			Depth (m)	Distance from pipeline (m)
		Easting	Northing		Length	Width	Height

Appendix 17: Threatened and Migratory Species Likelihood of Occurrence Assessment

Threatened and Migratory Species – Likelihood of Occurrence Assessment

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Reptiles					
Flatback Turtle	*Natator depressus*	VU/M	VU/M	The Project Area overlaps habitat critical to the survival of Flatback turtles and a Flatback turtle Biological Important Area (BIA) (inter-nesting).	**Likely** - No important habitat (foraging or nesting) for the species occurs within the Project Area. Individuals are likely to be sighted transiting through the area as they move through foraging areas.
Green Turtle	*Chelonia mydas*	Not listed	VU/M	The Green turtle utilises Darwin Harbour regularly (Whiting 2003).	**Likely** - Species is known to occur in the Darwin Harbour and surrounding waters.
Hawksbill Turtle	*Eretmochelys imbricata*	VU	VU/M	The Hawksbill turtle utilises Darwin Harbour regularly (Whiting 2003).	**Likely** - Species is known to occur in the Darwin Harbour and surrounding waters.
Leatherback Turtle	*Dermochelys coriacea*	CE	EN/M	The leatherback turtle is considered to be an oceanic species, which is unlikely to occur within the Darwin Harbour (Whiting 2001). The species is likely to occur in oceanic waters outside the Darwin Harbour.	**Potential** - Species unlikely to occur within the Darwin Harbour, but potentially occurs in surrounding waters.
Loggerhead Turtle	*Careta Caretta*	VU	EN/M	Loggerhead turtles are expected to be infrequent users of the Darwin Harbour (Whiting 2003). The Loggerhead turtle is more likely to occur in oceanic areas outside the Darwin Harbour.	**Potential** - Species may occur within the Darwin Harbour, but potentially occurs in surrounding waters.
Olive Ridley Turtle	*Lepidochelys olivacea*	EN/M	EN/M	Habitat critical to the survival of the Olive Ridley Turtles and a BIA (Inter-nesting) occur outside to the north and south of the Project Area respectively.	**Likely** - No important habitat (foraging or nesting) for the species occurs within the Project Area. Individuals are likely to be sighted transiting through the area as they move through foraging areas.
Plains Death Adder	*Acanthophsis hawkei*	VU	VU	Prefers flat, treeless, cracking soil riverine floodplains. Neither this species nor preferred habitat occurs within the Project Area.	**Unlikely** – Whilst the species has been recorded within 5 km of the preferred route alignment for the Project Area, there is no suitable habitat within the Project Area
Mammals					
Bare-rumped Sheath-tailed Bat	*Saccolaimus saccolaimus*	VU	VU	Open Pandanus woodland fringing the and eucalypt tall open forests. It roosts in tree hollows and caves. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - No suitable habitat within the Project Area.
Black-footed Tree-rat	*Mesembriomys gouldii*	EN	EN	Occurs in the Top End of the Northern Territory (NT) in tropical woodlands and open forests in coastal areas. . Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - No suitable habitat within the Project Area.
Brush-tailed Rabbit-rat	*Conilurus penicillatus*	VU	VU	The preferred habitat is eucalypt tall open forest, has been known to also occur on coastal grasslands with scattered large *Casuarina equisetifolia* trees, beaches, and stunted eucalypt woodlands on stony slopes. It shelters in tree hollows, hollow logs and, less frequently, in the crowns of pandanus or sand palms.	**Unlikely** – No suitable habitat is within the Project area.
Fawn Antechinus	*Antechinus bellus*	VU	VU	Occurs in savannah woodland and tall open forest of the Top End of the NT, shelters in tree hollows and fallen logs, shows a preference for areas exposed to cooler and less frequent fires. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - No suitable habitat within the Project Area.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Ghost Bat	*Macroderma gigas*	VU	VU	The distribution of this species is influenced by the availability of suitable caves and mines for roost sites. Daytime roosts may change seasonally. One of the largest known colonies occurs in a series of gold mine workings at Pine Creek in the NT.	**Unlikely** - no suitable habitat within the Project Area.
Golden Bandicoot	*Isoodon auratus*	EN	VU	The Golden Bandicoot has historically occupied a range of habitats across the Northern Territory, although the species favours heathland and shrubland habitats without greater tree cover. The species has declined significantly since European habitation, with the only population being on Marchinbar Island. A relocation program has also established populations on Raragala and Guluwuru islands.	**Unlikely –** As the species has disappeared from mainland distribution in the Northern territory, it is unlikely to be affected by the project.
Nabarlek (Top End)	*Petrogale concinna*	EN	EN	Nabarleks are restricted to rocky areas, especially on steep slopes, with large boulders, caves and crevices. They may move from these to forage in adjacent flat areas. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - No suitable habitat within the Project Area.
Northern Brush-tailed Possum	*Trichosurus vulpecula arnhemensis*	Not listed	VU	Most records are from tall open forests dominated by *Eucalyptus miniata and E. tetrodonta.* The species is unlikely to be present in light of recent reductions in the species range. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** –No suitable habitat within the Project Area.
Northern Brush-tailed Phascogale	*Phascogale pirata*	EN	VU	The Northern Brush-tailed Phascogale is restricted to eucalypt forests in the top end of the NT. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species occurs in eucalypt forests which are not present in proximity to the Project Area
Northern Quoll	*Dasyurus hallucatus*	EN	EN	This species formerly occurred across much of northern Australia, from south-eastern Queensland to the south-west Kimberley, with a disjunct population in the Pilbara. The most suitable habitats appear to be rocky areas. Neither this species nor preferred habitat occurs within the Project Area.	**Unlikely** – whilst the species has historically been recorded within 5 km of the Project Area there is no suitable habitat within the Project Area.
Water Mouse / False Water Rat	*Xeromys myoides*	VU	VU	Mangrove forests, freshwater swamps and floodplain saline grasslands.	**Unlikely** – the species has not been recorded within 5 km of the Project Area and there is no suitable habitat within the Project Area.
Marine Mammals					
Blue Whale	*Balaenoptera musculus*	Not listed	EN/M	The blue whale is found in every ocean except the arctic, with a range that extends from the periphery of drift-ice in polar seas to the tropics. It follows seasonal migration pattern between summering and wintering areas although some individuals may remain in certain areas year-round.. The Project Area does not contain any known feeding, breeding, calving, aggregation or migratory routes. The closest known recorded blue whales was hundreds of kilometres north of the Project Area.	**Unlikely** - The species is unlikely to occur within the Project Area as its preferred habitat is open ocean.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Fin Whale	*Balaenoptera physalus*	Not listed	VU/M	The North Atlantic fin whale has an extensive distribution. In general, fin whales are more common north of approximately 30°N latitude, but considerable confusion arises about their occurrence south of 30°N latitude because of the difficulty in distinguishing fin whales from Bryde's whales. Fin whale is not known to occur even infrequently in the North Marine Region (CoA 2012); however, the species is likely to occur in deeper offshore waters. The Project Area does not contain any known feeding, breeding, calving, aggregation or migratory routes.	**Unlikely** - The species is unlikely to occur within the Project Area as its preferred habitat is open ocean. It is seen to occur further offshore within Commonwealth waters. A 2018 study of whale strikes globally showed there has been no confirmed observations of Fin Whales within the NT waters. Their preference for deep water habitat also puts them outside the vast majority of Australian shipping lanes, including those of the NT. Overall Fin Whales are rarely seen in the Southern Hemisphere, thought to be driven by extensive Japanese exploitation of the species for whaling purposes, combined with a slow recovery rate.
Sei Whale	*Balaenoptera borealis*	Not listed	VU/M	Sei whales have been infrequently recorded in Australian waters. Typically occur within deeper offshore waters. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur within the Project Area as its preferred habitat is open ocean. While Sei Whales are occasionally observed in Northern Territory waters, they are more common further south towards Antarctica. The species is unlikely to habit the Darwin Harbour as it requires deep water habitat. An updated map of the species extent also shows the species potential habitat being outside the project area.
Birds					
Australian Painted Snipe	*Rostratula australis*	VU	EN	Shallow, vegetated, freshwater swamps, claypans or inundated grassland. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** – No suitable habitat within the Project Area
Curlew Sandpiper	*Calidris ferruginea*	CE	CE/M	Fresh and brackish water can include ephemeral and permanent lakes, dams, waterholes and bore drains, usually with bare edges of mud or sand. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** – Whilst the species has been recorded within 5 km of the Project Area, there is no suitable habitat within the Project Area
Eastern Curlew	*Numenius madagascariensis*	CE	CE/M	They are most common in mangrove areas but will also forage on intertidal flats and saltmarshes. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** – Whilst the species has been recorded within 5 km of the Project Area, there is no suitable habitat within the Project Area
Gouldian Finch	*Erythrura gouldiae*	EN	EN	The species forages in open woodland with groundcover of *Sorghum* and other annual and perennial grasses. Nests in hollows in *Eucalyptus tintinnans.* Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** – Whilst the species has been recorded within 5 km of the Project Area, there is no suitable habitat within the Project Area
Great Knot	*Calidris tenuirostris*	CR	CE/M	Migratory species. In the NT birds settle on large sheltered intertidal mudflats and sandflats, especially in mangrove areas. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** – Whilst the species has been recorded within 5 km of the Project Area, there is no suitable habitat within the Project Area
Greater Sand Plover	*Charadrius leschenaultii*	VU	VU/M	In the NT, Greater Sand Plovers have been recorded from most of the coastline. In the NT they forage along sandy beaches and sheltered mudflats and have been reported them occasionally also using inland saline wetlands but always close to the coast. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** – Whilst the species has been recorded within 5 km of the Project Area, there is no suitable habitat within the Project Area

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Grey Falcon	*Falco hypoleucos*	VU	VU	Occurs in lightly timbered lowland plains, typically on inland drainage systems, where the average annual rainfall is less than 500 mm. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** – Has not been recorded within 5 km of the project area and suitable habitat does not occur within the Project Area.
Lesser Sand Plover	*Charadrius mongolus*	EN	EN/M	Migratory species. In the NT the birds forage on sheltered mudflats, sandy beaches, estuaries and mangroves. They have also been reported to use inland saline wetlands occasionally but always close to the coast. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** – Whilst the species has been recorded within 5 km of the Project Area, there is no suitable habitat within the Project Area
Masked Owl (mainland Top End)	*Tyto novaehollandiae kimberli*	VU	VU	Occurs mainly in eucalypt tall open forests (especially those dominated by Darwin woollybutt *Eucalyptus miniata* and Darwin stringybark E. *tetrodonta*), but also roosts in monsoon rainforests, and forages in more open vegetation types, including grasslands. Although it may roost in dense foliage, it more typically roosts, and nests, in tree hollows. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - no suitable habitat within the Project Area
Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit	*Limosa lapponica baueri*	VU	VU	Widespread in coastal areas such as wetlands, however predominantly found in New Zealand during breeding season. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - no suitable habitat within the Project Area
Partridge Pigeon	*Geophaps smithii*	VU	VU	Occurs in open forest and woodland dominated by *Eucalyptus tetrodonta* and *E. miniata* with a structurally diverse understorey. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - no suitable habitat within the Project Area
Red Gosshawk	*Erythrotriorchis radiatus*	VU	VU	Forest and woodland with a mosaic of vegetation types, including eucalypt woodland, open forest, gallery rainforest, swamp sclerophyll forest and rainforest margins. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - no suitable habitat within the Project Area
Red Knot	*Calidris canutus*	EN	EN/M	Migratory species. In the NT birds settle on large sheltered intertidal mudflats and sandflats and are rarely encountered far from the coast. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** – Whilst the species has been recorded within 5 km of the Project Area, there is no suitable habitat within the Project Area
Sharks					
Dwarf Sawfish	*Pristis clavata*	VU	VU/M	The species' Australian distribution is considered to extend north from Cairns around the Cape York Peninsula in QLD, across northern Australian waters to the Pilbara coast in Western Australia. The species usually inhabits shallow (2–3 m) coastal waters and estuarine habitats. The species does not utilise any purely freshwater areas, as its range is restricted to brackish and salt water. Dwarf sawfish are considered unlikely to occur in the Darwin Harbour area although an individual has been reported from Buffalo Creek (ALA 2022a) approximately 10 km east of the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area based on previous records

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Freshwater Sawfish	*Pristis pristis*	VU	VU/M	The Freshwater Sawfish is a marine/estuarine species that spends its first 3-4 years in freshwater then the larger mature animals tend to occur more often in coastal and offshore waters up to 25 m depth. In the NT, Freshwater Sawfish have been recorded from the Adelaide, Victoria, Daly, East Alligator, South Alligator, Goomadeer, Roper, McArthur, Wearyan and Robinson Rivers (CoA 2015). The Project Area does not contain key habitat resources for this species for foraging or breeding. The closest known record is over 20 km away from the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area based on previous records.
Great White Shark	*Carcharodon carcharias*	Not Listed	VU/M	In Australia, Great White Sharks have been recorded from central QLD around the south coast to north-west WA but may occur further north on both coasts. It has been sighted in all coastal areas except in the NT.	**Unlikely** - The species is unlikely to occur within the Project Area as its preferred habitat is open ocean and is not typically off the Northern Territory coast.
Green Sawfish	*Pristis zijsron*	VU	VU/M	The Green Sawfish was once widely distributed but it is now thought that northern Australia may be the last region where significant populations of Green Sawfish exist. They inhabit muddy bottom habitats and also enter estuaries where they can be found in shallow water. Individuals of this species have been recorded in the region e.g. reported from Buffalo Creek (ALA 2022b) approximately 10 km east of the Project Area. The Project Area does not contain key habitat resources for this species such as foraging or breeding.	**Unlikely** - The species is unlikely to occur in the Project Area based on previous records.
Northern River Shark	*Glyphis garricki*	EN	EN	Since its discovery in 1986, only 36 specimens have been recorded. Little is known of the ecology of the northern river shark but it is probably restricted to shallow, brackish reaches of large rivers. This conclusion is based on the fact that it has not yet been caught in the coastal marine areas despite considerable fishing and collecting activity in these habitats. In the NT this species is only known within the from the Adelaide and East and South Alligator River systems. Individuals of this species of have been recorded in the broader Darwin area, these records are located well away from the Project Area in different habitat then what is found in the Project Area. This species is not known in the Darwin Harbour area.	**Unlikely** - The species is unlikely to occur in the Project Area based on previous records.
Scalloped Hammerhead	*Sphyrna lewini*	Not Listed	Conservation Dependent	The Scalloped Hammerhead has a circum-global distribution in tropical and sub-tropical waters. The scalloped hammerhead shows strong genetic population structuring across ocean basins as it rarely ventures into or across deep ocean waters but ranges quite widely over shallow coastal shelf waters. One individual of this species has been recorded in the Darwin Harbour Region. The Project Area does not contain key habitat resources for this species such as foraging or breeding.	**Unlikely** – The species is unlikely to occur in the Project Area based on previous records and there is no suitable habitat within the Project.
Speartooth Shark	*Glyphis glyphis*	Not Listed	CE	Predominantly occurs within tidal rivers and estuaries within the NT. There are records in the Adelaide River which reflects is likely distribution in tidal rivers and estuaries. No individuals have been recorded in the Darwin Harbour region.	**Unlikely** - The species is unlikely to occur in the Project Area based on previous records.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Whale Shark	*Rhincodon typus*	Not Listed	VU/M	In Australia, the Whale Shark is most commonly seen in waters off northern WA, NT and QLD. The Whale Shark seasonally aggregates in coastal waters off Ningaloo Reef between March and July each year, at Christmas Island between December and January, and in the Coral Sea between November and December. The Whale Shark is an oceanic and coastal, tropical to warm-temperate pelagic shark. The Project Area does not contain any known feeding, breeding, aggregation or migratory routes.	**Unlikely** - The species is unlikely to occur within the Project Area as its preferred habitat is open ocean.
Migratory Marine Birds					
Common Noddy, Brown Noddy	*Anous stolidus*	Not Listed	M	Tropical seabird with worldwide distribution. They breed on tropical and subtropical inshore or oceanic islands, which have rocky cliffs and coral or sand beaches. It nests on the ground, in trees or shrubs, and on cliffs or man-made structures, such as docks and jetties. During the non-breeding season, they will spend most of its time at sea and may roost on water, rocks, islets, flotsam and even the backs of sea turtles. The species may only be seen transiting the area, but is unlikely to land onshore with no suitable foraging habitat present.	**Unlikely** - Species is unlikely to occur given the onshore component of the Project is located within the existing DLNG facility disturbance envelope and suitable habitat is not available for this species
Fork-tailed swift	*Apus pacificus*	Not Listed	M	They spend most of the year relatively high in the air column, only coming down to near ground level at times of bad weather. Seen over open country from semi deserts to coasts, islands and sometimes over forests and cities. Species may be observed as an overhead visitor.	**Unlikely** - Species is aerial and unlikely to be found within the Project Area.
Great Frigatebird, Great Frigatebird	*Fregata minor*	Not Listed	M	It is a widespread seabird, with major colonies in the Indian Ocean, West and Central Pacific and Southern Atlantic. They inhabit remote islands in tropical and sub-tropical seas, where it breeds in small bushes, mangroves and even on the ground. . The species has not been recorded in the Darwin region in the last 30 years.	**Unlikely** - Species unlikely to occur in the Project Area and limited suitable habitat is present in the Project Area.
Lesser Frigatebird, Least Frigatebird	*Fregata ariel*	Not Listed	M	It is a widespread seabird, with major colonies in the Indian Ocean, West and Central Pacific and Southern Atlantic. They inhabit remote islands in tropical and sub-tropical seas, where it breeds in small bushes, mangroves and even on the ground. Outside the breeding season it is sedentary, with immature and non-breeding individuals dispersing throughout tropical seas. . The species has not been recorded in the Darwin region in the last 15 years. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - Species unlikely to occur in the Project Area and limited suitable habitat is present in the Project Area.
Little Tern	*Sternula albifrons*	Not Listed	M	Inhabits coastal waters, bays, inlets, saline or brackish lakes, salt fields and sewage ponds near coast throughout northwest, north, east and southeast Australia. It can also be found further inland, sometimes up to several kilometres from the sea. The species has not been recorded in the Darwin region in the last 15 years. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - Species unlikely to occur in the Project Area and limited suitable habitat is present in the Project Area.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Streaked Shearwater	*Calonectris leucomelas*	Not Listed	M	This species is pelagic and abundant off the north coasts of Australia from November to May. Occurs -on the west and east coasts in summer. Species is abundant off northern Australian coasts. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - Species unlikely to occur in the Project Area and the Project Area does not contain suitable habitat for the species.
White-tailed Tropicbird	*Phaethon lepturus*	Not listed	M	Tropicbirds are predominantly pelagic species, rarely coming to shore except to breed. The White-tailed Tropicbird forages in warm waters and over long distances, moving up to 1500 kilometres from breeding sites. The main breeding site is Christmas Island. Species may be observed as an overhead visitor.	**Unlikely –** Species unlikely to occur in the Project Area and the Project Area does not contain suitable habitat for the species
Migratory Marine Species					
Australian Snubfin Dolphin	*Orcaella brevirostris*	Not Listed	M	They occur in inshore coastal areas and some rivers from eastern India to north-eastern Australia and through southeast Asia to Vietnam. Inhabits coastal, brackish and freshwaters of the tropical and subtropical Indo-Pacific. A substantial population was located in the western Gulf of Carpentaria, and another in Blue Mud Bay. The species lives in brackish waters near coasts, river mouths and in estuaries. The Project area intersects the Australian Snubfin dolphin BIA for breeding. This species has been recorded within the Darwin Harbour.	**Likely** - Suitable habitat for the species is present. Individuals of the species have previously been recorded near Catalina Island, located to the east on the Project Area.
Dugong	*Dugong dugon*	Not Listed	M	Generally occurs in wide shallow protected bays and mangrove channels that support extensive sea grass meadows. Reported to use shallow waters such as tidal sandbanks and estuaries for calving. Australian range from Shark Bay, WA to Moreton Bay, QLD.	**Likely** – Suitable habitat for the species is present. The species is widely known from the Darwin harbour.
Indo-Pacific Humpback Dolphin	*Sousa chinensis*	Not Listed	M	The Indo-Pacific hump-backed dolphin, is found in tropical and temperate coastal waters of the Indian and Pacific Oceans from northern Australia and southern China in the east, through Indonesia, and around the coastal rim of the Indian Ocean to southern Africa. They are known to enter rivers, estuaries, and mangroves, particularly the latter. They prefer shallow waters <20 m in depth with warm temperatures between 15-36°C. The species is mostly recorded within 10 km of the coast and are on average recorded 2.8 km from the coast. The Project area intersects the Indo-Pacific Humpback dolphin BIA for breeding. This species has been recorded within the Darwin Harbour.	**Likely** - Suitable habitat for the species is present. The species is widely known from the Darwin Harbour.
Salt-water Crocodile	*Crocodylus porosus*	Not Listed	M	The Salt-water crocodile is commonly recorded in the Darwin Harbour. Nesting within Darwin Harbour is limited. As its common name implies, the saltwater crocodile has a high tolerance for saltwater, aided by salt-excreting glands on the tongue. It may be found in brackish water around coastal areas and rivers, often amongst mangrove forest, as well as occurring further out to sea, and also occurs in freshwater rivers, lakes, swamps and marshes, up to 200 kilometres inland	**Likely** - There is no important habitat for the species located within the Pproject Area. Individuals of the species have previously been sighted on boat ramps near the Project Area.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Spotted Bottlenose Dolphin	*Tursiops aduncus*	Not Listed	M	The Project area intersects the Spotted Bottlenose dolphin BIA for breeding. This species has been recorded within the Darwin Harbour. In Australia, the species is restricted to inshore areas such as bays and estuaries, nearshore waters, open coast environments, and shallow offshore waters including coastal areas around oceanic islands east and west of Australia including the Red Sea. Its habitat varies depending on the tides and the season but includes estuaries, coral reefs and surface waters at high seas, so it tolerates both saltwater and brackish water.	**Likely** - Suitable habitat for the species is present. The species is widely known from the Darwin Harbour.
Bryde's Whale	*Balaenoptera edeni*	Not Listed	M	The Bryde's whale can be found in tropical and sub-tropical waters throughout the Atlantic, Pacific and Indian Oceans. There appear to be two distinct habitat preferences amongst Bryde's whales, with some populations, usually comprising smaller-bodied individuals, occurring in coastal waters, while other populations can be found in the open ocean, however all Bryde's whales have a preference for warmer water above 16.3 Degrees Celsius. The Project Area does not contain any known feeding, breeding, calving, aggregation or migratory routes.	**Unlikely** - No suitable habitat is present within the Project Area and the species is unlikely to occur in the Project Area.
Giant Manta Ray	*Manta birostris*	Not Listed	M	This species is believed to have a wider distribution than the closely related reef manta ray, and is more migratory in its behaviour. It appears to be a seasonal visitor to coastal and offshore sites, and is commonly seen along productive coastlines with regular upwellings, as well as around oceanic islands, offshore pinnacles and seamounts. The south coast of Bathurst Island but are not expected to be present in large numbers. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - No suitable habitat is present within the Project Area and the species is unlikely to occur in the Project Area.
Humpback Whale	*Megaptera novaeangliae*	Not listed	M	Australia has two distinct Humpback Whale populations which throughout all coastal waters surrounding Australia; east coast and west coast. . Within the North Marine Region there are relatively few humpback whales known to travel north of their calving grounds located in Camden Sound (Jenner et al. 2001). No humpback whales were recorded during the 12 months of noise monitoring undertaken as part of the Barossa marine studies program (JASCO Applied Sciences 2016; McPherson et al. 2015). The Project Area does not contain any known feeding, breeding, calving, aggregation or migratory routes.	**Unlikely** - The species is unlikely to occur within the Project Area as its preferred habitat is open ocean. It is seen to occur further offshore within Commonwealth waters. A 2021 study by AECOM for the NT government confirmed there was no suitable habitat for Humpback Whales within the Darwin Harbour. The species occasionally travel through the harbour as part of migration for feeding and breeding, however the harbour is outside the main migration routes. In 2021, three humpbacks travelled 20 km inland up the alligator river. This had never been recorded before and marine scientists are still investigating the cause. It is suspected the Whales either got lost or were chased by a predator into the river mouth. All three individuals eventually made it back to open waters and there has been no further observations of Humpbacks in the river since.
Killer Whale, Orca	*Orcinus orca*	Not Listed	M	The Orca is found throughout all the world's oceans. The Orca occurs in virtually every marine region, from polar waters to the equator, and has even been known to enter bays, estuaries and rivers, as well as ice floes. However, it is most commonly recorded in coastal, temperate waters and in areas of high productivity. Its preferred habitat is open ocean. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur within the Project Area.
Longfin Mako	*Isurus pacus*	Not Listed	M	Widely scattered records suggest that the Longfin Mako shark has a worldwide distribution in tropical and warm-temperate oceans; the extent of its range is difficult to determine due to confusion with the Shortfin Mako. In the Indian Ocean, it has been reported from the Mozambique Channel. Its preferred habitat is open ocean likely in Commonwealth waters outside of the Project Area. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely -** The species is unlikely to occur within the Project Area.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Narrow Sawfish	*Anoxypristis cuspidata*	Not Listed	M	The Narrow Sawfish is found mainly in inshore coastal waters, to depths of around 40 m, where it is thought to spend most of its time on or near the bottom. It may also enter estuaries and river deltas, and has been reported to move upstream into rivers in some areas, although its occurrence in freshwater has yet to be verified Its preferred habitat is open ocean likely in Commonwealth waters outside of the Project Area. Neither this species nor preferred habitat occurs within the Project Area.	**Unlikely** - No suitable habitat is present within the Project Area.
Oceanic Whitetip Shark	*Carcharhinus longimanus*	Not Listed	M	The Oceanic Whitetip is found globally in deep, open oceans. Its preferred habitat is open ocean likely in the Commonwealth waters outside of the Project Area. Neither this species nor preferred habitat occurs within the Project Area.	**Unlikely** – The species is unlikely to occur within the Project Area.
Reef Manta Ray	*Manta alfredi*	Not Listed	M	The Reef Manta Ray is found in tropical and sub-tropical waters in the Pacific and Indian Oceans. Within this widespread range its populations appear to be quite patchy. It is more commonly found in shallow inshore waters and typically occurs around coastal reefs, tropical island groups, atolls, bays and productive coastlines.	**Unlikely** - The species is unlikely to occur within the Project Area and no suitable habitat is present within the Project Area.
Shortfin Mako	*Isurus oxyrinchus*	Not Listed	M	The Shortfin Mako inhabits offshore temperate and tropical seas worldwide. The closely related Longfin Mako Shark is found in the Gulf Stream or warmer offshore waters (for example, New Zealand and Maine). Its preferred habitat is open ocean likely in the Commonwealth waters outside of the Project Area. Neither this species not preferred habitat occur within the Project Area.	**Unlikely** – The species is unlikely to occur within the Project Area.
Migratory Terrestrial/Wetland Species					
Asian Dowitcher	*Limnodromus semipalmatus*	Not listed	M	In the NT the Asian Dowitcher is found in Darwin and Arnhem Land. The Asian Dowitcher occurs in sheltered coastal environments, such as embayments, coastal lagoons, estuaries and tidal creeks. They are known to frequent shallow water and exposed mudflats or sandflats.	**Potential** – Some species recorded in proximity to the Project Area. Potential habitat in the Darwin Harbour.
Common Sandpiper	*Actitis hypoleucos*	Not Listed	M	Shallow, pebbly, muddy or sandy edges of rivers and streams, coastal to far inland; dams, lakes, sewage ponds; margins of tidal rivers; waterways in mangroves or saltmarsh; mudflats; rocky or sandy beaches; causeways, riverside lawns, drains and street gutters.	**Potential** - The Project Area does not contain suitable habitat for nesting/roosting however there is suitable habitat for foraging on either side of the Project Area which may result in this species traversing the Project Area.
Grey Plover	*Pluvialis squatarola*	Not listed	M	Grey Plovers occur almost entirely in coastal areas, where they usually inhabit sheltered embayments, estuaries and lagoons with mudflats and sandflats, and occasionally on rocky coasts with wave-cut platforms or reef-flats, or on reefs within muddy lagoons. They also occur around terrestrial wetlands such as near-coastal lakes and swamps, or saltlakes.	**Potential** - The Project Area does not contain suitable habitat for nesting/roosting however there is suitable habitat for foraging on either side of the Project Area which may result in this species traversing the Project Area.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Oriental Plover	*Charadrius veredus*	Not listed	M	Oriental Plovers usually forage among short grass or on hard stony bare ground but also on mudflats or among beachcast seaweed on beaches. Oriental Plovers sometimes roost on soft wet mud or in shallow water of beaches and tidal mudflats. The species does not breed in Australia.	**Potential –** Some species recorded in proximity to the Project Area. Potential habitat in the Darwin Harbour and offshore of Wagait Beach.
Osprey	*Pandion haliaetus*	Not Listed	M	Treated as conspecific with *P. Cristatus*. The Osprey is thinly distributed around the coast of Australia where they forage for fish in fresh, brackish, or saline waters of rivers, lakes, estuaries and inshore coastal waters. Nests are usually located near a suitable area of foraging habitat and are a bulky structure made from piled sticks, often positioned in a tall dead tree or artificial structures such as telecommunication towers or poles. Breeding pairs defend breeding territory against other Ospreys, and active nests are usually more than 1 km apart.	**Potential** - The Project Area and surrounds contain suitable foraging habitat for the species. It is noted that there is an Osprey nest on the DLNG site (atop an artificial pole).
Bar-tailed Godwit	*Limodsa lapponica*	Not Listed	M	The Bar-tailed Godwit has been recorded in the coastal areas of all Australian states. It is widespread in the Torres Strait and along the east and south-east coasts of Queensland, NSW and Victoria, including the offshore islands. Populations have also been recorded in the Top End, from Darwin and Melville Island, east to the Alligator River and Croker Island. The Bar-tailed Godwit is found mainly in coastal habitats such as large intertidal sandflats, banks, mudflats, estuaries, inlets, harbours, coastal lagoons and bays. It is found often around beds of seagrass and, sometimes, in nearby saltmarsh. Species has been recorded in the Darwin Harbour. Neither this species nor preferred habitat occur within the Project Area	**Unlikely** - The species is unlikely to occur within the Project Area and the Project Area does not contain suitable habitat for this species.
Barn Swallow	*Hirundo rustica*	Not Listed	M	Species if found sporadically throughout northern Australia during non-breeding season. The barn swallow is found in vegetated areas including farmland, sports grounds, native grasslands and airstrips as well as over open water such as billabongs, lagoons, creeks and sewage treatment plants. The closest known record is over 5 km from the Project Area. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur within the Project Area and the Project Area does not contain suitable habitat for this species.
Clack-tailed Godwit	*Limosa limosa*	Not Listed	M	The Black-tailed Godwit is found in all states and territories of Australia; however, it prefers coastal regions, and the largest populations are found on the north coast between Darwin and Weipa. In Australia the Black-tailed Godwit has a primarily coastal habitat environment. The species is commonly found in sheltered bays, estuaries and lagoons with large intertidal mudflats or sandflats, or spits and banks of mud, sand or shell-grit; occasionally recorded on rocky coasts or coral islets. Species has been recorded in the Darwin Harbour. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur within the Project Area and the Project Area does not contain suitable habitat for this species.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Broad-billed sandpiper	*Limicola falcinellus*	Not Listed	M	Shallow, pebbly, muddy or sandy edges of rivers and streams, coastal to far inland; dams, lakes, sewage ponds; margins of tidal rivers; waterways in mangroves or saltmarsh; mudflats; rocky or sandy beaches; causeways, riverside lawns, drains and street gutters. The closest known record is over 5 km from the Project Area. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur within the Project Area and the Project Area does not contain suitable habitat for this species.
Common Greenshank	*Tringa nebularia*	Not Listed	M	Species is common throughout Australia from August till March. Found in mudflats, estuaries, saltmarshes, margins of lakes, wetlands, clay pans, fresh and salines, commercial salt fields, sewage ponds. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Grey-tailed Tattler	*Tringa brevipes*	Not Listed	M	Found in estuaries, tidal mudflats, mangroves, wave-washed rocks and reefs, shallow river margins, coastal or inland. In Australia adults arrive in the north coast from late Aug to early Sep. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Grey Wagtail	*Motacilla cinerea*	Not Listed	M	Found near running water, disused quarries, sandy rocky streams in escarpments and rainforests, sewage ponds, ploughed fields and airfields. Visitor to Australia from November to April. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Little Curlew	*Numenius minutus*	Not Listed	M	The Little Curlew is most often found feeding in short, dry grassland and sedgeland, including dry floodplains and black soil plains, which have scattered, shallow freshwater pools or areas seasonally inundated. Open woodlands with a grassy or burnt understorey, dry saltmarshes, coastal swamps, mudflats or sandflats of estuaries or beaches on sheltered coasts, mown lawns, gardens, recreational areas, ovals, racecourses and verges of roads and airstrips are also used. The closest known record of this species is over 5 km from the Project Area and was recorded 10 years ago. While the Project Area does contain some attributes which are known to be utilised by this species (i.e. mudflats), they typically prefer to forage in short grasses which are not present at the site.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Little Ringed Plover	*Charadrius dubius*	Not Listed	M	This species is associated with open plains; bare rolling country, often far from water; ploughed land; muddy or sandy wastes near inland swamps or tidal mudflats; bare clay pans; margins of coastal marshes; grassy airfields, sports fields, and lawns. They are a regular summer migrant to Australia from Sep-Mar. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Long-toed Stint	*Calirdirs subminuta*	Not Listed	M	The long-toed stint breeds in Siberia during the Northern Hemisphere summer. It is a visitor to New Guinea and Australia and a vagrant to Sweden, South Africa, Melanesia, Hawaii, the northwestern USA and the vicinity of the Bering Sea. In its over-wintering range it visits a variety of wetland habitats including shallow freshwater or brackish areas, lakes, swamps, floodplains, marshes, lagoons, muddy shores and sewage ponds. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Marsh Sandpiper	*Tringa stagnatilis*	Not Listed	M	It is a migratory species, with majority of birds wintering in Africa, and India with fewer migrating to Southeast Asia and Australia. They prefer to winter on freshwater wetlands such as swamps and lakes and are usually seen singly or in small groups. These birds forage by probing in shallow water or on wet mud. They mainly eat insects, and similar small prey. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Oriental, Horsfield's Cuckoo	*Cuculus optatus*	Not Listed	M	Treated as conspecific with *C. saturatus* (Himalayan Cuckoo). Inhabits monsoon forests and rainforest edges; leafy trees in paddocks; river flats, roadsides, mangroves and islands. The closest known record is over 5 km from the Project Area. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat for this species.
Oriental Pratincole	*Glareola maldivarum*	Not Listed	M	Usually inhabits open plains, floodplains or short grassland, often with extensive bare areas. Often occur near terrestrial and artificial wetlands, especially around the margins. This species also occurs along the coast, inhabiting beaches, mudflats and islands, or around coastal lagoons. Does not breed in Australia. The closest known record is over 10 km from the Project Area. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat for this species
Oriental Reedwarbler	*Acrocephalus orientalis*	Not Listed	M	Rare migrant to coastal North and eastern Australia. Found in dense reeds, cumbungi, over and near water. It breeds mainly in reed beds and can also be found in marshes, paddy fields, grassland and scrub where it forages for insects and other invertebrates. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Pacific golden Plover-	*Pluvialis fulva*	Not Listed	M	This species usually inhabits coastal habitats, though it occasionally occurs around inland wetlands. Usually occur on beaches, mudflats and sandflats in sheltered areas including harbours, estuaries and lagoons, and also in evaporation ponds in saltworks. The species is also sometimes recorded on islands, sand and coral cays and exposed reefs and rocks. Breeding occurs in dry areas of tundra away from the coast, usually on slopes of low hills, knolls or foothills vegetated with lichen and moss, or in bare, stony areas. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Pectoral Sandpiper	*Calidris melanotos*	Not Listed	M	Species has patchy distribution around Australia's coastline. Found in shallow fresh waters, often with low grass and other herbage; swamp margins, flooded pastures, sewage ponds; occasionally tidal areas and saltmarshes. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat for the species.
Pin-tailed Snipe	*Gallinago stenura*	Not Listed	M	Pin-tailed Snipe occurs most often in or at the edges of shallow freshwater swamps, ponds and lakes with emergent, sparse to dense cover of grass/sedge or other vegetation. The species is also found in drier, more open wetlands such as clay pans in more arid parts of species' range. It is also commonly seen at sewage ponds; not normally in saline or inter-tidal wetlands. The closest known record is over 10 km from the Project Area. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat for the species.
Red-necked Stint	*Calidris ruficollis*	Not Listed	M	Species are found in tidal mudflats, saltmarshes; sandy or shelly beaches; saline and freshwater wetlands, coastal and inland; salt fields and sewage ponds. They are often in dense flocks, feeding or roosting. Spends the southern summer months in Australia and is found widely except in the arid inland. The closest known record is over 10 km from the Project Area. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat for the species.
Red-rumped Swallow	*Cecropis daurica*	Not Listed	M	Migratory bird that spends the winter months in northern Australia. This species is found in open hilly country and mountains, river gorges, valleys, sea cliffs, as well as in cultivated areas and human habitations, including towns. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Ruddy Turnstone	*Arenaria interpres*	Not Listed	M	Winters on Australian coastlines. Tidal reefs and pools, weed covered rocks, pebbly shelly and sandy shores with stranded seaweed, mudflats, occasionally inland on shallow waters, sewage ponds, commercial salt fields, open or ploughed ground. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** – The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Rufous Fantail	*Rufous rufifrons*	Not Listed	M	The rufous fantail inhabits moist and moderately dense habitats. Within these areas, it has astonishingly large variations in habitat requirements. They can be found in eucalyptus forests, mangroves, rainforests and woodlands (usually near a river or swamp). Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Sanderling	*Calidris alba*	Not Listed	M	Broad ocean beaches of firm sand 'where waves ebb and flow', depositing strands and heaps of seaweed; often near river mouths; also inlets, tidal mudflats and coastal lagoons. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Sharp-tailed Sandpiper	*Calidris acuminata*	Not Listed	M	The sharp-tailed sandpiper breeds in northern Siberia but migrates south to winter in Australia and New Zealand. In the non-breeding season they can be found in tidal mudflats, saltmarshes, mangroves; shallow fresh, brackish or saline inland wetlands; floodwaters, irrigated pastures and crops; sewage ponds and salt fields. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Swinhoe's Snipe	*Gallinago megala*	Not Listed	M	Found on northern Australian coastlines. Non-breeding habitats include shallow freshwater wetlands of various kinds including paddy fields and sewage farms, with bare mud or shallow water for feeding, with nearby vegetation cover.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat for the species
Terek Sandpiper	*Xenus cinereus*	Not Listed	M	In Australia, the Terek Sandpiper has been recorded on coastal mudflats, lagoons, creeks and estuaries. Records indicate that the species favours muddy beaches near mangroves but may also be observed on rocky pools and coral reefs and occasionally up to 10 km inland around brackish pools. The closest known record is over 10 km from the Project Area. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Wandering Tattler	*Tringa incana*	Not Listed	M	Non-breeding habitats include shallow freshwater wetlands of various kinds including paddy fields and sewage farms, with bare mud or shallow water for feeding, with nearby vegetation cover. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Whimbrel	*Numenius phaeopus*	Not Listed	M	Estuaries, mangroves, tidal flats, coral cays, exposed reefs, flooded paddocks, sewage ponds, bare grasslands, sports grounds and lawns. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.

Common Name	Scientific Name	TPWC Act	EPBC Act	Description/Habitat	Likelihood of Occurrence
Wood Sandpiper	*Tringa glareola*	Not Listed	M	In Australia, the Terek Sandpiper has been recorded on coastal mudflats, lagoons, creeks and estuaries. Records indicate that the species favours muddy beaches near mangroves but may also be observed on rocky pools and coral reefs and occasionally up to 10 km inland around brackish pools. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat.
Yellow Wagtail	*Motacilla flava*	Not Listed	M	Regular summer migrant to coastal Australia, especially Darwin to Broome, but also north-eastern Queensland from November to April. Found in short grass and bare ground, swamp margins, sewage ponds, saltmarshes, playing fields, airfields, ploughed land and town lands. The closest known record over 10 km from the Project Area. This observation was recorded 30 years ago. Neither this species nor preferred habitat occur within the Project Area.	**Unlikely** - The species is unlikely to occur in the Project Area and the Project Area does not contain suitable habitat for the species.

CE – Critically Endangered
EN – Endangered
VU – Vulnerable
NT – Near Threatened
M - Migratory

WMPC Act 1998	Waste Management and Pollution Control Act 1998

Glossary

Term	Definition
Biologically important area	Areas spatially defined and mapped by the Commonwealth Department of Environment (DoE) where aggregations of individuals of a species are known to display a biologically important behaviour such as breeding, foraging, resting or migration.
Consequence	Impact of an event or incident e.g. a loss, injury or concern. May be expressed qualitatively or quantitatively.
DLNG team	The DLNG contractors
Environmental Performance Standard	A statement of performance required of a management action.
Environmental Performance Objective	Measurable level of performance required for the management of environmental aspects of an activity to ensure that environmental impacts and risks are of an acceptable level.
Impact	A positive or negative effect the DPD Project would have on the environment (including physical, ecological and socio-economic environments.
Licence	A licence granted under Part III or section 43 of the Energy Pipelines Act 1981 (NT)
Licensees	The registered holder of a licence
Measurement Criteria	A system of measurements that define whether a project is successful.
Non-Indigenous	Refers to heritage artefacts or sites that are not deemed "sacred sites" per the *Northern Territory Aboriginal Sacred Sites Act 1989* or deemed Aboriginal or Macassan archaeological sites or artefacts per the *Heritage Act 2011* (NT).

Term	Definition
Offshore Project Area	Offshore Project Area is the same area as the Project Area, except it extends between the boundary between Commonwealth and NT waters and the onshore termination point.
Onshore Project Area	Onshore Project Area is the same area as the Project Area, except it extends between the onshore termination point and the upstream weld of the beach valve.
Onshore termination point	The point (KP122.484, approximately 2 m above highest astronomical tide) to which the pipeline will be pulled ashore to by the shore pull activity.
Performance Criteria	The standards by which success of management actions is evaluated.
Pipeline	A pipe or system of pipes that has or have a maximum allowable operating pressure greater than 1050 kilopascals or a hoop stress (being a circumferential stress arising from internal pressure) that is, at one or more positions, greater than 20% of the specified minimum yield stress specified in the manufacturing standard with which the pipe complies and that are used or intended to be used for the conveyance of an energy-producing hydro-carbon, and includes: a. all structures for protecting or supporting a pipeline; and b. (b) all loading terminals, works and buildings and all fittings, pumps, tanks, appurtenances, and appliances, c. used in connection with a pipeline, but does not include: d. a pipeline as defined in the *Petroleum (Submerged Lands) Act 1981*; e. a pipeline constructed or to be constructed on land used for residential, business, agricultural, commercial, or industrial purposes, designed for use solely for the residential, business, agricultural, commercial or industrial purposes carried on that land and situated wholly within the boundaries of that land; or f. a pipeline or a pipeline of a class declared under section 4(2) to be a pipeline in respect of which a licence is not required
Pipeline management plan	Pipeline management plan in force, in relation to a pipeline, means: a. a pipeline management plan for the pipeline submitted by or for the pipeline licensee and accepted under these Regulations; or b. if the pipeline management plan is accepted in part – that part of the pipeline management plan that is accepted, as revised from time to time under these Regulations, but does not include a pipeline management plan for which the acceptance has been withdrawn.
Project Area	The Project Area is an area extending 500 m either side of the pipeline, within which the Construction Activity will take place.

Term	Definition
Residual risk	Risk remaining after implementation of mitigation measures.
Risk	A combination of the potential consequence of an event occurring and the likelihood of the consequence occurring.
Sensitive receptor	A receptor that could be subject to adverse impacts from the DPD Project.
Target	Specific and measurable performance requirements to achieve Environmental Performance Objectives.

Units of measurement

Unit	Definition
°	degrees
%	per cent
µS	microSiemens
MA	centimetre
dB	decibels
dB(A)	A-weighted sound pressure level in decibels
kHz	kilohertz
km	kilometre
km2	square kilometre
m	metre
m2	square metre
mg/L	milligrams per litre
nm	nautical mile (1.856 km)
ppt	parts per thousand

1 Introduction

1.1 Project overview

Santos NA Darwin Pipeline Pty Ltd (Santos) is the operator of the existing Bayu-Undan to Darwin Gas Export Pipeline (GEP). The Bayu-Undan to Darwin GEP is a dry natural gas export pipeline transporting gas from the Bayu-Undan field located in Timor-Leste waters to the Darwin Liquefied Natural Gas (DLNG) facility at Wickham Point peninsula near Darwin, Northern Territory (NT), Australia. The Bayu-Undan to Darwin GEP has been operational since 2005. In anticipation of the end of the Bayu-Undan field's commercial production in 2022/2023, the Barossa field is being developed to supply gas to the DLNG facility. The supply of backfill gas to the DLNG facility was originally planned to be achieved through the installation of a 262 kilometre (km) Barossa GEP to a tie-in point on the existing Bayu-Undan to Darwin GEP.

In recognition of potential Carbon Capture and Storage opportunities at the Bayu-Undan field, Santos has approved an alternative solution to transport backfill gas to the DLNG facility through the construction of an additional segment of pipeline to extend the Barossa GEP to the DLNG facility, instead of tying into the Bayu-Undan to Darwin GEP. Construction of this segment of pipeline is referred to as the Darwin Pipeline Duplication (DPD) Project, as it will be installed parallel to the existing Bayu-Undan to Darwin GEP. The effective 'duplication' of the existing Bayu-Undan to Darwin GEP is considered the optimal route to minimise potential environmental and social impacts.

The pipeline will run from a location where the Barossa GEP approaches the existing Bayu-Undan pipeline and continue through Darwin Harbour to the beach valve location at the DLNG facility at Wickham Point (**Figure 1-1**). Santos' DPD Project includes a ~23 km segment in Commonwealth waters and ~100 km segment in NT waters and lands adjacent to the existing Bayu-Undan to Darwin pipeline route. The DPD Project pipeline will be located for the most part 50 – 100 m from the existing Bayu-Undan to Darwin pipeline, to minimise potential environmental and social impacts. The Project Area for the DPD Project includes a 2 km buffer around the pipeline route in NT waters, the onshore construction area at the DLNG facility and an offshore spoil disposal ground, and buffer, for the trench spoil disposal (**Figure 1-1**).

Pre-lay trenching is required to meet a number of objectives, including providing pipeline protection and stability (in combination with rock installation), reducing pipeline spanning and ensuring compliance with shipping channel clear water requirements. Sections of the pipeline route within the harbour, with a combined length of up to ~12.8 km, will be trenched using various equipment with the remainder of the pipeline laid directly on the seabed. Rock sourced from a local quarry will be used to backfill in some areas where anchor protection or additional stabilisation is required.

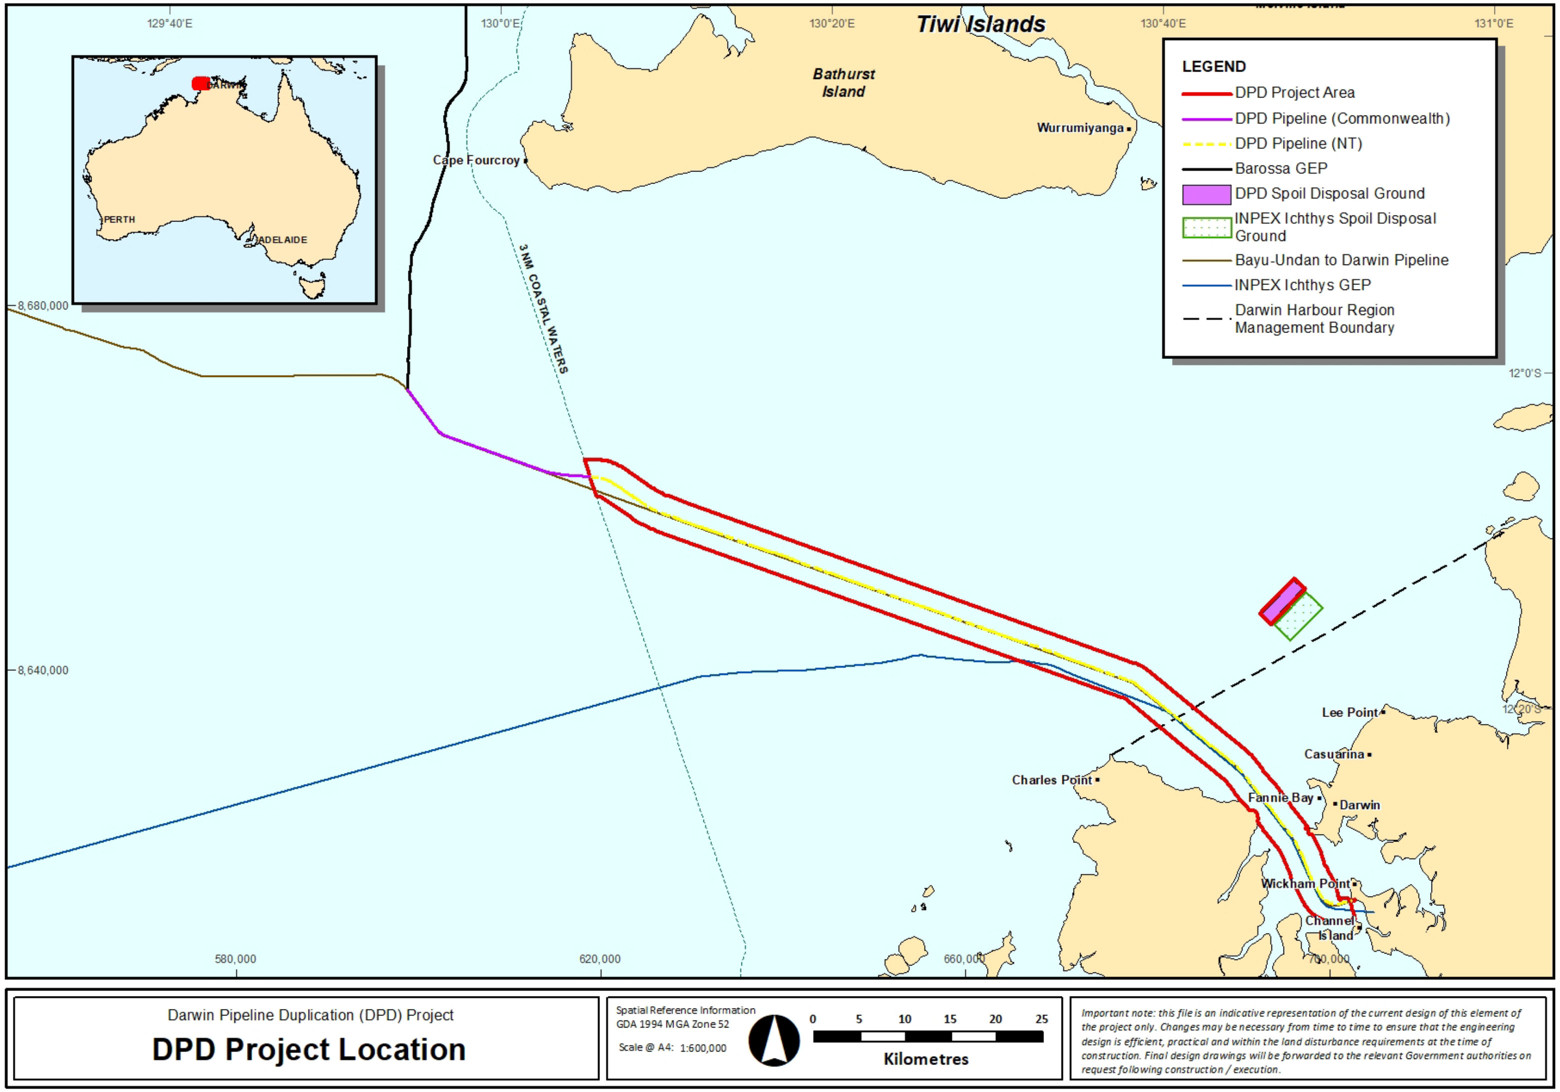

Figure 1-1: DPD Project Location

1.2 Purpose

This CEMP has been prepared to detail and provide guidance on environmental management requirements, to ensure the DPD Project pipeline construction activities in NT jurisdiction and on NT lands are undertaken in an environmentally responsible manner and in line with regulatory requirements.

This CEMP will be submitted with the DPD Project Supplementary Environmental Report (BAS-210 0020) (SER) under the NT *Environment Protection Act 2019* (EP Act) and supporting regulations. This CEMP will be provided to the relevant Minister in support of the Pipeline Management Plan (PMP) required to construct a pipeline under the *Energy Pipelines Act 1981* (NT), *Petroleum (Submerged Lands) Act 1981* (NT) and supporting regulations. This CEMP will also be provided to DCCEEW to support the preliminary documentation submission under the *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act). This CEMP also meets the content requirements for an Environment Plan under the *Petroleum (Submerged Lands) Act 1981* (NT) and supporting regulations, specifically the *(Management of Environment) Regulations 1999*.

The purpose of this CEMP is to meet the relevant requirements of the:

+ *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) as administered by Department of Climate Change, Energy, the Environment and Water (DCCEEW), including relevant management and recovery plans and conservation advice for Matters of National Environmental Significance (MNES) and Commonwealth Marine Reserves Network Management Plans.
+ NT EP Act and Environment Protection Regulations 2020, as administered by the NT EPA (2015).
+ NT Draft Guideline for the Preparation of an Environmental Management Plan (NT EPA, 2015)
+ *NT Energy Pipelines Act 1981*, and Energy Pipelines Regulations 2001 as administered by NT Department of Industry, Tourism and Trade (DITT)
+ *NT Petroleum (Submerged Lands) Act 1981* and supporting regulations (NT Petroleum (Submerged Lands) (Application of Commonwealth Laws) Regulations 2004 and Petroleum (Submerged Lands) (Management of Environment) Regulations 1999).

This CEMP details the environmental impacts and risks associated with the activity and demonstrates how these will be managed. The CEMP provides an implementation strategy that will be used to measure and report on environmental performance during planned activities and unplanned events, to ensure impacts and risks are continuously reduced to and maintained at an acceptable level. The environmental management of the activity described in the Offshore CEMP complies with the Santos Environment, Health and Safety Policy (**Attachment 1**) and with all relevant legislation (**Section 3**). All relevant stakeholder consultation performed has been considered in the development of this CEMP (**Section 9**).

1.3 Scope

This CEMP addresses the construction of the section of the DPD pipeline from the shore pull onshore termination point (location described in **Table 2-1**) to the boundary between NT and Commonwealth waters. Spoil disposal activities at the nominated DPD spoil disposal area are also covered under this CEMP. This CEMP is termed the DPD Project Offshore Pipeline CEMP (Offshore CEMP) as it covers primarily activities supporting installation of pipeline in marine waters, with some activities at the shoreline and onshore at the DLNG facility. The construction of the remaining section of pipeline between the onshore termination point and the upstream weld of the beach valve will be subject to the DPD Project Onshore Pipeline CEMP (BAS-210 0025) (Onshore CEMP).

A summary of activities relevant to each CEMP is provided in **Table 1-1**.

This CEMP is an overarching management plan for the Santos Barossa DPD Project team including the DPD Project contractors (Allseas, Deme Van Ord and subcontractors) and covers construction activities from the 3 nm Commonwealth waters boundary to the shore pull onshore termination point. Under this management plan there are three additional management plans that address specific activities during construction (**Figure 1-2**). These are the:

+ Trenching and Spoil Disposal Monitoring and Management Plan (TSDMMP) (BAS-210 0023) that addresses all trenching and spoil disposal activities from the 3 nm Commonwealth waters boundary to the onshore termination point
+ Acid Sulphate Soil and Dewatering Management Plan (ASSDMP) (BAS-210 0049) that addresses all activities associated with acid sulphate soils (ASS) or potential ASS (PASS) from lowest astronomical tide (LAT) to the upstream weld of the beach valve
+ Marine Megafauna Noise Management Plan (MMNMP) (BAS-210 0045) that addresses all activities associated with noise impacts to marine megafauna from the 3 nm Commonwealth/NT waters boundary to the onshore termination point.

Table 1-1: DPD Project Activities within the Project Area covered by the CEMPs

Phases	Activities		
	Offshore CEMP	**Onshore CEMP**	**Outside scope of CEMPs**
Surveys	Offshore Surveying during construction Environmental surveys during construction	Onshore surveying during construction	Low impact pre-construction surveys required to gather information for Project planning and approvals are out of scope for the CEMPs. These surveys include, but are not limited to, environment, heritage, geotechnical, geophysical and unexploded ordinance (UXO) surveys. Any surveys in Commonwealth waters.
Pre-lay works	Installation of offshore pipeline from the onshore termination point to the 3 nm Commonwealth/NT waters boundary Targeted trenching (~12.8 km in total) and spoil disposal from the onshore termination point to the 3 nm Commonwealth/NT waters boundary Spoil disposal at nominated spoil disposal grounds with some in situ placement at the shore-crossing Pre-lay span rectification Cable crossings along the pipeline route Installation of site buildings and generators Construction of the site access road Installation of traffic plates over the existing Bayu-Undan pipeline Preparation of the site pad, including installation of geotextile and site hard stand	Onshore trenching of the onshore pipeline from the upstream weld of the beach valve to the onshore termination point and onshore stockpile of trench material for use as trench backfill. This will involve: Excavation of trench from the upstream weld of the beach valve to site pad Extension of trench to the onshore termination point through the site pad once no longer in use Storage of any identified ASS / PASS on limestone pads and treated with lime prior to reuse or disposal to landfill	Any pre-lay works within Commonwealth waters.

Phases	Activities		
	Offshore CEMP	Onshore CEMP	Outside scope of CEMPs
	areas, installation of holdback anchor, linear winch, trench and shore pull wire.		

Pipeline installation and pre-commissioning	+ Pipelay activities
	+ In-line tee installation
	+ Pipeline shore pull
	+ Rock backfill
	+ Post-lay span rectification
	+ Testing and pre-commissioning the offshore pipeline
	+ Post-lay trenching
	+ Pipelay contingencies
		+ Installation of the onshore pipeline from the upstream weld of the beach valve to the onshore termination point
		+ Testing and pre-commissioning the onshore pipeline
		+ Tie-in onshore pipeline to the offshore pipeline at the onshore termination point
			+ Any installation or pre-commissioning within Commonwealth waters, including:
			  + DPD Project Pipeline end termination (PLET) installation
			  + Spool installation (between DPD Project PLET and Offshore Barossa GEP to PLET)
			+ Installation of the beach valve and the pipeline between the beach valve and the DLNG facility
			+ Installation of the shore crossing CP monitoring system

Demobilisation	+ Removal of the pre-commissioning spread + Removal of the hard stand and geotextile + Re-contouring of the site as applicable + Removal of causeway/s	+ Backfilling onshore pipeline trench + Site returned to pre-construction condition	
Operations	N/A	N/A	+ Operations + Inspection maintenance and repair
Decommissioning	N/A	N/A	+ Decommission pipeline + Removal of subsea infrastructure + Onshore decommissioning and rehabilitation + As-left/ post-surveys

1.4 Plan structure

This CEMP has been prepared and structured in accordance with the Guideline for the Preparation of an Environmental Management Plan (in draft) (NT EPA, 2015) and the Commonwealth Petroleum (Submerged Lands) (Management of Environment) Regulations (1999). The guideline requirements and where they have been addressed within the CEMP are detailed in **Table 1-2**.

1.5 Proponent

1.5.1 Details of the proponent

Santos, as the operator of the Barossa Joint Venture, has applied to the DITT for two pipeline licences for the nearshore section of the DPD pipeline:

- Coastal and Territorial Waters Licence for the section of the pipeline under the jurisdiction of the *Petroleum (Submerged Lands) Act 1981* (NT) (i.e. between the NT Coastal Waters Limit and the Territorial Sea Baseline)
- Inland Waters Licence for the section of pipeline under the jurisdiction of the *Energy Pipelines Act 1981* (NT) (i.e. between the Territorial Sea Baseline and the upstream weld of the beach valve).

Both licences are applicable to the section of pipeline within the scope of the Offshore CEMP. The proposed proponent details are provided in **Table 1-3**, with the nominated operator shown in bold.

Table 1-3: Proponent details for Barossa DPD Project's pipeline licences

Title	Proponent (nominated operator in bold)	ABN	Interest	Contact details
Coastal and Territorial Waters Licence Inland waters licence	Santos NA Barossa Pty Ltd	44 109 974 932	25.0%	Business Address: Level 7, 100 St Georges Terrace, Perth, Western Australia, 6000 Telephone number: (08) 6218 7100 Fax number: (08) 6218 7200 Email address: barossa.regulatory@santos.com

1.5.2 Details of nominated liaison person

Name: Dr Lachlan MacArthur

Title: Environmental Approvals Adviser

Business address: Level 7, 100 St Georges Terrace, Perth, WA 6000

Telephone number: (08) 6218 7100

Email: Barossa.regulatory@santos.com

1.5.3 Notification procedure in the event of changed details

If there is a change in the nominated operator or a change in the contact details for the operator or liaison person, Santos will notify the DITT and provide the updated details.

1.6 Document review, revision and availability

This CEMP has been prepared for submission with the SER (BAS-210 0020) and other supporting documents to the NT EPA, under the EP Act and to DCCEEW under the EPBC Act, and will be updated to reflect any relevant regulatory conditions associated with the DPD Project approvals.

This CEMP will also be provided to the relevant Minister in support of the PMP required to construct a pipeline under the NT *Energy Pipelines Act 1981* (NT) and Energy Pipelines Regulations 2001. A pipeline licensee for a pipeline for which a PMP is in force must submit to the Minister a proposed revision of the PMP in the event of a change, or proposed change, of circumstances or operations under Regulation 33, when requested by the Minister under Regulation 34 or at the end of each five-year period under Regulation 35.

Further, this CEMP will also be provided to the relevant Minister to meet the requirements of an Environmental Plan under the NT *Petroleum (Submerged Lands) Act 1981* and supporting regulations (NT Petroleum (Submerged Lands) (Application of Commonwealth Laws) Regulations 2004 and Petroleum (Submerged Lands) (Management of Environment) Regulations 1999). Under these regulations, a revision is required in the event of a change, or proposed change, of circumstances or operations under Regulation 17, when requested by the Designated Authority under Regulation 18 or at the end of each five-year period under Regulation 19.

Santos will review and update the document as required based on regulatory feedback and any regulatory conditions on the DPD Project approval as applicable. The final CEMP will be made publicly available on an Australian website.

2 Detailed activity description

2.1 Overview

Table 2-1 provides the key attributes of the construction activity covered by this CEMP. A detailed activity description is provided in **Section 2.3.**

Table 2-1: Attributes of the Activity[1]

Attribute	Summary
Activity location	The DPD pipeline will extend from the pipeline end termination at kilometre point 0 in Commonwealth waters to the upstream weld of the beach valve (KP 122.692) onshore at the DLNG facility. The scope of this CEMP is limited to the section of pipeline within NT waters and lands, from ~KP 23 to KP 122.484 (the onshore termination point). The onshore termination point is two metres above highest astronomical tide (HAT). The nominal coordinates of the KPs are provided in **Table 2-2**. The location of the Project Area within which construction activities covered within this plan will occur, is shown in **Figure 2-1** with further detail of the onshore Project Area provided in **Figure 2-2**. Support facilities and activities for the offshore pipeline construction by the offshore pipeline installation contractors will occur in areas overlapping those used by the onshore pipeline installation contractors to manage the installation of the pipeline section from the onshore termination point (KP122.484) to the upstream weld of the beach valve (KP 122.692), which are outside the scope of this CEMP.
Pipeline characteristics	Approximately 100 km of pipeline will be installed under this CEMP from ~KP 23 to the onshore termination point (KP 122.484). The pipeline diameter from the pipeline end termination (KP 0) up to an-inline tee (approximately 60 km offshore) is 26 inches, after which the pipeline increases to 34 inches. Pipeline will be constructed from carbon steel with an external anti-corrosion coating and sacrificial anodes to maintain the pipeline integrity and a concrete coating to provide stability and protection.
Key activities	+ Pre-lay works phase: + Targeted trenching along sections of the pipeline route (~12.8 km in total) from the shore pull onshore termination point to near the outer boundary of the Darwin Harbour Region Management Area (Figure 2-3) + Spoil disposal at nominated spoil disposal ground (Figure 2-3) with some in-situ placement at shore-crossing to reduce ASS Risk + Pre-lay span rectification + Installation of cable crossings along the pipeline route + Pipeline installation and pre-commissioning phase:

[1] The scope of this CEMP is limited to the section of pipeline within NT waters.

Attribute	Summary
	+ Pipelay activities + In-line tee installation + Pipeline shore pull + Trench backfill using rock + Post-lay span rectification + Testing and pre-commissioning the offshore pipeline Tie-in offshore pipeline to the onshore pipeline at the onshore termination point
Vessels	**Trenching**
	+ Backhoe Dredge (BHD) assisted by Split Hopper Barge + Cutter Suction Dredge (CSD)
	Pipelay and Rock Installation
	+ Shallow water pipelay barge (SWPLB) + Deep water pipelay vessel + Pipe supply vessels (PSV) + Construction support vessel/survey (CSV) + Nearshore CSV/survey (Span Rectification) + BHD for rock installation + Fall pipe vessel (FPV) for rock installation
	Support Operations
	+ Multicat (Shallow water anchor handling for SWPLB and CSD) + Anchor handling tugs (AHTs) + Supply boat for all vessels + Crew boat (crew changes) + Survey vessels
Vessel fuel	Vessels will use Group II hydrocarbon fuels such as marine gas oil (MGO) or marine diesel oil (MDO).
Proposed schedule	A probable DPD construction sequence and schedule is discussed in **Section 2.4.** The construction activities will likely span a cumulative period of 15 months in the field.

The locations for activities along the DPD Pipeline are described using ‘kilometre points’ (KP), where KP0 is the beginning of the DPD Project pipeline from the “pipeline end termination point” (PLET C) in Commonwealth waters.

Table 2-2: DPD Pipeline start and end locations

Location	Kilometre point	Easting	Northing
Boundary between Commonwealth and NT waters	~KP23	618,128.53	8,663,104.10
Shore pull onshore termination point	KP122.484	702,272.73	8,614,606.40
Upstream weld of the beach valve	KP122.692	702,472.29	8,614,655.73

*Coordinates in GDA 94, MGA zone 52

2.2 Offshore Project Area

DPD Project construction activities in NT jurisdiction will occur within a Project Area defined in **Figure 2-1**. The Project Area extends 2 km either side of the DPD pipeline route and additionally includes the spoil disposal ground. Activities undertaken within the Project Area that are not associated with the DPD Project are beyond the scope of this CEMP.

The Project Area consists of the three key 'areas', being:

+ Offshore NT waters (i.e., NT waters outside Darwin Harbour Region Management Area). Note this includes the proposed location for spoil disposal;
+ Darwin Harbour (i.e., waters within the Darwin Harbour Management Area); and
+ Shore crossing location including the short onshore section of the pipeline to the upstream weld beach valve. Note activities between the onshore termination point and the upstream weld of the beach valve are not covered under this CEMP (refer to **Section 1.3**) with the exception of DPD offshore support facilities e.g. site offices and laydown area.

The Project Area within the NT waters has not been amended since the Darwin Pipeline Duplication (DPD) Project – NT EPA Referral (BAA-201 0003; Santos, 2021). However, there has been a refinement to the onshore area for the DPD Project to include the temporary access road, part of which previously fell outside of the Project Area. The Project Area is shown in **Figure 2-1** with further detail of the shore crossing at the DLNG facility, including support facilities, shown in **Figure 2-2**.

The locations for activities along the DPD Project pipeline are described using 'kilometre points' (KP), where KP 0 is the beginning of the DPD Project pipeline from the "pipeline end termination point C" (PLET C) in Commonwealth waters.

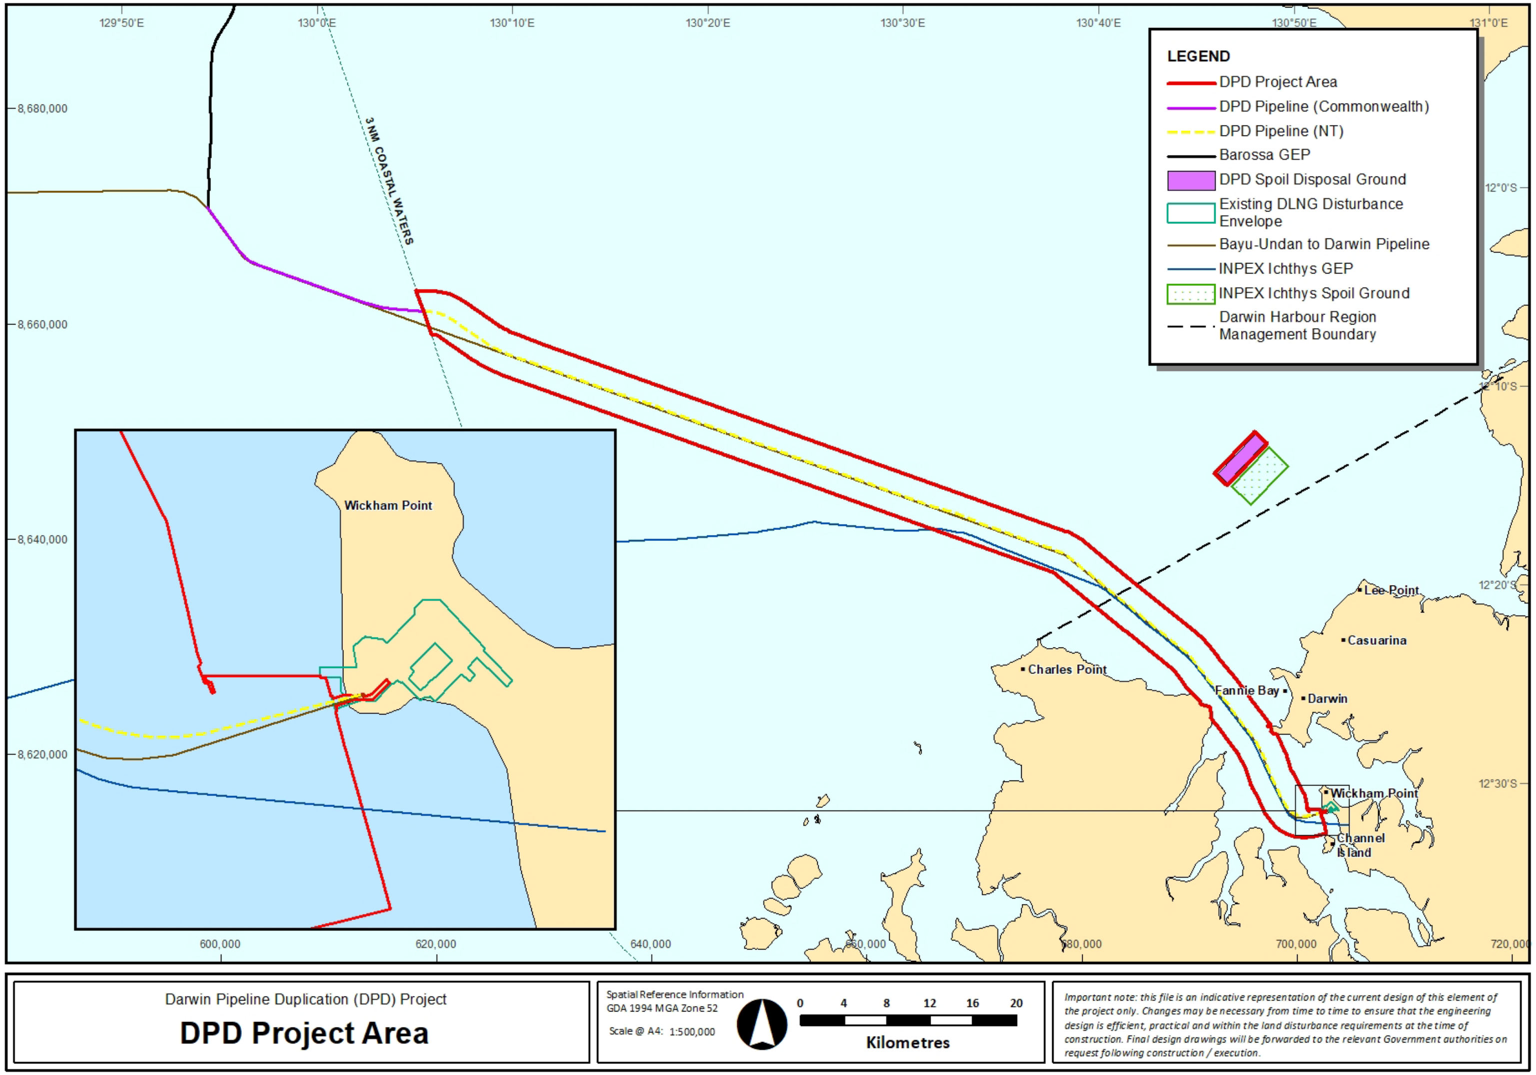

Figure 2-1: DPD Project Area

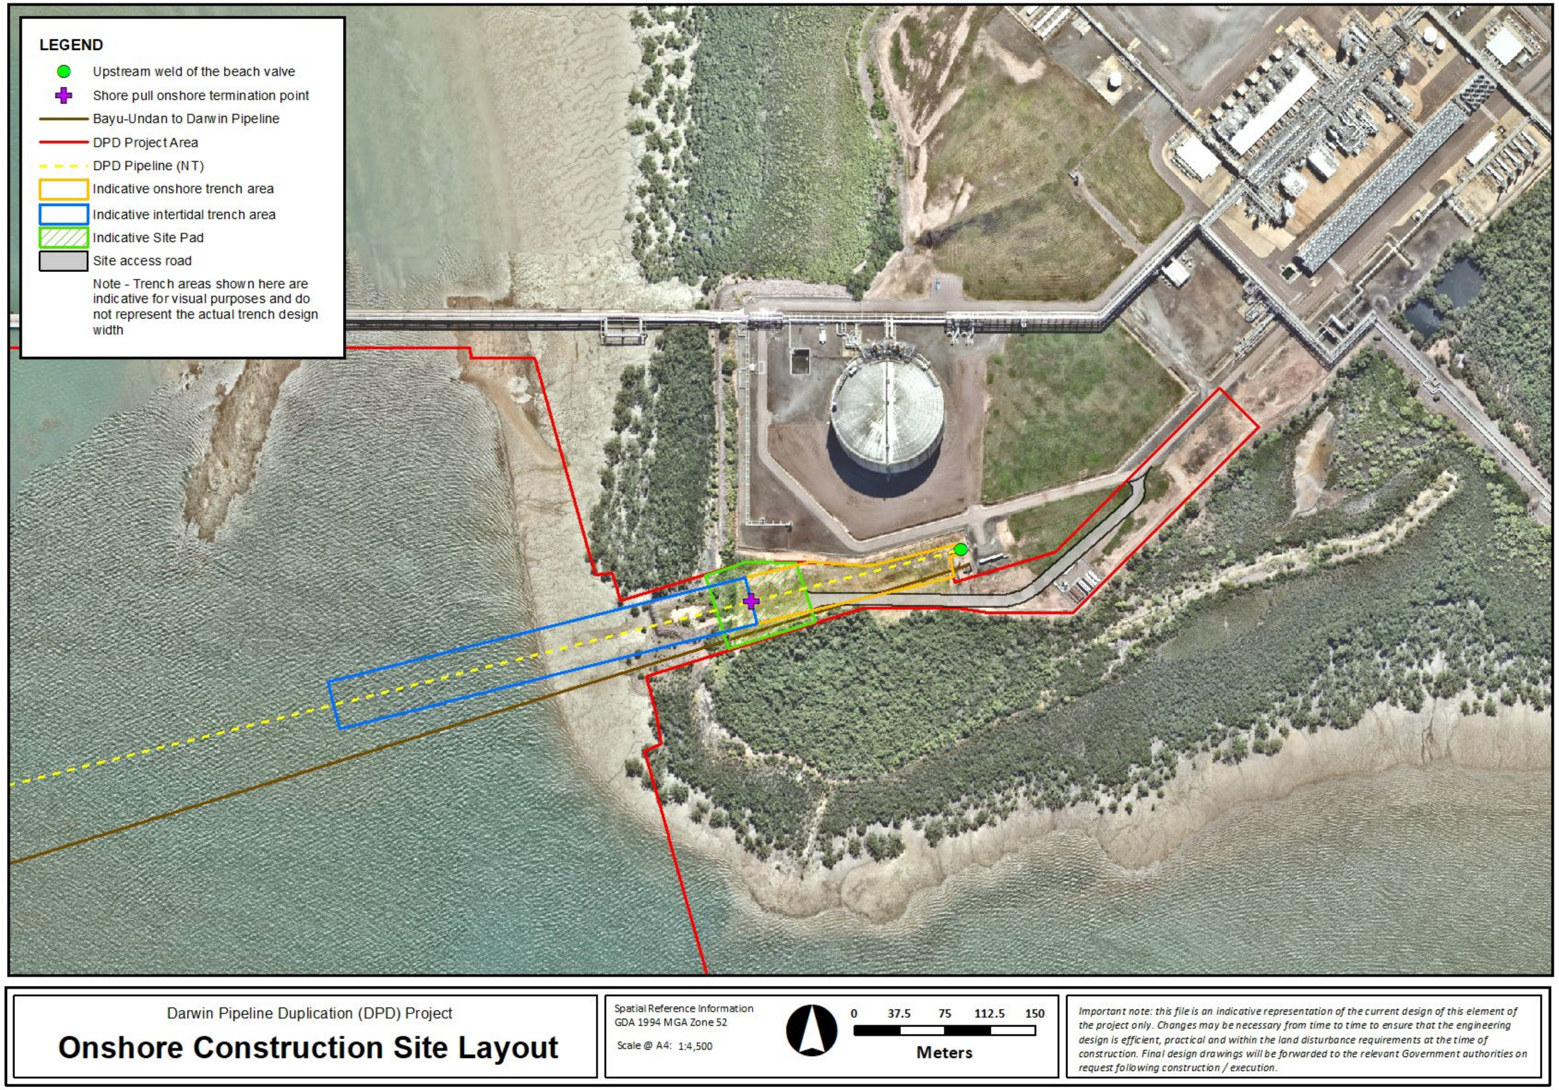

Figure 2-2: Shore crossing and indicative onshore layout within the Project Area

2.3 General detail of construction

2.3.1 Pre-lay works

For the offshore section of the DPD Project pipeline (i.e. from approximately the outer boundary of Darwin Harbour to the NT water limit) the pipeline will be installed directly on the seabed. Route optimisation has been conducted to avoid seabed features. Given pipeline stability is improved when the pipeline can be placed as flat as possible, some seabed intervention will be required as part of pre-lay rectification and/or stabilisation activities.

While carbon steel pipe with concrete coating provides substantial protection to the DPD Project pipeline from external impacts, in shallower waters, including sections within Darwin Harbour, the DPD Project pipeline will require stabilisation due to exposure to waves, currents and tidal movement, and will need further impact protection from third-party activities (i.e. anchors). As such, in some areas the DPD Project pipeline will be installed and buried in a trench on the seafloor for stabilisation and protection.

2.3.1.1 Pipeline pre-lay trenching

Locations of proposed trenching along the pipeline are shown in **Figure 2-3.** There are various trench types that may be used depending on the overall design requirements. Proposed indicative trench designs for the DPD Project are shown in **Figure 2-4**.

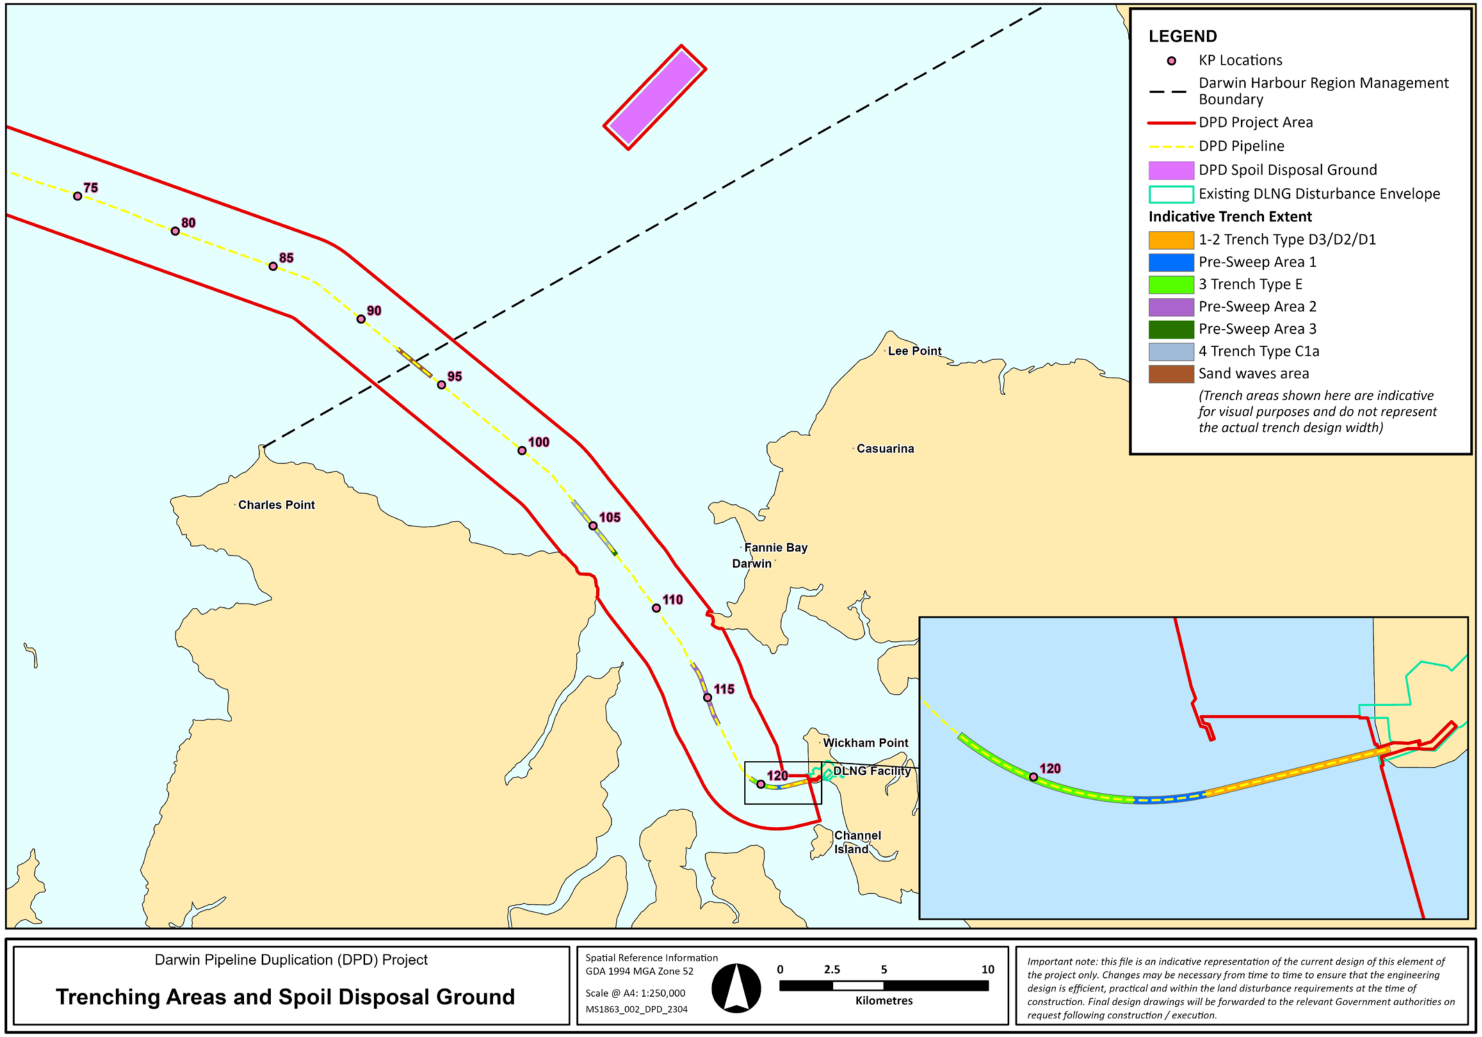

Figure 2-3: Indicative trench locations

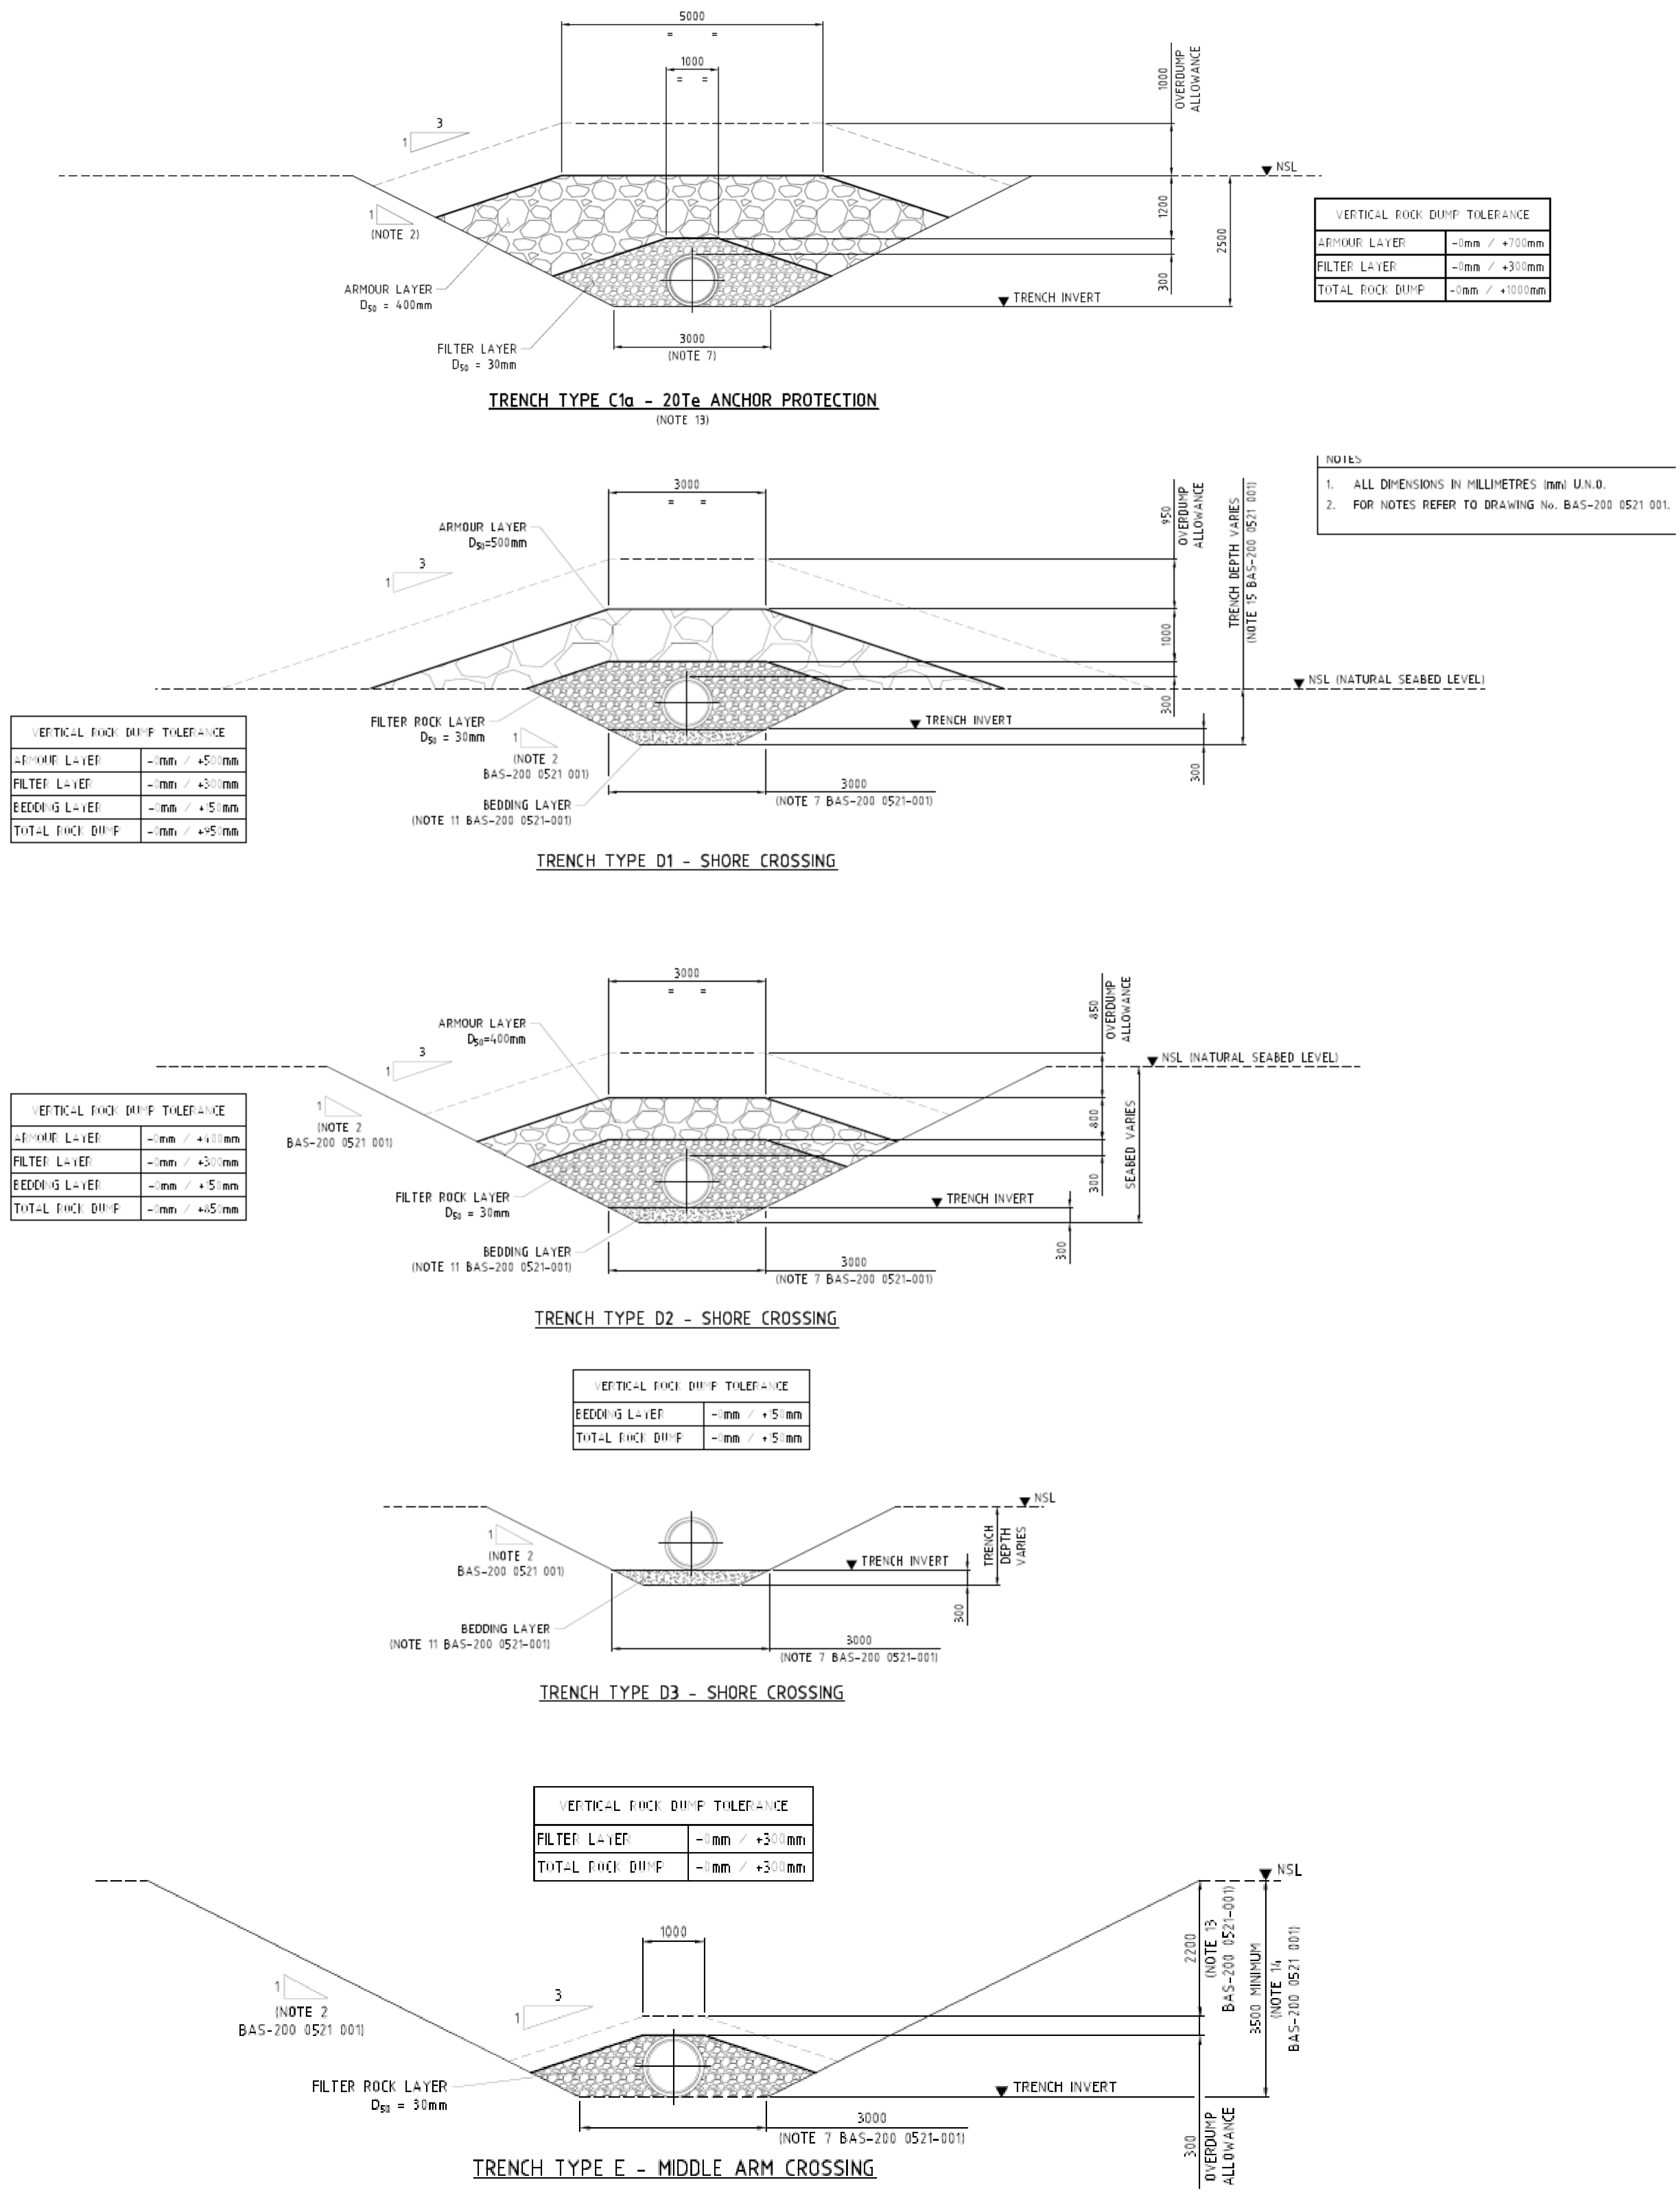

Figure 2-4: Indicative trench designs for the DPD Project

2.3.1.1.1 Darwin Harbour trenching

The pre-lay trenching associated with the DPD Project pipeline installation will involve the excavation of a trench along sections of the pipeline route in Darwin Harbour (**Figure 2-3**) within an indicative trench design width up to 40 m (with a 20 m buffer either side). A Trailer Suction Hopper Dredge (TSHD), Cutter Suction Dredge (CSD) and Backhoe Dredge (BHD) have been proposed for the pre-lay trenching works. Material will be excavated and disposed of at the spoil disposal ground, adjacent to the INPEX spoil disposal ground, as shown in **Figure 2-1**.

Closer to shore a BHD will be used (**Figure 2-3**). Rock breaking tools may be used by the BHD for rock breaking. The BHD will be supported in shallow waters on spuds and will empty spoil onto split hopper barges. These barges are self-propelled or will be towed to the spoil disposal ground, where barges 'split' and spoil is released.

No blasting or rock fragmentation is proposed for the activity, however there may be some requirement for mechanical rock breaking using a BHD mounted hammer or Xcentric ripper at localised rock areas during trenching.

An indicative window for trenching activities is presented in **Section 2.4**. Depending on the final construction schedule, a maintenance dredging campaign may be required to ensure the trench is in specification for pipe lay. It is likely that only isolated pockets along the trench would require maintenance trenching.

Further information on trenching activities, impact assessment and monitoring/management measures is provided in the TSDMMP (BAS-210 0023).

2.3.1.1.2 Shore crossing

A combination of land-based excavators from onshore and a BHD from offshore will be used to dig the trench through the inter-tidal area of the shore crossing at the DLNG facility. To support this, some temporary shoreline modifications may be required, including the construction of a temporary causeway/s so the excavators can operate further from the current shoreline. The temporary causeway/s would be built with rock and fill (**Section 2.3.1.3**).

Experience from the original Bayu-Undan to Darwin pipeline shore crossing works identified that the intertidal zone has potential to contain ASS. Some of the material excavated during the crossing construction was shown to have potential for ASS, which if left exposed to the air would have required treatment with lime. However, the ASS material recovered at the shore crossing was placed below the waterline, so no treatment was ultimately required.

If ASS or potential acid sulphate soils (PASS) are identified during trenching activities, these will be managed by keeping the ASS/PASS material submerged. ASS/PASS material will be placed as close to LAT as possible to keep the material wet under most tidal states which will result in natural dispersion with the tides. PASS in both the intertidal zone and above highest astronomical tide (HAT) is anticipated to have sufficient acid-buffering capacity to avoid the generation of ASS.

Further information on ASS/PASS, impact assessment and monitoring/management measures is provided in the ASSDMP (BAS-210 0049).

2.3.1.1.3 Spoil disposal

Trenching for the DPD Project pipeline installation will result in the requirement to dispose of an estimated 255,000 m³ of spoil however up to750,000 m³ has been considered as a contingency. The proposed spoil disposal ground for trenched material is located to the north of Darwin Harbour, within the Beagle Gulf, approximately 12 km north-west of Lee Point. This location has been selected with consideration of technical, environmental, cost and safety aspects. The selected site is adjacent to the spoil disposal ground approved for use by INPEX for the Ichthys Gas Field Development Project (refer to **Figure 2-1**).

While most of the spoil material will be disposed of within the spoil disposal ground, material excavated at the shore crossing and up to the onshore termination point using land-based excavators will be placed as close to LAT as possible, resulting in the material being saturated across most tidal states. The material will naturally disperse via tidal action and any material remaining at high tide will be removed by BHD and disposed to the offshore DPD spoil disposal ground. This will be done to manage ASS risk and is further detailed in the ASSDMP (BAS-210 0049).

2.3.1.2 Onshore site set-up

Site works within the onshore portion of the Project Area will be required to support the offshore DPD Project construction activities up to the upstream weld of the beach valve (**Figure 2-5**). Earthworks will be required to facilitate the set-up of the onshore site and allow positioning of equipment including removal of rock associated with an existing marine offloading facility (rock groyne), construction of a shore pull and Flood/Clean/Gauge/Testing (FCGT) site pad and the creation of a temporary access road. The construction of the onshore site and onshore component of the shore crossing shall allow for shore pull activities, FCGT activities, onshore trenching and pipelay activities, and equipment layout for contingency operations, including but not limited to allowing for wet buckle dewatering to be performed whilst the pull head is attached to the winch wire.

To facilitate parallel activities at the site pad and shore crossing areas during trenching and pipeline installation of the onshore section, a temporary road will be built through the DLNG site. This will facilitate access to the shore crossing from the south side of the proposed pipeline route.

2.3.1.3 Rock causeway/s

Santos expects that a temporary rock causeway/s will be required to assist with the pre-lay trenching at the shore crossing. In the event these structures are required, they will be located at the shore crossing. Approximately 1600 m^3 of rocks will be required to be imported from the quarry for construction of the causeway. Revetment rocks will mostly be sourced from the location (approximately 1500 m^3). A small layer of gravel or rocks will be applied as a top layer to allow machinery egress. The temporary causeways will cover a footprint of up to approximately 200 m long and 25 m wide either side of the pipeline, with height up to 4 m but an average height of 2 m.

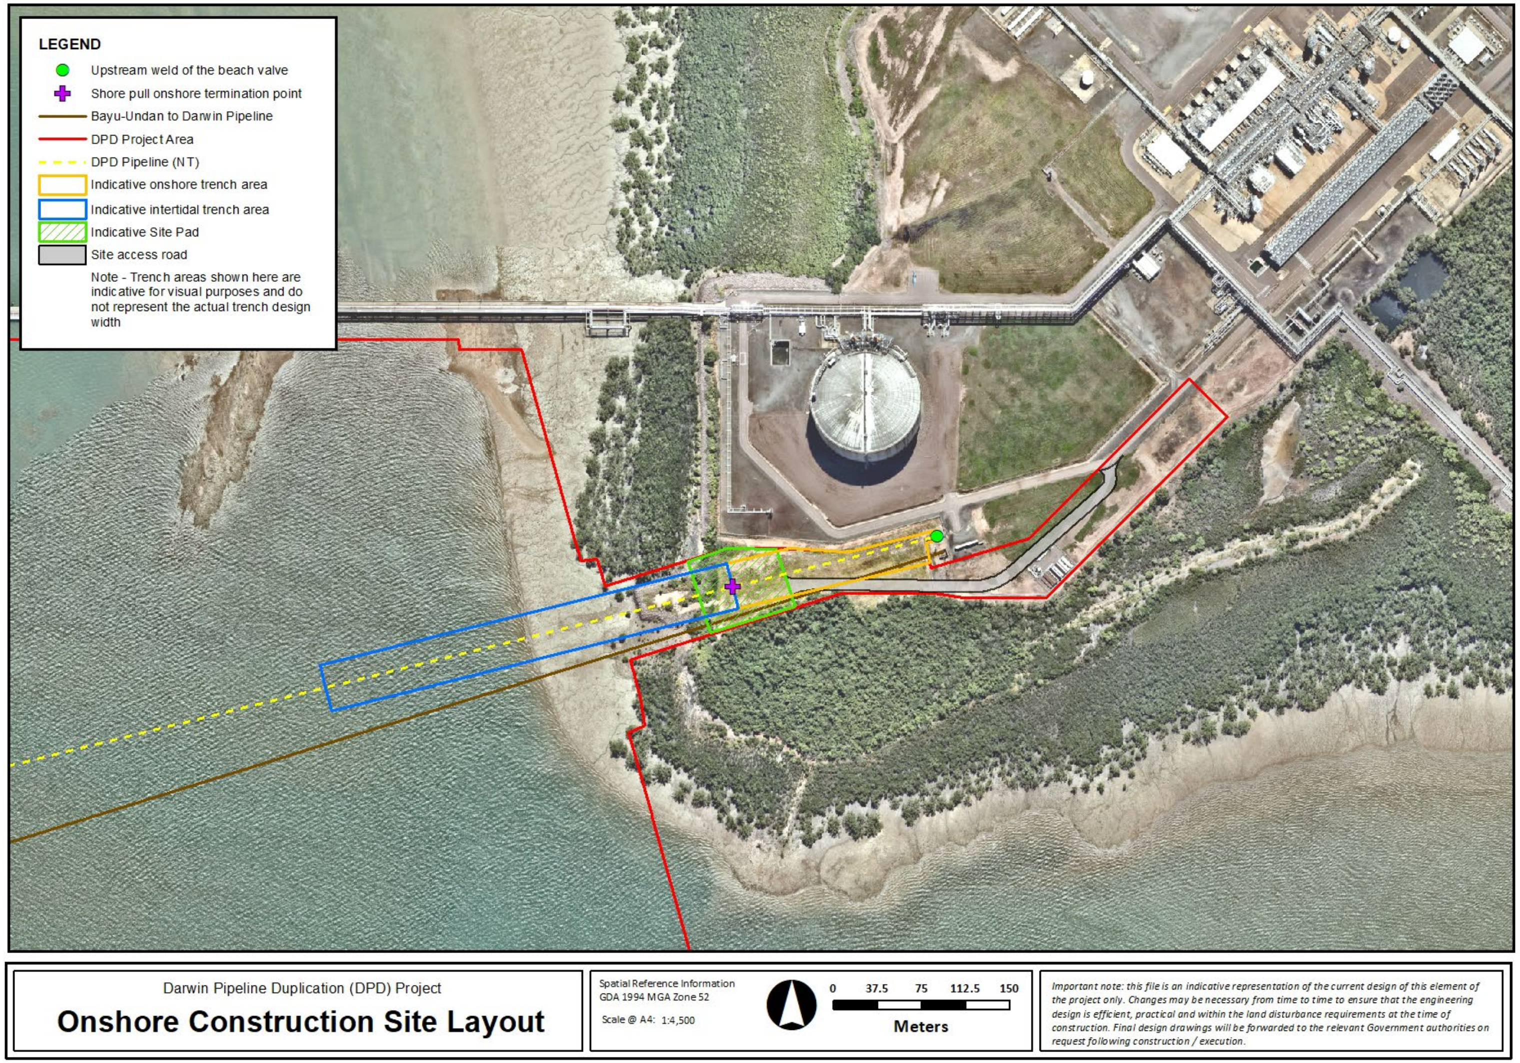

Figure 2-5: Onshore construction site layout

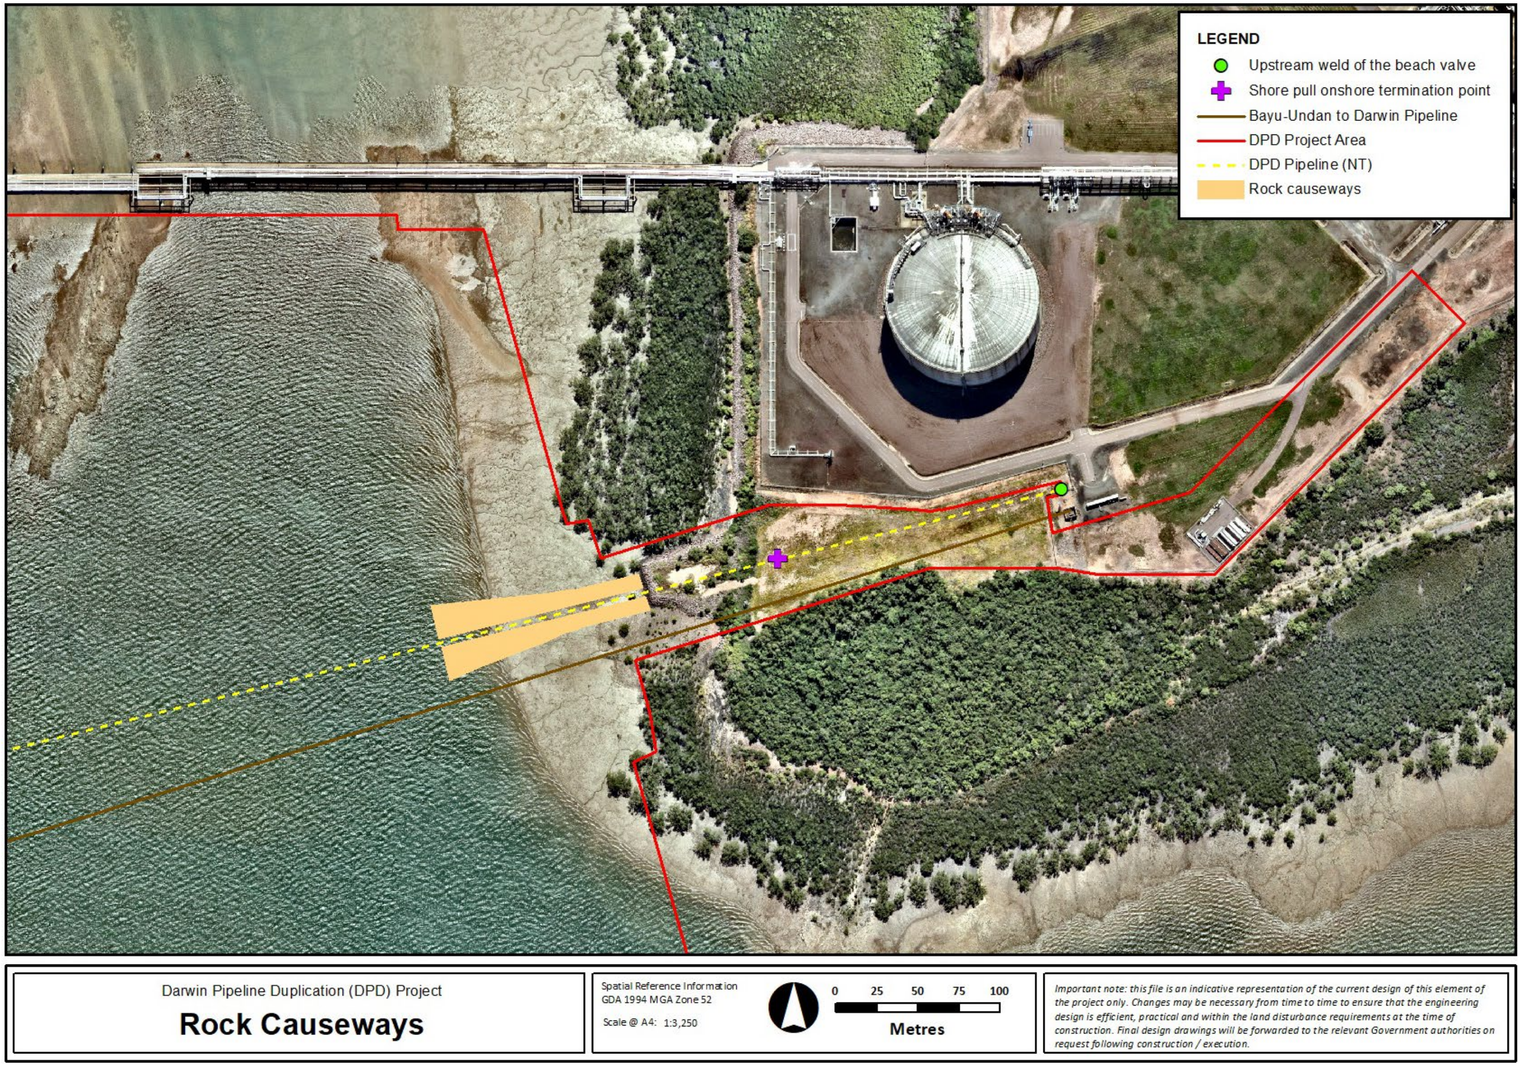

Figure 2-6: Location of causeway

2.3.1.4 Pre-lay span rectification and foundation installation

Pre-lay span rectification will be required in some areas to reduce pipeline spanning. The use of a TSHD to rectify sand waves by removal of sediment between kilometre point (KP) 92.2 and 94.4 is shown in **Figure 2-3**. Otherwise, pre-lay span rectification will occur preferentially through use of mass flow excavation (MFE).

An MFE tool works by accelerating a mass flow of water to blow away sediments within a localised area and can be used to accurately remove sediment high points and reduce pipeline spanning. MFE is an alternative to the installation of numerous concrete mattresses or grout bags. Where concrete mattresses or grout bags aim to support a spanning pipeline, the MFE will remove the span entirely limiting the exposure of the pipeline over its operational life and remove potential integrity concerns. The MFE would be deployed by a construction vessel using dynamic positioning and therefore no additional seabed disturbance is required other than within the localised area where the tool operates.

The use of MFE has been identified as a potential method to reduce sediment high points at 8 locations within two areas along the offshore pipeline route in NT waters. The first area is between KP 51 to 53 (four sites), approximately 40 km offshore from Darwin Harbour boundary and the second area is between KP 72 and 81 (four sites), approximately 12 km from the Darwin Harbour boundary. At each location it is expected that typically less than 100 m of excavation, to a nominal width of 3 m at the bottom of the excavation, would be required along the pipeline route.

The use of MFE would occur during pre-lay activities and is expected to take an indicative 7 – 14 days to complete, with an estimated six hours of operation at each site.

The MFE tool will generate localised turbidity at the seabed during the excavation process. At the locations identified for MFE use, sediment characteristics, as identified by DPD Project sediment sampling (RPS, 2022), indicate a high proportion of sand/gravel (70 – 90 %), with a lesser contribution of fine sediments (silt/clay) (10 – 30 %). Given the localised method and area of operation and the type of sediments observed at the excavation sites, turbidity created by the MFE tool is predicted to be localised and temporary only. The lower fines content will also help mitigate large plume generation and limiting turbidity.

The installation of concrete mattresses or grout bags may be used additional to MFE in instances where MFE proves not suitable (e.g., if consolidated sediments are encountered that cannot be removed by MFE) or as an adjunct to MFE if there is residual spanning requiring further rectification. Each concrete mattress footprint is ~18 m^2 and may be installed in groups and stacked on top of each other to reach the desired height.

In addition, for the in-line tee, a steel pre-lay foundation may be installed, complete with scour protection using mattresses or grout filled mats, with an approximate footprint of 375 m^2.

2.3.1.5 Cable crossings

Telecommunications and power cables in Darwin Harbour will be protected during pipelay operations using concrete mattresses if required. Supports either side of the individual cables will be provided, and it is likely that concrete mattresses will also be used to provide clearance between the DPD Project pipeline and cable.

If concrete mattresses are to be used, it is estimated that the footprint of the mattresses over the four existing cables will each be approximately 12 m × 12 m, or 600 m^2.

For future cables, installation over the DPD Project pipeline will be managed in consultation with the owner/operator of the future cable and Santos.

Detailed surveys will be performed prior to any activities being performed in the vicinity of the power and telecommunication routes. Furthermore, anchoring associated with pipelay activities in this area will include appropriate pull-on and pull-off separation distances to ensure no interaction with the cables present.

2.3.1.6 Pipeline crossings

The DPD pipeline crosses over the Bayu-Undan to Darwin pipeline at two locations (KP ~110.6 and KP ~113.3) in order to avoid encroaching into the Darwin shipping channel. The crossing locations have been selected in regions where the Bayu-Undan to Darwin pipeline is covered by a rock berm. The DPD pipeline is supported by concrete mattresses over the crossings to manage spanning and to ensure a minimum separation between the DPD pipeline and the Bayu-Undan to Darwin pipeline rock berm.

There is the potential to install nominally 30,000 tonnes of rock at the crossing locations subject to pipeline detailed design.

2.3.2 Pipeline installation and pre-commissioning

2.3.2.1 Pipelay activities

The pipeline will be 26/34-inch diameter carbon-steel with an external anti-corrosion coating and anodes to maintain the pipeline integrity and a concrete coating to provide stability and protection.

The DPD Project pipeline will be installed using a continuous assembly pipe-welding installation method, which involves the assembly of the single pipe joints (approximately 12 m in length) in a horizontal working plane on-board the pipelay vessel. The pipe joints are welded together, inspected and then the welded area is coated on-board the vessel before being lowered behind the pipelay vessel. The pipelay uses an ‘S-lay’ method (with the S notation referring to the shape of the pipeline catenary as it is lowered to the seabed). As the pipeline is lowered, it is supported on-board the pipelay vessel using a curved steel structure fitted with rollers known as a ‘stinger’.

The pipelay vessel that will be used is dependent on a range of factors including the availability of vessels, final pipeline parameters and water depth. Both dynamically positioned (DP) and anchored pipelay vessels will be used to perform the installation, dependant on water depth. Examples of pipelay vessels are shown in **Figure 2-7** and **Figure 2-8**.

In the offshore NT waters, the pipeline will be installed at approximately 2 km/day using a deep-water DP pipelay vessel. For this ~65 km extent the installation footprint will be limited to a conservative width of 5 m along the pipeline route.

Figure 2-7: Example of pipelaying vessel (offshore)

Figure 2-8: Example of pipelaying vessel (nearshore)

In shallower waters, predominantly within the Darwin Harbour, anchoring will be required and the speed of pipelay will be reduced to ~300–400 m/day, depending on the coordination of other supporting activities (i.e., pipelay barge and shore pull). For this ~34 km extent, the installation footprint will be limited to 1 m along the pipeline route, plus the footprints required for vessel anchoring. It is estimated that each of the 10 anchors has a footprint of ~10 m^2, including chain sweep. Between 10–20 anchor moves are expected each day, for a period conservatively estimated as 100 days.

When close to the shore crossing, pre-installed onshore anchors may be used. These will be within the proposed shore crossing (i.e., onshore) disturbance footprint. If onshore anchors are used, these anchors have a typical footprint of 5 m × 5 m with an additional 40 m^2 for anchor wire on the seabed.

The base case is for the DPD Project pipeline to be sequentially installed, beginning at the shore crossing, and progressing offshore through NT waters to the PLET in Commonwealth waters. For this to occur the last section of pipe laid by the shallow water pipelay barge will have a recovery head arrangement installed which will include a submersed pennant buoy, allowing this and the pipe to be recovered by the deep water pipelay vessel. Once retrieved the recovery head will be removed and recovered pipe welded to the new section of pipe to commence the deep-water pipelaying process. The base case handover point will be at KP91.5 in approximately 20 m of water, in this case the shallow water pipelay barge will have laid approximately 34 km of pipe and the deep water pipelay vessel will lay approximately 65 km of pipe in NT waters.

An alternative, to pipelaying sequentially from onshore to offshore is to pipelay concurrently with the deep water pipelay vessel and a shallow water pipelay barge. In this scenario, the shallow water vessel would still commence at the shore crossing to facilitate the shore pull and the deepwater vessel would begin lay at KP0. An above water tie-in (AWTI) would be performed where the two sections of pipeline meet. The AWTI would occur using the shallow water pipelay barge and would involve recovery of pipeline end sections using davits and subsequent welding from a temporary work platform. This activity would involve the installation of buoyancy modules on the pipe tails to support the pipeline end sections and facilitate correct alignment for welding. Timing of AWTI operations would be conducted to coincide with neap tides where practicable.

2.3.2.2 Dead-man anchoring

A dead-man anchor may be used during a midline start up with the dynamically positioned pipelay vessel. The dead-man anchor will 'dig' into the seabed to provide stability for the dynamically positioned pipelay vessel during pipelay initiation.

A dead-man anchor will be employed adjacent to the DPD pipeline route, approximately 1500 m towards Darwin on the proposed pipeline route. There is no 'target box' or 'cut-to-length' requirements for the dead-man anchor cable start-up location, as the pipe will be recovered. The pipeline initiation point (for the deep water pipelay vessel) is approximately located at KP91.5, with the dead-man anchor situated adjacent to the pipeline route at approximately KP90.

The expected duration of the dead-man anchor operation from connection of the dead-man anchor wire until head touchdown is approximately seven hours. This includes an allowance for contingency time.

Before the actual pipeline initiation can commence, the anchor will be installed and tested according to the procedure outlined in the Gas Export Pipeline – Audacia 26-inch Pipelay Procedure (BAS-273 5005). This is summarised below:

+ Install the anchor, typically 22 tonne stevshark, fluke angle 32 degrees, at the midline start-up location adjacent to KP90;
+ Move dynamically positioned vessel to the required test location and pay out the 2.5-inch dead-man anchor cable from the dead-man anchor winch;
+ The dead-man anchor will be tested by applying a factored bottom tension, for a duration of 30 minutes. To achieve the required test tension, tension will be increased in a slow and controlled manner to allow the anchor to set firmly into the ground;
+ On successful completion:
+ The dead-man anchor cable will be slackened from the dead-man anchor winch; and

+ The dead-man anchor cable will be transferred outboard, re-routed over the stinger and secured in the firing line. The dead-man anchor start-up rigging will be prepared and Audacia will set up at the start-up position.

A remotely operated vehicle deployed from the dynamically positioned vessel or survey support vessel will perform the following tasks during installation and testing of the anchor:

+ Monitor the correct landing of the dead-man anchor;
+ Take a fix of the position of the dead-man anchor after landing;
+ Monitor the anchor during the tensioning and testing of the dead-man anchor wire; and
+ Take a fix of the dead-man anchor after completion of the test.

2.3.2.3 In-line tee

The in-line tee (ILT) will be installed at KP62.8 during the pipelay activities by the deep-water DP pipelay vessel. If required, a foundation for the ILT will be pre-installed during pre-lay works. The ILT is welded into the DPD Project pipeline on-board the pipelay vessel and is installed as part of normal pipelay. A protection frame, approximately 5 m high, will be installed post-pipelay by crane (guided by ROV).

2.3.2.4 Pipeline shore pull

Shore pull to bring the DPD Project pipeline onshore will use a conventional winch operation. The arrangement for the shore pull consists of a winch spread installed on a winch pad and attached to a hold back anchor located onshore.

The pipeline pull head on the shallow water pipelay vessel is connected to the winch using a pull wire and suitable rigging. The pipe will be pulled ashore from the pipelay vessel using the winch spread located onshore through the pre-constructed trench and winched up to ~2 m above HAT (i.e. the shore pull onshore termination point).

The pulling arrangement will allow for the shore pull to be completed as a continuous operation, which will take approximately two weeks.

2.3.2.5 Trench backfill

The primary method of maintaining pipeline stability on the seabed will be the concrete weighted pipeline coating. It will also be necessary to install localised secondary stabilisation/protection for sections within Darwin Harbour where the concrete weighted coating alone is not considered sufficient to provide stability and/or protection. Backfilling using rock will also be required to protect the pipeline in areas where 21.5 tonne anchors may be used.

Rock sourced from onshore will be used for pipeline stabilisation and protection. The rock will likely be installed via a fall pipe vessel (FPV) or side dump vessel (SDV). Self-propelled DP vessels will be used to install rock on to the seabed, possibly with support barges used to transport rock. The volume of rock required is expected to be 200,000 tonnes and no more than 500,000 tonnes.

2.3.2.6 Post-lay span rectification

To provide pipeline stability, post-lay span rectification may be required and if so, would be undertaken by the installation of grout bags using a remotely operated vehicle (ROV). The likely disturbance footprint for each occasion of post-lay span rectification is 25 m². There will be a requirement to undertake downline flushing of the slurry which will result in a nominal amount of ~1.2 m^3 per fil cycle. It is estimated that there will be ~30 pre- or post-lay grout bags.

The actual locations would not be known until after the DPD Project pipeline is installed and surveyed.

2.3.2.7 Flood/ clean/ gauge/ testing (FCGT) and dewatering/ pre-commissioning

The following section outlines all aspects of the FCGT and dewatering/pre-commissioning processes, however there is no planned discharge of FCGT fluids in NT waters and discharges are limited to Commonwealth waters and will be in accordance with the relevant environmental approvals. Information provided on the FCGT process and discharges within Commonwealth waters has been provided for context as water extraction, filter flushing and pipelay contingencies outlined in **Sections 2.3.2.8** and **2.3.2.9** will occur within the Project Area.

Once installed, the DPD Project pipeline internal surfaces need to be cleaned, tested, and preserved in preparation to carry hydrocarbons. This is conducted through pigging, whereby a series of pipeline inspection gauges (pigs) will be pushed through the pipeline to clean the pipeline, gauge the pipeline, and ensure all air is removed during the flooding process. Pigs are typically bullet shaped instruments which are pushed through the pipeline. Pig launcher/receivers (PLRs) will be installed on the pipeline end termination point (PLET) in Commonwealth waters and at the shore crossing. The pigs will be pushed using chemically treated seawater with seawater sourced from Darwin Harbour. The chemically treated seawater is typically a mixture of biocides (to prevent biofouling and bacterial corrosion on the internal surfaces), an oxygen scavenger (to control corrosion of the pipeline) and a dye (for leak detection during hydrotest). The proposed water treatment chemical is 'Hydrosure' or 'Hydro-3', however there may be a requirement to use other Santos approved chemical packages. The concentration of treated chemical will depend on the required preservation period, which is the period the pipeline will be left filled with the chemically treated seawater before being dewatered for tie-in and commissioning. However, the maximum concentration will be 550 ppm.

Following pigging operations the pipeline will be subjected to a hydrostatic pressure test (hydrotest). Hydrotesting will be completed in line with Santos' specification, Pressure Testing of Process and Utility Piping (1540-120-SPC-0018), and Downer standard, Hydrostatic Testing (SM-QA-ST014) (Downer, 2022). The offshore pipeline installation contractor will source hydrotesting water by water winning from Darwin Harbour, which will be filtered to remove particulates and then chemically treated. A volume of chemically treated seawater will be pushed into the pipeline to raise its pressure. This hydrotest pressure will be held for a period of time as per the relevant standard to test the pipeline integrity. There will be small, localised discharges at the PLET as the pipeline is depressurised.

On completion of FCGT, the flooded pipeline will be dewatered with ~55,000 m^3 of treated seawater discharged at the PLET in Commonwealth waters. The pipeline will be dewatered using a train of dewatering pigs separated by monoethylene glycol (MEG) slugs, driven by nitrogen, which will condition the pipeline. Approximately 1000 m^3 of MEG will be discharged. Dewatering is expected to take one week and discharge will be at the seabed through a diffuser attached to PLET C.

On completion of dewatering, the pipeline will be left packed with nitrogen, ready for hook up.

While the current plan is to dewater the entire DPD Project pipeline in one event as described above, if there is a failure in the pipeline during installation that requires remedial construction work on the pipeline, or if a pipeline wet buckle occurs during pipelay (a wet buckle is when there is a failure in the pipeline during installation which results in the ingress of raw / untreated sea water into the pipeline), contingency plans will be implemented, with associated discharges. Refer to pipelay contingencies below for detail.

2.3.2.8 Water extraction and filter flushing

To provide water for FCGT activities, water will be extracted (water winning) from Darwin Harbour. Water winning will be via a pumping spread comprising four mesh-screened, submersible pumps supported on an anchored pontoon. It is anticipated that the pontoon and extraction hose will be positioned approximately 600 m from shore in approximately 15 m of water at LAT. The total volume of water required will be dependent upon the nature of the FCGT and any contingency requirements (e.g. pipeline filling associated with responding to a wet buckle event). Planned FCGT water winning requirements are expected to require approximately 55,000 m^3 of water. Pumping rates are expected to be approximately 9 – 16 m^3/minute and water winning for FCGT activities is expected to take place over approximately three days (not including any contingency activities).

Water extracted from Darwin Harbour will be filtered prior to chemical treatment. To ensure the effectiveness of filters, regular backflushing is required. While the number of backflushes and volume of water associated with backflushing may vary depending upon the effectiveness of filters and level of clogging by suspended solids, it is estimated that a total of approximately 300 m^3 of backflush water is expected to be discharged. Backflush water will have a higher suspended solids loading compared to water extracted (i.e., higher than ambient Darwin Harbour water suspended solid concentration). The concentration of total suspended solids (TSS) within backflush water will depend upon the ambient concentration within Darwin Harbour, which will vary with tidal state and season. Water during spring tides and over the wet season are expected to be more turbid (higher TSS concentration) than water during neap tides and over the dry season.

Backflush water will be discharged onto the existing disturbed shore crossing construction site, where it will then drain into the intertidal area and solids will disperse with tidal movements. Where possible, and dependent on the progress of shore crossing rock installation at the time of FCGT activities, backflush water will be discharged onto installed rock, to baffle the flow of the discharged backflush water.

2.3.2.9 Pipelay contingencies

While highly unlikely to occur, failures in the DPD Project pipeline and the occurrence of wet buckling can occur during pipelay activities and in these situations, pipelay contingency activities will be required.

A 'wet buckle' event may occur during installation should the pipeline become buckled and fracture during pipelay, resulting in flooding of the pipeline with raw, untreated seawater. If this occurs, the raw seawater will need to be displaced from the pipeline to prevent corrosion to the undamaged section of pipeline. To remove the raw seawater, a contingency pig is launched with treated seawater containing preservation chemicals (biocide, corrosion inhibitor and oxygen scavenger) to flush the pipeline, followed by a second contingency pig which is pushed with compressed dry air. The pipeline end is then recovered and pipelay can continue.

The wet buckle event may occur anywhere along the proposed pipeline between KP0 and KP122.2 and therefore contingency dewatering could occur within this range, treated seawater discharge modelling has been conducted at three locations (KP84, KP102 and KP114) to inform impact assessment of contingency treated seawater of discharge in NT waters. These sites which were specifically selected due to their proximity of pipeline to areas of environmental importance (i.e., reefs, coral, etc) and to be representative of differing metocean conditions along the pipeline route in NT waters.

In the event of an extended period before pipelay can recommence, the pipeline will be flushed and then filled with inhibited seawater to safely preserve the pipeline in the intervening period before pipelay is recommenced. The inhibited seawater will be treated with chemicals to preserve the pipeline (i.e., the same treatment described in **Section 2.3.2.7**). If preservation is required, the entire content of the treated seawater within the pipeline will be discharged (dewatered) prior to pipelay recommencing.

Both overflow and dewatering discharges were modelled at these locations. The volume of treated seawater released as overflow (~600 m^3) was modelled at all three locations. However, during dewatering the volume was varied due to the length of the pipe at the given location, shown below.

- KP84 – 19,958 m^3
- KP102 – 10,623 m^3
- KP114 – 4,400 m^3

2.3.2.10 Demobilisation of onshore support facilities

At the completion of the pipeline installation and pre-commissioning activities, the offshore pipeline installation contractor/ sub-contractors will be responsible for removal the onshore supporting facilities e.g. site pad, access roads (**Figure 2-2**) and demobilising any onshore equipment. Wastes will be disposed of, and site reinstatement undertaken as required.

The causeway/s will be removed upon completion of all activities at the shore crossing site. Excavators will start at the deep end and recover material into dump trucks for temporary storage, with material subsequently disposed offsite. A final survey will be completed to confirm all material brought to site for the causeway has been removed.

2.3.3 Summary of vessel and support activities

Vessel and support activities will include the operation of vessels, vehicles/mobile plant, helicopters and ROVs. Vessel and support activities associated with the DPD Project will be undertaken throughout all phases of the DPD Project.

2.3.3.1 Vessel activities

A number of vessel types will be required to complete the proposed activities, including:

- Marine survey vessels – to support pre-lay and post-lay surveys of the Project pipeline, including verifying trench depth and rock placement, support pipeline and structure placement and monitor spoil ground.
- Environmental monitoring vessel – to conduct environmental monitoring during construction activities;
- Pipelay vessels – A deep water pipelay vessel and shallow water pipelay barge, to install the pipeline and ILT;
- Construction vessels – to support installation of structures (i.e., spool, mattresses for scour protection, mechanical protection, stabilisation and pipeline support) and pre-commissioning activities;
- Rock installation vessels – including fall pipe vessel, side dump vessels and non-propelled barges;
- Trenching and spoil disposal vessels – including a cutter suction dredge (CSD), trailing suction hopper dredge (TSHD), backhoe dredge (BHD) and split hopper barges (SHB);
- Pipe supply vessels – to provide pipe to the pipelay vessel; and
- Supply vessels – to provide general support, crew transfers, material and supplies to all offshore activities.

For trenching and spoil disposal activities, an expected 11 vessels will be required, for deep water and shallow pipelay activities an expected six and seven vessels, respectively, are expected to be involved, for rock installation an expected six vessels will be involved and for pre-commissioning an expected four vessels will be involved.

Supply vessels are expected to operate from local regional ports (i.e. Darwin) to transport fuel, stores, waste and specialist supplies such as rock, pipe etc.

Bunkering (re-fuelling) of the vessels may take place either at sea (i.e. if required for the pipelay vessel) or in port (support and other vessels).

Vessels will vary in length and draft. They may anchor depending on water depth and activity type, with varying anchor requirement and disturbance footprints. Known sensitive areas will be avoided when anchoring.

2.3.3.2 Helicopter activities

Helicopters are the primary means of transporting passengers or urgent freight to and from the pipelay vessel and helideck equipped construction vessel during offshore installation and pre-commissioning activities. They are also the preferred means of evacuating personnel in the event of an emergency. Helicopter support will be principally supplied from Darwin Airport. Helicopter operations will be approximately three days per week, with typically two flights each day. Helicopters will operate during daylight hours unless in the event of an emergency. Helicopters may be required to refuel offshore.

2.3.3.3 Remotely operated vehicle activities

Throughout the DPD Project, offshore activities will be supported by ROVs. The ROV can be fitted with various tools and camera systems that can be used to capture permanent records of the underwater operations and immediate surrounding environment.

2.3.3.4 Onshore facilities and equipment

Constructing onshore facilities will be required to undertake activities up to the shore pull onshore termination point. The activities include:

+ Preparation the site pad and temporary stockpile – this will include a pre-excavation survey to establish a baseline for re-contouring of the site at completion of works. Soil investigations will also be conducted at the locations of the causeway, winch installation area and temporary stockpile area. Excavation will then commence with ~5000 m^3 of material moved to the temporary spoil stockpile or intertidal area (location of spoil dependent on ASS inspection)
+ Temporary road construction, installation of geotextile and site hard stand areas – Compaction of loose soils will be done with vibratory rollers and post compaction geo-fabric to be installed where hardstand material will be applied. The hardstand material shall be placed and compacted to a minimum thickness of 300 mm. Lighting will be provided for safety purposes during night activities.
+ Site installation of the ablution facilities and office buildings. Ablutions will be connected to a septic tank with sludge periodically removed. Office containers will be lifted in via mobile crane and electrical wiring connected to a generator which will be in protective casing.
+ Installation of holdback anchor, linear winch, trench and shore pull wire. The winch will be installed using a crane with lifting capacity of 300/350 tons. Prior to the pipe pull operations an anchor pit will be excavated with ~1608 m^3 of material removed, which will be stored onsite and used as backfill for the pit on completion of activities. The anchor pit is above HAT and as the water table is assumed to be equal with the sea level it is expected that the bottom of the pit will be dry (with the exclusion of rain events).

The types of equipment expected to be used include:

+ Light vehicles;
+ Mobile equipment such as excavators, graders, trucks, fuel trucks, etc.; and
+ Heavy equipment such as cranes

Santos

Facilities to be installed at the project site include:

- Muster point
- Generator
- Contractors offices
- Meeting room
- Stores container
- HV parking area
- LV parking area
- Light towers
- Septic tank with water supply tank
- Ablution facility discharging on septic tank
- Gas detectors

All equipment and facilities are rated for cyclones as per the Cyclone rated design report.

2.3.4 Resource requirements and access

Other resources required for the DPD Project will include:

- Personnel will be required during the construction period. Labour will be recruited from the domestic and local labour market where possible; this is subject to the contractors' resourcing requirements at the time. Accommodation will be provided for the workforce within the Darwin area or onboard vessels.
- Power will likely be supplied by onsite generators to support construction amenities and operation of equipment.
- Water usage for onshore activities including for dust suppression, washdown facilities and ablutions supply will likely be sourced from mains water supply within the DLNG facility or provided as self-sufficient water through containerised water trucks.
- Access to the shore crossing location (i.e. onshore site) will be via the existing DLNG access at the end of Middle Arm Peninsula into Wickham Point.

2.3.5 Fuels and chemicals

Chemical and fuel storage will be stored onsite within the shore crossing location and will include bunded fuel storage/tanks. Fuel trucks will likely be used to supply fuel to construction equipment including excavators, graders, cranes, and generators. Hydrotest chemicals will also be stored onshore within a hydrotest spread (i.e. biocides, oxygen scavenger and dye).

2.3.6 Atmospheric Emissions

A greenhouse gas (GHG) emissions study was conducted to determine the scope 1, 2 and 3 emissions from the DPD Project and the broader Barossa development. The scope 1 emissions within NT jurisdiction are emissions that result directly from the construction DPD Project includes:

- Vessel-based construction activities
- Onshore construction activities from power generating equipment (i.e. engine and generators)

Scope 2 and Scope 3 emissions are associated with the broader Barossa project and comprise electricity use, transport and construction of materials and consumption of Barossa products by customers.

The total scope 1 emissions for DPD Project construction activities in the NT are approximately 50,000 tCO_2-e.

2.3.7 Discharges

The DPD construction activities will produce the following discharges:

+ Vessel wastes including sewage, greywater, food waste, cooling water and reverse osmosis (RO) brine, deck drainage and bilge
+ Contingency pigging resulting discharge of FCGT fluids (in the event of an unplanned wet buckle only)
+ Trench spoil (offshore, intertidal and onshore including PASS)
+ Filter backflush discharges associated with FCGT activities (water extraction).

Approximate volumes of these discharges are presented in **Table 2-3**.

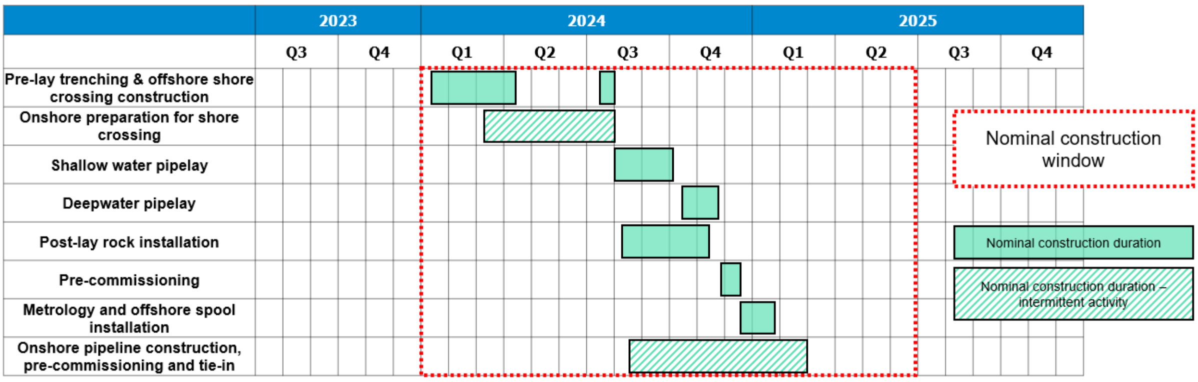
Table 2-3 Projected and contingency construction discharge volumes for the DPD Project in NT jurisdiction

Discharge source	Projected volume (m^3)	Contingency volume (m^3)
Vessel waste	n/a	n/a
Contingency treated seawater discharges	n/a	Dependent upon wet-buckle location. Example discharge volumes are provided below: ~19,958 m^3 (KP84) ~10,623 m^3 (KP102) ~4,400 m^3 (KP114)
Trench spoil	~255,000	750,000
Downline flushing of grout lines	~40	n/a
Filter backflushing	~300 m^3	

2.4 Indicative construction schedule

Santos is targeting to have all DPD regulatory approvals in place by Q1 2024 to ensure construction activities do not delay Barossa first gas in the first half of 2025. A nominal DPD construction sequence and schedule is shown in **Table 2-4** representing a start of construction activities at the beginning of nominal construction window. The construction activities will span a nominal cumulative period of 15-months in the field. The actual construction sequence and schedule will be subject to the timely receipt of all regulatory approvals and drivers such as vessel availability, operational issues, and weather. Santos' regulatory approvals and stakeholder consultation consider construction activities at any time between Q1 2024 to mid-2025.

Table 2-4: Preliminary pre-lay, construction, installation, and pre-commissioning schedule for DPD



3 Legal and other obligations

The following sections describe the legislative framework governing the environmental impacts from the construction of the DPD Pipeline (NT).

3.1 Commonwealth Environmental Approval

The DPD Project including the DPD Pipeline section in Commonwealth Waters was referred to the DCCEEW under the EPBC Act on 7 October 2022 (EPBC 2022-9372). On 6 December 2022 the DPD Project was determined to be a Controlled Action requiring further assessment based on Preliminary Documentation. Further information was requested under section 95A(2) of the EPBC Act on 23 December 2022.

It was determined that the Project may have a significant impact on the following controlling provisions under the EPBC Act:

+ Listed threatened species and communities (sections 18 & 18A)
+ Listed migratory species (sections 20 & 20A)
+ Commonwealth marine areas (sections 23 & 24A)

The Preliminary Documentation is currently being prepared for submission to DCCEEW.

This CEMP will be updated to reflect any relevant regulatory conditions associated with this approval.

3.2 Northern Territory Environmental Approvals

The DPD Project was referred to the NT EPA on 14 January 2022 under Section 55 of the EP Act. The NT EPA determined the DPD proposal required assessment by Supplementary Environmental Report (SER) (Tier 2) in accordance with the Environment Protection Regulations 2020 (EP Regulations). The SER is required to address public submissions and include information additional to the referral document in relation to specific aspects of potential significance.

This CEMP has been prepared for submission with the SER (BAS-210 0020) and other supporting documents to the NT EPA under the EP Act and will be updated to reflect any relevant regulatory conditions associated with the DPD Project approvals. It will also be submitted to DITT for approval under the *Energy Pipelines Act 1981* and the *Petroleum (Submerged Lands) Act 1981 and Energy Pipelines Act 1981*.

The following approvals are also required for construction of the DPD Project under NT legislation:

+ Department of Infrastructure, Planning and Logistics (DIPL) - Development Permit (*Planning Act 1999*) and Occupational License (*Crown Lands Act* (1992))
+ DITT – Energy Division Consent to construct and Consent to Test (*Energy Pipeline Act 1981* and *Petroleum (Submerged Lands) Act 1981*) Pipeline licenses (*Petroleum (Submerged Lands) Act 1981 and Energy Pipeline Act 1981*)
+ Fisheries Permit (*Fisheries Act 1998*)
+ Underwater Heritage Clearance (*Heritage Act 2011*)

Conditions within these permits, where they are relevant to the environmental management of works will be incorporated into future revisions of the CEMP.

3.3 Aboriginal Areas Protection Authority certificates

Aboriginal Areas Protection Authority (AAPA) certificates aim to protect indigenous sacred sites preventing damage from nearby works and outlines conditions to be followed when carrying out works on land and sea near to sacred sites across NT. The AAPA administer these certificates under the *Northern Territory Aboriginal Sacred Sites Act 1989*.

Santos has received an AAPA Authority Certificate (C2022-098) from AAPA on 23 December 2022 and will ensure the requirements of the certificate (including avoidance of restricted work areas) and the *Northern Territory Aboriginal Sacred Sites Act 1989* are met.

3.4 Legislative framework

Environmental legislative requirements governing the DPD Project are described in the following sections. All activities will comply with legislative requirements established under relevant Commonwealth and NT legislation. Key legislation is described below in **Sections 3.5.1**, **3.5.2**, **3.5.3** and **3.6**. Other relevant legislation is described in **Table 3-1** and **Table 3-2**.

3.5 Key Legislation

3.5.1 Environment Protection and Biodiversity Conservation Act 1999 (Cth)

The EPBC Act is administered by DCCEEW. The EPBC Act provides a legal framework to protect and manage nationally and internationally important flora, fauna, ecological communities, and heritage places, which are defined in the EPBC Act as matters of national environmental significance. There are nine matters of national environmental significance to which the EPBC Act applies, these are: world heritage properties, national heritage places, wetlands of international importance, nationally threatened species and ecological communities, migratory species, Commonwealth marine areas, the Great Barrier Reef Marine Park, nuclear actions, and water resources (in relation to coal seam gas development and large coal mining development) (DCCEEW, 2022a). When a person proposes to take an action that they consider may need approval under the EPBC Act, they must refer the proposal to the Commonwealth Minister for Environment.

Section 3A of the EPBC Act sets out the principles of ecologically sustainable development (ESD), which are:

+ Decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations
+ If there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation
+ The principle of inter-generational equity—that the present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations
+ The conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making
+ Improved valuation, pricing and incentive mechanisms should be promoted.

The construction and operation of the DPD Project (including the Commonwealth waters section) has been referred to DCCEEW under the EPBC Act and assessed to be a Controlled Action (referral number EPBC 2022/9372) requiring further assessment based on Preliminary Documentation (in progress).

3.5.2 Environmental Protection Act 2019 (NT)

The EP Act and associated EP Regulations are administered by DEPWS. The EP Act protects the environment and related purposes of the Northern Territory. The Act also:

+ Promotes ecologically sustainable development
+ Recognises the role of environmental impact assessment and environmental approval in promoting the protection and management of the environment of the Territory
+ Provides for broad community involvement during the process of environmental impact assessment and environmental approval
+ Recognises the role that Aboriginal people have as stewards of their country as conferred under their traditions and recognised in law, and the importance of participation by promotion of ecologically sustainable development.

This CEMP has been developed under the guidance of this Act and the NT EPA Draft Guidelines for an Environmental Management Plan (NT EPA, 2015) and will be submitted to NT EPA with the DPD SER (BAS-210 0020) for assessment.

3.5.3 Energy Pipelines Act 1981

The *Energy Pipelines Act 1981* (NT) allows for the creation of provisions for the construction, operation, maintenance and cessation of use or abandonment of pipelines for the conveyance of energy-producing hydrocarbons, and for related purposes. The *Energy Pipelines Act applies* to the DPD pipeline inshore from the NT Territorial Sea Baseline to the upstream weld of the beach valve.

The NT *Energy Pipelines Act 1981* and subsidiary Energy Pipelines Regulations require the proponent to operate licensed pipelines in accordance with an accepted Pipeline Management Plan (PMP). The Energy Pipelines Regulations do not require the PMP to explicitly consider environmental impacts and risks, however it is DITT – Energy Division policy that an environmental management plan (EMP), detailing environmental management, is submitted to with the PMP for approval. This CEMP and supporting plans will constitute the EMP to be provided with the PMP for approval under the *Energy Pipelines Act 1981*.

3.5.4 Petroleum (Submerged Lands) Act 1981 (NT).

The *Petroleum (Submerged Lands) Act 1981* allows for the creation of provisions with respect to the exploration for and the exploitation of the petroleum resources, and certain other resources, of certain submerged lands adjacent to the coasts of the Northern Territory and for other purposes. The *Petroleum (Submerged Lands) Act 1981* applies to the DPD pipeline in NT coastal waters, i.e., between the NT Territorial Sea Baseline and the NT/Commonwealth waters boundary.

3.5.4.1 Petroleum (Submerged Lands) (Management of Environment) Regulations 1999 (Cth)

The Petroleum (Submerged Lands) (Management of Environment) Regulations 1999 allow for the creation of provisions with respect to the exploration and the production of the petroleum resources, and certain other resources, of certain submerged lands adjacent to the coasts of the Northern Territory and for related purposes*.* The regulations aim to ensure that proponents carry out all petroleum activity in a way that is consistent with the principles of ecologically sustainable development, in accordance with an environment plan that has appropriate environmental performance objectives and standards as well as measurement criteria for determining whether the objectives and standards are met. These Commonwealth regulations are enacted by the Petroleum (Submerged Lands) (Application of Commonwealth Laws) Regulations 2004 and apply between the

Commonwealth/NT waters boundary and the Territorial Sea Baseline. This CEMP has been developed in accordance with the content requirements for an Environment Plan under these regulations, including identifying clear and appropriate environmental performance objectives and standards as well as associated measurement criteria.

3.6 Other relevant legislation

3.6.1 Commonwealth legislation

Other Commonwealth legislative requirements relevant to the DPD offshore construction activities are outlined in **Table 3-1**.

Table 3-1: Other Commonwealth legislation relevant to DPD offshore construction activities

Title	Description
Aboriginal and Torres Strait Islander Heritage Protection Act 1984	The purpose of this act is to preserve and protect places and objects in Australia and in Australian waters from injury or desecration; places or objects in question must be of particular significance to Aboriginal people with Aboriginal tradition.
Biosecurity Act 2015	The Act describes how to manage biosecurity threats to plant, animal and human health in Australia and its external territories, ensuring a very low level of risk.
Industrial Chemicals (Notification and Assessment) Regulations 1990 (Cth) National Industrial Chemicals Notification and Assessment Scheme (NICNAS)	Industrial chemicals are regulated by the Australian Government and administered by NICNAS. NICNAS provides a national notification and assessment scheme to protect the health of the public, workers and the environment from the harmful effect of industrial chemicals. NICNAS also assess all chemicals new to Australia and existing chemicals on a priority basis, in response to concerns about their safety on health and environmental grounds.
National Greenhouse and Energy Reporting Act 2007	Introduces a single national reporting framework for the reporting and dissemination of information about GHG emissions, GHG projects and energy use and production of corporations.
Native Title Act 1993	This Act provides for the recognition and protection of native title and provides or permits for the validation of past acts and intermediate period acts, invalidated because of the existence of native title. It additionally establishes ways in which future dealings affecting native title may proceed and sets standards for those dealings and establishes mechanisms for determining claims to native title.
Protection of the Sea (Harmful Anti-fouling Systems) Act 2006	This Act relates to the protection of the sea from the effect of harmful anti-fouling systems. It covers the application or

Title	Description
	use of harmful anti-fouling systems and the issue and endorsement of the required certificates and anti-fouling declarations.
Protection of the Sea (Prevention of Pollution from Ships) Act 1983	This Act relates to the prevention of pollution (in any form) from ships and MARPOL requirements are implemented under this Act. MARPOL requirements are implemented under this Act.
Ozone Protection and Synthetic Greenhouse Gas Management Act 1989	This Act, and associated regulations, implements the requirements of the Vienna Convention and Montreal Protocol to avoid using ozone depleting substances.
Underwater Cultural Heritage Act 2018 *Underwater Cultural Heritage (Consequential and Transitional Provisions) Act 2018*	This Act provides for the protection of shipwrecks, sunken aircraft and their associated artefacts that have lain in territorial waters for 75 years or more. It is an offence to interfere with any shipwreck covered by the Act. Some sites also have a protected zone around them.

Notes:

1. The *Environment Protection (Sea Dumping) Act 1981* (Cth) does not apply as spoil disposal will be within NT waters and therefore a sea dumping permit is not required.
2. There will be no trenching of the pipeline route or spoil disposal between the territorial baseline and NT coastal waters limit and therefore the activities included in this TSDMMP do not fall under the jurisdiction of the *Petroleum (Submerged Lands) (Management of Environment) Regulations 1999.*

3.6.2 Northern Territory legislation

Other Northern Territory legislative requirements relevant to the DPD Project offshore construction activities are outlined in **Table 3-2**.

Table 3-2: Other Northern Territory legislation relevant to DPD offshore construction

Title	Description
Aboriginal Land Rights (Northern Territory) Act 1976	The Act provides the basis upon which Aboriginal Australian people in the Northern Territory can claim rights to land based on traditional occupation
Aboriginal Land Act 1978	This Act provides for the access to Aboriginal land, certain roads bordered by Aboriginal land and the seas adjacent to Aboriginal land.
Bushfires Management Act 2016 Bushfires Management (General) Regulations 2017	The Act establishes the Bushfires Council and provides for the prevention and control of bushfires in the NT.
Dangerous Goods Act 1998 and Dangerous Goods Regulations 2017	This Act provides for the safe storage, handling, and transport of certain dangerous goods. These being explosives (including fireworks) and fuel gas (including Autogas) (NT WorkSafe, 2021)

Title	Description
Environmental Offences and Penalties Act 2011	This Act defines levels and penalties for environmental offences
Fire and Emergency Act 1996 Fire and Emergency Regulations 1996	This Act provides for the establishment and operation of the NT Fire and Rescue Service and their operational and emergency response activities. The Regulations outline general requirements under the Act, such as storing flammable or combustible material and using cutting, heating and welding equipment.
Fisheries Act 1988	This Act provides for the regulation, conservation and management of fisheries and fishery resources to maintain their sustainable utilisation, to regulate the sale and processing of fish and aquatic life, and for related purposes.
Heritage Act 2011	This Act provides a framework for the identification, assessment, recording, conservation, and protection of the Northern Territory's cultural and natural heritage.
Marine Act 1981	This Act is to regulate shipping within the Northern Territory and to provide for the application to the Northern Territory of the uniform shipping laws code and for related matters.
Marine Pollution Act 1999	This Act protects the marine and coastal environment by minimising intentional and negligent discharges of ship-sourced pollutants into coastal waters, and for related purposes.
Native Title Act 1993	This Act provides for the recognition and protection of native title and provides or permits for the validation of past acts and intermediate period acts, invalidated because of the existence of native title. It additionally establishes ways in which future dealings affecting native title may proceed and sets standards for those dealings and establishes mechanisms for determining claims to native title.
Northern Territory Aboriginal Sacred Sites Act 1989	This Act aims to provide a practical balance between the recognised need to preserve and enhance Aboriginal cultural tradition, in relation to certain land in the Northern Territory and the aspirations of the Aboriginal and all other peoples of the Northern Territory for their economic, cultural, and social advancement; by establishing a procedure for the protection and registration of sacred sites, providing for entry onto sacred sites and the conditions to which such entry is subject, establishing a procedure for the avoidance of sacred sites in the development and use of land and establishing an Authority for the purposes of the Act and a procedure for the review of decisions of the Authority by the Minister.
Northern Territory Environment Protection Authority Act 2012	This act aims to: a) promote ecology sustainable development; b) to protect the environment, having regard to the need to enable ecologically sustainable development; (c) to promote effective waste

Title	Description
	management and waste minimisation strategies; and (d) to enhance community and business confidence in the environmental protection regime of the Territory.
Planning Act 1999 Planning Regulation 2000	The Act provides framework of controls for the orderly use and development of land. The objective of the Act includes ensuring that strategic planning is applied to planning schemes and implemented in individual planning decisions, promotion of sustainable development of land and promotion of the responsible use of land and water resources to limit the adverse effects on development of ecological processes. Division 2 of the Act provides the planning basis for the submission, review, and authorisation of Exceptional Development Permits (EDPs), and related EDP variations. An EDP has been issued for the DLNG Plant. Approval for the DPD Project will be obtained under the Planning Act 1999 (NT), Santos is consulting with DIPL regarding the pathway for this approval.
Ports Management Act 2015	This Act provides for the safe, efficient, and effective control, management, and operation of Northern Territory ports.
Territory Parks and Wildlife Conservation Act 1976	This Act provides for the establishment of Territory Parks and other parks and reserves and for the study, protection, and conservation of wildlife in Northern Territory. This includes provisions on changes and revocation of parks, reserves and sanctuaries, the preparation and implementation of plans of management, the creation and management of sanctuaries and on the management of wildlife, flora, and fauna.
Waste Management and Pollution Control Act 1998 Waste Management and Pollution Control (Administration) Regulations 1998	This Act provides for the protection of the environment through encouragement of effective waste management and pollution prevention and control practices and for related purposes.
Weeds Management Act 2001	This Act allows for the classification of declared weeds or potential weeds, requirements for managing declared weeds or potential weeds and preparing management plans.

3.7 International conventions and agreements

Australia is signatory to numerous international conventions and agreements that obligate the Commonwealth government to prevent pollution and protect specified habitats for flora and fauna. Those which are relevant to the activity re outlined in **Table 3-3**.

Table 3-3: International agreements and conventions relevant to the activity

International agreements and conventions	
Title	**Description**
China-Australia Migratory Bird Agreement (CAMBA)	This agreement recognises the special international concern for the protection of migratory birds and birds in danger of extinction that migrate between Australia and China. Implemented in the EPBC Act.
Japan-Australia Migratory Bird Agreement (JAMBA)	This agreement recognises the special international concern for the protection of migratory birds and birds in danger of extinction that migrate between Australia and Japan. Implemented in the EPBC Act.
International Convention for the Prevention of Pollution from Ships (MARPOL)	This convention is to eliminate international marine environment pollution through hydrocarbons and other toxic substances and to reduce the accidental discharge of such substances.
Republic of Korea-Australia Migratory Bird Agreement (ROKAMBA)	This agreement recognises the special international concern for the protection of migratory birds and birds in danger of extinction that migrate between Australia and Korea. Implemented in the EPBC Act.
United Nations Convention on Biological Diversity – 1992	An international treaty to sustain life on earth.
United Nations Framework Convention on Climate Change (1992)	The objective of the convention is to stabilise GHG concentrations in the atmosphere at a level that would prevent dangerous interference with the climate system. Australia ratified the convention in December 1992, and it came into force on 21 December 1993.

3.8 Standards, codes and guidelines

There are several Australian Standards, Codes of Practice and Guidelines relevant to this CEMP, which have been identified below.

+ AS2885 Pipelines - Gas and Liquid Petroleum
+ AS/NZS 4801 Occupational Health and Safety (OHS) Management
+ AS/NZS ISO 9001:2008, Quality management systems – Requirements
+ AS/NZS ISO 14001:2004, Environmental management system – Requirements with guidance for use
+ AS/NZS ISO 31000:2009, Risk management – Principles and guidelines
+ HB 203:2006 Environmental Risk Management – Principles and Process
+ Australian Ballast Water Management Requirements. Version 8 (ABWM Requirements; Commonwealth of Australia, 2020a)
+ National Assessment Guidelines for Dredging (NAGD; Commonwealth of Australia, 2009a)
+ National Biofouling Management Guidance for Non-trading Vessels (NSPMMPI, Commonwealth of Australia, 2009b)
+ National Water Quality Management Strategy: Australian Guidelines for Water Quality Monitoring and Reporting (ANZECC & ARMCANZ, 2000)

+ Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018)
+ Darwin Port Environmental Management Plan (Darwin Port, 2020)
+ Declaration of Beneficial Uses and Objectives, Darwin Harbour Region, Northern Territory Government Gazette No. G27, 7 July 2010
+ Darwin Harbour Water Quality Protection Plan (DLRM, 2014)
+ Darwin Harbour Strategy 2020–2025 (DHAC 2020)
+ Guidelines for Environmental Assessment of Marine Dredging in the Northern Territory (NT EPA, 2013)
+ Draft Guidelines for the Preparation of an Environmental Management Plan (NT EPA, 2015)
+ Guideline for Reporting on Environmental Monitoring (NT EPA, 2016)
+ Water Quality Objectives for the Darwin Harbour Region – Background document (DNRETAS, 2010)
+ Marine Bioregional Plan for the North Marine Region (DSEWPAC, 2012)
+ National Guidance on the Management of Whale and Dolphin Incidents in Australian Waters (DSEWPAC, 2013).

4 Environmental management framework

4.1 Santos Management System

Santos's Management System (known as the SMS) exists to support its moral, professional, and legal obligations to undertake work in a manner that does not cause harm to people or the environment. The framework of policies, standards, processes, procedures, tools, and control measures that, when used together by a properly resourced and competent organisation, result in:

+ A common HSE approach is followed across the organisation.
+ HSE is proactively managed and maintained.
+ The mandatory requirements of HSE management are implemented and are auditable.
+ HSE management performance is measured, and corrective actions are taken.
+ Opportunities for improvement are recognised and implemented.
+ Workforce commitments are understood and demonstrated.

The Implementation Strategy (**Section 8**) and Stakeholder Consultation (**Section 9**) align with the Management System structure and are designed to require that:

+ environmental impacts and risks continue to be identified for the duration of the activity and reduced to ALARP
+ controls are effective in reducing environmental impacts and risks to ALARP and acceptable levels
+ environmental performance objectives (EPOs) and environmental performance standards (EPSs) set out in this CEMP are met
+ consultation with relevant and interested persons is maintained throughout the activity as appropriate.

4.2 Santos' environment, health, and safety policy

Santos' Environment, Health and Safety Policy (**Attachment 1**) clearly sets out its strategic environmental objectives and the commitment of the management team to continuous environmental performance improvement. This CEMP has been prepared in accordance with the fundamentals of this policy. By accepting employment with Santos, each employee and contractor is made aware during the recruitment process that he or she is responsible for the application of this policy.

4.3 DPD Project environmental management plans

This Offshore CEMP is an overarching management plan covers DPD project construction activities (as defined in **Section 2**) from the 3 nm Commonwealth waters boundary to the onshore termination point. The Onshore CEMP (BAS-210 0025), covers the construction of the DPD Project pipeline from the onshore termination point to the upstream weld of the beach valve. Support facilities for activities under the Offshore CEMP may overlap the same areas used for activities covered under the Onshore CEMP. The TSDMMP, ASSDMP and MMNMP sit under these CEMPs and address specific activities and associated management measures requiring further detail and/or requested to be developed by the NT EPA for submission along with the SER. The activities for these management plans are outlined in **Section 6** and **Figure 1-1**.

4.4 Supporting Management Processes and Procedures

4.4.1 Contractor Health, Safety and Environment requirements

The Santos HSE Contractor Management Operating Standard (SMS-HSS-OS08) supports the minimum requirements and expectations for HSE management of Contractors and subcontractors. In addition, the DPD Project has a developed an HSE Exhibit for its scopes of work. The HSE Exhibit forms a part of all contracts and has a detailed environmental requirements section including requirements for:

+ Contractor to develop an environmental implementation plan to demonstrate how applicable environmental legislation and environmental approval requirements and requirements under this CEMP will be implemented
+ Contractor to use an Environmental Management System for managing environmental impacts and risks throughout the activity, demonstrating leadership and accountability, organisational capability, and training/induction processes and performance reporting against environmental requirements
+ Definition of key activities to support continuous environmental improvement
+ Definition of the operational area of the work
+ Chemical selection, approval, and chemical register requirements
+ Prohibited of materials and chemicals
+ Vessel environmental requirements, including trenching and spoil disposal requirements, marine discharge requirements, waste management requirements, unplanned discharge requirements, marine fauna interaction requirements, lighting requirements and invasive marine species requirements

The HSE requirements for contracts/contractor management during pre-contract planning, contracting, contract execution and contract completion and evaluation are outlined in the HSE Contractor Management Operating Standard (SMS-HSS-OS08) and the Contracting and Procurement Operating Standard (SMS-PRC-OS01). These include the following minimum requirements:

+ Contractors to comply with all applicable HSE laws and regulations and any additional guidelines, operating standards and policies provided to the Contractor.
+ A review of the Contractor HSE Management System is completed before being contracted.
+ Provisions for Santos to conduct audits/inspections of the Contractor's operations, equipment and emergency procedures at any time.

4.4.2 Chemical selection and assessment procedure

All chemicals that are planned to be operationally discharged to the environment during the DPD construction activity will be evaluated using a defined framework and set of tools to ensure potential impacts are acceptable, ALARP and met Santos' expectation for environmental performance.

All chemicals that may be discharged to the environment will be detailed in a chemical register that is maintained and updated by the construction contractor. The contractor will submit the chemical application forms, with an SDS, to Santos for approval.

Chemicals that may be discharged to the environment will also require an environmental risk assessment which includes and assessment following principles of the United Kingdom Offshore Chemical Notification Scheme (OCNS) rating system.. The chemical hazard assessment and risk management (CHARM) model under the OCNS is the primary tool to rank offshore chemicals based on assessment of toxicity, biodegradation and bioaccumulation data provided by the chemical supplier.

Santos will approve chemicals planned to be discharge to the environment if they are Gold/Silver (OCNS CHARM) or OCNS group rating D/E (if not CHARM rated) or have an environmental risk assessment submitted by Contractor and approved by Santos.

4.4.3 Santos marine vessel vetting process

Santos manages marine vessel vetting and assurance using a hierarchy of procedures, outlined below. These requirements for vessel acceptance criteria include technical, personnel (e.g. crew competencies) and operational requirements for marine vessels engaged by Santos.

4.4.3.1 Marine assurance

The Marine Offshore Assurance Criteria (1530-045-STN-0001) is a standard that requires all vessels (including MODUs) used by Santos to be vetted. The vetting process is based on industry standards and best practices along with considerations of guidelines and recommendations from recognised industry organisations such as Oil Companies International Marine Forum (OCIMF) and International Maritime Contractors Association (IMCA), and international regulatory agencies like the IMO and vessel Classification Societies. The Marine Offshore Assurance Criteria requires a valid Offshore Vessel Inspection Database (OVID) report or Common Marine Inspection Document (CMID) report as required for vessel operation types. For vessels where the OVID and/or CMID are not valid or available, a Santos Approved Inspection Report is required.

4.4.3.2 Marine standards & compliance

The standards and guidelines that Santos expects the chartered vessels to operate to are:

+ Flag State Legislation
+ Coastal State Legislation for Marine Operations including Biosecurity Compliance
+ MCA Code of Safe Working Practices for Merchant Seamen (2015)
+ IMCA – M117
+ IMCA – M182
+ OCIMF – OVID and OVMSA
+ A.714 (17) Code of Safe Practice for Stowage and Securing (CSS Code) 2011 (IMO)
+ Guide for Offshore Marine Operations (GOMO) (Previously NWES Guidelines)
+ International Convention for the Safety of Life at Sea (SOLAS) 1974, as amended (IMO).
+ International Maritime Dangerous Goods (IMDG) Code (IMO)
+ Guidelines for the Preparation of cargo Securing Manual (MSC.1/Circ.1353 – IMO)
+ IACS - International Association of Classification Societies Rules
+ Safer Together Offshore Vessel Deck Water Management Specification
+ OCIMF Deck-Cargo-Management-Onboard-Offshore-Vessels

Santos performs a risk assessment or HSE Qualification Evaluation process for each vessel to identify any HSE issues or specific management requirements prior to commencing activities.

4.4.4 Santos waste management process

The Santos Environment Hazard Controls Procedure (SMS-EXA-OS01-PD02) requires that for all waste generated by contractors under its influence, the hierarchy of waste management applies whereby wastes are (in order of preference) avoided, reduced, re-used, recycled, treated and/or correctly disposed. A waste inventory must be documented and onshore waste disposal records standardised (Waste Monitoring and Reporting Procedure – SMS-EXA-OS01-PD02-PD01) to allow accurate and consistent waste tracking. Contractors under this CEMP will demonstrate waste management processes will be aligned with regulatory and Santos requirements through the provision of Waste Management Plan for Santos acceptance.

4.4.4.1 Summary of requirements

The Australian ballast water requirements set out the obligation on vessel operators with regards to the management of ballast water and ballast tank sediment when operating within Australian seas. All internationally operating vessels entering Australia will require:

+ An approved Ballast Water Management Plan
+ Maintenance of a complete and accurate record of all ballast water movements including those conducted in Australian waters
+ An international Ballast Water Management Certificate.

Ballast water exchange should be conducted in areas at least 12 nm from the nearest land and in water at least 50 metres deep. Volumetric exchange must be at least 95% of the relevant tank. Records on ballast water exchange shall include the start and finish times and geographic coordinates of the operation.

All ballast water management equipment such as pumps will be maintained as per the vessel preventive maintenance system and regularly tested to ascertain accurate calculations for ballast water exchange operations.

4.4.4.2 Australian pre-arrival report

All international vessels must submit a Ballast Water Report and a Pre-Arrival Report (PAR), 96 to 12 hours prior to arriving in an Australian port through the MNES (MARS), for the Australian Department of Agriculture to review and process.

MARS is the online portal for commercial Vessel Masters and Shipping Agents to submit reports required of all international vessels seeking Australian biosecurity clearance; and request services such as coastal strip, waste removal, ship sanitation certification and crew change.

Department of Agriculture will request evidence from vessels with a ballast water management system of:

+ Valid ballast water management plan specific to the vessel (consistent with the Convention)
+ Valid ballast water management certificate, or certificate of compliance, that is approved by a port state administration, or a recognised survey authority (consistent with the Convention)
+ Ballast water management records that clearly demonstrate the BWMS has been operated consistent with the ballast water management plan.

A Department of Agriculture biosecurity officer will board the vessel to verify the Pre-Arrival Report and Vessel Master must ensure the vessel and personnel are available and able to demonstrate proficiency in the operation and maintenance of the ballast water management system.

4.4.5 Biofouling management

IMS may be present as biofouling on the vessel hull, or within piping, sea chests, etc. The biofouling which may be found on and in a vessel reflects the vessel's design, construction, maintenance, and operations. Each of these aspects introduces biofouling vulnerabilities but also offers opportunities to limit the extent and development of biofouling, with commensurate reduction in biosecurity risks.

4.4.5.1 Vessel risk assessment

Vessels mobilised to the operational area from international or domestic waters will comply with the Australian National Biofouling Management Guidance for the Petroleum Production and Exploration Industry (Commonwealth of Australia, 2009c). This includes:

+ Completion of a biofouling risk assessment
+ Implementation of mitigation measures commensurate with the level of risk.

Figure 4-1 presents the risk assessment process. Factors that will inform risk are:

+ Timing of marine pest risk assessment relative to vessels selection and movement to the title area to ensure there is sufficient time to implement control measures in cases where management is warranted
+ History of the vessels including time spent in ports of call since last dry dock and clean to inform whether the facility or vessel may have been exposed to high risk ports/locations
+ Level of biofouling and the presence of species of concern (in particular the presence of marine pests) within biofouling communities on the vessels associated with the activity (often informed by biofouling record books and/or maintenance/cleaning or inspection programs)
+ Operational profile relevant to biosecurity risk such as operating speed, time alongside a facility and the need for ballast exchanges within the title area
+ Receiving environment including the presence of shallow water sensitivities within proximity to the activity and the presence and area of non-biocidal surfaces on facilities that could harbour marine pests
+ Presence and effectiveness of external and internal marine growth prevention systems including effectiveness and integrity of antifouling coatings and functionality of internal treatment systems
+ Qualifications and competency of personnel conducting and reviewing the risk assessment and making management decisions.

4.4.5.2 Vessel risk status

There are three outcomes from the risk assessment which categorise the vessels risk status as outlined below. Vessels are required to have a 'low' risk status to demonstrate to the government that Santos has taken all reasonable measures to minimise the risk of IMS.

+ Low – low risk of introducing IMS; no additional management measures required
+ Uncertain – risk of introducing IMS is not apparent; precautionary approach adopted, additional management measures required to achieve low status
+ High – high risk of introducing IMS; additional management measures will be required.

4.4.5.3 Potential management measures to achieve low risk status

The outcome of the risk assessment will determine management measures required. If the vessel is deemed as 'low' risk status, no other measures are required (providing the vessel does not exceed the seven-day threshold at stationary or slow speed, in waters outside Australia (similar region).

For vessels that present an 'uncertain' or 'high' risk, Contractors will engage a qualified IMS inspector to conduct inspections and/or provide advice on obtaining low status. **Table 4-1** lists mitigation measures that can be applied to achieve 'low' risk status.

Table 4-1: Biofouling mitigation measures

No.	Mitigation Measure	Overview
1	IMS inspection	Visual inspection of submerged surfaces and niche areas by a qualified biosecurity inspector to better understand the actual biosecurity risk. IMS Inspectors will have the qualifications and align inspections and reports with DPIRD guidance in: + Criteria for Suitably Qualified Invasive Marine Pests Experts (DPIRD, 2017a) + Best Practice Guidelines for Invasive Marine Species Inspections (DPIRD, 2017b) + Invasive Marine Species Report Requirements (DPIRD, 2017c)
2	In-water cleaning	The appropriateness of in-water cleaning operations must be a decision made closely with IMS inspector on a case-by-case basis. Many factors will be considered, including: + Degree and type of biofouling; + Location of biofouling on the vessel. Prior to undertaking in-water cleaning within Australia, approval from the relevant state/territory authority must be granted and conditions may be imposed. Application for administering authority (Harbour Master, local government or state environmental protection agency) at least five working days prior to the proposed commencement of the work.
3	Dry docking cleaning	Dry docking and the removal/cleaning of biofouling will include hull surfaces, niche areas such as sea chests, all retractable equipment such as thrusters, intakes and outlets, anodes and voids.
4	Temporal or spatial controls	Temporal or spatial controls to limit vessel exposure to sources of risk.
5	Application of anti-fouling coating	Depending on the age the vessel may require application of new anti-fouling coating. The anti-fouling coating type will be based on technical advice and carried out by professional operators. All vessels greater than 400 gross tonnes will retain Antifouling System Certificate.
6	Treatment of internal seawater systems	In the absence of a marine growth prevention system, cleaning of internal seawater systems may be required, which may include: + Dehydration + Heat

No.	Mitigation Measure	Overview
		+ Physical removal + Chemical treatment. Treatment of Internal Seawater systems will ideally be undertaken prior to mobilisation to Australia. Where chemical treatments are to be undertaken within Australian waters, advice will be sought from the Australian Pesticides and Veterinary Medical Authority (www.apvma.gov.au) in relation to permit and reporting requirements as it is prohibited to clean internal systems without a permit.

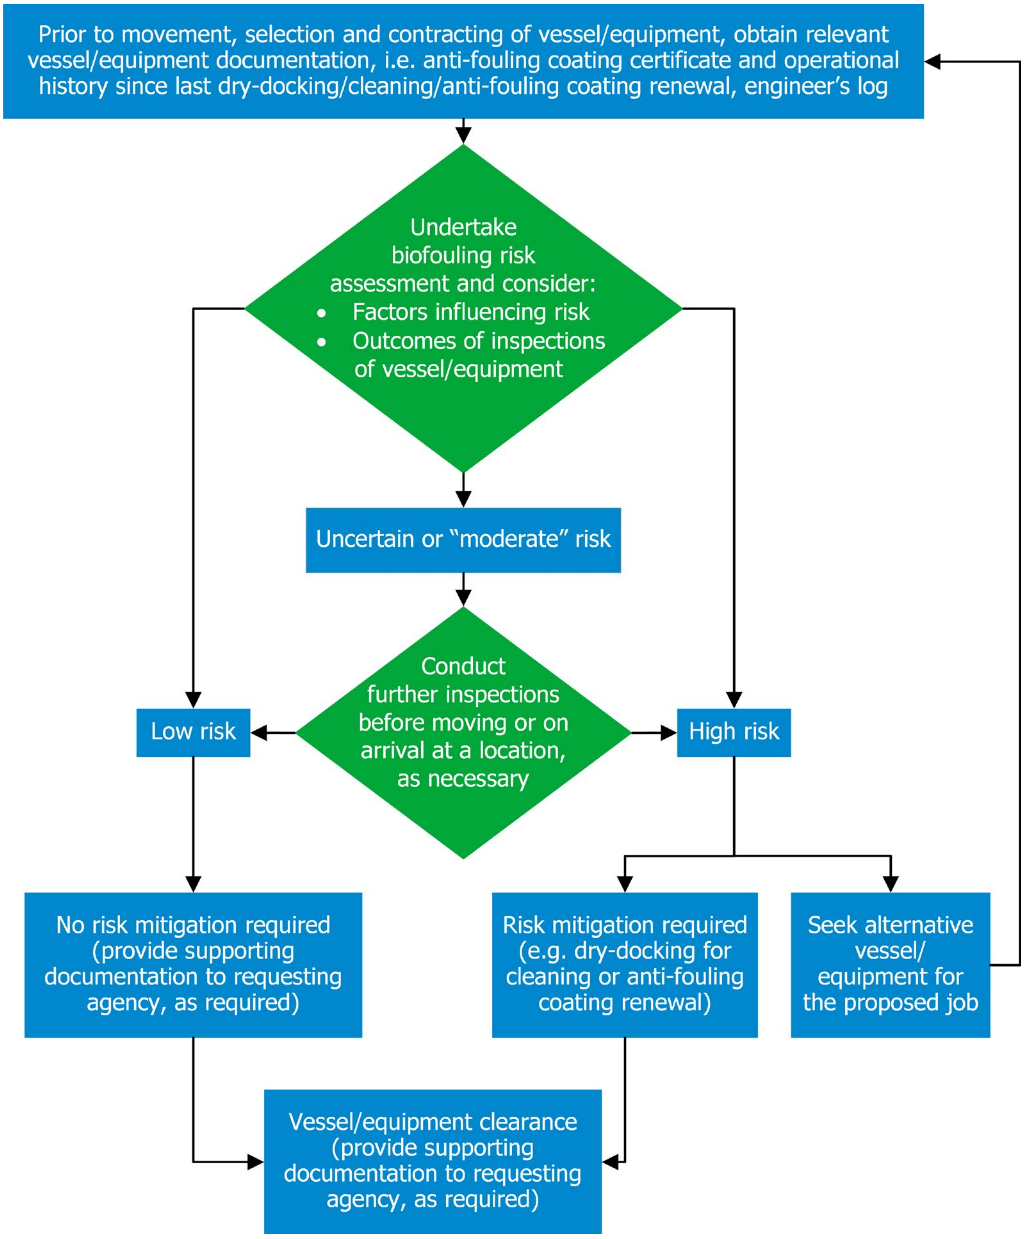


Figure 4-1: Generic biofouling risk assessment process (from Department of Agriculture, Fisheries and Forestry, 2009)

5 Existing environment

This section describes the key physical, biological, socio-economic, and cultural characteristics of the Project Area including the DPD spoil disposal ground. These characteristics have been summarised and grouped into the relevant NT EPA Environmental factors (NT EPA, 2022). Information provided in this section is drawn from the following documents:

+ Darwin Pipeline Duplication (DPD) Project – NT EPA Referral (BAS-201 0003; Santos, 2022)
+ Darwin Pipeline Duplication (DPD) Project – EPBC Referral Supporting Information (BAA-201 0004; Santos, 2022)
+ Santos Barossa DPD – Pipeline Benthic Survey report (BAS-210 0014; RPS, 2022)
+ Ichthys Gas Field Development Project – Draft Environmental Impact Statement (EIS) (INPEX, 2010)
+ INPEX Ichthys GEP Dredging and Spoil Disposal Management Plan (INPEX, 2014)
+ INPEX Ichthys Maintenance Dredging and Spoil Disposal Management Plan (INPEX, 2018)
+ INPEX Draft Maintenance Dredging and Spoil Disposal Management Plan (2023 – 2027) (INPEX, 2022)
+ Darwin Harbour – A Summary of the Ichthys LNG Project Nearshore Environmental Monitoring Program (NEMP) (Cardno, 2014).

5.1 Coastal processes

5.1.1 Physical environment

5.1.1.1 Meteorological conditions

5.1.1.1.1 Climate

The Project Area resides within the monsoonal (wet-dry) tropics of Northern Australia, which is subject to two distinct seasons a hot wet season from November to March and a warm dry season from May to September, with both April and October acting as transitional months between wet and dry seasons, respectively.

Temperatures are hot all year round with mean maximum temperature >30 °C, November is the hottest month of the year ranging from 25 °C mean minimum temperature to 33 °C mean maximum temperature. While June and July are the coolest months in the year ranging from 19 °C mean minimum temperature to 30 °C mean maximum temperature (BOM, 2022).

5.1.1.1.2 Rainfall

The annual mean rainfall for Darwin is 1723.8 mm with the majority of this (87%) rainfall coming in wet season months between November and March. Mean monthly evaporation ranges from 160 mm in February to 245 mm in October, with annual daily evaporation of 6.7 mm. Mean 9 am and 3 pm relative humidity is also higher in the wet season following similar trends to rainfall (BOM, 2022). Monthly and annual mean, max and min rainfall averages from 1941 to 2022 for Darwin International Airport are provided in **Table 5-1**.

Table 5-1: Average monthly and annual mean, max and min rainfall (mm) from 1941 to 2022 for Darwin International Airport (BOM, 2022)

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
Mean	431	369	311	102	21	2	1	5	17	70	142	252	1724
Max	940	1110	1014	396	296	51	27	84	130	339	371	665	2777
Min	136	103	88	0.6	0	0	0	0	0	0	17	19	1025

5.1.1.1.3 Wind direction and speed

During the wet season winds are predominately light westerly and west–north–west winds, whilst in the dry season winds are varying from the south–east through to the north. Mean wind speeds are generally stronger in the afternoon than in the morning throughout the year. Mean morning wind speeds are typically stronger in the dry season, whilst mean afternoon wind speeds increase during the late dry season and build into the wet season where stronger winds are associated with afternoon storm cells.

5.1.1.1.4 Cyclone activity

The monsoonal tropics are also subject to intermittent cyclone activity usually resulting in the strongest winds and heaviest amount of rainfall. The cyclone season runs from 1 November to 30 April. Cyclones in the Anson-Beagle region are known to occur with low to moderate frequency. Storm surges often result in flooding, raised tidal levels, and increased wave heights resulting in damage, most of the damage caused by cyclones occurs near to the coast within 50 km from the coastline, causing concern for vessels and coastal developments in the area. Storm surges are hard to predict and dependent on the characteristics of the associated cyclone such as speed, intensity and the angle it crosses the coast. Bathymetry also contributes to the risk level of storm surges (BOM, 2022).

5.1.2 Coastal morphology

5.1.2.1 Offshore NT waters

The bathymetry of the Project Area in offshore NT waters has been thoroughly investigated and is well understood. Recent surveys have shown that the seabed along the DPD Project pipeline route in offshore NT waters and within the spoil disposal area is generally flat and featureless and typically less than 30 m in depth.

Within 5 km (north) of the Project Area resides the Carbonate bank and terrace system of the Van Diemen Rise key ecological feature (KEF) of regional significance. The feature consists of banks, terraces, channels, and valleys and the variability in water depth and substrate composition may contribute to the presence of unique ecosystems in the channels. The feature has enhanced biodiversity and productivity relative to surrounding areas and supports relatively high species diversity. This area will not be directly impacted by the DPD Project.

5.1.2.2 Darwin Harbour

Darwin Harbour is a large, drowned river system approximately 500 km^2 in extent. It is comprised of three arms (East Arm, West Arm, and Middle Arm), which along with the smaller Woods Inlet converge into a single unit before opening to the ocean and into Beagle Gulf in the north.

Freshwater inflow from the Elizabeth River into the East Arm and the Blackmore and Darwin rivers into the Middle Arm generally occurs between January and April creating more estuarine conditions.

Port Darwin's main channel is approximately 1525 m wide and 15 – 25 m deep, with a maximum recorded depth of 36 m. The channel is generally deeper on the eastern side of the Harbour, while the western side is broader and shallower areas with intertidal flats and shoal being more extensive.

The channel extends into the East Arm with depths of more than 10 m below LAT, the bathymetry of this area has been modified by dredging associated with the development of East Arm Wharf. A slightly deeper channel can be found in the Middle Arm extending up to the western side of Channel Island.

5.1.3 Oceanography

5.1.3.1 Offshore NT waters

The North Marine Region has no major ocean currents. However, there are tidal currents that play a role in the movement of water, biota, and benthic sediments. There are three recognised large-scale ecological systems in the North Marine Region which are the:

+ Gulf of Carpentaria
+ Arafura
+ Joseph Bonaparte Gulf.

The offshore NT waters Project Area traverses two meso-scale bioregions, the Bonaparte Gulf and Anson-Beagle Bioregions. The Bonaparte Gulf bioregion is predominately within offshore Commonwealth waters, but overlaps with NT coastal waters, south of Bathurst Island.

Oceanic currents within the Bonaparte Gulf are influenced by the Indonesian Through Flow (ITF) and South Equatorial Current. During the dry season (May to September) nearshore currents are generally westerly, whilst in the wet season (November to March) nearshore currents are easterly. Tides are semi-diurnal (two highs and two lows each day) and vary throughout the bioregion from offshore microtidal range (2 to 3 m variation) to inshore mesotidal range (3 to 4 m variation).

The Project Area within the Anson-Beagle Bioregion traverses Beagle Gulf. Due to the extent of the continental shelf ocean currents only have a minor influence on the Beagle Gulf region. Beagle Gulf has limited oceanic interaction and is strongly influenced by strong internal circulation. During the dry season (May to September) there is a south westerly drift due to south-easterly winds, the ITF, and the South Equatorial Current. Whilst during the wet season (November to March) there is a north-easterly drift due to the north westerly monsoonal winds. Tides in the gulf range from 6 to 8 m (IMCRA Technical Group, 1998).

Wave action in Beagle Gulf is seasonal; monsoonal north-westerly winds during the wet season (November to March) increase wave energy within Beagle Gulf and at the entrance to Darwin Harbour, due to the uninterrupted fetch over the Timor Sea. Whilst in the dry season (May to September) south-easterly trade winds generate low wave energy due to limited fetch.

5.1.3.2 Darwin Harbour

Darwin Harbour has a macrotidal (more than four metres) regime with tide range reaching 8 m which is considerable by world standards. Tides are generally semi-diurnal (two highs and two lows each day) with some inequality between successive tides in a single day. Neap tides result in a two-day period where tidal conditions are nearly diurnal (one high and one low each day). There is a great degree of variation in daily tidal range with the presence of spring-neap tide cycle approximately every 15 days. The spring phase of the cycle has an average tidal range of 6 m, while the neap phase average tidal range is 3 m . Large tidal movements and to a lesser extent wind, drives rapid and regular exchange of large volumes of water between Darwin Harbour and Beagle Gulf.

Darwin Harbour is considered sheltered with tsunamis and swell waves unlikely to occur due to the harbour's orientation, shallow bathymetry and protection afforded by the Tiwi Islands. Most waves are generated within Darwin Harbour or Beagle Gulf and are well below 1 m with periods of 2 – 5 seconds, under non-cyclone conditions. Tropical cyclones can cause extreme wave conditions producing significant wave height of 4.5 m and approximate periods of 7.5 seconds at the entrance to Darwin Harbour. Inside the harbour waves heights are reduced by the bathymetry to approximately 0.7 m (GHDM, 1997).

5.2 Marine environmental quality

5.2.1 Water quality

5.2.1.1 Offshore Northern Territory waters

Ichthys NEMP monitoring found that waters in Beagle Gulf were highly turbid in the wet season compared to the dry season likely due to stronger winds, larger waves, greater rainfall, and increased freshwater input (Cardno, 2014).

Environmental surveys to support the Barossa GEP Installation EP investigated water quality within the Barossa field (seasonal through 2015) and along the Barossa Gas Export Pipeline (GEP) (July to August 2017). This included areas close to the Project Area in Offshore NT waters, in which results showed metal concentrations below Australian and New Zealand Environment and Conservation Council (ANZECC) & Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ) (2000) dissolved metal trigger values (Santos, 2021).

In 2021, water sampling and analysis along the DPD pipeline route and at the spoil disposal ground in the offshore NT waters of the Project Area was completed (RPS, 2022 BAS-210-0014). Concentrations of three metals in water samples were detected above ANZG (2018) default guideline values (DGVs) (for slightly to moderately disturbed marine offshore ecosystems, at the 95% species protection level) Copper concentrations ins samples from three sites at western end of the offshore pipeline route were above the DGV; one of these exceedances was much higher than the DVG with the other two only slightly greater than the DVG, therefore it is likely an outlier and indicative of a potential contaminant. Lead concentrations were found to be much higher in the offshore Darwin Harbour samples than in samples taken at the spoil ground, with one sample above the DGV. Zinc concentrations were found at or above the DGV in 5 samples collected from the western end of the offshore pipeline route and across the proposed spoil disposal ground, with no clear trend in exceedances between surface and bottom waters. Arsenic was recorded below the ANZG (2018) DGV (RPS, 2022).

All nutrient concentrations were below the associated ANZG (2018) DGV (RPS, 2022). Dissolved hydrocarbons were below limits of reporting (LoR) for all samples. Naturally Occurring Radioactive Material (NORMs) were detected in near-seabed samples at two sited along the offshore pipeline route in low concentrations.

Total Suspended Solids (TSS) concentration were all above the limits of reporting LoR and ranged from 1.7 to 8.6 mg/L at offshore sites and 1.4 to 6.2 mg/L at spoil disposal grounds. There was no correlation between depth and TSS at either location.

Water column profiles at sites along the offshore pipeline and at the spoil ground showed no indications of stratification of the water column.

5.2.1.2 Darwin Harbour

Typically, water quality is high in the harbour, although naturally turbid as well. Water quality is highly variable within Darwin Harbour due to tide, sampling location, and season (**Table 5-2**). Darwin Harbour water quality is affected by high levels of surface runoff in the wet season (November to March), which can extend until April or May depending on rainfall received. Tides also influence water quality in the harbour with neap tides promoting water clarity while spring tides carry sediment for fringing mangrove and resuspend fine sediment from the harbour floor (DHAC, 2008).

Water temperatures within Darwin Harbour are predominately high with some seasonal variation, averaging 30.6°C in the wet season and 24.5°C in the dry season. The lowest water temperatures occur in June and July (23°C) while the highest occur in October and November (33°C) (Padovan, 1997).

Salinity within Darwin Harbour is also subject to some seasonal variation, with mean salinity levels in the Harbour being lower during the wet season, due to freshwater influence being greater (**Table 5-3**). Sea water salinity has a global average of 35 ppt (parts per thousand), however salinities throughout the harbour are approximately 37 ppt during the dry season. Salinity is higher in the dry season due to increased evaporation and less freshwater inflow. Areas in the middle of the harbour such as Weed Reef can experience salinity as low as 27 ppt due to monsoonal inflow during February and March (Parry & Munksgaard, 1995). Salinities in the arms are heavily influenced by freshwater inflow in the wet season and can drop to 17 ppt. The water column during this time is heavily stratified with Parry and Munksgaard (1995) reported salinities on the bottom of the harbour to be up to 12 ppt higher than the surface.

Darwin Harbour waters remain well oxygenated throughout the year. Padovan (1997) finding no seasonal effects. Dissolved oxygen levels range from 74% to 96%, averaging approximately 84%. Dissolved oxygen levels are slightly higher at the harbours mouth compared to further into the estuary. Additionally, during spring tide cycles oxygen levels increased by 7% at high tide compared low tide (Padovan, 1997).

Darwin Harbour waters have a narrow pH range of 8.3 – 8.6. Padovan (1997) found no seasonal, spatial, or tidal effect on the pH of the harbour.

Turbidity in the Darwin Harbour is higher in the wet season compared to the dry season, mainly due to influx of terrigenous sediment and somewhat due to surface water sheet flow. Light levels at the bottom of the harbour can be as low as 1% of surface light levels during the wet season (Padovan, 1997). However, the most important factors affecting turbidity are tidal cycle and location (Padovan, 1997). Spring tides are associated with higher current velocities, and therefore higher capacity of water to move sediment, which results is greater turbidity (DHAC, 2005).

5.2.2 Sediment quality

Sediments sampled in the Santos Barossa DPD Pipeline Benthic Survey were found to be represented by slightly gravelly muddy sands to gravelly sands (RPS, 2022) The silt/clay and gravel components indicated a transition in benthic sediments from KP0 to the shore crossing at KP122.5. Sampled areas including the offshore pipeline, the spoil ground, the sand wave dredge area in the northern part of Darwin Harbour and the pipeline route in southern Darwin Harbour (near the shore crossing) were all significantly different in terms of particle size distribution, with clay/silt and gravel per cent contributions highest in Darwin Harbour. Similar transitional patterns were observed for infauna biological assemblage composition along the offshore pipeline route and at the spoil ground. It is likely that other unmeasured factors, e.g. current speeds/site energy, riverine input into Darwin Harbour (e.g. freshwater, silt), salinity profiles up the river and sediment chemistry, also contribute, and that there is likely to be seasonal variability in the distribution and composition of benthic faunal assemblages

Overall, no contaminants of concern were found in the sediments along the pipeline route or at the potential spoil disposal ground, with elevated levels of arsenic considered to be naturally occurring.

Therefore, the sediments along the pipeline route are suitable for unconfined ocean disposal, as per the National Assessment Guidelines for Dredging (NAGD) and NT EPA (2013) guidelines for dredging.

5.2.2.1 Acid sulfate soils

ASS are formed naturally and often occur in low lying coastal areas (BAA-201 0003; Santos, 2021). Coastal estuarine and mangrove environments develop ASS due to its typical waterlogged nature, saltwater influences and anaerobic soils.

ASS mapping over the Darwin region indicates that the Project Area shore crossing has a high potential for ASS to occur (BAA-201 0003; Santos, 2021). However, considering the historical earthworks undertaken as part of the development of the DLNG facility, the natural material has been removed across the onshore zone and replaced by imported (non-ASS) fill material (generally sand) up to a depth of approximately 6 m below ground level. Therefore, ASS associated with the naturally occurring soil material is no longer expected to be present within the onshore zone and the risk has been diminished, however the presence of ASS cannot be completely discounted and may require management. (BAS-210-0049; Santos, 2023).

5.2.3 Underwater noise

Underwater noise, excluding naturally occurring noise, within Darwin Harbour is influenced by the existing shipping traffic, biological sources, and weather. Vessel traffic in Darwin Harbour is a year-round source of noise with the Port of Darwin recording 1,510 trading vessel visits in 2021 – 2022 financial year (Darwin Port Operations, 2022). Further information regarding ambient noise levels in Darwin Harbour including measures is detailed in the MMNMP (BAS-210 0022).

5.3 Marine ecosystems

5.3.1 Benthic habitats

The Darwin region supports several benthic habitats including mangroves, coral, seagrass, macroalgae and soft-bottom benthos described below. Further details of benthic habitats can be found in DPD Project NT EPA Referral and Santos Barossa DPD – Pipeline Benthic Survey Report (Santos, 2021; RPS, 2022 BAS-210-0014).

5.3.1.1 Offshore Northern Territory waters

RPS conducted baseline investigations in October 2021 and June 2022 using drop/towed video at 30 sites and ROV video transects at 42 sites respectively (RPS, 2022). These surveys were used to describe the seabed of the offshore DPD Project pipeline route and to ground truth the results of the Australian Institute for Marine Science (AIMS) 2021 Revised Predicted Benthic Habitat Map for Darwin Harbour. The results are included in full in the NT EPA Referral (Santos, 2021), Santos Barossa DPD – Pipeline Survey Report (RPS, 2022) and are summarised below.

The benthic habitats along the offshore DPD Project pipeline route verified the expectations from the AIMS (2021) Revised Predicted Benthic Habitat Map and were found to be silty shelly sand habitat, with, burrows and polychaete worm tubes. Biota commonly associated with this habitat type were very sparse to sparse, and included hydroids, soft corals (gorgonians, *Junceella* and Alcyoniidae), sea stars and sponges. This soft sediment habitat was also present at the offshore end of the DPD Project pipeline route. Within three of these silty, shelly sand sites, there were sections of sand waves, roughly one metre high, with silty sand in the troughs and coarse shelly sand at the peaks. This substrate was associated with very sparse epibiota. The proposed sand waves dredge area (sand waves) was found to contain rippled coarse sand with very little epibiota (<1% abundance), consisting of some sparse soft corals and crinoids.

The spoil disposal ground sites all consisted of the same soft substrate habitat. This habitat is defined by silty/clay sediment with medium density biota. Biota commonly seen at this habitat were soft corals (gorgonians, *Junceella* and Alcyoniidae), branching and encrusting sponges, Bryozoa (lace coral), invertebrate burrows, polychaete tubes, brown algae and occasional motile crinoids.

5.3.1.2 Darwin Harbour

Benthic habitat surveys were completed in Darwin Harbour in October 2021 and in June 2022 (RPS, 2022). The October 2021 survey was completed systematically to describe habitats along the proposed pipeline route. The June 2022 survey targeted sites which were predicted by the AIMS (2021) Revised Predicted Benthic Habitat Map to have unique habitat or showed features from geophysical surveys, that were considered to potentially represent maritime heritage features. The comparison between the AIMS and survey datasets revealed differences between predicted and observed habitat types, particularly with the level of information provided (approximate densities of biota, substrate types are not available in AIMS data).

Sections 5.3.1.2.1 and **5.3.1.2.2** summarise the findings of the October 2021 and June 2022 surveys respectively.

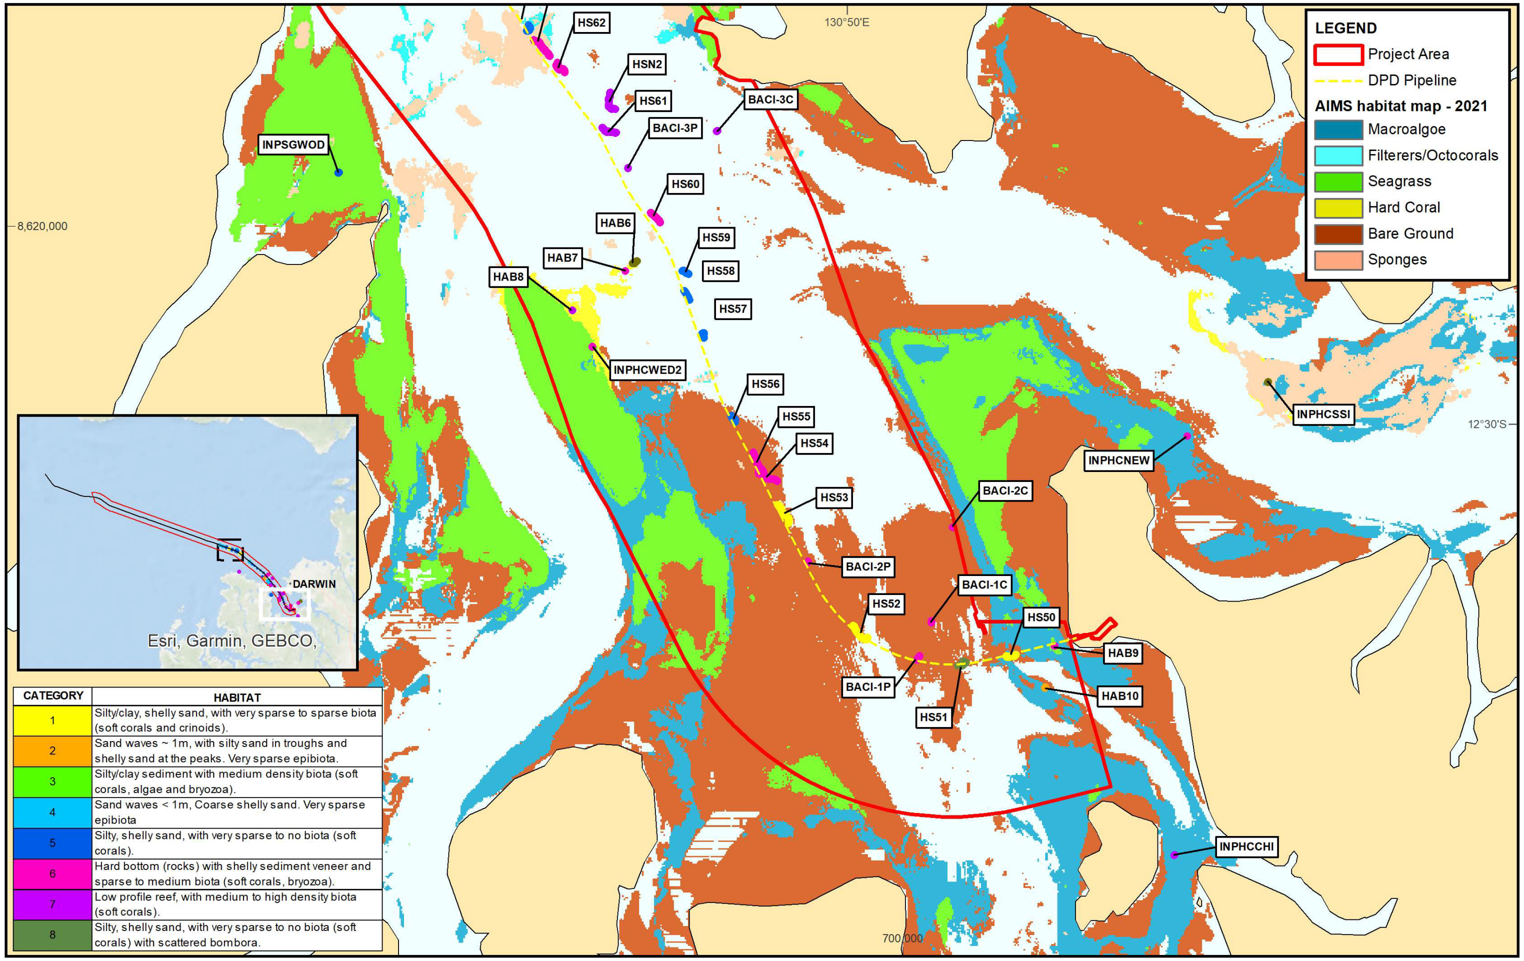
5.3.1.2.1 October 2021 survey

Darwin Harbour benthic habitats comprised soft sediment habitats with two hard substrate habitats recorded during the surveys. Hard substrates were recorded along the section of the pipeline route offshore from Fannie Bay and low profile reef was recorded offshore of Woods Inlet with medium to high density epibiota. The soft substrate habitat adjacent to hard substrate habitats in Darwin Harbour were generally silty, shelly sand with very sparse soft corals to no conspicuous epibiota. As this habitat was recorded both adjacent to and between hard substrate habitats, this soft substrate habitat is potentially a veneer overlying submerged geology. Other recorded soft sediment benthic habitats in Darwin Harbour included:

+ Sand waves <1 m with coarse shelly sand and very sparse epibiota
+ Silt/clay, shelly sand, with very sparse to sparse biota (soft corals and crinoids) (at the southern end of the pipeline, near the shore crossing)
+ Silty, shelly sand with sparse epibiota (soft corals) and scattered bombora (at the southern end of the pipeline, near the shore crossing).

5.3.1.2.2 June 2022 Survey

Key objectives of the June 2022 survey were to collect additional samples and benthic habitat imagery during other surveys to augment the benthic dataset and to ground truth the AIMS (2021) Revised Predicted Benthic Habitat Map at selected sites within Darwin Harbour and to increase the number of benthic survey sites along the pipeline route. Ground-truthing within Darwin Harbour focused on sites predicted to be suitable for rarer high-value biota types (e.g., macroalgae, hard corals and seagrass) that were closest to the proposed pipeline route (and therefore had the greatest potential to be influenced by DPD Project construction activities, including trenching). This included an area west of the pipeline route where the route comes closest to the shoreline of Cox Peninsula (including sites HAB 1-4), an area west of the pipeline route where the route comes closest to Weed Reef (including sites HAB 6-8) and sites close to the shore crossing (HAB 9 and 10) (refer to **Figure 5-1**). Results from these surveys showed that the selected sites which were predicted as suitable for macroalgae, seagrass and/or hard coral by the AIMS (2021) Revised Predicted Benthic Habitat Map typically did not show presence of these biota types (BAS 210 0014; RPS 2022, **Figure 5-1** – **Figure 5-3**). Additional to these benthic habitat ground-truthing sites, a number of benthic habitat monitoring sites used by INPEX during the Ichthys project were ground-truthed including hard coral sites (INPHCMAN, INPHCWED, INPHCCHI, INPHCSSI and INPHCNEW) and seagrass sites (INPSGWOD and INPSGCPW) (refer **Figure 5-1** – **Figure 5-3**). Surveys from these sites generally confirmed the presence of seagrass or hard coral as expected, although seagrass was observed at very low densities. The additional sites surveyed along the pipeline route within Darwin Harbour in June 2022 provided results consistent with surveys in October 2021 in that sites comprise a mix of hard substrate and sediments supporting varying densities of filter-feeding biota such as soft corals, hydroids, crinoids and sponges but with an absence of photosynthetic biota such as hard corals, seagrass and algae (BAS 210 0014; RPS, 2022; **Figure 5-1** – **Figure 5-3**).



CATEGORY	HABITAT
1	Silty/clay, shelly sand, with very sparse to sparse biota (soft corals and crinoids).
2	Sand waves ~ 1m, with silty sand in troughs and shelly sand at the peaks. Very sparse epibiota.
3	Silty/clay sediment with medium density biota (soft corals, algae and bryozoa).
4	Sand waves < 1m, Coarse shelly sand. Very sparse epibiota
5	Silty, shelly sand, with very sparse to no biota (soft corals).
6	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
7	Low profile reef, with medium to high density biota (soft corals).
8	Silty, shelly sand, with very sparse to no biota (soft corals) with scattered bombora.

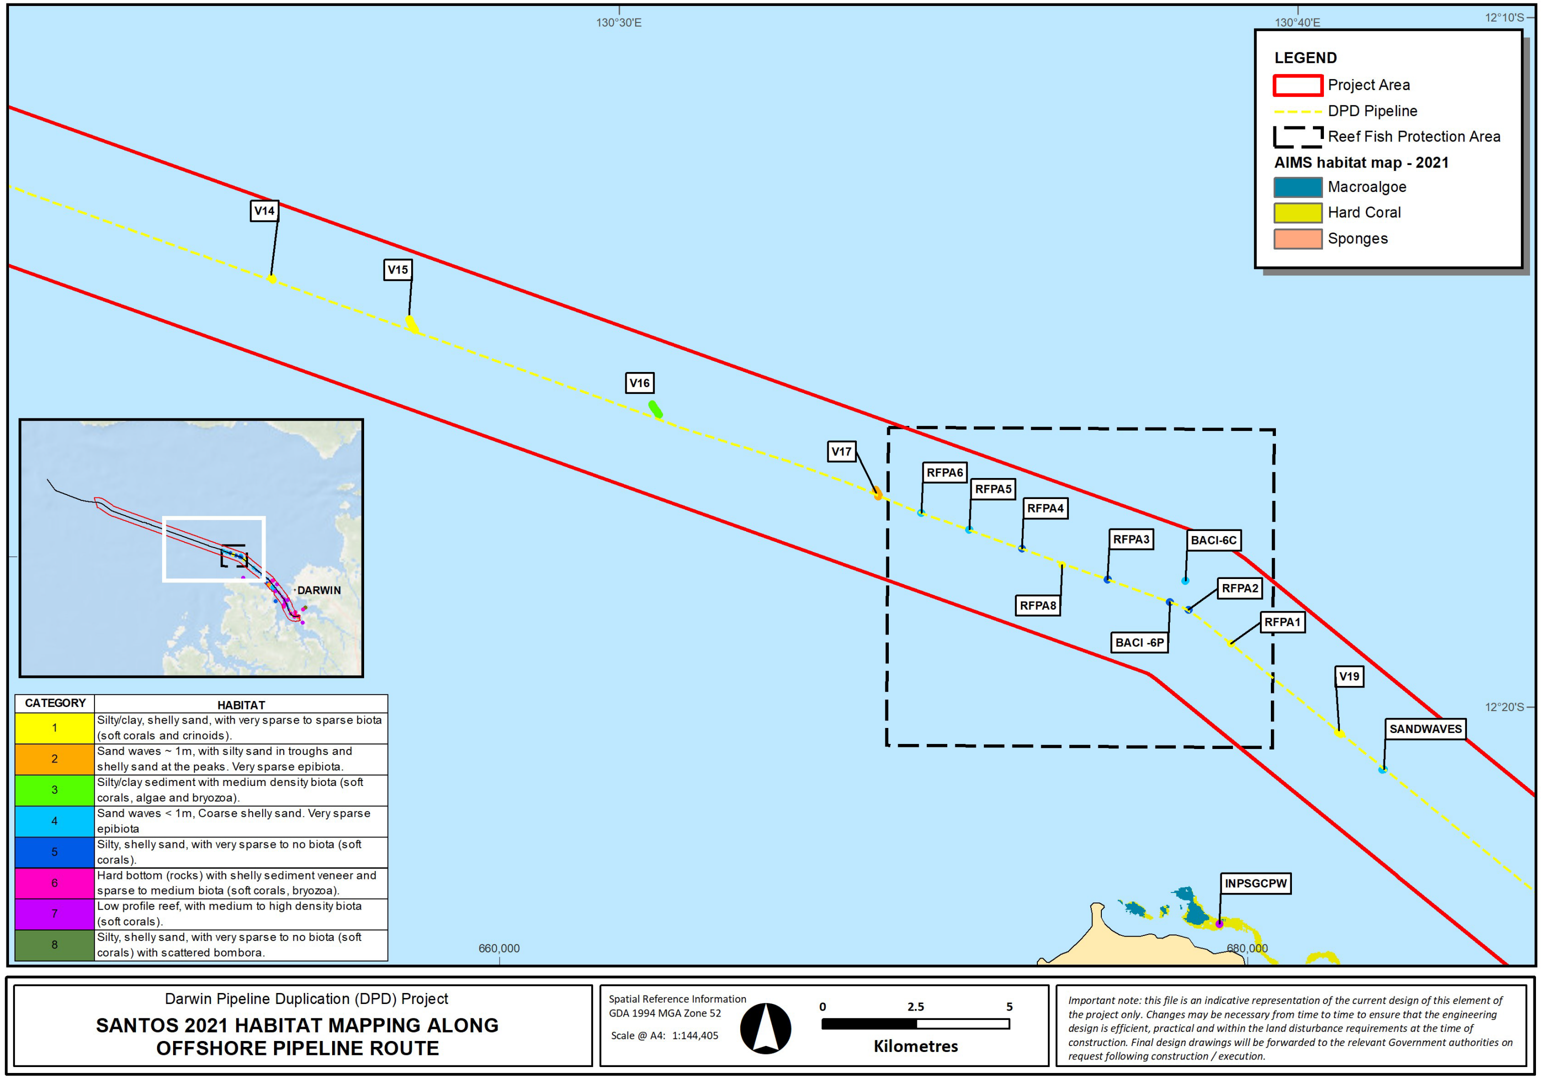

Figure 5-3: RPS surveys habitat mapping along offshore pipeline route

5.3.1.3 Protected/significant areas

Protected/significant areas identified near or overlapping the Project Area are detailed in **Table 5-2**. NT Reef Fish Protection Areas (RFPA) are described in **Section 5.3.1.3.1**.

Table 5-2: Protected areas near or overlapping the Project Area

Value/ sensitivity	Name	Overlaps Project Area	Protection classification/ zone
Nationally Important Wetlands	Port Darwin	✓	-
Northern Territory Reserves	Casuarina	✗	Coastal Reserve
	Charles Darwin	✗	National Park
NT Reef Fish Protection Areas	Charles Point Wide	✓	Reef Fish Protection Area
	Lorna Shoal	✗	Reef Fish Protection Area

5.3.1.3.1 NT reef fish protection areas

The DPD Project pipeline route intersects the Charles Point Wide RFPA and is approximately 9 km west of the Lorna Shoal RFPA (refer **Figure 5-4**). No fishing activities are permitted within RFPAs. Protection of these areas prevents over-fishing of golden snapper, black jewfish and other vulnerable reef species. The Project Area is also in close proximity to East Point Aquatic Life Reserve and Doctors Gully Aquatic Life Reserve (refer **Figure 5-4**).

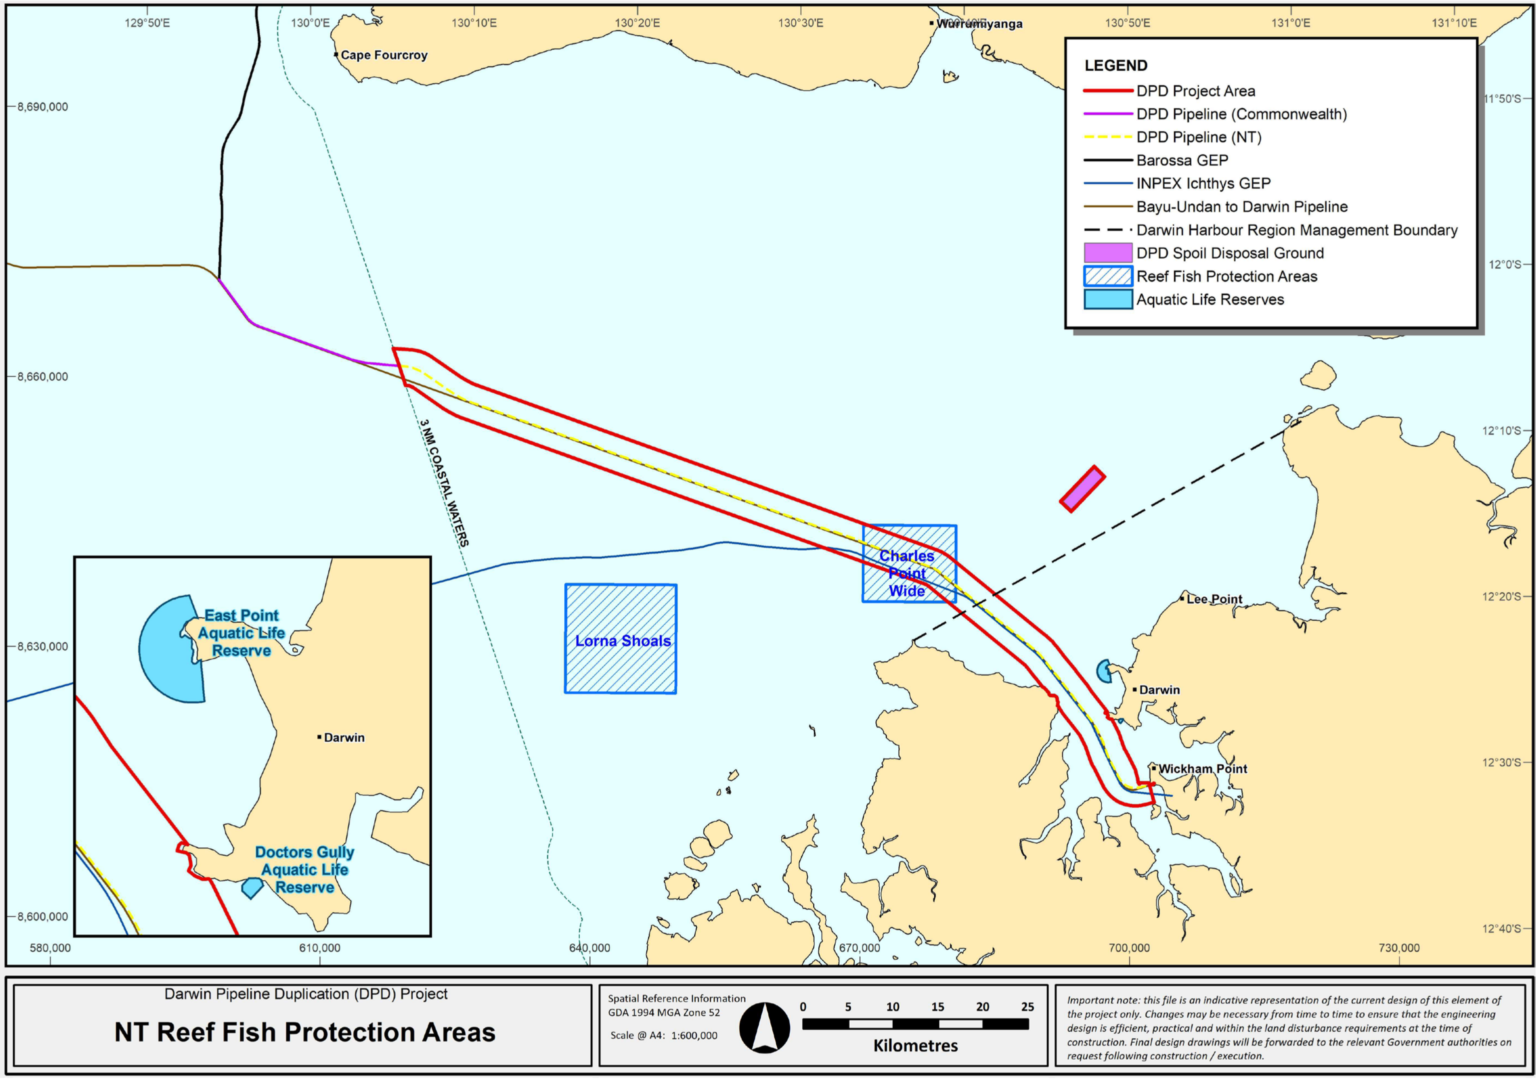

Figure 5-4: Northern Territory Aquatic Reserves and Reef Fish Protection Areas

5.4 Terrestrial ecosystems

5.4.1 Flora

A search of the DEPWS Natural Resource (NR) Maps database for threatened flora and significant flora within 5 km of the onshore Project Area identified one significant flora species, Byblis (*Byblis aquatica*) (DEPWS, 2022). This species is listed as near threatened under the *Territory Parks and Wildlife Conservation Act 1976* (TPWC Act 1976) and was recorded approximately 5 km to the south-east of the onshore Project Area. It grows in semi-aquatic conditions and is insectivorous to acquire nutrients in nutrient-poor environments (Atlas of Living Australia, 2022). This species is commonly found in areas specifically between Darwin and Berry Springs.

Previous flora surveys of the DLNG Facility disturbance envelope did not identify the presence of any threatened or conservation significant flora species (BAA-201 0003; Santos, 2021). The Byblis is unlikely to occur within the onshore Project Area as it has been previously disturbed and there are no permanent freshwater habitats present (BAA-201 0003; Santos, 2021).

5.4.2 Mangroves

Monitoring of the mangrove communities surrounding the DLNG Facility has being ongoing since 2006 (ConocoPhillips, 2018). They are comprised of predominately *Rhizophora* and *Sonneratia* species and to a lesser extent *Aegialitis*, *Avicennia*, *Osbornia* and *Aegiceras* species. The data collected indicates that the mangrove communities are in good health, with no significant deterioration or stress resulting from DLNG Facility operations.

CDM Smith's (2021) vegetation assessment of the DPD shore crossing location identified less than five individuals of one mangrove species, *Sonneratia alba*, within 20 m either side of the DPD pipeline alignment. This species of mangrove is a common taxon that is well represented and characterised in the DLNG Facility's mangrove monitoring program. CDM Smith (2021c) concluded that the vegetation in proximity to the DPD pipeline is of low ecological value and well represented in the area.

These mangroves are located outside of the pipeline alignment for the approximately 200 m section of onshore pipeline, therefore are unlikely to be impacted by the onshore works relevant to this CEMP.

5.5 Fauna

5.5.1.1 Threatened and migratory fauna

The Protected Matters Search Tool (PMST) is used to search for matters (including species) protected under the EPBC Act and generates a list of protected matters that may occur in or near a selected area. PMST searches were undertaken on 24 August 2021 within five kilometres either side of the Project Area. Copies of the PMST search reports are available in **Attachment 2**.

A summary of the Listed Threatened Species (LTS) and Listed Migratory Species (LMS) identified by the PMST for the Project Area and surrounds is shown in **Table 5-3**.

Table 5-3: Summary of EPBC Act Listed Threatened (LTS) and Listed Migratory Species (LMS) identified by the Protected Matters Search Tool

Threatened and migratory fauna type	Number of species
LTS	41 (birds – 14, mammals – 13, reptiles – 7, sharks – 8): + Critically Endangered – 4 + Endangered – 12 + Vulnerable – 24 + Conservation Dependent – 1
LMS	74 (migratory marine birds – 6, migratory marine species – 28, migratory terrestrial species – 6, migratory wetland species – 34) 21 of which are also listed as 'Threatened': + Critically Endangered – 4 + Endangered – 6 + Vulnerable – 11
Total	95

Those fauna listed as threatened or migratory species under the EPBC Act and which have been identified as being likely to occur or potentially present within the Project Area, are listed in **Table 5-4**.

Table 5-4: EPBC Act listed threatened and migratory marine fauna within the Project Area

Common name	Scientific name	EPBC Act status	Presence	Particular values or sensitivities
Marine reptiles				
Flatback turtle	*Natator depressus*	Vulnerable, Migratory	Likely	Species is known to occur in Darwin Harbour and surrounding waters. Refer **Figure 5-5**.
Olive ridley turtle	*Lepidochelys olivacea*	Endangered, Migratory	Likely	Species unlikely to occur in Darwin Harbour but is likely to occur in shallow soft-bottomed habitats of protected waters represented within the Project Area seaward of Darwin Harbour. Refer **Figure 5-6.**
Green turtle	*Chelonia mydas*	Vulnerable, Migratory	Likely	Species is known to occur in Darwin Harbour and surrounding waters.
Hawksbill turtle	*Eretmochelys imbricata*	Vulnerable, Migratory	Likely	Species is known to occur in Darwin Harbour and surrounding waters.
Leatherback turtle	*Dermochelys coriacea*	Endangered, Migratory	Potential	Species unlikely to occur within Darwin Harbour, but potentially occurs in surrounding waters.
Loggerhead turtle	*Caretta caretta*	Endangered, Migratory	Potential	Species unlikely to occur within Darwin Harbour, but potentially occurs in surrounding waters.
Salt-water crocodile	*Crocodylus porosus*	Migratory	Likely	Species is known to occur within Darwin Harbour; individuals sighted on boat ramps near Project Area. There is no important habitat for the species in the Project Area.
Marine mammals				
Australian snubfin dolphin	*Orcaella brevirostris*	Migratory	Likely	Suitable habitat for the species is present. Individuals of the species have previously been recorded in Darwin Harbour and near Catalina Island, located to the east of the Project Area. Refer **Figure 5-7**.
Dugong	*Dugong dugon*	Migratory	Likely	Individuals of the species are known to occur within Darwin Harbour.
Indo-Pacific humpback dolphin	*Sousa chinensis*	Migratory	Likely	Suitable habitat for the species is present. The species is widely known from Darwin Harbour. Refer **Figure 5-8**.
Spotted bottlenose dolphin	*Tursiops aduncus*	Migratory	Likely	Suitable habitat for the species is present. The species is widely known to occur within Darwin Harbour. Refer **Figure 5-9**.
Birds				
Asian dowitcher[1]	*Limnodromus semipalmatus*	Migratory	Potential	Some species recorded in proximity to the Project Area. Potential habitat in Darwin Harbour.
Common sandpiper [1]	*Actitis hypoleucos*	Migratory	Potential	The Project Area does not contain suitable habitat for nesting/roosting, however there is suitable habitat for foraging on either side of the Project Area which may result in this species traversing the Project Area.
Grey plover [1]	*Pluvialis squatarola*	Migratory	Potential	The Project Area does not contain suitable habitat for nesting/roosting however there is suitable habitat for foraging on either side of the Project Area which may result in this species traversing the Project Area.
Oriental plover[1]	*Charadrius veredus*	Migratory	Potential	Some species recorded in proximity to the Project Area. Potential habitat in the Darwin Harbour and offshore of Wagait Beach.
Osprey	*Pandion haliaetus*	Migratory	Potential	The Project Area and surrounds contain suitable foraging habitat for the species. It is noted that there is an osprey nest on the DLNG site (atop an artificial pole).

Notes:

1. It is important to note that although there is a number of migratory species as having the potential to or likely to occur within or nearby to the Project Area, several of these were migratory birds, most of which would likely be transiting to areas either side of the Project area where suitable habitat is known to occur (i.e. shoreline crossing is within a disturbed area). Other than the osprey, which is known to nest on tall artificial structures, migratory birds have not been considered further. In addition, given the shore crossing is located within the existing DLNG disturbance envelope and there is no suitable habitat for other migratory terrestrial species within the Project area, migratory terrestrial species have not been considered further.

Santos

Table 5-5: Biological Important Areas (BIAs) identified within 5 km of the Project Area

Species	BIA	Project Area overlap
Marine reptiles		
Flatback turtle	Nesting/Internesting	Overlaps
Marine mammals		
Australian snubfin dolphin	Breeding	Overlaps
Indo-Pacific humpback dolphin	Breeding	Overlaps
Spotted bottlenose dolphin	Breeding	Overlaps

Relevant recovery plans, conservation advice, and wildlife conservation plans for marine fauna identified in the PMST are outlined in **Table 5-6**. Recovery plans set out the research and management actions necessary to stop the decline of and support the recovery of LTS. **Table 5-6** summarises the threats relevant to each LTS and the DPD Project with references to the CEMP sections where these are addressed.

5.5.1.2 Marine reptiles

There are six species of marine turtle known to occur in NT waters, of these only green, hawksbill and flatback turtles are known to occur in Darwin Harbour regularly. Olive ridley and loggerhead turtles are known to occasionally occur in Darwin Harbour, and leatherback turtles are unlikely to occur in the Harbour as they are an oceanic species (Whiting, 2001; Whiting, 2003). The closest nesting sites to the Project Area are Casuarina Beach and Cox Peninsula beaches, although these are not considered significant nesting areas and Casuarina Beach is additionally a popular recreational area (Pendoley Environmental, 2022). Other more significant turtle nesting sites in the region include Bare Sand Island and Quail Island, located approximately 50 km from Darwin and over 25 km from the Project Area near the mouth of Bynoe Harbour.

5.5.1.3 Marine mammals

Dolphin species are the most recorded marine mammal in Darwin Harbour, with the Australian snubfin (*Orcaella heinsohni*), Indo-Pacific humpback (*Sousa chinensis*) and Indo-Pacific spotted bottlenose (*Tursiops aduncus*) having known populations in Darwin Harbour. There are approximately 150 individuals across all species thought to inhabit the Darwin region (Brooks & Pollock, 2015).

Dugongs (*Dugong dugon*) are also known to occur in the Darwin region. Ichthys NEMP dugong monitoring estimates approximately 180 to 300 individuals inhabit the Darwin Region (Cardno, 2014).

5.5.1.4 Other fauna

5.5.1.4.1 Bony fishes and sharks

Darwin Harbour supports an abundance of fish species across an array of habitats. There is a diverse range of species within the harbour, from small site-specific species such as gobies, cardinals, and pipefish to larger species of recreational and commercially importance such as mackerel, trevallies, and barramundi. Barramundi is the most targeted recreational species in the Northern Territory accounting for 26% of total recreational catch; however, barramundi only accounts for 5% of total catch in Darwin Harbour. Jewfish are the most targeted species in Darwin Harbour followed by golden snapper.

Juvenile recreationally and commercially important fish species utilise mangroves within Darwin Harbour for habitat.

Three protected sawfish species listed on the PMST search results have been recorded within the Darwin Harbour region—the dwarf sawfish (*Pristis clavata*), freshwater sawfish *(Pristis pristis* or *Prisitis microdon*) and green sawfish (*Pristis zijsron*). However, they are unlikely to be encountered in the Project Area.

Whale sharks are known to migrate to Australian waters seasonally, aggregating at Ningaloo Reef and in the Coral Sea following surges in food productivity. The migratory paths of whale sharks are not known to include Darwin Harbour and records from NT coastline are anecdotal (Woinarski *et al*., 2007).

5.5.1.4.2 Seabirds and shorebirds

Of the 37 species of migratory shorebirds that regularly visit Australia (Commonwealth of Australia, 2017b; Lilleyman *et al*., 2018), 25 of them occur along the coastlines of Darwin Harbour, which has a variety of coastal habitats that migratory shorebirds use during the non-breeding season (Lilleyman *et al*., 2018). This includes natural sites such as beaches, rocky reefs, intertidal sand and mud flats, but also an artificial site – the dredge spoil disposal ponds at Darwin Port's East Arm Wharf.

Lilleyman *et al*. (2018) undertook aerial surveys of Darwin Harbour and recorded 724 individuals of 19 species of bird during the low tidal phase of the survey and at high tide recorded 789 individual shorebirds belonging to 13 species. The study was focused on the Far Eastern curlew (*Numenius madagascarensis*), two flocks of which were identified in numbers that meet the threshold for protection of threatened shorebirds under the EPBC Act. One flock was recorded at East Arm Wharf, where large congregations assemble frequently. The other flock was at a saltpan, south-east of East Arm Wharf, adjacent to the Darwin LNG Plant (although it was noted that this roosting site may not be available at the highest tides) (Lilleyman *et al*., 2018).

5.5.1.4.3 Phytoplankton

Inner Darwin Harbour is known to have low concentrations of bio-available nutrients, low light levels and high turbidity which limits the growth of phytoplankton. The large tidal range also ensures that the Harbour is well flushed. Ichthys NEMP monitoring found low biomass of phytoplankton indicated by low chlorophyll-a fluorescence, although there was a slight increase in phytoplankton biomass during the wet season compared to the dry season. This could be due to the additional nutrient input from increase rainfall and subsequent runoff. Variations in phytoplankton biomass within Darwin Harbour follows complex patterns indicating that multiple factors may influence the productivity of phytoplankton in the Harbour.

5.6 Community and economy

5.6.1 Socio-economic environment

Socio-economic activities that may occur within the Project Area and surrounds including recreational, traditional and commercial fishing, shipping, oil and gas production, defence activities and tourism, as summarised in **Table 5-7**.

More detailed descriptions of socio-economic considerations are provided in the DPD NT EPA Referral (BAA-201 0003; Santos, 2021).

Table 5-7: Summary of socio-economic activities that occur within the Project Area

Value/ sensitivity	Description
Commercial fisheries – Commonwealth	The Northern Prawn Fishery is the only active Commonwealth managed fishery overlapping the Project Area. There are three other inactive or low operating (less than five vessels active in the fishery each year since 2005) Commonwealth managed fisheries overlapping the Project Area: Southern Bluefin Tuna Fishery, Western Tuna and Billfish Fishery and the Western Skipjack Tuna Fishery (Commonwealth of Australia, 2020d; DAFF, 2022).
Commercial fisheries – NT	There are five NT managed fisheries that intersect the Project Area: Coastal Line, Demersal, Offshore Net and Line, Spanish Mackerel, and Aquarium Fishery.
Recreational fishing	Recreational fishing does occur within the Project Area. The Darwin Harbour/Surrounds fishing zone supporting 63% of total fishing effort within the Greater Darwin Area (Matthews *et al*. 2019).
Traditional fishing	Traditional Australian Indigenous fishing in NT waters predominately occurs within inshore tidal waters. Approximately 55% of NT's coastline is owned by Traditional Aboriginal Owner groups in the Northern Land Council region (NLC, 2022).
Shipping	The closest major commercial port to the Project Area is Darwin. The Darwin Port Corporation serves multiple shipping and cargo markets, including cruise and naval vessels, livestock exports, dry bulk ore, offshore oil and gas rig services, and container and general cargo. The Australian Maritime Safety Authority (AMSA) shipping routes close to the Project Area are shown in **Figure 5-12**.
Tourism	Within Darwin Harbour common tourism/recreational activities include fishing, boating, scuba-diving, sailing, water-skiing, and beach use.
Defence	The Project Area intersects a Central Defence Practice Area of the Darwin Air Weapons Range (AWR), a maritime military zone administered by the Department of Defence. The Project Area is also nearby to the North Australian Exercise Area (NAXA) Defence Training Area approximately 3km to the South

Value/ sensitivity	Description
Petroleum industry	Several offshore petroleum projects are in operation and there is considerable exploration activity within the NMR; however, only the existing INPEX Ichthys and Santos Bayu-Undan to Darwin gas export pipelines overlap with the Project Area.
Aboriginal heritage	There are four registered/recorded sacred sites within Darwin Harbour within or adjacent to the Project Area: three rocky areas and shoals on the western side of the Harbour and an underwater sand and rock bar outside the mouth of the Harbour, north of Cox Peninsula. Santos has received an Authority Certificate from the AAPA for the DPD Project (Authority Certificate C2022/098) and will abide by conditions of the certificate.
Maritime heritage	Five historic shipwrecks listed under the *Underwater Cultural Heritage Act 2018* (Commonwealth) are overlapped by the Project Area: I-124 Japanese Submarine (1942) 800 m radial protection zone, Yu Han 22 unlisted protection zone, Song Saigon (1982) unlisted protection zone, Mauna Loa United States Army Transport ship (USAT) (1942) 100 m radial protection zone and Meigs USAT (1942) unlisted protection zone (DCCEEW, 2022b). Santos has undertaken maritime heritage surveys within the Project Area to determine the presence of additional maritime heritage objects and will apply measures to ensure these are not impacted.

5.6.1.1 Commercial fishing and aquaculture

5.6.1.1.1 Commonwealth fisheries

The Northern Prawn Fishery is the only active Commonwealth managed fishery that overlaps the Project Area (Santos, 2021). The Commonwealth managed Southern Bluefin Tuna Fishery, the Western Tuna and Billfish Fishery and the Western Skipjack Tuna Fishery overlap with the Project Area but have been excluded from assessment as these fisheries are either inactive or operate at extremely low levels (<5 vessels active each year since 2005) within or nearby the Project Area (DAFF, 2022; Santos, 2021).

5.6.1.1.2 Northern Territory fisheries

Northern Territory managed fisheries include the Aquarium Fishery, the Offshore Net and Line Fishery, the Spanish Mackerel Fishery, the Coastal Line Fishery, and the Demersal Fishery (Santos, 2021). The Aquarium Fishery includes freshwater, estuarine, and marine habitats to the outer boundary of the Australian Fishing Zone (AFZ), which is 200 nm offshore (Santos, 2021). The Offshore Net and Line Fishery and the Spanish Mackerel Fishery extend from the high water mark of NT waters to the outer boundaries of the AFZ (Santos, 2021). The Demersal Fishery extends 15 nm from the NT low water mark to the outer limit of the AFZ, excluding the area of the Timor Reef Fishery (Santos, 2021). The Coastal Line Fishery extends seaward from the high water mark to 15 nm from the low water mark, covering the entire NT coastline (Santos, 2021).

The Aquarium Fishery is a small-scale, multi-species fishery that is active within the Project Area (Santos, 2021). Licencees employ several types of nets, hand pumps, freshwater pots, and hand-held instruments to collect specimens. The fishery supplies local, interstate, and international pet retailers and wholesalers, including aquarium fishes (mostly rainbowfish, catfish, scats), invertebrates (hermit crabs, snails, whelks, and hard and soft corals) and plants.

The Offshore Net and Line Fishery permits the use of pelagic gillnets and longline gear (Santos, 2021). Pelagic gill nets are the primary gear utilised and are generally set within 15 nm of the coast (Santos, 2021). Most fishing effort is within 12 nm of the coast and immediately offshore in the Gulf of Carpentaria (Northern Territory Government, 2022b). The fishery targets Australian blacktip sharks (*Carcharhinus tilstoni*), common blacktip sharks (*C. limbatus*) and grey mackerel (*Scomberomorus semifasciatus*), other shark species (i.e. hammerhead, bull, tiger, pigeye, lemon, winghead and dusky whalers) and finfish (i.e. Spanish mackerel, longtail tina, black pomfret) are also caught by the fishery (Northern Territory Government, 2021). There is potential for fishing to overlap with the Project Area; however, stakeholder consultation conducted by Santos (2021) only identified one licence holder that may fish off the south-west end of the Tiwi Islands.

The Spanish Mackerel Fishery permits the use of troll lines, floating handlines, and rods, solely targeting Spanish mackerel (*Scomberomorus commerson*) (Santos, 2021). Most of the fishing effort occurs around reefs, headlands, and shoals off the western and eastern mainland coast and near islands including Bathurst Island, Groote Eylandt, and the Wessel Islands (Northern Territory Government, 2021). In 2012, there were 16 fishery licences with 12 actively operating (Santos, 2021). There is potential for fishing to occur close to or within the Project Area. Stakeholders have advised during stakeholder consultation by Santos (2021), that there is potential for fishing to occur within the southern extent of the original Barossa GEP (Santos, 2021).

The Coastal Line Fishery permits the use of a variety of gear types including rod and line, hand lines, cast nets (for bait only), scoop nets and gaffs (Northern Territory Government, 2016a). Drop lines and five fish traps are permitted beyond 2 nm from the coast; however, fish traps are only permitted in the Eastern zone of the fishery (Northern Territory Government, 2016b). Black jewfish and golden snapper are the main targeted species of the fishery, although emperor, cod and other snapper species are

Santos

caught as bycatch. Fishing effort is concentrated within nearshore waters, therefore there is potential for fishing to occur within or close to the nearshore Project Area.

The Demersal Fishery permits the use of fish traps, hand lines, droplines, and semi-demersal trawl nets (Northern Territory Government, 2022). It is important to note that semi-demersal trawl nets are only permitted in two defined multi-gear areas (Northern Territory Government, 2022). Trap catch is mainly goldband snapper and red snapper with red emperor and cod caught as bycatch (Northern Territory Government, 2022). Trawl catch is mainly saddletail snapper and crimson snapper with painted sweetlip, redspot emperor and goldband snapper caught as bycatch. There are 18 licences currently issued for the fishery (Santos, 2021). Most fishing effort occurs within deep offshore waters along the Timor Reef Fishery eastern boundary in water depths 80 – 100 m, therefore there is low potential for fishing to overlap with the Project Area.

Most fisheries are not permitted to operate within Darwin Harbour, except for the Coastal Line Fishery and Aquarium Fishery (DPIR, 2015). Therefore there is little to no commercial fishing taking place within Darwin Harbour.

The Darwin Aquaculture Centre is located on Channel Island in the Middle Arm Peninsula. It is a research facility undertaking a range of research and development projects on several species including pearl oysters, sea cucumbers, giant clams, prawns, barramundi, mud crabs, reef fish, as well as undertaking several disease investigations (Northern Territory Government, 2018).

Santos

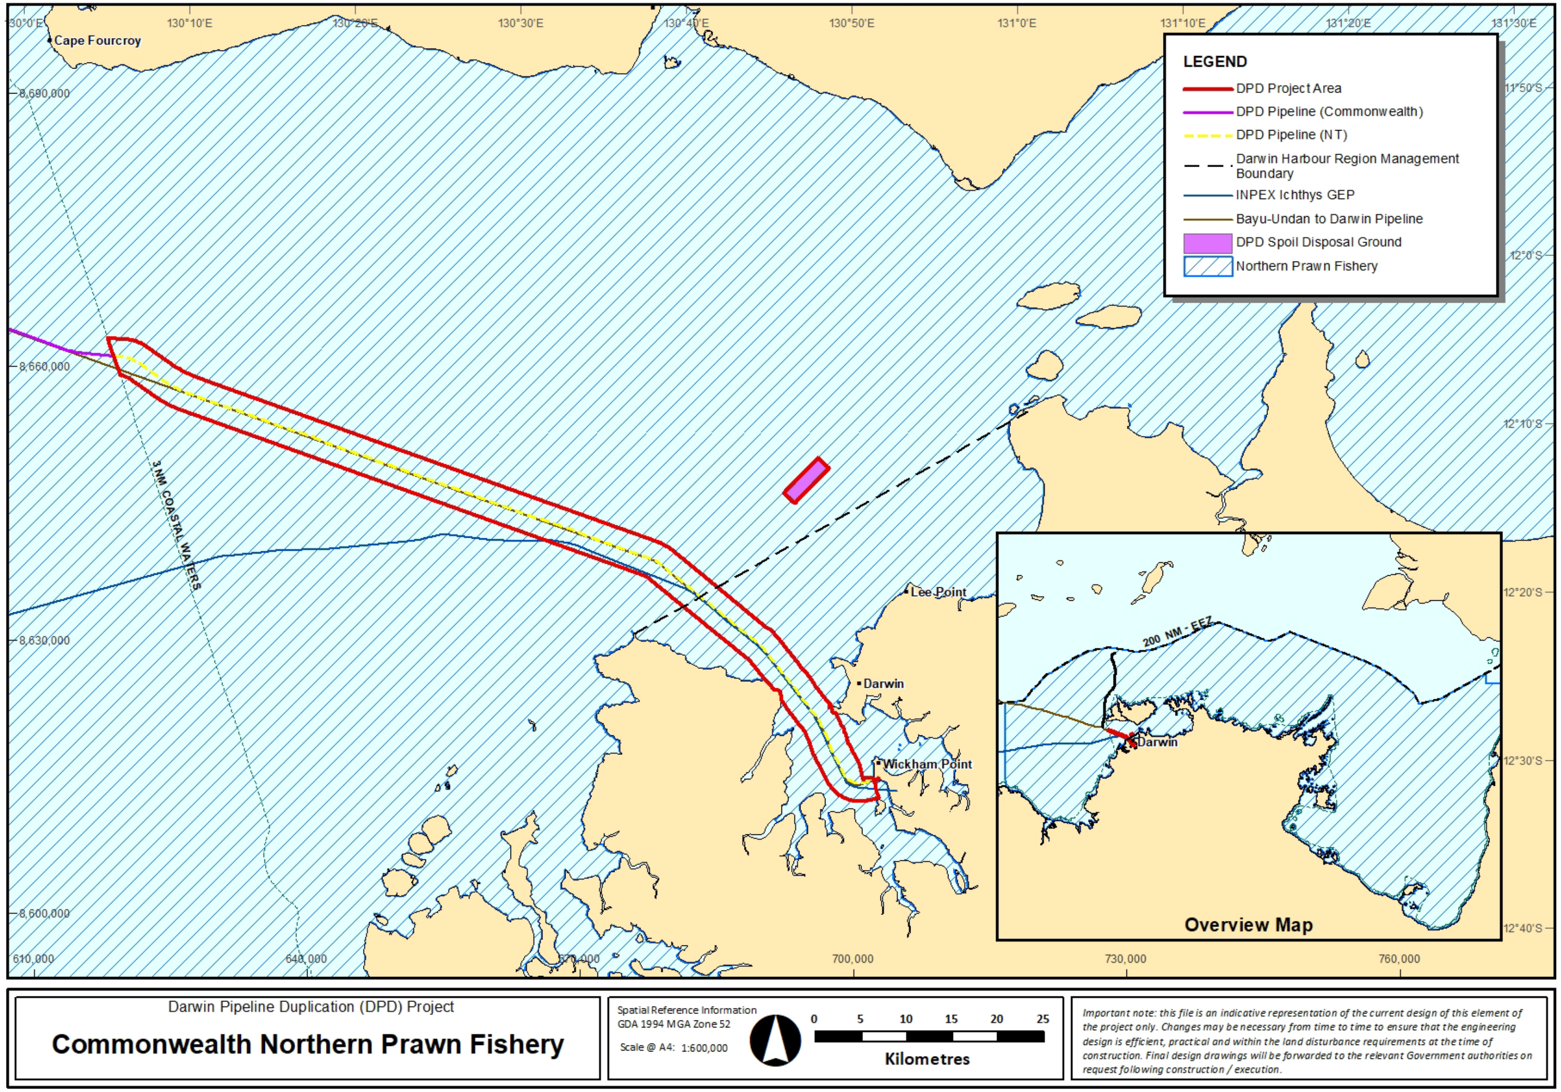

Figure 5-10: Commonwealth managed Northern Prawn Fishery

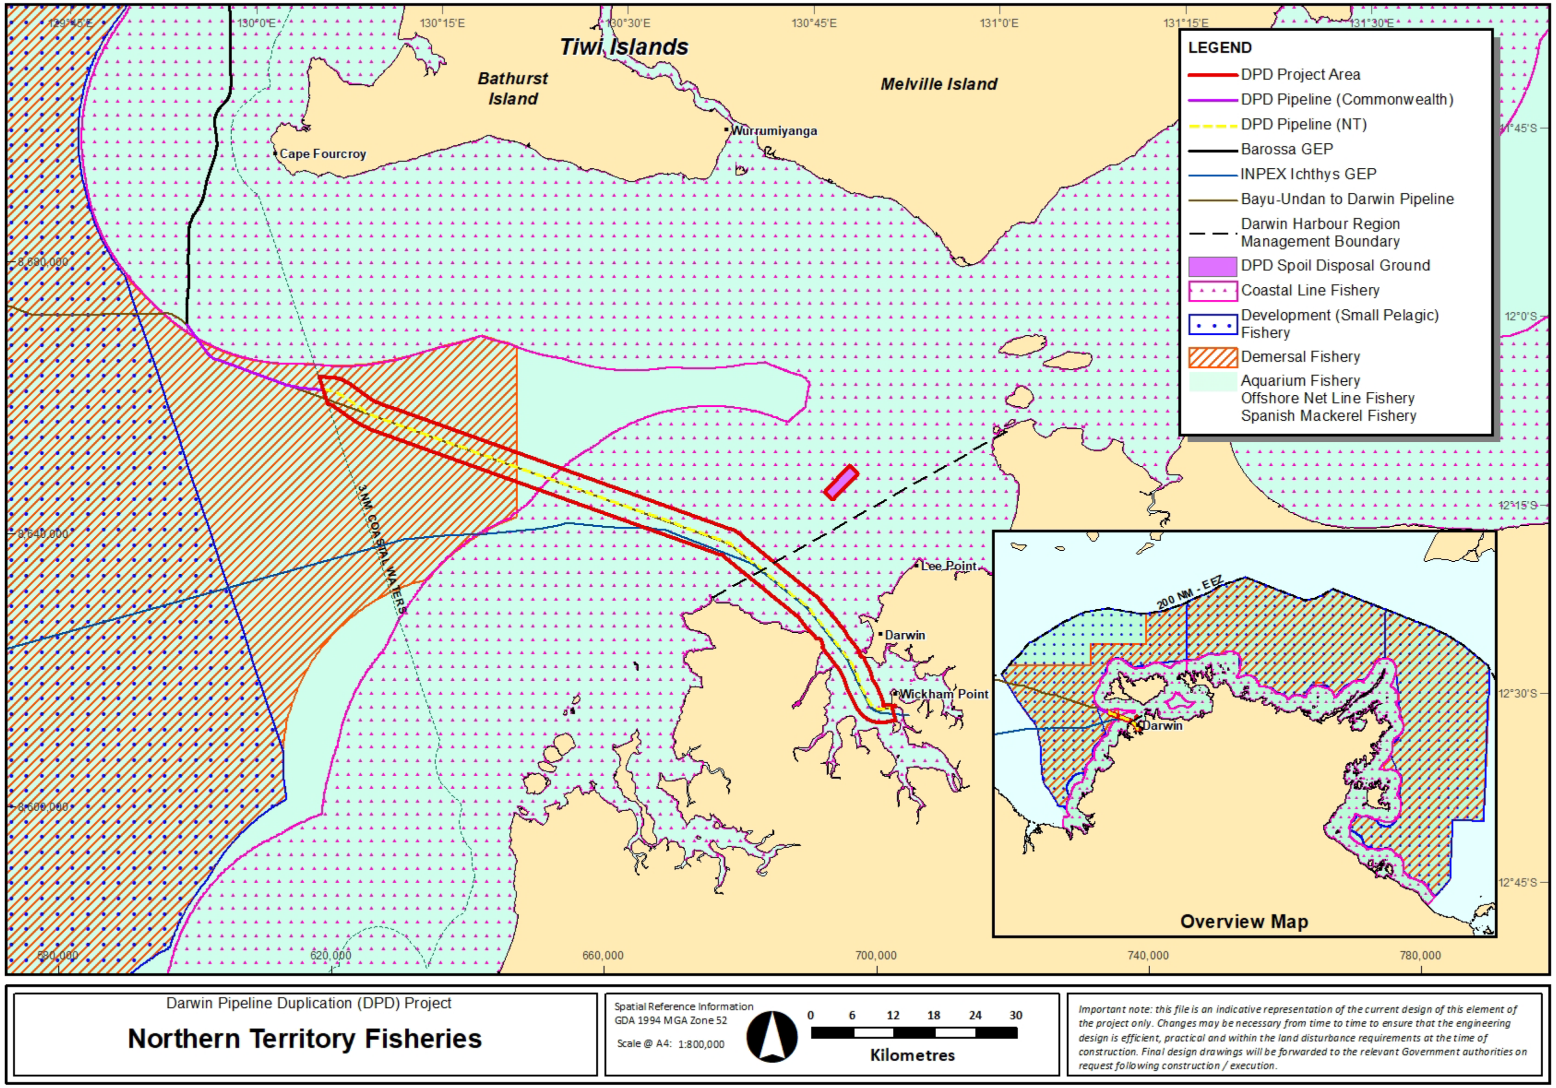

Figure 5-11: Northern Territory managed commercial fisheries

5.6.1.2 Shipping

Vessel traffic data from the AMSA Marine Traffic Database (AMSA, 2021) for the Project Area during March 2021 is shown in **Figure 5-12**, which shows the Project Area intersects areas of high shipping traffic.

Shipping traffic in the offshore NT waters of the Project Area is relatively light; however, at the approach to Darwin Harbour, and within the harbour itself, several notable shipping traffic lanes converge to create a high-density shipping traffic area that overlaps with the Project Area.

The Port of Darwin recorded 1,510 trading vessel visits in 2021-2022 (Darwin Port Authority, 2022) with traffic in the Port typically influenced by number of the well-established industrial and commercial facilities that receive a wide of maritime traffic (i.e. cargo, livestock vessels, LNG tankers and cruise ships).

Whilst 61 cruise ships visited Darwin Port in 2020-21, with the majority travelling between South East Asia and the eastern coast of Australia, this number dropped significantly with the onset of the Covid-19 pandemic with 36 cruise ships recorded in 2021-22. Regional commercial shipping activities are also associated with support and supply vessels servicing oil and gas offshore facilities. For example, in 2021-22, there were 283 rig tender vessel calls to Darwin Port facilities. The Port forms the main base for oil and gas contracted supply vessels that support northwest Australia offshore activities (Darwin Port Authority, 2021).

Although Darwin Port remains the primary active port in the region, there is small-scale port activity at the Tiwi Islands. Port Melville is located on Melville Island (122 km north of Darwin) and the wharf infrastructure at Port Melville was constructed in 2013. Shipping traffic associated with the route between Darwin Port and the Tiwi Islands, including Port Melville, is shown in **Figure 5-12**.

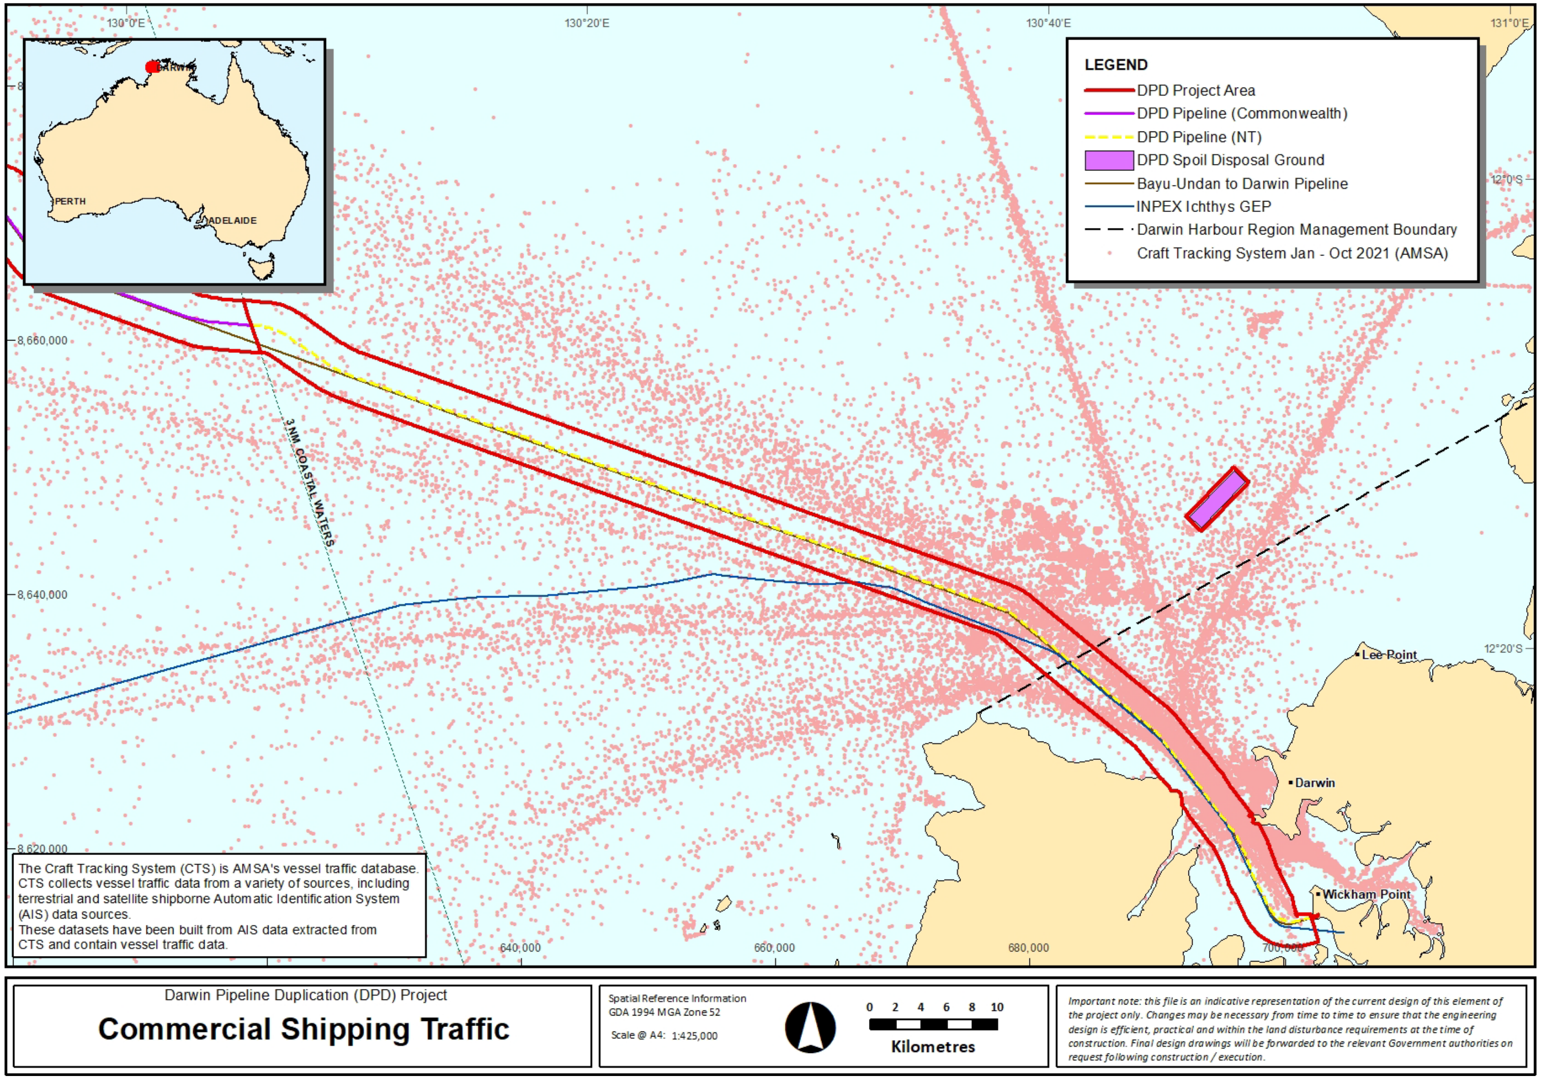

Figure 5-12: Commercial shipping traffic

5.6.1.3 Recreational activities and tourism

During 2021 there were 1,283,000 visitors to the Northern Territory, which contributed an estimated $1.84 billion to the local community (Tourism NT, 2022). This was substantially lower than 2019, with 2,001,000 visitors contributing an estimated $2.6 billion, likely due to the reduction in international visitation resulting from border closures (Tourism NT, 2022).

The Darwin Harbour supports a range of commercial and recreational uses, including fisheries, tourism and recreational shipping and boating activities. Fishing tours often frequent Fenton Patches located approximately 30 km north-west of Darwin Harbour. Recreational fishers also visit Casuarina Bay and Lee Point.

The water surrounding Middle Arm Peninsula is used for recreational fishing, sailing, and boating. However, tour boats tend to avoid this section of the Harbour due to navigational hazards associated with the shallow nearshore waters (URS, 2002).

5.6.1.4 Traditional fishing

Approximately 55% of NT's coastline is owned by Traditional Aboriginal Owner groups in the Northern Land Council region (NLC, 2022). Several areas within this coastal region have been declared Aboriginal sacred sites, which are restricted from other recreational and commercial fishing. Within Darwin Harbour, fishing and foraging for food and other resources occurs within the intertidal regions, mainly around Nightcliff, Coconut Grove, Kululuk, Sadgroves Creek, and Lee Point. As such, Indigenous fishing is likely to occur within the coastal areas of the Project Area but is likely to be restricted mainly to NT coastal waters.

5.6.1.5 Defence

A search on National Map (DCA, 2021) was undertaken and identified that the Project Area intersects the Darwin Air Weapons Range (AWR) Central Defence Practice Area and is nearby to the Australian Exercise Area (NAXA) Defence Training Area (approximately 3 km to the south), as shown in **Figure 5-13**.

5.6.1.6 Petroleum industry

Several offshore petroleum projects are in operation and there is considerable exploration activity within the NMR.

The Project Area contains two existing gas export pipelines (GEPs), the Bayu-Undan to Darwin GEP (approx. 50-100 m to the west of the proposed DPD Project pipeline route) and the INPEX Ichthys GEP which is further to the west of the Bayu-Undan to Darwin GEP (**Section 2.2**).

The two primary LNG facilities on Middle Arm Peninsula are the DLNG Facility operated by Santos, and the Ichthys LNG Project operated by INPEX. The Project pipeline will connect into the existing DLNG Facility and the Project Area overlaps the DLNG Facility.

The DLNG Facility is a gas processing facility which includes units for:

+ Gas receiving facilities (including the beach valve, pig receiver and meter station for the Bayu-Undan to Darwin pipeline)
+ Acid gas removal
+ Dehydration and mercury removal
+ Propane and ethylene refrigeration
+ Liquefaction, methane compression and nitrogen rejection.

There are several exploration and production permits and leases throughout the NT and Commonwealth waters adjacent to the Project Area, which include current exploration and production activities including platforms, FPSO (floating, production, storage and offloading) vessels, pipelines, and drilling.

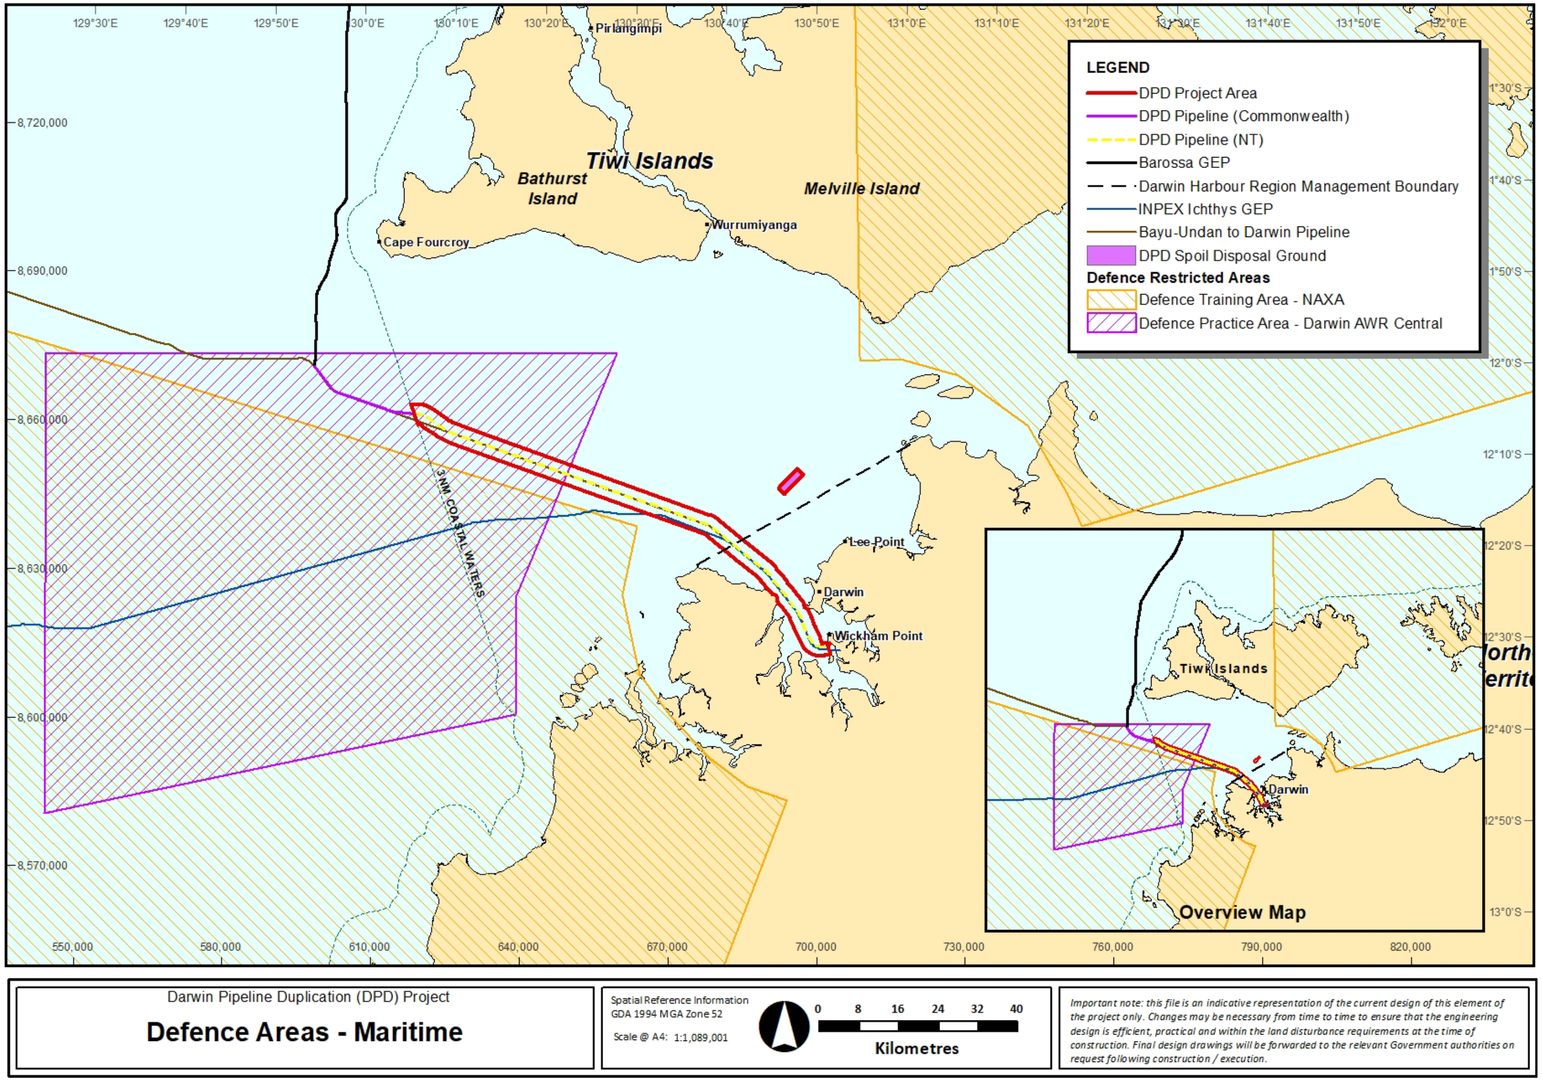

Figure 5-13: Defence areas – maritime

5.6.2 Culture and heritage

5.6.2.1 Cultural environment

Darwin Harbour is host to a wide range of historical, spiritual and heritage values that are significant to the people of the Northern Territory and Australia. These values have been broadly categorised as either Aboriginal and non-Aboriginal values and are described in more detail in the following **Sections 5.6.2.1.1** and **5.6.2.1.2**. Further detail of the cultural environment can be found in Santos' NT EPA referral (Santos, 2021).

5.6.2.1.1 Aboriginal sacred sites

Sacred sites are places within the landscape that have a special meaning or significance under Aboriginal tradition, this can include hills, rocks, waterholes, trees, plains, lakes, billabongs (AAPA, 2022). There are many sacred sites within Darwin Harbour and the surrounding waters, all sacred sites within the Northern Territory are protected under the *Northern Territory Aboriginal Sacred Sites Act 1989*. In coastal and sea areas, sacred sites may include features which lie both above and below the water (AAPA, 2022). Sacred sites are surrounded by "restricted works" areas in which no land or maritime development works of any kind is allowed, under the *Northern Territory Aboriginal Sacred Sites Act 1989*.

There are sacred sites within Darwin Harbour that are adjacent to or overlap the Project Area (INPEX, 2010). These sites as identified in INPEX (2010), include rocky areas or shoals on the western side of the Darwin Harbour, and an underwater sand and rock bar at the mouth of the harbour, north of the Cox Peninsula.

Santos has received an Authority Certificate from AAPA for the DPD Project (Authority Certificate C2022/098) and will ensure conditions of the certificate and the requirements of the *Northern Territory Aboriginal Sacred Sites Act 1989* are met including adherence to requirements to avoid work in a restricted works area (RWA) in Darwin Harbour. Refer to (**Figure 5-14**) for subject lands area covered by the Authority Certificate in Darwin Harbour.

5.6.2.1.2 Non-Aboriginal heritage sites

Darwin Harbour is host to several shipwrecks and sunken aircraft, some of which are protected under the *Heritage Act 2011* (NT) and/or the *Underwater Cultural Heritage Act 2018* (Commonwealth) (**Figure 5-16**). Most wrecks are associated with either, the bombing of Darwin in 1942 or Cyclone Tracy in 1974. The Project Area is within ~2 km east of the oldest known wreck in Darwin Harbour the *SS Ellengowan*, a nineteenth-century Norwegian-built iron steamer, which is of high significance to maritime archaeology (Northern Territory Government, 1999; **Figure 5-15**).

The *Underwater Cultural Heritage Act 2018* may declare a protected zone around wrecks which require a permit to enter, there are currently three protected zones having closed water orders in NT. These are the Japanese submarine I-124 (1942), Florence D (1942) and Sanyo Maru (1937) (**Figure 5-15**). The regional harbourmaster has also ordered the Booya and Catalina 6 wrecks to have closed water controls over them and permission from the Heritage Branch is needed to enter the zones.

The Australian National Shipwrecks Database has identified five historic wrecks that overlap the Project Area, all of which are listed under the Underwater Cultural Heritage Act (DCCEEW, 2022b). These wrecks are the Japanese submarine I-124 (1942) 800 m radial protection zone, Yu Han 22 unlisted protection zone, Song Saigon (1982) unlisted protection zone, Mauna Loa USAT (1942) 100 m radial protection zone and Meigs USAT (1942) unlisted protection zone (DCCEEW, 2022b). The pipeline route has been deliberately altered to avoid the I-124 and Mauna Loa USAT wrecks.

No European heritage is currently listed at Wickham Point, with the remnants of artefacts documented and removed prior to the construction of the DLNG facility. There are no World, National or Commonwealth Heritage places within or near the Project Area.

Santos has engaged the services of a maritime archaeologist (Cosmos Archaeology) to undertake an underwater heritage assessment of the pipeline route and surrounding buffer and will work with the Heritage Branch of the NT Department of Territory Families, Housing and Communities to ensure disruption to underwater heritage objects are avoided or minimised as far as practicable and that requirements of the *Heritage Act 2011* are met.

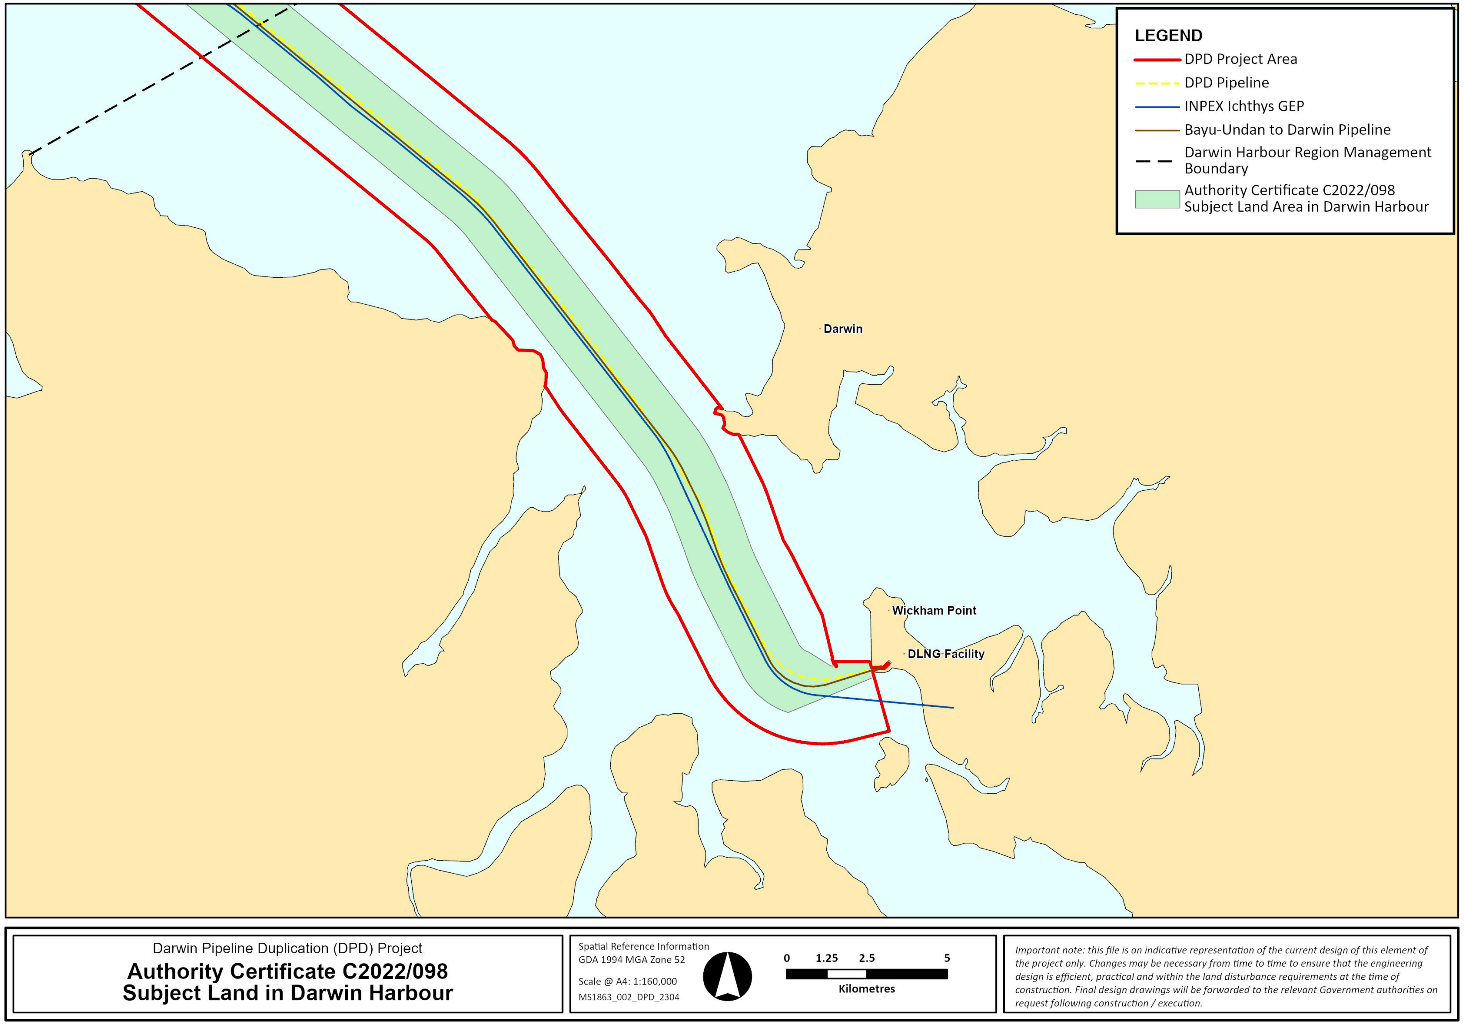

Figure 5-14: Authority Certificate C2022/098 subject land area in Darwin Harbour

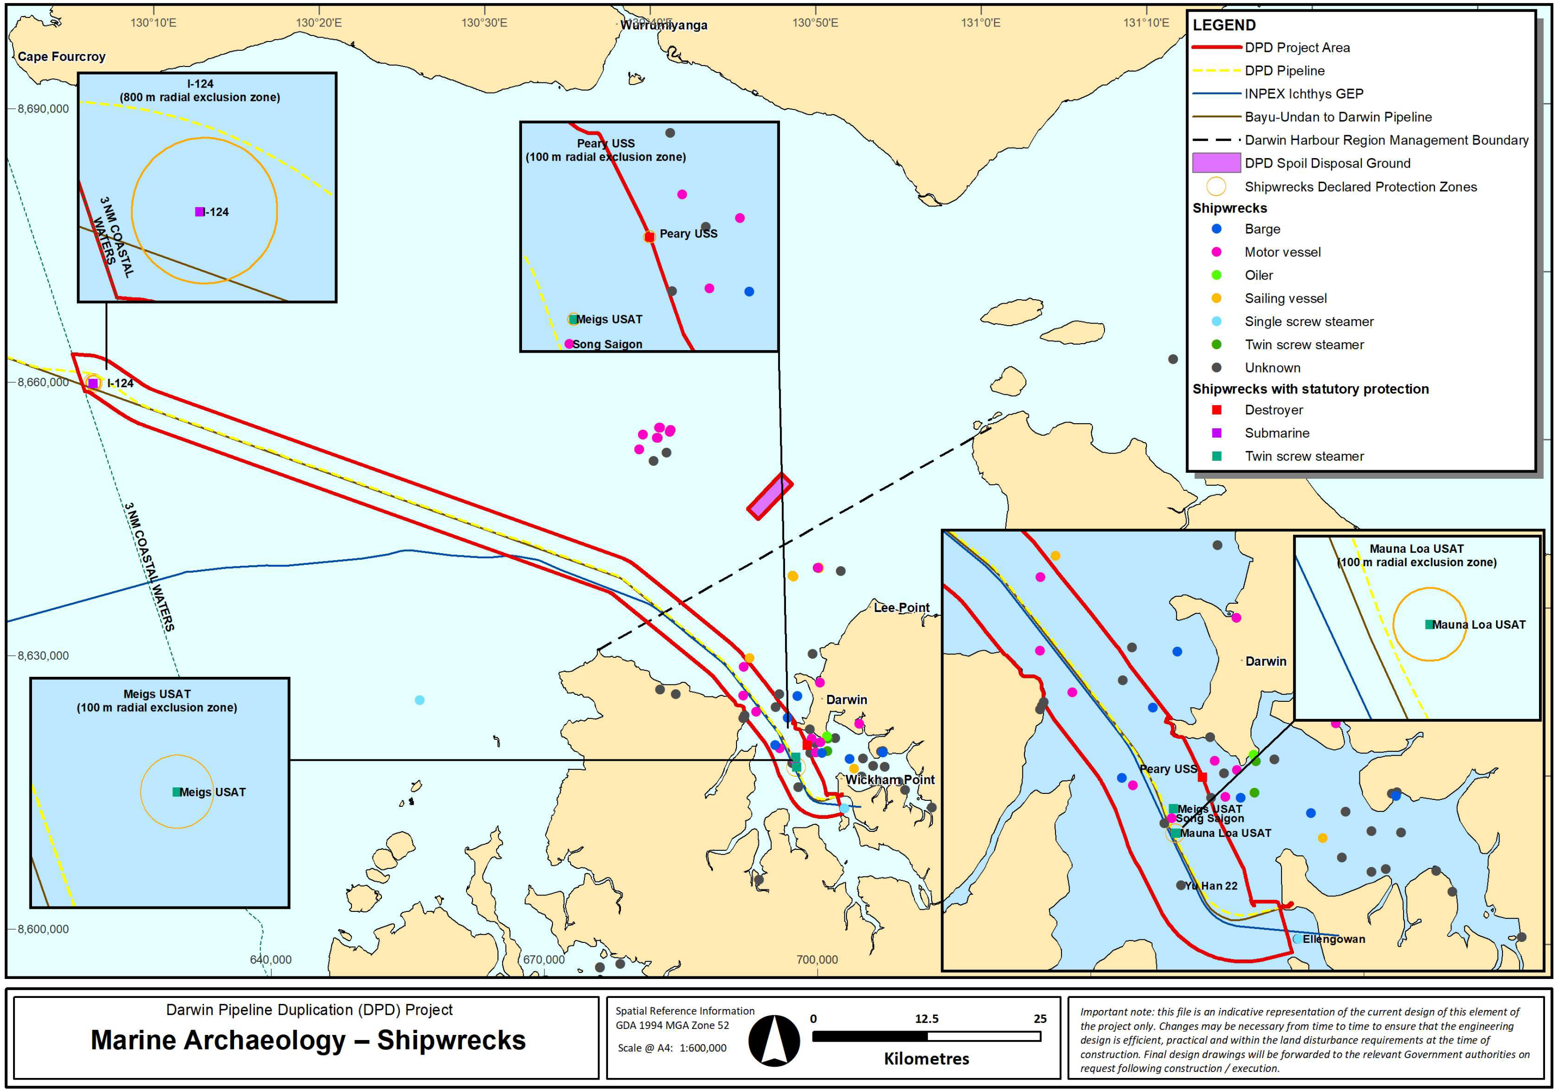

Figure 5-15: Shipwreck locations within and adjacent to Darwin Harbour

5.7 Windows of sensitivity

Timing of peak activity for threatened species and other sensitive receptors is outlined in **Table 5-8**.

Table 5-8: Windows of sensitivity in the vicinity of the Project Area

Key	
	Peak activity, presence reliable and predictable
	Lower level of abundance/activity/ presence
	Very low activity/presence
	Activity can occur throughout year

Footnotes

[1] The 'run-off' is towards the end of the wet season and is the peak Barramundi fishing season for recreational fishers (https://northernterritory.com/things-to-do/outdoor-activities/fishing/fishing-seasons/the-run-off)

6 Impact and risk assessment

This CEMP has employed a systematic impact and risk assessment process for the environmental management of the DPD Project construction activities. The impact and risk assessment process has been developed in line with Santos' Environmental Impact Identification (ENVID) process and is consistent with the requirements of the Petroleum (Submerged Lands) (Management of Environment) Regulations 1999 for NT waters and the NT EPA Draft Guideline for the Preparation of an Environmental Management Plan (NT EPA, 2015).

6.1 Conceptual site model

A conceptual site model, as required by the NT EPA, is a written or illustrated representation of the nature, fate and transport of discharges, wastes or contaminants that allows assessment of potential and/or actual exposure of the environment to contaminants (NT EPA, 2015). The Conceptual Site Model for this CEMP is embedded within the risk assessment which details receptors and pathways, refer **Table 6-7**.

6.2 Impact and risk assessment methods

The CEMP environmental impact and risk assessment was performed consistent with the Santos' Risk Matrix Procedure (SMS-LRG-OS01-TP02) and identification of management actions was consistent with Santos' Environment Hazard Controls Procedure (SMS-EXA-OS01-PD02). An environmental aspect, for the purpose of this environmental management plan, is defined as characteristics of the construction activities that could potentially affect the environment.

6.2.1 Identification of environmental hazard

Environmental hazards for this CEMP were identified using Santos' DPD Project NT EPA Referral (BAA-201 0002; Santos, 2021), DPD Project Basis of Approval (BAS-210 0005; Santos, 2022) and discussion by the DPD Project team and environmental specialists. Key DPD Project construction activities and associated hazards and results from key technical studies were presented during ENVID workshops to inform the impact and risk assessment process.

6.2.2 Standard controls

The standard controls identified in **Table 6-7** were drawn from:

+ Santos' DPD Project NT EPA Referral (BAA-201 0002; Santos, 2021)
+ Santos' environmental plans and procedures for similar activities
+ Regulator approved management plans developed by other proponents.

Additional controls were provided by ENVID workshop attendees based on their relevant experience.

6.2.3 Impact and risk assessment

All hazards identified were assigned a consequence level following the six levels and criteria outlined in Santos' Risk Matrix Procedure (SMS-LRG-OS01-TP02). More detailed criteria were developed to assist in addressing NT EPA Key Environmental Factors. These are the NT EPA consequence descriptors shown in **Table 6-1**.

The consequence is defined as the resulting impact from an event occurring. Consequence level for this assessment was based on the credible worst-case scenario and assumed no management actions were in place. Categories of environmental consequence and detailed definitions of each severity level are outlined in **Table 6-2**.

The likelihood can be described as the probability that the described consequence will occur. When determining the likelihood of consequences, proposed prevention and mitigation controls identified to mitigate potential impacts were considered. A detailed description of likelihood levels is outlined in **Table 6-3**.

The consequence and likelihood levels are not presented in this CEMP but are contained in the ENVID documentation. **Section 6.3** and **Table 6-7** outline the residual consequences and likelihoods which is the outcome after standard and additional (as low as reasonably practicable; ALARP) management actions are applied.

A likelihood level was only assigned to unplanned events as per the Santos Risk Matrix Procedures (SMS-LRG-OS01-TP02), shown in **Table 6-4.** The consequence and likelihood for each impact was then assessed to determine the residual impact or risk that remained after proposed standard controls were considered.

Table 6-1: NT EPA Consequence Descriptors

Consequence Level		I	II	III	IV	V	VI
Acceptability		Acceptable	Acceptable	Unacceptable	Unacceptable	Unacceptable	Unacceptable
Consequence Level Description		**Negligible** No impact of negligible impact	**Minor** Detectable but insignificant change to local population, industry or ecosystem factors Localised effect	**Moderate** Significant impact to local population industry or ecosystem factors	**Major** Major long-term effect on local population industry or ecosystem factors	**Severe** Complete loss of local population industry or ecosystem factors AND/OR extensive regional impacts with slow recovery	**Critical** Irreversible impacts to regional population industry or ecosystem factors
Environmental Receptors	**Marine Ecosystems** Fauna, habitat, conservation significant areas and ecological function, processes and integrity	Short term behavioural impacts only to small proportion of local population and not during critical lifecycle activity. No decrease in local population size / area of occupancy of species / loss or disruption of habitat critical / disruption to the breeding cycle/ vales of a protected area. No introduction of disease and no reduction in habitat area/function.	Detectable but insignificant decrease in local population size and threat to local population viability. Insignificant disruption to the breeding cycle of local population / area of occupancy of species / loss of habitat critical to survival of a species/ values of a protected area. Detectable but insignificant loss of area/function of habitat with rapid recovery within 2 years.	Moderate. Significant decrease in local population size but no threat to overall population viability. Significant behavioural disruption or disruption to the breeding cycle of local population / Significant reduction in area of occupancy of species / loss of habitat critical to survival of a species. Modify, destroy, remove or decrease availability of quality habitat to the extent that a long-term decline in local population or function of habitat is likely with recovery over medium term (2-10 years) Introduction of disease likely to cause significant population decline	Long term decrease in local population size and threat to local population viability. Major disruption to the breeding cycle of local population / area of occupancy of species / loss of habitat critical to survival of a species/ values of a protected area Fragmentation of existing population / Loss or change of habitat to the extent that a long-term decline in local population and function of habitat is likely with slow recovery over decades Introduction of disease likely to cause long term population decline	Complete loss of local population, habitat critical to survival of local population or protected area/conservation significant area Widespread (regional) decline in population size or habitat critical to regional population Extensive destruction of local habitat with no recovery or long term (decades) or widespread loss of area or function of primary producers on a regional scale	Complete loss of regional population Complete loss of habitat critical to survival of regional population
	Marine Environmental Quality Water quality, sediment quality, ecosystem health and parameters that support fishing, aquaculture, recreation, aesthetics and cultural/spiritual values	Negligible. No or negligible reduction in physical environment nor decrease in ecosystem function/health. No or negligible loss of value to socio-economic activities	Detectable but localised, short term and insignificant impact to physical environment or ecosystem function/health or value to socio-economic activities. Rapid recovery evident within ~ 2 years.	Significant wide-scale medium term impact to physical environment, decrease in ecosystem function/health or value to socio-economic activities. Recovery over medium term (2-10 years).	Wide-scale, long term impact to physical environment, long term decrease in ecosystem function/health or value to socio-economic activities. Slow recovery over decades.	Extensive impact to/destruction of physical environment with no recovery or shutdown of socio-economic activities Long term (decades) and widespread loss of ecosystem function/health on a regional scale that damages value to socio-economic activities.	Complete destruction of regional physical environment / habitat with no recovery Complete loss of area or function of primary producers on a regional scale

Consequence Level		I	II	III	IV	V	VI
	Coastal Processes Geophysical processes, primary productivity/ nutrient cycling, conservation significant areas/coastal landforms and cultural, aesthetic or recreation values	Short term changes to local geophysical/hydrological processes, widespread loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale	Detectable but insignificant loss or change to local geophysical/hydrological processes, area or function of primary producers/nutrient cycling or conservation significant areas with rapid recovery within 2 years.	Moderate. Significant modification, destruction, removal or change of local geophysical/hydrological processes, wide-scale loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale with recovery over medium term (2-10 years).	Long term loss or change of local geophysical/hydrological processes, widespread loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale with slow recovery over decades	Extensive destruction of local geophysical/hydrological processes, widespread loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale with no recovery or long term (decades)	Complete loss or change of geophysical/hydrological processes. Complete loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale.
	Community and Economy Includes: fisheries (commercial and recreational); tourism; oil and gas; defence; commercial shipping	No or negligible loss of value of the local industry. No or negligible reduction in key natural features or populations supporting the activity.	Detectable but insignificant short-term loss of value of the local industry. Detectable but insignificant reduction in key natural features or population supporting the local activity.	Significant loss of value of the local industry. Significant medium-term reduction of key natural features or populations supporting the local activity.	Major long-term loss of value of the local industry and threat to viability. Major reduction of key natural features or populations supporting the local activity.	Shutdown of local industry or widespread major damage to regional industry. Permanent loss of key natural features or populations supporting the local industry.	Permanent shutdown of local or regional industry Permanent loss of key natural features or populations supporting the local or regional industry
	Culture and heritage Includes: Indigenous heritage and maritime heritage (i.e. shipwrecks)	No or negligible impact on the area's cultural or heritage values. No or negligible alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Detectable but insignificant impact on one or more of the area's cultural or heritage values. Detectable but insignificant alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Significant impact on one or more of the area's cultural or heritage values. Significant alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Major long-term effect on one or more of the area's cultural or heritage values. Major alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Complete loss of one or more of the area's cultural or heritage values.	Permanent loss of one or more of the area's cultural or heritage values with no recovery.

Santos

Table 6-2: Summary environmental consequence level descriptions

Consequence Level	Consequence Level Description
I	**Negligible** – No impact or negligible impact
II	**Minor** – Detectable but insignificant change to local population, industry or ecosystem factors
III	**Moderate** – Significant impact to local population, industry or ecosystem factors
IV	**Major** – Major long-term effect on local population, industry or ecosystem factors
V	**Severe** – Complete loss of local population, industry or ecosystem factors AND/OR extensive regional impacts with slow recovery
VI	**Critical** – Irreversible impact to regional population, industry or ecosystem factors

Table 6-3: Likelihood descriptions

No.	Matrix	Description
F	Almost Certain	Occurs in almost all circumstances OR could occur within days to weeks
E	Likely	Occurs in most circumstances OR could occur within weeks to months
D	Occasional	Has occurred before in Santos OR could occur within months to years
C	Possible	Has occurred before in the industry OR could occur within the next few years
B	Unlikely	Has occurred elsewhere OR could occur within decades
A	Remote	Requires exceptional circumstances and is unlikely even in the long term

Table 6-4: Risk assessment matrix

		Consequence					
		I	II	II	IV	V	VI
Likelihood	F	Low	Medium	High	Very High	Very High	Very High
	E	Low	Medium	High	High	Very High	Very High
	D	Low	Low	Medium	High	High	Very High
	C	Very Low	Low	Low	Medium	High	Very High
	B	Very Low	Very Low	Low	Low	Medium	High
	A	Very Low	Very Low	Very Low	Low	Medium	Medium

6.3 Residual consequences and risks

6.3.1 Planned events

The residual consequence levels from the planned impacts following implementation of standard and additional (as low as reasonably practicable; ALARP) management actions detailed in **Section 7** are summarised in **Table 6-5**. Given the likelihood of a planned event occurring is 100% (in other words, it will occur), the risk ranking is not assessed. A comprehensive impact assessment for each of the planned events, and subsequent management actions proposed by Santos to reduce the impacts to ALARP and/or acceptable levels are detailed in the following sections. Within the ENVID developed by Santos some environmental aspects had multiple residual consequence ratings since multiple environmental factors were assessed. In these cases the residual consequence of greatest severity was chosen for this summary.

Table 6-5: Summary of the residual consequence levels associated with planned impacts

CEMP section	Planned event impact	Residual consequence
7.6.1	Interactions with other marine users	II - Minor
7.6.2	Seabed and benthic habitat disturbance	II - Minor
7.6.3	Onshore ground disturbance	II – Minor
7.6.4	Noise emissions	II - Minor
7.6.5	Light emissions	II - Minor
7.6.6	Routine vessel discharges	I - Negligible
	Pre-commissioning water extraction and discharges	II - Minor
7.6.8	Atmospheric emissions	I - Negligible
7.6.9	Contingency Pipeline Discharges	II - Minor

6.3.2 Unplanned events

The residual risk levels from unplanned events following implementation of standard and additional (ALARP) management actions (detailed in **Section 7**) are summarised in **Table 6-6**. Comprehensive risk assessments for each of the unplanned events, and subsequent management actions proposed to reduce the risk to ALARP and acceptable levels are detailed in the following sections. Within the ENVID some unplanned events had multiple residual risk ratings since multiple environmental factors were assessed. In these cases the residual risk of greatest severity was chosen for this summary.

Table 6-6: Summary of the residual risk level associated with unplanned risks

CEMP section	Unplanned event risk	Residual risk level
7.7.1	Dropped objects	Low
7.7.2	Introduction of invasive marine species	Low
7.7.3	Unplanned marine fauna interaction	Low
7.7.4	Release of liquid hazardous material	Low
7.7.5	Release of hydrocarbon (offshore bunkering or vessel tank rupture)	Low
7.7.6	Release of dry natural gas	Very Low

6.4 Impact/risk assessment summary

The outcomes of the impact / risk assessment are presented in **Table 6-7**, including reference to the relevant management strategy within this CEMP proposed to manage individual environmental aspects.

Santos

Table 6-7: Summary of impact and risk assessment outcomes

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
Planned impacts							
Interaction with other marine users	Vessel activities including: + Surveys/ROV operations + Pre-lay works + Pipeline installation and pre-commissioning Marine DPD Project infrastructure including: + Pipeline and supporting/stabilising structures (including rock installation) + Pipeline crossings + Cable crossings Coastal DPD Project infrastructure and equipment required to construct it, including: + Temporary causeway/s	Impact to other marine users may occur as a result of the presence of vessels and associated exclusion zones, where applicable, in the Project Area, causing potential inconvenience. For trenching and spoil disposal activities, an expected 11 vessels will be involved, for deep water and shallow pipelay activities an expected 6 and 7 vessels, respectively, will be involved, for rock installation an expected 6 vessels will be involved and for pre-commissioning an expected 4 vessels will be involved. On an ongoing basis, subsea infrastructure may present a hazard to marine users due to the potential for snagging. The temporary physical presence of the causeway structures (approximately 200 m in length) and associated activities at the shore-crossing location may exclude other users from this intertidal/ shoreline area, although given this is within the existing disturbance footprint for the DLNG Facility, interactions are considered unlikely and impact negligible.	**Spatial** Localised around the Project vessels (and vessel exclusion zones, advised through a notice to mariners [NTM], as applicable), pipeline route and shore crossing activities including temporary causeway structures. Vessel exclusion zones are typically 500 m and will apply to Project vessels, including pipelay vessel, construction vessels and dredging vessels. **Temporal** Temporary and intermittent presence of project vessels within the Project Area within a nominal 15-month cumulative period. Ongoing presence of the pipeline within the Project Area once construction has been completed. Temporary presence of causeway structures.	+ Interactions with other marine users including potential displacement from commercial, recreation and tourism areas or alteration of routes to avoid exclusion areas. Turbidity generated from trenching activities may dissuade other users from the area while it is present. + Construction and the presence of a causeway/s at the shore-crossing area may exclude other users from the area during construction.	+ **Community and economy** (commercial fishers, traditional fishing, tourism and recreational activities, shipping traffic and other oil and gas activities)	II-Minor	**Section 7.6.1**
Seabed and benthic habitat disturbance	Pre-lay trenching with: + Cutter suction dredge (CSD) + Trailer suction hopper dredge (TSHD)	**Temporary and permanent infrastructure** Temporary and permanent infrastructure placement, resulting in direct disturbance to seabed, benthic habitat and cultural sites. Temporary	**Spatial** Localised within the Project Area to the pipeline, supporting structure footprints, trenching zones, causeway/s, spoil ground, anchoring footprints and the zones of moderate impact and zones of influence	Temporary and permanent infrastructure Disturbance of benthic habitat Disturbance of the seabed from vessel anchoring or placing of infrastructure and rock could:	**Marine environmental quality** (water quality, physical parameters that support fishing, aquaculture, recreation	II-Minor	**Section 7.6.2**

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
	+ Backhoe dredge (BHD) + Land-based excavators Spoil Disposal at: + Spoil ground + In situ Vessel activities: + Vessel anchoring during pipelay installation (pipelay, water winning, cutter dredge) + Positioning on spuds for back hoe and cutter + Installation of underwater positioning structures Installation of marine DPD Project infrastructure including: + Pipeline installation + ILT installation (including foundations) + Pre-lay span and supporting/stabilising structures including cable crossings and post-lay span rectifications + Rock placement Installation of coastal DPD Project infrastructure and equipment including: + Causeway/s (132 m x 44 m)	disturbance will occur from anchoring and the presence of temporary causeway/s. Permanent disturbance will occur from placement of permanent infrastructure (pipeline, rock protect etc.). Potential change to current flows Alteration of currents within Darwin Harbour will also occur due to temporary causeway/s blocking the flow of water. Trenching and spoil disposal Spoil from trenching areas will be transported to and disposed of in the DPD spoil disposal area in offshore NT waters, which will result in permanent disturbance from smothering due to sedimentation. Spoil from trenching activities at the shore crossing in the intertidal area will be side cast to the lower intertidal area to provide a mitigation to potential acid sulfate soil risk (i.e. to keep wet under most tidal conditions). Dependent upon access by BHD this build-up of spoil will be subsequently removed (if not already dispersed) for disposal to the DPD spoil disposal area in offshore NT waters using a BHD and SHB. **Onshore** Clearing of regrown native grasses and weeds in a previously disturbed area will be required prior to excavating a trench for onshore	derived from sediment dispersion modelling. **Temporal** Construction activities will typically occur for days to months at a site. Temporary causeway/s is in place for the duration of construction activity. Ongoing presence of the pipeline within the Project Area Permanent presence of DPD spoil ground in offshore NT waters Sporadically during high rainfall events due to increased levels of runoff.	Disturb the seabed and result in loss of habitat Impact infauna/ epifauna and primary producers Increase water turbidity and sedimentation Anchoring has the potential to result in disturbance to maritime heritage and sacred sites protected under the *Northern Territory Aboriginal Sacred Sites Act 1989* (NT) and the *Heritage Act 2011* (NT) The pipeline will create an artificial reef that could attract and support marine biota including fish which may benefit recreational fishing resources Rock placement may result in creation of artificial reef that could attract and support marine biota including fish which may benefit recreational fishing resources Creation of barrier to coastal processes Potential disturbance up to 20 m x 200 m in inter-tidal area Potential change to current flows Potential alteration of currents due to temporary project infrastructure with potential for seabed scouring/coastal erosion. Trenching and spoil disposal Increase in sedimentation and reduction in water quality from: Trenching activities	and aesthetics, sediment quality) **Marine ecosystem** (potential loss of the following habitats: macroalgae, sandy sediment with filter feeders and sponges, infauna, epifauna and biota quality, benthic habitats, and primary producer habitat, including mangroves) **Coastal processes** (bathymetry and seabed features) **Community and economy** (impacts to demersal fish habitats) **Culture and heritage** (heritage areas, shipwrecks, maritime archaeology and sacred sites)		

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
	Construction above HAT and onshore support facilities: + site clearing for onshore activities including pull winches and site buildings + placement of geotextile and hardstand + onshore laydown area + access road	pipeline section, which increases the risk of run off during rainfall event.		Additional run off created by onshore land and vegetation clearing and onshore site pad. Trenching nearshore in mangrove muds may result in ASS leaching and reduction in health of intertidal marine animals Direct and indirect impact to benthic habitats, including removal and smothering of benthic habitats Reduction in available food for marine species utilising the area Potential to impact fish health and other fauna Potential risk of coastal erosion If heavy rainfall is received, water may need to be pumped from the trench to adjacent land area. If stormwater runoff enters Darwin Harbour, coastal water quality may be impacted If trenching reaches groundwater, there is potential for acid release and metal leaching into the groundwater from oxidised ASS.			
Onshore ground disturbance	Onshore construction (above HAT) including: + trench/excavation + temporary storage of fill to be stockpiled in the disturbance footprint for use as backfill + disposal of excess fill + site clearing for onshore activities including pull	Clearing of regrown native grasses and weeds in a previously disturbed area will be required prior to excavating a trench for onshore pipeline section. Excavated soil will be temporarily stockpiled within the onshore Project Area to be used as fill or disposed of if in excess. Preparation of the DPD site pad, including vegetation clearing.	**Spatial** Localised within the Project Area **Temporal** Temporary duration when the section of trench will be open. The trench will be backfilled at the conclusion of pre-commissioning works. The clearing of any vegetation currently present onsite will be permanent.	Excavating the trench may result in: + minimal clearing of the ground/vegetation + digging soil and placing it adjacent for later re-use + additional fill of specific parameters to be brought to site if engineered backfill required. This may require disposal of excess 'original' soil – may need	+ Marine environmental quality (coastal water quality) + Marine ecosystem (marine fauna) + Terrestrial impacts (sediment quality, vegetation and terrestrial fauna) + Air quality	II – Minor	Section 7.6.3

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
	winches and site buildings + Placement of geotextile and hardstand + Access road			to be tested/treated prior to disposal + potential risk from erosion + spread of weeds + If heavy rainfall is received, water may need to be pumped from the trench to adjacent land area. If stormwater runoff enters Darwin Harbour, coastal water quality may be impacted. + If trenching reaches groundwater, there is potential for acid release and metal leaching into the groundwater from oxidised ASS.			
Noise emissions	Pre-lay works including: + Cutter suction dredge (CSD) + Trailer suction hopper dredge (TSHD) + Backhoe dredge (BHD) for excavating with potential used of hydraulic tools (Xcentric Ripper, hydraulic hammer) for fracturing rock + + Mass flow excavation (MFE) + Construction of two temporary causeways either side of the trench at the shore crossing Pipelay by nearshore pipelay barge in shallower	+ Vessel noise is considered non-impulsive (continuous) and broadband and includes vessel thrusters, engines and propellers, as well as noise emitted onboard which is converted to underwater noise through the hull. The main source of vessel noise will be from propellers or dynamic positioning (DP) thrusters (deeper water pipelay only). Project vessels (excluding trenching vessels) may emit noise up to ~180 dB re 1 µPa at 1 m. + Trenching will be completed using different trenching vessels, including a BHD, a TSHD and a CSD. Noise includes operation of vessel engines for propulsion (as applicable), onboard equipment, pumps and interaction of trenching equipment with the	**Spatial** For TSHD, CSD and BHD trenching and Xcentric Ripper tool use, permanent threshold shift (PTS) SEL24 hour ranges for dolphins, dugongs and turtles modelled at <50 m. Equivalent threshold range for hydraulic hammer modelled at 100- 160 m. For TSHD, CSD and BHD trenching and Xcentric Ripper tool use, temporary threshold shift (TTS) SEL24 hour ranges for dolphins, dugongs and turtles modelled at 40-350 m. Equivalent threshold range for hydraulic hammer modelled at 950- 2,500 m. The PTS and TTS ranges were shown to decrease with reduced hammering time (per 24 hours) for the hydraulic hammer. For behavioural response thresholds, ranges for marine mammals (dolphins and dugongs) varied from 100s of metres to 10s of kilometres for scenarios modelled at MSL.	+ Project activities including trenching, pipelay, additional vessel operations and will add to the existing underwater noise profile inside and outside Darwin Harbour during construction. + The use of sound in the underwater environment is important for marine animals, particularly cetaceans, to navigate, communicate and forage effectively, along with reptiles, sharks/rays and other fish, for a range of functions such as social interaction, foraging and orientation. Underwater noise could result in: + Acoustic masking: - Disruption to underwater acoustic cues	+ **Marine ecosystem** (marine mammals particularly cetaceans, marine reptiles, sharks, rays, pelagic and demersal fish, seabirds, shorebirds and invertebrates) + **Marine environmental quality** (impact to parameters that support fishing, aquaculture, recreation, aesthetics and cultural/ spiritual values)	II-Minor	Section 7.6.4

Santos

	waters including Darwin Harbour. Pipelay by dynamic positioning (DP) vessel in deeper waters outside of Darwin Harbour. Operation of onshore plant and equipment within Project Area at DLNG facility Support operations including: + General vessel operations during all DPD Project activities + Vessel and subsea positioning equipment e.g. MBES, SSS, LBL) / USBL) + Helicopter operations	seabed. The following source levels are considered representative of trenching vessel non-impulsive noise: + TSHD: 184 dB re 1µPa @1m + CSD: 182 dB re 1µPa @1m + BHD: 175 dB re 1µPa @1m + BHD rock breaking tools will be either non-impulsive from Xcentric Ripper tool or impulsive from hydraulic hammer (contingency only). Representative source levels are: + Xcentric Ripper: 184.8 dB re 1 µPa2 s m^2 + Hydraulic hammer: 192 dB 1 µPa2s m^2	Spatial scales for other activities are as follows: + Localised: A support vessel using main engines and bow thrusters to maintain position will become inaudible above background noise within thousands of metres. + Localised: A conservative estimate is that survey equipment (MBES/SSS) will be inaudible within thousands of metres, depending on the activity characteristics. + Localised: Helicopter noise will be highly localised and most of the noise will not transfer into the water. **Temporal** Vessel noise for the duration of the construction activity (12-15 months), with intermittent survey equipment and helicopter noise. Trenching vessel noise expected over indicative period of 2-3 months. Noise will be very infrequent during operations given scale of planned vessel pipeline inspection surveys indicatively every 1-3 years.	- Masking of vocalisations and signals from predators and prey + Behavioural response: - Modification of fauna behaviour (avoidance, attraction and disruption of normal behaviour) - Disturbance, leading to behavioural changes or displacement from areas - Indirectly by inducing behavioural and physiological changes in predator or prey species. + Physiological impacts: - Increased stress levels - Physical injury to fauna from exposure to excessive noise (barotrauma, hearing loss including TTS and PTS + Onshore construction activities are not expected to have an impact as they will not occur in water.			
Light emissions	Construction activities undertaken at night: + Surveys/ROV operations + Pre-lay works, pipeline installation and pre-commissioning + Lighting of Project Area at shore crossing	Potential impacts from light emissions may occur in the Project Area from: + Operational, safety and navigational lighting on the vessels including: - Pipelay vessel - CSD, TSHD and BHD - Construction vessel/survey vessel - Anchor handler (e.g. Multicat)	**Spatial** Localised: Limited light 'spill' or 'glow' on surface waters surrounding a vessel. Light spill modelling conducted for an offshore pipelay vessel and an offshore construction vessel, considered 'worst-case' in terms of vessel lighting for the DPD Project, indicates that vessel light spill intensity is around 10 times that of a full moon at 150-200m from these vessels (either individually or side by side) and drops to the intensity of a full	Change in fauna behaviour due to light emissions from vessels including: + Disrupting nesting turtles + Disorientating hatchlings + Hatchlings getting caught in vessel light pools with increased predation + Attract seabirds and shorebirds	+ **Marine ecosystem** (marine mammals, Marine reptiles, Pelagic and Demersal fish, Sharks, Rays, Seabirds and Shorebirds) + **Marine environmental quality** (impact to parameters that support fishing,	II-Minor	Section 7.6.5

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
		- Platform supply vessel (psv) - SHB + Spot lighting that may also be used as needed, such as equipment deployment and retrieval + Task and security lighting at the shore crossing. Lighting will typically consist of bright white (in other words, metal halide, halogen, fluorescent) lights typical of lighting used in the offshore petroleum industry and not dissimilar to lighting used by other vessels in the Project Area, including shipping and fishing vessels.	moon at 500-1000m (Pendoley, 2022). At a distance of 2.5-4.5km, light spill was modelled to have dropped to 0.1 (10%) of a full moon. At this level, lighting is considered unlikely to have any impacts on marine turtle hatchlings (which are considered particularly sensitive to lighting impacts) (Pendoley Environmental, 2022). **Temporal** Navigational and task lighting is required 24 hours a day for the duration of the construction activities in the marine environment. When onshore it is expected that night works will be undertaken as required		aquaculture, recreation, aesthetics and cultural/ spiritual values) + **Community and economy** (fisheries and tourism)		
Routine vessel discharges	All vessel activities	Only those discharges allowable under maritime regulations will be permitted as would apply to other commercial vessel using Darwin Harbour and NT waters. Planned discharges from vessels to the marine environment include: + Deck drainage/run off including residual chemicals - Deck drainage from rainfall or wash-down operations would discharge to the marine environment. The deck drainage would contain particulate matter and residual chemicals such as cleaning chemicals, oil and grease. + Sewage and grey water - The volume of sewage and food waste is directly proportional to the number of persons on-board the vessels. Depending on waste production rates and	**Spatial** <u>Localised:</u> The small volumes of non-hazardous discharges may cause localised nutrient enrichment, organic and particulate loading, toxic impacts to marine fauna, thermal impacts and increased salinity in waters around discharge points and in the direction of the prevailing current. The environment that may be affected by operational discharges will likely be contained within the Project Area and are predicted to be localised on a scale of metres to 10s of metres in the upper 5 m of the water column. <u>Localised:</u> Backflush water will be discharged onto existing disturbed shore crossing construction site to drain into the intertidal area. Backflush water will also potentially be discharged onto the installed rock causeway to baffle the flow of the discharged backflush water.	The small volumes discharged may cause localised nutrient enrichment, organic and particulate loading, toxic impacts to marine fauna, thermal impacts and increased salinity.	+ Marine environmental quality (water quality) + **Marine Ecosystem** (ecosystem health) + **Coastal processes** (primary productivity/nutrient cycling) + **Community and economy** (fisheries commercial and recreational) and tourism)	I-Negligible	Section 7.6.6

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
		the specifications of sewage systems available, the total volume of this waste stream generated typically ranges between 0.04 and 0.45 m³ per day per person. Treated sewage/greywater will be disposed in accordance with Marine Order 96. + Food wastes - Putrescible waste is estimated to consist of approximately 1 L of food waste per person per day. The vessel will dispose of food waste in accordance with AMSA and Marine Order 95, and MARPOL Annex V. + Cooling water - Seawater is used as a heat exchange medium for cooling machinery engines. Cooling water temperatures vary, depending on the vessel's engines' workload and activity. + Bilge water - While in the Project Area, the vessel may discharge oily water after treatment at a concentration of up to 15 ppm through an approved oily water filter system required by Marine Order 91. + Brine (if a reverse osmosis unit is used for water treatment) - If a reverse osmosis unit is used for water treatment, waste brine generated will be discharged to the ocean at a salinity of approximately 10% higher than seawater. The volume of the discharge depends on the requirement for fresh (or potable) water and	**Temporal** Intermittent and Short-term: During the period of the vessel activities (weeks to months), localised impacts to water quality will occur.				

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
		demand based on the number of people on-board.					
Pre-commissioning water extraction and discharges	Water winning and filter flushing for pipeline pre-commissioning.	Water winning from Darwin harbour is required to provide water for filling pipeline with treated seawater for flushing, cleaning, gauging and testing (FCGT) activities. Water is required to be filtered to remove particulates prior to being treated with chemical and pumped into pipeline. The filtering equipment will be required to be backwashed back into Darwin Harbour to clean the filter. The backwashed water will have a higher particulate concentration than ambient water conditions and will cause increased turbidity at the discharge point. Total backflush volume is expected to be approximately 300 m^3 over 3 days. TSS concentration of backflush water waster will be approximately 1,500 mg/L in the wet season and 680 mg/L in the dry season. Entrainment of marine fauna during water extraction process.	**Spatial** Localised: Backflush water will be discharged onto existing disturbed shore crossing construction site to drain into the intertidal area. Backflush water will also potentially be discharged onto the installed rock causeway to baffle the flow of the discharged backflush water. **Temporal** Intermittent and Short-term: During the period of the water winning for pre-commissioning (three days).	The small volumes discharged may cause localised nutrient enrichment, organic and particulate loading, toxic impacts to marine fauna, thermal impacts and increased salinity. Injury or mortality of marine fauna entrained in water extraction.	+ Marine environmental quality (water quality) + Marine Ecosystem (ecosystem health) + Coastal processes (primary productivity/nutrient cycling) + Community and economy (fisheries (commercial and recreational) and tourism)	II - Minor	Section 7.6.7
Atmospheric emissions	Atmospheric emissions from combustion engines associated with vessels, equipment and vehicles impacting on air quality and adding to GHGs in the atmosphere .	+ Operation of vessel engines, helicopters, generators, mobile and fixed plant and equipment. These emissions will include GHG emissions, such as carbon dioxide (CO_2), methane (CH_4) and nitrous oxide (N_2O), and non-GHG emissions, such as sulphur oxides (SO_X) and nitrogen oxides (NO_X) + Operation of incinerators on vessels	**Spatial** Localised: The quantities of gaseous emissions are relatively small and will, under normal circumstances, quickly dissipate into the surrounding atmosphere. **Temporal** For the duration of the construction activities	Atmospheric emissions from activity vessels can result in deterioration of local air quality. Emissions of GHG can cause an incremental increase in global GHG concentrations. Given the nature and scale of DPD Project construction activities (low frequency and relatively short duration), both risks are considered to have a negligible impact on air quality.	+ Marine environmental quality (Local air quality) + Community and economy (tourism)	I-Negligible	Section 7.6.8

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
		Although the vessels may use ozone-depleting substances (ODS), this will be in a closed rechargeable refrigeration system and there is no plan to release ODS to the atmosphere					
Contingency pipeline discharges	+ Pipeline installation and pre-commissioning: - Discharge of treated seawater in the event of pipeline remedial work during construction such as responding to a wet buckle event or stuck pig that requires flushing, filling and dewatering using treated seawater (Note – the wet buckle event is an unplanned event but in response to a wet buckle or stuck pig, there will be the planned response)	Contingency flushing and dewatering of treated seawater to the marine environment. During installation and pre-commissioning, in the event of a wet buckle or stuck pig, contingency flushing, filling and dewatering may be required in order to displace raw seawater from the pipeline that would otherwise lead to corrosion. Treated seawater discharge was modelled at three location–: + KP114 – 600 m^3 overflow + 19958.3 m^3 dewatering + KP102 – 600 m^3 overflow + 10623.3 m^3 dewatering and + KP84 – 600 m^3 overflow + 4399.9 m^3 dewatering.	**Spatial** Localised reduction in water quality in proximity to the discharge areas as treated seawater discharge modelling found (BAS-210 0035; RPS, 2022): + The discharge at KP84 resulted in a preservation chemical plume that was generally continuous up to ~1.4 km from the release location, with small, isolated patches predicted up to 9.61 km. Isolated patches beyond 2 km were predicted to occur during 2 of the 25 simulations and the plume was predicted to travel a maximum distance of 9.61 km in only one simulation. The isolated patches were due to an accumulation of the treated seawater, which had occurred during a current reversal, causing it to concentrate. The potential areas of exposure based on the PC99%, PC95% and PC90% thresholds 0.40 km^2, 0.17 km^2 and 0.08 km^2, respectively; + the discharge at KP102 resulted in isolated patches of the preservation chemical up to 6.78 km from the release location due to the plume drifting into the shallow intertidal areas, reducing the potential for mixing and dilution. The modelling also predicted a continuous area of exposure up to ~4 km west offset from the release location	Contamination/toxic effects to marine fauna. Potential impacts to fish and fisheries (commercial and recreational). Treated seawater discharge modelling does not identify any areas where dosage of biocide (time and concentration) will exceed the No Observable Effect Concentration (NOEC) and 99% species protection level (PC99%), i.e. 48 – 96 hour dosage of 0.06 – 0.1 mg/L).	+ Marine environmental quality (water quality, sediment quality and physical parameters that support fishing, aquaculture, recreation and aesthetics) + Marine ecosystem (infauna, epifauna and biota quality, marine mammals, marine reptiles, pelagic and demersal fish and sharks and rays) + Community and economy (physical parameters that support fishing and pelagic and demersal fish)	II-Minor	Section 7.6.9

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
			due to the plume migrating into the shallower waters, mixing less, resulting in the concentration accumulating. The area of exposure for the PC99% threshold was 4.14 km^2; and + the discharge at KP114, resulted in a maximum distance from the release location of 2.40 km and an area of exposure based on the PC99% threshold of 1.45 km^2. The preservation chemical concentrations did not trigger any other threshold over a 12-hour continuous duration. **Temporal** Temporary reduction in water quality in proximity to the discharge areas as treated seawater discharge modelling found (BAS-210 0035; RPS, 2022): + The release duration for pipeline overfilling or overflow has been estimated to be 38 minutes at all three locations + the release duration for dewatering activities varied due to the length of the pipeline at the given locations (KP84 >21.4 hours, KP102 >11.4 hours and KP114 >4.7 hours)				
Unplanned events							
Dropped objects	Vessel activities including: + Surveys/ROV operations + Pre-lay works + Pipeline installation and pre-commissioning, e.g. post-lay span rectification	Solid objects such as those listed below can be accidentally released to the marine environment + Non-hazardous solid wastes, such as paper, plastics and packaging, personal protective equipment, small tools and unsecured deck equipment	**Spatial** The event will only occur within the Project Area, and all non-buoyant waste material or dropped objects are expected to remain within the Project Area. Buoyant objects could potentially move beyond the Project Area. **Temporal**	If an object is dropped overboard, potential impacts would be limited to minor and localised disturbance of the seabed and benthic habitats near the dropped object. Benthic habitat loss.	+ Marine environmental quality (water quality and sediment quality) + Marine ecosystem (benthic habitats, infauna and epifauana and protected areas [Charles Point Wide RFPA])	Low	Section 7.7.1

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
		+ Hazardous solid wastes, such as batteries, fluorescent tubes, medical wastes, and aerosol cans + Equipment and materials, such as hard hats, tools or infrastructure (e.g., pipe joints, mattresses, frames) Dropped could result from: + Loss of control of suspended loads (e.g. concrete mattresses for pipeline stabilisation) may also be accidentally dropped through operator error or mechanical failure + Loss of equipment and waste off vessel deck Larger objects, such as A-frames and sea containers, are secured to the vessel deck and cannot credibly be lost overboard Dropped objects resulting in damage to the Bayu-Undan to Darwin pipeline and subsequent dry natural gas release is covered specifically as a separate unplanned event below.	An unplanned release of solids may occur during construction activities. Water contamination from hazardous objects could cause prolonged or permanent reduction in water quality.	Potential damage to communication cables in Darwin Harbour Potential damage to cultural heritage objects and sites. Potential reduction in water quality from water contamination, cause by objects such as batteries.	+ Community and economy (oil and gas operations, other users, e.g. fisheries, tourism and recreational fishers and other industries e.g. telecommunications)		
Introduction of invasive marine species (IMS)	Vessel activities including: + Surveys/ROV operations + Pre-lay works Pipeline installation and pre-commissioning, e.g. post-lay span rectification	Introduction of IMS may occur due to: + Biofouling on vessels and external/internal niches (such as sea chests, seawater systems) + Biofouling on equipment that is routinely submerged in water (such as survey equipment) + Discharge of high-risk ballast water + Cross-contamination between vessels	**Spatial** Localised (seabed and water column within the Project Area) to widespread if successfully translocated to new areas via ocean currents or project equipment transit. **Temporal** Temporary to long-term (in the event of successful translocation).	Potential establishment of IMS in the marine environment as a result of the project requires IMS to: + Be present on a vector (biofouling on activity vessels and ballast water are considered credible vectors) + Be released from the vector + Establish in the receiving environment	+ Marine environmental quality (ecosystem health) + Marine ecosystem (benthic habitats, benthic communities and ecological function and processes) + Coastal processes (ecological processes)	Low	Section 7.7.2

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
		Once established, IMS have the potential to out-compete indigenous species and affect overall native ecosystem function.		If established, impact could include localised (seabed and water column near the Project Area) to widespread impacts, if IMS successfully establish to new areas. IMS could displace and outcompete local species.	+ Community and economy (other users e.g. commercial and recreational users and ports and shipping)		
Unplanned marine fauna interactions	Vessel activities including: + Surveys/ROV operations + Pre-lay works + Pipeline installation and pre-commissioning, e.g. Post-lay span rectification Trenching activities – TSHD	There is the potential for vessels or equipment (for example, TSHD, CSD, and ROV) involved in construction activities to interact with marine fauna, including potential strike or collision, potentially resulting in severe injury or mortality.	**Spatial** Within the Project Area, in the immediate vicinity of the vessels or subsea equipment. **Temporal** During all construction activity.	Collisions may result in behavioural impacts, physical injury to, or the death of the fauna involved.	+ Marine ecosystem (marine fauna – marine mammals, reptiles, fish and sharks)	Low	Section 7.7.3
Release of liquid hazardous material (excluding diesel release from bunkering and vessel tank rupture which is presented below)	Vessel activities including: + Surveys/ROV operations + Pre-lay works Pipeline installation and pre-commissioning, e.g. Post-lay span rectification	Hazardous liquids used on the DPD Project include fuels and oils for equipment and machinery and other task-specific chemicals required for construction activities. Causes for accidental hazardous liquid releases include: + ROV failure (including oil seal, hydraulic system hose and quick-disconnect system failures) (approximately 0.05 m^3 (50 L)) + Stern tube oil (non-hydrocarbon-based lube oil) from the vessel thruster/propeller stern tube (approximately less than 1 m^3) + Loss of primary containment (drums, tanks, intermediate bulk containers (IBCs)) due to handling, storage and dropped objects (such as swinging load during lifting activities)	**Spatial** Volumes are likely to be small and limited to the volume of individual containers (such as IBCs, 44 gallon drums) stored on the deck of supply vessels or tank/hose sizes within equipment/machinery. A worst-case credible spill for this scenario is considered to be the loss of an intermediate bulk container (1 m^3). Spills to the marine environment of this size will disperse rapidly. Concentrations above toxic or harmful thresholds are expected to occur at short distances from the release point, and should a spill occur, potential impacts beyond the Project Area are not expected in the event of a worst-case spill. **Temporal** Potentially toxic or harmful threshold concentrations will be limited to a very short period following a release, as a spill is expected to disperse rapidly.	Decreases in water and sediment quality. The potential impacts to water and sediment quality are expected to be localised and temporary given the volumes of hazardous materials that may credibly be lost overboard. Impacts to fauna may result in injury or mortality through contact and/or ingestion; however, while this would reasonably be expected to impact upon individual animals; no population-scale impacts would credibly occur.	+ Marine environmental quality (water quality and sediment quality) + Marine ecosystem (marine fauna – marine mammals, reptiles, fish, sharks, seabirds and shorebirds)	Low	Section 7.7.4

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
		+ Vessel pipework failure or rupture, hydraulic hose failure and inadequate bunding + Spills or leaking machinery accidentally discharged overboard in deck drainage water + Overflow of the open and closed drainage systems Oily water from vessels includes bilge water and deck drainage water.					
Release of hydrocarbon (offshore bunkering or vessel tank rupture)	Vessel activities including: + Surveys/ROV operations + Pre-lay works + Pipeline installation and pre-commissioning, e.g. Post-lay span rectification Vessel bunkering	A minor spill (of up to ~10 m^3) of marine gas oil (MGO) or marine diesel oil (MDO) could occur during vessel to vessel refuelling. Spills during refuelling can occur through several pathways, including fuel hose breaks, coupling failure or tank overfilling. It is considered credible that a release of diesel to the marine environment could occur from a vessel fuel tank rupture. For the purpose of risk assessment, a worst-case discharge of up to 700 m^3 of MDO or MGO is considered credible from the offshore pipelay vesseland a spill of up to 300 m^3 is considered credible for project vessels in Darwin Harbour (e.g., the nearshore pipelay barge)	**Spatial** MDO spill trajectory modelling (BAS-210 0030; RPS, 2022) at KP 91.5 (just outside Darwin Harbour) indicated that there was some probability of a 700 m^3 marine diesel oil (MDO) spill, extending as follows (using the moderate exposure thresholds): + Shoreline loading was predicted to occur along the Cox-Finniss region, outside the Harbour to the west and within the West Arm in the dry season and along the Cox-Finniss region, outside the Harbour to the East and west and within the East Arm in the wet season. + Surface oil was predicted to occur within approximately 19.9 km (Dry season) and 19.3 (Wet season) of the release location. + Total submerged oil was predicted to occur within approximately 36.9 km (Dry season) and 51.3 km (Wet season) of the release location + Dissolved hydrocarbons were predicted to occur with approximately 10 km (Dry season) and 13.7 km (Wet season) of the release location.	A release to the marine environment, would be likely to rapidly disperse and evaporate but could lead to a reduction in: + Water quality + Sediment quality + Ecosystem health and impact to parameters supporting commercial and recreational uses Behavioural/physiological impact to marine fauna (particularly those associated with the surface such as cetaceans and marine turtles) and plankton within the upper water column and/or associated with shallow waters and shorelines. Impact to other users due to spill response activities. Impacts to benthic habitats, including intertidal habitats and primary producers. Impact to culture and heritage areas.	+ Marine environmental quality (water quality, physical parameters that support socio-economic activities) + Marine ecosystem (marine fauna, benthic habitats, intertidal habitats, protected areas [Charles Point Wide RFPA]) + Coastal processes (primary productivity e.g. mangroves) + Community and economy (community and economy e.g. commercial and recreational users) + Culture and heritage (impacts to sacred sites or important cultural heritage significance)	Low	Section 7.7.5

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
			MDO spill trajectory modelling for vessel fuel tank rupture (BAS-210 0030; RPS, 2022) at KP 114 (in the middle of Darwin Harbour) indicated that there was some probability of a 300 m^3 marine diesel oil (MDO) spill respectively, extending as follows (using the moderate exposure thresholds): + Shoreline loading was predicted to occur within the East Arm, Middle Arm, West Arm of the Harbour and at Wickham Point in both wet and dry seasons. During the wet season shoreline loading is also expected outside the harbour to the east and west. + Surface oil was predicted to occur within approximately 19.6 km (Dry season) and 18.9 km (Wet season) of the release location. + Total submerged oil was predicted to occur within approximately 30.3 km (Dry season) and 32.4 km (Wet season) of the release location + Dissolved hydrocarbons were predicted to occur with approximately 0.6 km (Dry season) and 7.3 km (Wet season) of the release location. The extent of shoreline loading, and distance travelled of MDO from smaller spills of 87.5 m^3 and 10 m^3 modelled at KP 114 will be lower than that described for the 300 m^3 scenario **Temporal** + MDO spill trajectory modelling at KP 91.5 for 700 m^3 indicated that within a 50-day simulation: 85% of spilled oil will have evaporated into the atmosphere.				

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
			+ 5% of spilled oil will remain on the shoreline. + 8% of spilled oil will have decayed by the end of the simulation. + No spilled oil will remain on the water's surface MDO spill trajectory modelling at KP 114 for 87.5 m^3 indicated that within a 20-day simulation: + 85% of spilled oil will have evaporated into the atmosphere. + 12% of spilled oil will remain on the shoreline. + 2% of spilled oil will have decayed by the end of the simulation. + No spilled oil will remain on the water's surface MDO spill trajectory modelling at KP 114 for 10 m^3 indicated that within a 10-day simulation: + 80% of spilled oil will have evaporated into the atmosphere. + 20% of spilled oil will remain on the shoreline. MDO spill trajectory modelling at KP 114 for 300 m^3 indicated that within a 30-day simulation: + 71% of spilled oil will have evaporated into the atmosphere. + 25% of spilled oil will remain on the shoreline. + 3% of spilled oil will have decayed by the end of the simulation. No spilled oil will remain on the water's surface				

Aspect	Activity	Description of hazard	Spatial and temporal scale	Potential impacts / risks	Sensitive receptors	Residual consequence level/ risk rating (planned impact / (unplanned risk)	Management strategy
Release of dry natural gas	During DPD Project construction – dropped object damages the existing Bayu-Undan to Darwin GEP.	A Bayu-Undan pipeline leak would result in a release of dry gas to the environment. Damage to the Bayu-Undan pipeline during construction activities could occur due to anchor impact/drag or objects being dropped from vessels	**Spatial** The scale of a pipeline leak is dependent on the nature of the damage. Small 'pinhole' leaks will result in a stream of bubbles which may dissolve before reaching the surface. A major rupture (e.g. catastrophic failure) would result in the discharge of a large volume of dry gas forming a large plume in the water column and dispersing into the atmosphere. A catastrophic failure is considered to be the worst-case credible release from the pipeline. **Temporal** The worst case discharge could occur during construction.	The gas cloud may result in impacts to air-breathing fauna, such as marine mammals, marine reptiles and birds. Animals breathing in the immediate vicinity of the release may be asphyxiated, potentially resulting in mortality. Given the dispersion of gas into the atmosphere, this potential effect would be highly localised to the release location. The gas cloud poses a risk to the health and safety of other users, such as fishers (traditional and commercial), tourism and recreational users. A gas cloud could potentially form an explosive mix which, if ignited, result in injury/death and damage to property. However, all other marine users will be excluded from the exclusion zone and therefore will not be within 500 m of an event, if it occurs.	+ Marine environmental quality (water quality, ecosystem health and physical parameters tat support socio-economic activities) + Marine ecosystem (marine fauna and protected areas [Charles Point Wide RFPA]) + Community and economy (other users e.g. commercial and recreational activities) + Culture and heritage	Very Low	Section 7.7.6

6.5 Assessment of potential for cumulative impacts

The following sections provide a summary of the assessment of potential cumulative impacts associated with DPD Project construction activities within the DPD Project Supplementary Environmental Report (SER) (BAS-210 0020).

6.5.1 Cumulative assessment methodology

Existing activities and proposed projects in the Darwin region were screened to determine their potential to cumulatively interact with the DPD Project impacts. This included government and private infrastructure projects, Darwin Harbour dredging projects and resource processing operations. The degree of cumulative impact between the DPD Project and identified nearby projects and activities was determined based on the potential for spatial and temporal interaction. The list of projects and activities considered to have a high or medium potential to interact cumulatively with DPD Project impacts, based on spatial and temporal overlap, is provided within the SER (BAS-210 0020). The potential cumulative impacts are discussed in further detail within the SER (BAS-210 0020) and have been summarised below. Cumulative impacts to all NT EPA Environmental Factors from the DPD Project and other projects/activities are not considered to be significant.

6.5.2 Cumulative impacts to marine environmental quality

This CEMP's activities have the potential to elevate turbidity levels within Darwin Harbor due to sediment suspension from trenching activities. Sediment dispersion modelling completed for the DPD Project (BAS-210 0036; RPS, 2022) predicted that there will be no exceedance of suspended sediment concentration (SSC) thresholds where influence or impact to sensitive benthic habitats (hard corals and seagrass) could occur, with modelling showing that sedimentation threshold exceedance would be restricted to within or immediately adjacent to the trenching footprint (RPS, 2022). These zones do not overlap with equivalent zones for other dredging activities in Darwin Harbour that may occur at the same time or close to the time of DPD Project trenching (including Mandorah Marine Facilities, HMAS Coonawarra dredging, INPEX maintenance dredging and Darwin Shiplift and Marine Industries dredging). Therefore, there is low potential for turbidity to result in cumulative impacts to water and sediment quality with other projects activities.

6.5.3 Cumulative impacts to marine ecosystems

This CEMP's activities will have direct impacts to the benthic habitats which will all be restricted to within or immediately adjacent to Project infrastructure footprints, including the designated spoil disposal ground. Benthic habitats in the infrastructure footprints do not consist of rare or sensitive receptors (i.e., hard corals or seagrass) and are predominately hard substrate or sediment substrates supporting filter feeding biota; these habitats are well represented throughout the Project Area. Direct impacts to benthic habitat are not predicted to have significant impacts to ecosystem functions. Although other projects will have direct impacts to benthic habitats, the cumulative impacts are unlikely to be significant when considered against the total available benthic habitat within Darwin Harbour.

There is also potential from indirect impacts to marine ecosystem, for example impacts to benthic habitats from increased SSC and sedimentation. As described above, SSC and sedimentation from DPD Project trenching is unlikely to interact significantly with water quality impacts from other dredging projects in Darwin Harbour, therefore the DPD Project is unlikely to result in significant cumulative indirect impacts to marine ecosystems.

Construction activity will temporarily increase vessel traffic in Darwin Harbour and if construction activity timing overlaps with other projects activities then vessel traffic will be further increased. Increased vessel activity has the potential to result in higher levels of sound and light emissions. It is however unlikely that cumulative activity from noise and light emissions will have a significant impact, as Santos considers proposed controls and management actions to be effective.

6.5.4 Cumulative impacts to atmospheric processes

This CEMP's activities will generate atmospheric emissions during construction which will contribute to the overall concentration of greenhouse gases (GHG) in the Earth's atmosphere. Emissions resulting from construction activities (i.e., vessel combustion engines) will occur on a short-term basis and be limited to the construction phase of the project. As an overall contribution to GHG gas levels, this will be a negligible increase. The DPD Project is included in Santos' Climate transition action plan and will adhere to the Santos GHG Management plan and energy management program.

6.5.5 Cumulative impacts to coastal processes

This CEMP's activities are not expected to significantly alter hydrological or geophysical process. The trenching activity and the installation of temporary (e.g., causeways at the shore crossing) or longer-term infrastructure (e.g., pipeline and rock protection) may have a slight and local effect on water movement, however not to the extent where this would be expected to change coastal geomorphology or coastal ecosystem processes. Furthermore there are no known projects which would interact with any localised changes in hydrology from the DPD Project to create cumulatively impacts.

6.5.6 Cumulative impacts to community and economy

This construction activities will increase vessel activity within Darwin Harbour, which has the potential to cause cumulative impacts to other commercial and recreational harbour users, in particular if the timing of construction activities overlap with other projects activities. It is important to note that the potential for cumulative impacts from vessel activities would occur primarily during the construction phase, which will be temporary (12 – 15 months). Furthermore, the increase in vessel activity related to the DPD Project is not expected to add significantly to the overall movements within Darwin Harbour based on annual harbour statistics and historical year to year variation. Therefore, DPD Project vessel activities are unlikely to contribute a significant extent to cumulative vessel impacts on harbour marine users.

6.5.7 Cumulative impacts to culture and heritage

Following controls in place, the DPD Project will not impact on indigenous sacred sites and will avoid maritime heritage objects as far as practical, with any maritime heritage disturbance localised to the pipeline route and done in accordance with regulatory requirements. There are no other activities or projects which are considered to have the potential for cumulative impacts with the DPD Project to identified cultural heritage sites.

7 Environmental management strategies

This section outlines the environmental management strategies (EMS) that will be implemented for management of areas and activities associated with the DPD Project construction works, therefore minimising and/or mitigating impacts and risks to the environment.

The EMS to be implemented as part of this CEMP comprise the following:

- Planned impact management strategies (**Section 7.6**)
- Unplanned risks management strategies (**Section 7.7**).

These EMS outline environmental performance objectives (EPOs) and measurable targets and management actions in place to ensure that the EPOs and targets are met. Performance indicators and monitoring activities (where applicable) are used to quantify success in meeting targets and identify the need for corrective actions. This ensures the continuous improvement of the effectiveness of the DPD Project's EMS. The EMS define the reporting requirements, terms, and responsibilities.

All EMS are structured to align with the template presented in **Table 7-1**.

Table 7-1: Environmental management strategy template

Item	Content
Environmental Performance Objectives (EPO)	Environmental management goal(s) tailored to each aspect per NT EPA requirements.
Target	Aspect specific measurable performance necessary to successfully achieve objective. Part 1 of NT EPA required performance criteria.
Performance Indicator	Quantitative or qualitative measures representing the performance related to Target(s). Part 2 of NT EPA required performance criteria.
Management actions	Tasks to be undertaken to meet objective/s. For example, install turtle deflection chains on TSHD drag head, comply with Darwin Port vessel speed restrictions etc.

7.1 NT EPA hierarchy

In the development of the EMS outlined within this CEMP Santos applied the Environmental Decision-Making Hierarchy outlined within the EP Act. This hierarchy being:

- To ensure that actions are designed to avoid adverse impacts on the environment
- To identify management options to mitigate adverse impacts on the environment to the greatest extent practicable
- And if appropriate, provide for environmental offsets in accordance with the EP Act for residual adverse impacts on the environment that cannot be avoided or mitigated[2].

[2] No offsets were deemed appropriate for this project.

7.2 Environmental performance objectives

Environmental performance objectives (EPOs) have been defined and are listed in following sections for each planned and unplanned event. The EPOs set the desired outcomes/goals for the activity, consistent with the NT EPA environmental factor objectives, and guide the setting or performance criteria.

7.3 Performance criteria

To assess whether EPOs are being achieved, specific performance criteria have been defined, taking the form of targets and performance indicators. Detailed specific measurable targets must be defined and then met to achieve overarching EPOs. Performance indicators are the factor that is measured to assess whether the performance targets have been achieved.

7.4 Management actions

To mitigate impacts of the DPD project construction activities and to achieve EPOs and performance criteria, management actions have been defined. This will include standard management actions that will be implemented as part of normal operations, and adaptive management actions that will be implemented if triggered.

7.5 Adaptive management mechanism

While the consequences of all planned impacts were assessed as either minor or negligible and the level of unplanned risks were assessed as low or very low, a monitoring and adaptive management mechanism will be applied to the following events to ensure EPOs are met:

+ Seabed and benthic habitat disturbance via generation of turbid plumes and sedimentation during trenching. These adaptive management actions are detailed in **Table 7-6** and the TSDMMP [BAS-210 0023]
+ Disturbance of marine fauna via noise generated during construction activities. These adaptive management actions are detailed in **Table 7-10** and the MMNMP [BAS-210 0045].

Adaptive management can also be triggered through Santos' incident response and assurance processes (**Section 8.3**), with corrective actions implemented and management adapted as required to address any identified incidents and non-conformances.

7.6 Planned event - impact management strategies

Santos' environmental impact assessment identified impacts related to nine planned events associated with DPD Project construction activities in the Project Area (Refer to **Section 6**).

7.6.1 Interaction with other marine users

7.6.1.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-2**.

Table 7-2: Interaction with other marine users (including construction activities and Project infrastructure) EPOs and associated performance criteria

EPO	Performance criteria	
	Target/s	Performance Indicator/s
Avoid incidents resulting from interaction with other marine users	Zero incidents resulting from interactions.	Number of recorded incidents
Minimise impacts to other marine users	Zero impacts to other marine users activities	Number of complaints from other marine users
Stakeholders are well-informed of the DPD Project and its associated restrictions	DPD Project stakeholder are provided with activity update/s and notification of commencement of trenching and spoil disposal activities.	Records demonstrate that stakeholder communications (meetings, publications etc.) performed as indicated in Stakeholder Engagement process

These EPOs in conjunction with the economic benefits of the Project to the Darwin economy align with the following NT EPA Factor objective (NT EPA 2022):

+ Community and economy – Enhance communities and the economy for the welfare, amenity and benefit of current and future generations of Territorians.

The management actions for this planned event are shown in **Table 7-3**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-3: Management actions for interaction with other marine users

MA Reference	Management Action
Standard management actions	
Avoidance	
DPD-MA01	Intertidal and shoreline construction is in pre-disturbed area (DLNG footprint) with no public access
DPD-MA02	Installation of the pipeline within pre-agreed route, with minimal incursions into the shipping channel (as defined in consultation with the regional harbour master)
Mitigation	
DPD-MA03	Anti-snag protection for mechanical support structures
DPD-MA04	Activity vessels equipped and crewed in accordance with Australian maritime requirements
DPD-MA05	Development and implementation of communication plan (including applicable notifications) for relevant stakeholders (including recreational and commercial fishing bodies and tourism operations) to minimise adverse impacts on other marine users
DPD-MA06	Implementation of cautionary zones around DPD Project vessel to mitigate against adverse interactions
DPD-MA07	One vessel will act as a surveillance vessel within the operational area during gas export pipeline installation and trenching activity
DPD-MA08	The proposed pipeline route will be marked on marine charts, in the same way that the existing pipelines are gazetted and marked on marine charts
DPD-MA09	Construction activities undertaken in accordance with Santos HSE management and marine vessel vetting processes
DPD-MA10	Causeway/s will be temporary structure/s and will be removed following trenching and pipeline installation
Additional (ALARP) management actions	
Avoidance	
DPD-MA11	Pipeline will not be installed in the vicinity of the jewfish aggregation area within the Charles Point Wide RFPA

Table 7-4: Additional management actions not adopted for interaction with other marine users.

Additional management actions not adopted		Reasoning for rejection
1	Signage to alert small boat users of activities and key locations (e.g., boat ramps)	Evidence from previous construction activities in Darwin Harbour indicates that this is not an effective method of public notification. Therefore Santos has committed to ongoing consultation with relevant stakeholders to develop more effective public notification.
2	Divide the pipeline installation scope into multiple campaigns to minimise work performed during the Northern Prawn Fishery season periods of sensitivity (2 April to 15 June and 1 August to 21 November)	The Project Area does not overlap areas historically fished by prawn trawlers.

7.6.1.2 Demonstration of ALARP and residual impact

No alternative options to the use of vessels are possible to undertake the marine activity.

The presence of the vessels, the pipeline and associated infrastructure (together with cautionary zones) and causeway/s is not expected to significantly impact tourism, commercial and traditional fishing operations or shipping traffic, given the localised areas of vessel activities, the relatively short durations of activities at any given point along the pipeline route, the various routes that can be taken to avoid the area and the limited number of users active in the vicinity.

The proposed management controls for marine user interaction are considered appropriate to manage the risk to ALARP. Standard management actions to reduce interaction with other marine users due to vessel presence during construction activities have been adopted.

An additional management actions that was deemed practicable and reduce the consequence of the presence of the pipeline on other marine users has been adopted (**Table 7-3**). Additional management actions that have not been adopted and the reasoning for rejection are found in

Table 7-4. The overall worst-case consequence is assessed as Minor. If the management controls are adhered to, then the risk of interfering with other marine users will be reduced to ALARP and the impact level is considered Minor and acceptable.

Stakeholders have been informed throughout the preparation of the CEMP of the proposed vessel activities and the presence of the pipeline as detailed in **Section 9**.

7.6.2 Seabed and benthic habitat disturbance

7.6.2.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-5**.

Table 7-5: Seabed and benthic habitat disturbance EPOs and associated performance criteria

EPO	Performance criteria	
	Target/s	**Performance Indicator/s**
Minimise direct impacts to sensitive marine habitat, cultural values and socio-economic sensitivities	Pipeline alignment and trench areas designed to minimise trenching requirements and direct footprint of seabed disturbance	+ Quantitative risk assessment (BAS-201 0925) + Nearshore pipeline route selection report- Darwin Harbour (BAS-200 0642)
	No trenching outside the pre-defined boundaries[1] of the trench areas	+ Nearshore pipeline trench and trench backfill alignment details 34in northern route (BAS-200 0523 001) + Trenching out-survey reports
	No anchoring on sensitive seabed areas	+ Incident reports of anchoring inside anchoring exclusion zone

EPO	Performance criteria	
	Target/s	Performance Indicator/s
	No installation activities (pipelay, and causeway construction, trench backfill etc.) outside of the proposed footprint	Records of construction areas, including: + Construction activity logs, vessel logs + Post-construction survey
	No damage to known heritage sites of significance or existing submerged infrastructure	Incident reports of damage to heritage sites/ artefacts of significance, or existing infrastructure
	Potential culturally significant objects discovered during construction reported and managed as per Unexpected Finds Protocol (BAS-210-0051)	Unexpected finds notification records
Avoid sediment dispersion and sedimentation related impacts on seagrass and hard coral habitats from trenching and spoil disposal activities	No DPD Project related reduction in water quality or sedimentation resulting in impact to seagrass and hard coral marine habitats	+ Water quality and benthic habitat monitoring data (refer to TSDMMP; BAS-210 0023) + Attributability assessments + Reports on adaptive management actions and effectiveness
Minimise impacts from spoil disposal	No spoil disposal outside of DPD spoil disposal ground	+ During and post spoil disposal Hydrographic surveys + Spoil disposal logs

Notes:

1. Boundaries of direct seabed and benthic habitat disturbance are defined by the trench design and any approved changes to that design.

These EPOs align with the following NT EPA Factor objectives (NT EPA 2022):

+ Coastal processes – Protect the geophysical and hydrological processes that shape coastal morphology so that the environmental values of the coast are maintained.
+ Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.
+ Culture and heritage – Protect culture and heritage.

The management actions for this planned impact are shown in **Table 7-6**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-6: Management actions for seabed and benthic habitat disturbance

MA reference	Management actions
Standard management actions	
Avoidance	
DPD-MA12	Trenching, stabilisation and freespan correction/ prevention will only be undertaken at identified areas (using standard positional accuracy measures used in the industry)
Mitigation	
DPD-MA13	Overflow from the TSHD will be undertaken through the adaptive management processes There will be 'environmental valve' or 'green valve' where available (attached to O/F to reduce air entrained, to reduce billowing and facilitates sediment sinking) as standard which will be used as a first step
DPD-MA14	Standard operating procedure for spoil disposal will be used.
DPD-MA15	Spoil will not be disposed of in a single location, to avoid developing a single large mound.
DPD-MA16	Spoil will only be placed *in situ* within a short section of trenching within intertidal zones to keep wet under most tidal conditions and will be removed subsequently where accessible by BHD and SHB for offshore disposal
DPD-MA17	When available, the base case is for the DP pipelay vessel to be used to install as much of the pipeline as depth allows DP vessel can be used in deeper water from KP23 (Territorial water boundary) to ~KP91.5 where the shallow water pipelay (<20 m) and associated anchoring will begin
DPD-MA18	Anchor management plans will be developed to allow safe anchoring of vessels undertaking pipelay, trenching and other support activities in the vicinity of sensitive habitats and nearshore heritage or sacred sites
DPD-MA19	Trained and competent anchor handling operators will be used
DPD-MA20	Anchors exclusion areas will be implemented to avoid sensitive habitats and heritage sites
DPD-MA21	Objects identified as cultural heritage objects that cannot be avoided will be managed as per NT Heritage Branch requirements

MA reference	Management actions
DPD-MA22	Differential global positioning system (DGPS) will be operational on the pipelay vessels to maintain accurate vessel position during installation
DPD-MA23	+ DGPS used to confirm ILT foundation structure position during installation + Underwater positioning system (USBL/ transponders) and ROV to confirm installation location and positioning (within required location accuracy to reduce disturbance to the seabed)
DPD-MA24	Installation plan will be developed and include: + requirement for trained and experienced vessel crews + pipe to be installed in trench as per approved design
DPD-MA25	Span-specific rectification plans developed that include: + pre-span method selection + real-time monitoring of span rectification + post-rectification inspections
DPD-MA26	Permanent rock installation will be limited to only those pipeline sections requiring stabilization and/or anchor protection, as informed by a quantitative risk assessment
DPD-MA27	Causeway/s will be temporary structure/s and will be removed following trenching and pipeline installation
Monitoring	
DPD-MA28	Adaptive management process will be implemented as defined within the TSDMMP (BAS-210 0023) which will include environmental monitoring of water quality with management measures applied if water quality exceeds trigger levels
DPD-MA29	Continuous monitoring of anchor wire tensions to prevent anchor drag on seabed and wire length measurement of the winch will be monitored to prevent anchor drag
Additional (ALARP) management actions	
Avoidance	

MA reference	Management actions
DPD-MA30	Pre-lay surveys will confirm the nature of the seabed within the ILT foundation location to ensure the structure is installed on bare area of the seabed. Post-lay surveys will allow verification of the impact assessment
DPD-MA31	Where practicable rock installation will not exceed seabed level within practical installation tolerances.

Table 7-7: Additional management actions not adopted for seabed and benthic habitat disturbance

Additional management actions not adopted		Reasoning for rejection
1	No trenching using CSD	Not technically feasible to stabilize and protect pipeline without trenching. The CSD is a significant mitigation in the event hard soils are encountered. Not utilizing the CSD may pose substantial schedule and cost impacts if harder soil types are encountered that are beyond the operating limits of the TSHD and BHD.
2	No trenching using TSHD	Not technically feasible to stabilise and protect pipeline without trenching using TSHD
3	No trenching using BHD	Not technically feasible to stabilise and protect pipeline without using BHD
4	Restrict timing of activities to operate outside of known sensitive periods. Flatback turtle peak nesting period is May to October and Dolphin peak calving is October to April.	Beaches closest to the Project Area are not considered significant turtle nesting beaches. Beyond ALARP to prevent trenching in peak dolphin calving period, based on excessive cost and schedule implications relevant to the potential minor impacts identified. Monitoring programs have been unable to determine spatial and temporal patterns in occurrence and abundance of dolphins in Darwin Harbour or any links to anthropogenic activities and behavioural disruption. Trenching areas are adjacent high use areas for vessels and the effects of turbidity are expected to be minor in the context of natural variability.
5	No offshore spoil disposal	Spoil will be generated from trenching activities. The only alternative is for onshore disposal of spoil, however the additional time in the field that would be required, would be prohibitive, prolong impact to other users of Darwin Harbour and additional environmental impacts would occur with onshore disposal. Given the minor impacts predicted from the offshore disposal of spoil, this control is rejected.
6	Spoil to be disposed of in a manner to create a uniform thickness of spoil	Spoil will not be disposed in one area only however will not be uniformly spread. The additional effort to ensure uniform thickness of spoil is not reasonably practicable in comparison to any potential benefits and would create additional turbidity. Sediment modelling has not identified re-suspension and ongoing transportation of sediments to be significant.

Additional management actions not adopted		Reasoning for rejection
7	No vessel anchoring	Given the shallow water depths, it is not feasible to use a DP vessel to install the pipeline and consequently, the use of an anchored pipelay vessel is required. Using a DP vessel will add a lot of noise in the shallow waters which is likely to be a bigger problem and disturbances from anchoring.
8	Pre-lay and post-lay benthic habitat surveys along the full gas export pipeline route	Habitats along the pipeline route are well known having been extensively studied through geophysical surveys and drop camera/ROV survey. The route has been shown to be devoid of unique habitat or high value primary producer habitat and additional surveys would provide no significant further information for informing management measures.
9	Pre-lay and post-lay surveys at anchoring locations	A conservative approach has been adopted for managing anchoring activities. Exclusion zones will apply to seabed areas identified as sacred sites, potential maritime heritage sites (identified by maritime heritage assessment) and mapped sensitive benthic habitat (hard coral and seagrass). Given the numerous anchoring locations which would be required to be surveyed and the conservative approach taken to delineate avoidance areas, pre- and post- anchoring surveys are considered to have a disproportionate level of cost and effort.
10	Pre-lay and post-lay surveys at ILT foundation location	Habitats along the pipeline route are well known as having been extensively studied through geophysical surveys and drop camera/ROV survey. The route has been shown to be devoid of unique habitat or high value primary producer habitat such as seagrass and hard corals. Pre- or pos-lay benthic habitat surveys would provide no significant further information of environmental benefit and have been ruled out.
11	Not using rocks to protect and stabilize the pipeline	Rocks are required to provide anchor protection adequate for mitigating risks associated with current and future vessel use within the Project Area. Rock protection has been reduced as far as practical while still maintaining adequate protection.
12	Do not use temporary causeway/s	Causeway/s required to allow excavator to access into deeper waters.

Santos

7.6.2.2 Adaptive management mechanism

An adaptive management process is defined within the TSDMMP (BAS-210 0023) which includes a water quality monitoring program with management measures applied if water quality exceeds turbidity trigger levels.

7.6.2.3 Demonstration of ALARP and residual risk

Trenching has been minimised as far as practicable to reduce impacts and where possible dynamic positioning (DP) vessel will be used to reduce anchoring disturbance.

Standard management actions have been adopted to reduce the impact of construction activities and the presence of the pipeline to the seabed and benthic habitats. Additional feasible management actions that reduce the impacts from seabed and benthic habitat disturbance have been adopted, including an adaptive management strategy designed to reduce turbidity effects from trenching through the application of management actions if monitored turbidity exceeds set threshold levels (detailed in the TSDMMP BAS-210 0023) (**Table 7-6**). Additional management actions that have not been adopted are outlined in **Table 7-6**, with the reasoning for their rejection.

Management actions are considered to manage risks to ALARP. Activities which may cause seabed and benthic habitat disturbance are localised in nature and there is a lack of unique habitats, hard coral or significant seagrass areas within the pipeline route and trenching areas. Additionally, original habitat that will be disturbed or removed is expected to recolonise rapidly on the pipeline and rock installation.

Residual impacts are expected to be temporary, as habitats under the pipeline and trenching zone footprints will be removed permanently but will recover rapidly as new habitat establishes. The area potentially impacted is small compared to the total area that the same habitats occupy outside of the disturbance footprint. The habitats in the direct disturbance footprint are not considered rare nor identified as critical foraging habitats for marine species. Additionally, no impacts are predicted to benthic habitats outside of the direct disturbance footprint. Therefore, no long-term impacts to marine species are expected.

Seabed disturbance created from trenching activities and construction activities associated with the causeway/s are not expected to significantly impact coastal processes, given the large volumes of water movement and temporary and localised nature of activities.

To avoid/manage impacts to maritime heritage, Santos has followed guidance provided by Department of Territory Families, Housing, and Communities – Heritage Branch. Additionally, Santos has received an Authority Certificate from AAPA for the DPD Project (Authority Certificate C2022/098) and will ensure conditions of the certificate and the requirements of the *Northern Territory Aboriginal Sacred Sites Act 1989* are met.

The residual impacts are therefore considered acceptable.

7.6.3 Onshore ground disturbance

7.6.3.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-8**.

Table 7-8: Ground disturbance and clearing EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Avoid impacts to native vegetation and fauna from ground disturbance and clearing	Ground disturbance within previously cleared areas	+ Recorded areas disturbed via excavation logs
	Zero incidents of disturbance to vegetation outside previously cleared areas	+ Number of recorded incidents of damage to environment outside of previously cleared areas
	Zero incidents of injury to terrestrial native fauna as a result of the DPD construction activities	+ Number of recorded incidents relating to terrestrial fauna injury or mortality as a result of ground disturbance.
Prevent project attributable mobilisation of heavy metals and acidification products to the surrounding environment	No incidents of project attributable mobilisation of heavy metals and acidification products to the surrounding environment	+ Records of ASS presence in sediment/soil via excavation logs/ daily observations/ photographs + Incident investigation records

These EPOs align with the following NT EPA Factor objectives (NT EPA 2022):

+ Terrestrial environmental quality – Protect the quality and integrity of land and soils so that environmental values are supported and maintained.
+ Terrestrial ecosystems – `Protect terrestrial habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.
+ Marine environmental quality (coastal water quality)
+ Marine ecosystem (marine fauna)

The management actions considered for this planned event are shown in **Table 7-9**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-9: **Management actions for onshore ground disturbance during offshore DPD construction activities**

MA Reference	Management Action
Standard management actions	
Avoidance	
DPD-MA32	Restrict disturbance to within the onshore Project Area and existing DLNG site area
DPD-MA33	Establish appropriate access restrictions into the onshore Project Area
Mitigation	
DPD-MA34	Direct stormwater runoff from the open trench to filter through the rock causeway, when present
DPD-MA35	Install geotextiles under primary construction area (i.e., site pad)
DPD-MA36	Return area to natural grade to match existing topography
DPD-MA37	All personnel to complete the DLNG HSE site induction
DPD-MA38	Maintain batters or install fauna ladders on trench entry and exit to allow fauna to exit the trench
DPD-MA39	Implement ASS and groundwater management and monitoring requirements within the ASSDMP (BAS-210-0049). The ASSDMP includes requirements for: + Soil stockpiling, laboratory testing and treatment, dependent upon location of work and encountering ASS + Groundwater laboratory testing and treatment, if groundwater is reached + Maintenance of testing and inspection records
DPD-MA40	Plan onshore works to minimise the amount of time soil is exposed to the air
DPD-MA41	Trench inspections to be performed daily to check for trapped wildlife

MA Reference	Management Action
DPD-MA42	Insert caps on ends of pipe if the pipe is to be unattended for periods >12 hours; to prevent fauna ingress.
DPD-MA43	Ensure any native vertebrates injured by DPD construction activities are referred to an appropriate wildlife carer group or veterinarian
Additional (ALARP) management actions	
Avoidance	
DPD-MA44	Limit vehicles to access roads, prepared site pad or defined boundaries within the onshore Project Area/DLNG disturbance
Mitigation	
DPD-MA45	Use water truck for dust suppression
DPD-MA46	Establish and implement vehicle speed controls
DPD-MA47	Wet parking area will be monitored daily, with photographs taken.

7.6.3.2 Demonstration of ALARP and residual impact

Construction works for the activities in this CEMP will be confined to the Project area and existing disturbed areas within the DLNG site area. Given the type of construction occurring there are no credible alternatives to reduce ground disturbance. **Table 7-9** details the management actions to reduce impact to onshore sediment quality, water quality, air quality, vegetation, and terrestrial fauna.

There will be regular inspections of trenches and preventative measures in place to control fauna egress. Engineering design will also prevent fauna entrapment.

During the construction of the Bayu-Undan pipeline natural material within the onshore Project Area was replaced by imported (non-ASS) fill material (generally sand) up to a depth of approximately 6 m below ground level. Hence it is considered that material at the site is likely to be non-ASS. None-the-less, should ASS material be encountered during earthworks within the onshore Project Area, it will be managed in line with the ASSDMP (BAS-210-0049).

Terrestrial fauna and vegetation may interact with stockpiled soils, however given that these will be managed within short temporal scales in accordance with the ASSDMP there would be an insignificant impact.

Given the temporary and localised nature of the impacts, and the existing disturbance at the site, the implementation of standard and additional (ALARP) management actions in place, including the implementation of the ASSDMP (BAS-210 0049) are appropriate for the nature and scale of this activity. Therefore, the assessed residual consequence for the impact of physical presence is minor and acid sulfate soils is negligible and both cannot be reduced further. Additional known residual impacts have been reduced to ALARP and are considered acceptable noise emissions.

7.6.4 Noise Emissions

7.6.4.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-10**.

Table 7-10: Noise emissions EPOs and associated performance criteria

EPO	Performance criteria	
	Target/s	Performance Indicator/s
Avoid hearing injury impacts to protected marine species from underwater noise generated by DPD Project trenching and spoil disposal activities	Zero incidents of injury or mortality to EPBC Act listed marine fauna from noise generated during DPD construction activities	+ Incident reports of injured or dead EPBC Act listed fauna + MFO records of EPBC Act listed fauna within vessel observation/exclusion zones
	Zero incidents of trenching or rock breaking while EPBC Act listed marine fauna observed in exclusion zone	+ MFO records of EPBC Act listed fauna within vessel exclusion zone

This EPO aligns with the following NT EPA Factor objectives (NT EPA 2022):

+ Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions for this planned impact are shown in **Table 7-11**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-11: Management actions for noise emissions during routine construction including the use of an Xcentric Ripper tool

MA reference	Management actions
Standard management actions	
Avoidance	
DPD-MA48	Observation and exclusion zones for marine fauna developed based on noise modelling results and standard protocols
Mitigation	
DPD-MA49	Vessel inductions for all crew to address marine fauna risks and the required management controls
DPD-MA50	Vessel and helicopter to complete Part 8 of the Environment Protection and Biodiversity Conservation Regulations 2000, which includes controls for minimising interaction with marine fauna
DPD-MA51	Personnel trained in MFO to be present on pipelay, dredge and rock installation vessels/barges during daylight hours, including one crew member with MFO training on the bridge at all times
DPD-MA52	All marine fauna interactions and observations to be appropriately recorded and reported to DEPWS/NT EPA and DCCEEW as required
DPD-MA53	Maintenance of vessel, vehicle and equipment combustions engines and vessel incinerators as per planned maintenance system
Additional (ALARP) management actions	
Avoidance	
DPD-MA54	Observation and shut-down zones for marine fauna have been developed based on noise modelling results for trenching and standard protocols and include: + Observation (150 m) and exclusion (50 m) zones for marine mammals and turtles. + Observation zone monitored for 10 minutes prior to commencing trenching during daylight only. A Marine Megafauna Observation and Adaptive Management Protocol for routine trenching operations, including the use of Xcentric Ripper tool, is to be followed as per MMNMP (BAS-210 0045)
Mitigation	

MA reference	Management actions
DPD-MA55	+ Soft start (ramp-up) of hydraulic tools (rock breaking) by BHD, where practicable + Soft start (ramp-up) of trenching equipment, where practicable, will apply to the CSD and TSHD

Santos

Table 7-12: Additional environmental management actions for contingency rock breaking using hydraulic hammer

MA reference	Management actions
Contingency management actions	
1	Increased Observation and Exclusion Zones for hydraulic hammering based on noise modelling results will be applied as follows: + If up to 8 hours of rock breaking is required, an increased Observation Zone of 2.5km (marine mammals) and 1km (turtle) will apply and an increased Exclusion Zone of 150m for marine mammals and turtles will apply + If up to 6 hours of rock breaking is required, an increased Observation Zone of 2 km (marine mammals) and 750 m (turtle) will apply and an increased Exclusion Zone of 100m for marine mammals and turtles will apply + If up to 4 hours of rock breaking is required, an increased Observation Zone of 1.5 km (marine mammals) and 750 m (turtle) will apply and an increased Exclusion Zone of 100 m for marine mammals and turtles will apply + If up to 2 hours of rock breaking is required, an increased Observation Zone of 1 km (marine mammals) and 500 m (turtle) will apply and an increased Exclusion Zone of 50 m for marine mammals and turtles will apply
2	Contingency hydraulic hammering protocols for managing noise impacts will be followed as per MMNMP (BAS-210 0045)
3	Hydraulic hammering for no greater than 8 hrs over a 24 hr period.
4	No hydraulic hammering at night
5	A separate vessel with MFO onboard will be required to patrol the Observation Zone prior to and during hydraulic hammering

Table 7-13: Additional (ALARP) management actions not adopted for noise emissions

Additional management actions not adopted		Reasoning for rejection
1	Schedule trenching activities outside of peak flatback turtle nesting period (May to October) or outside of peak Darwin Harbour dolphin calving period (October to April).	+ It would not be possible to avoid both peak periods. + The potential benefit of avoiding locations of higher marine megafauna sensitivity at certain times of the year, such as nesting periods for turtles and dolphin calving periods, is considered disproportionately low compared to the implications to Project scheduling and costs - While there are known flatback turtle nesting sites (Cox Peninsula and Casuarina Beach), and a known period of increased nesting activity (May to October), the densities of nesting turtles in these areas are very low and not significant on a regional scale (Chatto and Baker, 2008). Furthermore, these sites are on a scale of 1000s of meters away from the pipeline route and trenching areas (as they are from existing vessel traffic using navigation channels) and the relative risk of behavioural effects to turtles at this scale from vessel noise is considered low (Popper et al., 2014). For dolphins, there is evidence that there is a peak in calving within Darwin Harbour between October and April (Palmer, 2010). Important areas have not been defined however and given the high mobility of dolphin species within Darwin Harbour and the use of adjoining coastal areas (Griffiths et al., 2019) it is unlikely that behavioural disturbance around DPD Project activities, relative to the total area of Darwin Harbour and surrounding coastal waters, would have a significant impact on calving behaviour.
2	The observation period for marine megafauna prior to commencing dredging and pile driving is 20 minutes and the MFO is solely dedicated to the task of sighting and recording marine megafauna interactions prior to, and during, dredging and pile driving operations.	+ A 20-minute observation period was considered excessive for the size of the Observation Zone (150 m) and a 10-minute observation period was considered sufficient to monitor this zone for marine fauna. An additional 10 minutes would prolong dredging operations without any appreciable benefit. + A MFO for the pre-start up observation period was considered warranted however a MFO solely to the task of sighting and recording marine megafauna for the entirety of dredging operations was not considered warranted given that the dredging vessel to have multiple crew with marine fauna observation training onboard during daylight hours and the

Additional management actions not adopted		Reasoning for rejection
		vessel bridge to be constantly manned with at least one crew with MFO training on the bridge at all times.
3	No use of DP vessels.	Not using DP vessels will cause additional seabed and benthic habitat impacts through the need to use anchoring to hold position during pipelay. The use of DP also decreases pipelay duration and reduces impact to other users through shorter timeframe.
4	Cease noise generating activities (e.g. DP) when near marine fauna.	Ceasing DP activities when near sensitive fauna may reduce the potential for impacts, however, the potential for impacts beyond behavioural disturbance are very low. Engine/DP thruster noise cannot reliably be ceased due to the safety critical role of vessel propulsion. It is also not practical to cease pipelay or other critical construction activities in a short timeframe as safely abandoning such operations can often take a number of hours (namely laying down the pipeline or disconnecting from a structure), during which time the impacted fauna will have left the area. Therefore, this control is not deemed feasible.
5	Soft start/power-up procedures for use of sonar equipment and use of fauna observation and shutdown zones.	The systems being used are at a low power or are an intermittent type such that the reduced cumulative exposure would reduce TTS or PTS impacts for marine fauna and behavioural impacts were not considered credible
6	No use of helicopters.	Use of helicopters required (e.g. vessel/crew transfers) and restriction will result in an overall longer duration construction activity and therefore noise impacts
7	Avoidance of night work for routine trenching and Xcentric Hammer use.	Avoidance will result in an overall longer duration construction activity and therefore noise impacts and also increase the safety risk profile. The cost of implementing this far exceeds the benefit gained.

7.6.4.2 Adaptive management mechanism

Adaptive management mechanisms related to noise emissions are outlined in the MNMMP (BAS-210 0045).

7.6.4.3 Demonstration of ALARP and residual impact

Use of vessels and subsea equipment will be required to complete construction activities, therefore underwater noise emissions are unavoidable if the planned activity is to proceed.

Trenching and rock breaking activities will follow industry standard measures to prevent physiological impact to marine megafauna from noise, including implementation of Observation and Exclusion Zones and associated adaptive management measures, use of marine fauna observers to monitor zones and use of soft-starts where practicable. These zones have been informed by underwater noise modelling and appropriate thresholds to ensure the scale of these zones are sufficient to meet environmental objectives. In addition to the implementation of monitored zones, marine megafauna are expected to display avoidance behaviour of sound source at close ranges, thereby reducing the potential for physiological impact. For contingency hydraulic hammering, while not expected to be required, the zones have been increased significantly and additional measures put in place to ensure physiological impacts to do not occur to marine megafauna.

While there is the potential for behavioural response on larger scales of 100s of metres to 1000s of metres from continuous noise from trenching activities, depending upon fauna type, the activities are not expected to produce emissions significantly louder than other marine vessels that frequent or transit through the vicinity of the Project Area (e.g. cargo ships, LNG tankers, cruise ships and offshore oil and gas vessels). Given construction activity is temporary and trenching is expected to last for ~2-3 months, the addition of Project noise sources to the existing ambient noise environment is not expected to result in any significant additional behavioural effects within Darwin Harbour. The activity is unlikely to affect the health of and/or displace marine megafauna, as biologically important behaviours can continue given the widespread availability of suitable habitat within Darwin Harbour relative to the size of behavioural effect ranges.

Santos has considered the actions prescribed in various recovery plans and conservation advice, such as the Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017), when developing the controls relevant to potential construction activities to minimise noise impacts on marine fauna. Management controls are in place to reduce operating noise, including vessel operational protocols, and to adhere to the fauna interaction management stated in EPBC Regulations (Part 8). As such, noise emitted during the activities is not expected to significantly impact on marine fauna within the Project Area.

The potential benefit of avoiding locations of higher marine megafauna sensitivity at certain times of the year, such as nesting periods for turtles and dolphin calving periods, is considered disproportionately low compared to the implications to Project scheduling and costs. There are also mutually exclusive sensitivity periods for dolphins and turtles. While there are known flatback turtle nesting sites (Cox Peninsula and Casuarina Beach), and a known period of increased nesting activity (May to October), the densities of nesting turtles in these areas are very low and not significant on a regional scale (Chatto and Baker, 2008). Furthermore, these sites are on a scale of 1000s of meters away from the pipeline route and trenching areas (as they are from existing vessel traffic using navigation channels) and the relative risk of behavioural effects to turtles at this scale from vessel noise is considered low (Popper et al., 2014).

For dolphins, there is evidence that there is a peak in calving within Darwin Harbour between October and April (Palmer, 2010). Important areas have not been defined however and given the high mobility of dolphin species within Darwin Harbour and the use of adjoining coastal areas (Griffiths et al., 2019) it is unlikely that behavioural disturbance around DPD Project activities, relative to the total area of Darwin Harbour and surrounding coastal waters, would have a significant impact on calving behaviour.

Other additional management actions were considered but rejected due to lack of feasibility, the associated cost or because the effort was disproportionate to any benefit (**Table 7-11**). Therefore, the risks to marine fauna from noise associated with the DPD Project activities are considered to be ALARP.

The potential consequence of noise emissions on receptors is assessed as II - Minor following the implementation of standard and additional (ALARP) management actions and will not have a significant impact on any habitat identified as critical to the survival of marine megafauna. With the management actions in place, no significant impacts are expected. Therefore, the impacts of noise emissions to the receiving environment are ALARP and considered environmentally acceptable.

7.6.5 Light emissions

7.6.5.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-14**.

Table 7-14: Light emissions EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Minimise light disturbance to fauna and fauna habitat (including to turtle nesting beaches and turtle hatchlings)	Nighttime task light generation is minimised as described in management actions.	+ Records of vessel light spill on Darwin Harbour turtle nesting beaches + Records of HSE inspections. + Records of inductions i.e., inductions cover use of excessive task lighting at night

These EPOs align with the following NT EPA Factor objectives (NT EPA 2022):

+ Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions for this planned impact are show in **Table 7-11**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Santos

Table 7-15: Management actions for light emissions

MA Reference	Management actions
Standard management actions	
Avoidance	
DPD-MA56	Pipelay vessels will have enclosed pipe welding decks
Mitigation	
DPD-MA57	Shielding, where practicable, and/or orienting operational lights (excluding navigational lighting) on vessels to limit light spill to the environment
DPD-MA58	Housekeeping measures will be adopted, including requiring all crew to keep shutters on windows closed at night, to limit light emissions from vessels
Additional (ALARP) management actions	
Mitigation	
DPD-MA59	Vessel searchlights will only be operated in an emergency situation.
Monitoring	
DPD-MA60	Santos will document vessel light spill on Darwin Harbour turtle nesting beaches as part of the DPD Project's environmental monitoring program

Table 7-16: Additional management actions not adopted for light emissions

Additional management actions not adopted		Reasoning for rejection
1	Crew transfers or loading of supplies (not including linepipe deliveries) which require direction of floodlights outside vessel will not occur during hours of darkness within 10 km of turtle nesting beaches during peak hatchling season. Linepipe loading may require additional lighting as deemed necessary during operation to maintain a safely lit work area.	Nearby beaches are not significant turtle nesting beaches. Significant turtle nesting beaches are >10 km from the Project Area. Therefore, the cost of this management action is disproportionately higher than the change to environmental impact.
2	Do not undertake gas export pipeline installation during peak turtle nesting and hatchling emergence season.	Nearby beaches are not significant turtle nesting beaches. Significant turtle nesting beaches are >10 km from the Project Area. Therefore, the cost of this management action is disproportionately higher than the change to environmental impact.

Additional management actions not adopted		Reasoning for rejection
3	Sequence activities to limit the time pipelay, and associated activities, are performed within peak internesting periods and near important habitat for listed marine turtles.	Nearby beaches are not significant turtle nesting beaches. Significant turtle nesting beaches are >10 km from the Project Area. It is additionally not practicable to time the start date of the activity due to scheduling constraints. Therefore, the cost of this management action is disproportionately higher than the change to environmental impact.
4	Vessels shall be fitted with turtle friendly (low vapour sodium or LED) directional lighting (requirement applies to external lighting only).	Nearby beaches are not significant turtle nesting beaches. Significant turtle nesting beaches are >10 km from the Project Area. Not practicable to change out vessel lights for short duration activities and also lighting must meet navigational requirements. White lights required for operational requirements will be directed onto work areas and/or shielded to limit external light spill. It is therefore not feasible.
5	Marine fauna observers specifically looking out for turtle hatchlings entrapped within light spill with adaptive management measures should a significant number be spotted.	Possibility of entrapment will be low, due to use of shaded and directed inward lighting and with only very low density turtle nesting locations nearby. Nearby beaches are not significant turtle nesting beaches. While dedicated observers for turtle hatchlings are not proposed, project vessels will record all fauna interactions and incidents observed. Corrective actions will apply as part of the incident reporting and investigation process.
6	Do not perform pipe transfer operations at night when operating within 10 km of marine turtle nesting habitat during peak hatchling emergence season.	Nearby beaches are not significant turtle nesting beaches. If pipe transfer is restricted to day light hours, the pipelay vessel will run out of pipe and it will have to slow lay, stop laying or lay down the pipe . Slowing down pipelay will result in an increase in the amount of time that the pipelay is operating within 10 km of marine turtle nesting habitat. Light spill during pipe transfer will be minimal as flood lights will be directed onto the deck of the PSV and not the surface of the water. It is also temporary. Therefore, the cost of this management action is disproportionately higher than the change to environmental impact.
7	Restrict lighting to navigation lights only	Operational lighting, including lighting of work areas and decks, is required for safe working conditions. Therefore, the cost and increased risk of this management action is disproportionately higher than the change to environmental impact.

7.6.5.2 Demonstration of ALARP and residual impacts

Artificial lighting is required 24 hours a day during the activity to maintain operational and navigational safety. A minimum level of artificial lighting is required on a 24-hour basis to alert other marine users of the activity. There are also minimum light requirements that will be necessary to provide safe working conditions. To reduce lighting at night further would restrict the activity hours resulting in the activity taking approximately twice as long to complete. This would increase the period of time the Project Area would need to be avoided by other marine users and the amount of waste, discharges and emissions produced. The larger scale consequences associated with reducing light levels during construction activities are disproportionate to the environmental benefits.

Lighting of the vessels is industry standard and required to meet relevant maritime and safety regulations. The potential consequences of the anthropogenic light sources in the Project Area are considered to be restricted to short-term behavioural impacts on individual fauna that may be present in the Project Area during the activity.

The activity will not compromise the objectives as set out in the Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017), the Wildlife Conservation Plan for Seabirds (Commonwealth of Australia, 2020c) or the National Light Pollution Guidelines for Wildlife (Commonwealth of Australia, 2020b), as biologically important behaviours of nesting turtle adults and emerging/dispersing hatchlings at important sites can continue given that there are no regionally significant turtle nesting beaches close to the Project Area. Additional management actions that were considered feasible and cost effective were adopted (**Table 7-15**). Therefore, the use of 24-hour per day artificial lighting at an intensity to allow work to proceed safely is considered ALARP.

BIAs for flatback turtles overlap the Project Area. Significant impacts are not expected on nesting turtles or emerging/dispersing hatchlings, and light emissions from the activity will not cause turtles to be displaced from these habitats. The nearest known nesting sites are at Cox Peninsula and at Casuarina Beach, although these are not considered significant nesting areas and Casuarina Beach is additionally a popular recreational area with significant potential for land disturbance from people and animals, including lighting (e.g., bonfires).

The Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017) specifies the following priority action for the turtles in relation to light pollution:

+ Artificial light within or adjacent to habitat critical to the survival of marine turtles will be managed such that marine turtles are not displaced from these habitats.

The Project Area overlaps an internesting buffer habitat critical to the survival of flatback turtles, which extends 60 km from key nesting locations. However, internesting female turtles are not impacted by light emissions from either natural or anthropogenic sources, as they do not use light as a cue for this behaviour. Therefore, light emissions will not have a significant residual impact on marine turtles or any habitat identified as critical to the survival of marine turtles and residual impact is considered environmentally acceptable.

7.6.6 Routine vessel discharges

7.6.6.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-17**.

Table 7-17: Routine vessel discharges EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Minimise environmental impacts from waste and liquid discharges generated during DPD construction activities	Zero recorded environmental incidents of vessel discharges not meeting regulatory requirements	+ Incident records of non-compliant discharges

These EPOs align with the following NT EPA Factor objectives (NT EPA 2022):

+ Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions for this planned impact are shown in **Table 7-18**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-18: Management actions for routine vessel discharges

MA reference	Management Action
Standard management actions	
Mitigation	
DPD-MA61	Vessels will comply with relevant Marine Orders with respect to planned discharges, including: + Marine Order 91 – Marine Pollution Prevention: Oil, which implements Annex I of the MARPOL + Marine Order 96 – Marine Pollution Prevention: Sewage, which implements Annex IV of the MARPOL
DPD-MA62	Santos Marine Assurance Process
Additional management actions	
N/A	

Table 7-19: Additional management actions not adopted for routine vessel discharges

Additional management actions not adopted		Reasoning for rejection
1	Storage and transport of sewage, putrescible and waste for disposal onshore regardless of legislative requirement.	Waste is managed in accordance with required legislative controls and discharge of sewage, greywater, and putrescible results in a negligible impact. The additional costs for transport and disposal, increased health, and safety risks (e.g., hygiene) and increased environmental impact (e.g., atmospheric emissions from vessels transporting waste) outweigh any environmental benefit gained.

7.6.6.2 Demonstration of ALARP and residual impact

Vessel waste is managed in accordance with marine legislation and results in negligible impacts in the discharge of sewage, greywater, and putrescibles. The additional costs, health and safety risks (i.e., hygiene) and environmental impact (i.e., emissions) outweigh any environmental benefit gained by taking vessel waste for onshore disposal. The Project Area is within NT waters i.e., within 3 nm of 'nearest land' (territorial baseline) therefore discharges of sewage and food wastes cannot occur in the Project Area (i.e., within 3 nm of land) as per MARPOL Annex IV and V. To reduce the impacts and risks associated with discharging liquid wastes, these wastes will be treated in line with industry best practice. Discharge of sewage and other liquid wastes from vessels in Australian waters is permissible under the *Protection of the Sea (Prevention of Pollution from Ships) Act 1983*, which reflects requirements of MARPOL 73/78 Annexes IV, V and I and AMSA Marine Orders 95 and 96. The MARPOL standard is considered to be the most appropriate standard, given the nature and scale of the activities. These standards are internationally accepted and used industry wide.

Stakeholders have been informed throughout the preparation of the CEMP of the proposed vessel activities as detailed in **Section 9**.

The proposed standard management actions and additional management actions that are considered feasible and cost effective for routine vessel discharges are considered appropriate to manage the risk to ALARP. Additional management actions that were not adopted are detailed in **Table 7-19**, with reasoning for their rejection.

Routine vessel discharges are not expected to have significant residual impact to the receiving environment with the management controls proposed, including compliance with all MARPOL requirements. Therefore, compliance with the relevant and appropriate MARPOL requirements and standards is expected to reduce the residual impacts to a level which is considered environmentally acceptable.

7.6.7 Pre-commissioning water extraction and discharges

7.6.7.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-20**.

Table 7-20: Pre-commissioning discharges EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Minimise environmental impacts from pre-commissioning water extraction and discharges generated during DPD construction activities	Zero environmental harm resulting from mismanagement of pre-commissioning water extraction and discharges	+ Number of recorded incidents and severity of incidents

These EPOs align with the following NT EPA Factor objectives (NT EPA 2022):

+ Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions for this planned impact are shown in **Table 7-21**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-21: Management actions for pre-commissioning water extraction and discharges

MA reference	Management Action
Standard management actions	
Mitigation	
DPD-MA63	Protection/screening of abstraction hose end to prevent fauna entrainment
DPD-MA64	Backflush water will be discharge onto existing disturbed shore crossing construction site so that it drains into the intertidal area and solids disperse with tidal movement, minimising turbidity effects
Additional management actions	
DPD-MA65	Where possible, and dependant on the progress of shore crossing rock installation at time of FCGT activities, backflush water will be discharged onto installed rock, to baffle the flow of discharged backflush water

Table 7-22: Additional management action not adopted for pre-commissioning water extraction and discharges

Additional management actions not adopted		Reasoning for rejection
1	Use of potable water instead of sea water for pre-commissioning activities	Potable water isn't typically used for pre-commissioning due to the difficulties in obtaining the large volumes required –potable water is normally transported by road tankers with only 20 – 30m^3 capacity, compared with ~ 50,000 m^3 required to fill the DPD Pipeline. Potable water would also require treatment with some chemicals such as oxygen scavengers and biocides to mitigate oxygen or bacterial corrosion. A reverse osmosis (RO) plant could be set up on site to manufacture "potable water" from sea water, but normally the chloride levels will be higher from an RO plant than potable water which could lead to corrosion. This would also need a sea water winning spread. This would introduce additional impacts such as discharge of a high salinity waste stream and would have large pumping/energy requirements.

7.6.7.2 Demonstration of ALARP and residual impact

There are no additional practicable alternatives to using seawater for pre-commissioning. Potable water is not used for testing due to the difficulties in obtaining the large volumes required. As discussed in **Table 7-22**, the use of potable water or an RO plant are not practicable.

The proposed standard management actions and additional management actions that are considered feasible and cost effective for pre-commissioning water extractions and discharges are considered appropriate to manage the risk to ALARP. Additional management actions that were not adopted are detailed in **Table 7-21**, with reasoning for their rejection.

Stakeholders have been informed throughout the preparation of the CEMP of the proposed vessel activities and the presence of the pipeline as detailed in **Section 9**.

Pre-commissioning discharges are not expected to have significant residual impact to the receiving environment with the management controls proposed, including compliance with all requirements. Therefore, compliance with the relevant and appropriate requirements and standards is expected to reduce the residual impacts to a level which is considered environmentally acceptable. Although, there is potential for marine fauna entrainment from water winning activities the abstraction hose will be fitted with protection/screening preventing this, which is deemed environmentally acceptable.

Deteriorating water quality is identified as a potential threat to turtles in the marine turtle recovery plan and some bird and shark species. However, the routine vessel and pre-commissioning discharges are not expected to have significant residual impact to the receiving environment with management controls proposed. Therefore, the impact level of routine vessel and pre-commissioning discharges due to vessel-based activities is considered acceptable.

7.6.8 Atmospheric emissions

7.6.8.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-23.**

Table 7-23: Atmospheric emissions EPOs and associated performance criteria

EPO	Performance criteria	
	Target/s	Performance Indicator/s
Minimise environmental impacts from atmospheric emissions generated during DPD construction activities	Compliance with preventative maintenance procedures for equipment utilised for construction activities that generate atm emissions combustion engines, incinerators and ozone depleting substances (ODS) containing equipment	+ Planned maintenance records

These EPOs align with the following NT EPA Factor objective (NT EPA 2022):

+ Air quality – Protect air quality and minimise emissions and their impact so that environmental values are maintained.

The management actions for this planned impact are shown in **Table 7-24.** Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-24: Management actions for atmospheric emissions

MA reference	Management actions
Standard management actions	
Mitigation	
DPD-MA53	Maintenance of vessel, vehicle and equipment combustions engines and vessel incinerators as per planned maintenance system
DPD-MA66	Atmospheric emissions from combustion, incinerators and ODS managed in accordance with standard maritime practice (MARPOL) MARPOL standards include no incineration in harbour
DPD-MA67	Monitoring and reporting of fuel consumption and calculated GHG emissions
DPD-MA68	Use of low sulphur diesel
Additional (ALARP) management actions	
N/A	

7.6.8.2 Demonstration of ALARP and residual risk

Power generation through combustion of fossil fuels is essential to undertaking the construction activities. There are no practicable alternatives to the use of equipment, vessels and vehicles powered by combustion engines for the activity. Given the routine maintenance of these systems by suitably qualified personnel, all practicable management measures are considered to have been implemented.

Atmospheric emissions from vessels are managed in accordance with marine legislation and results in negligible impacts. Part of the Project Area is within Darwin Harbour, where incineration is prohibited. The additional costs, health and safety risks and environmental impact (i.e., emissions) from returning waste to shore for vessel operating outside of the harbour (i.e., hygiene additional increased fuel combustion for additional vessel trips) outweigh any environmental benefit gained by preventing incineration.

There is no option other than to use refrigeration systems (e.g., air conditioning and food refrigeration) to provide acceptable workplace conditions and meet food hygiene standards. Additionally, there is no practical alternative to using ozone depleting substances (ODS) as refrigeration chemicals. Accidental release and fugitive emissions of ODS has the potential to contribute to ozone layer depletion. Maintenance of refrigeration systems containing ODS is on a routine, but infrequent basis, and with controls implemented, the likelihood of an accidental ODS release of material volume is considered rare.

Records of fuel consumption during construction works will be maintained to identify the quantity of GHG emissions generated from fuel combustion. This information would inform annual reporting under the *National Greenhouse and Energy Reporting Act 2007*. Atmospheric emissions from vessels are permissible under the *Protection of the Sea (Prevention of Pollution from Ships) Act 1983*, which is enacted in Australian waters by Marine Order 97 (Marine pollution prevention – air pollution) (which also reflects MARPOL Annex VI requirements). This is an internationally accepted standard that is used industry wide, and compliance with MARPOL standards is required under Australian law. Regulations include the requirement to control the level of NO_X and SO_X from vessel engines. Compliance with these requirements, together with implementation of the controls listed above, reduces to ALARP the environmental impacts associated with air emissions.

The assessed residual consequence for this impact is negligible and cannot be reduced further. It is considered therefore that the impact of the activities conducted is ALARP and considered environmentally acceptable.

7.6.9 Contingency pipeline discharges

7.6.9.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-25**.

Table 7-25: Contingency construction and pre-commissioning pipeline discharges EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Minimise environmental impacts from contingency treated seawater discharge	No significant impact to marine water quality from due to contingency pipeline dewatering	+ Water quality monitoring report
	Treated seawater chemical usage and discharge preformed as detailed in management actions (**Table 7-26)**	Contingency treated seawater discharge procedure and post-discharge report

These EPOs align with the following NT EPA Factor objectives (NT EPA 2022):

+ Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions for this planned impact are shown in **Table 7-26.** Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-26: Management actions for contingency construction and pre-commissioning pipeline discharge

MA reference	Management actions
Standard management actions	
Avoidance	
DPD-MA69	Pipeline installation procedures Maintenance requirements for pipelaying equipment to minimise risk of operational failure Redundancy in nearshore pipelay vessel anchors Pipelay vessel will have redundancy in station keeping capabilities in operating in DP2 (as a minimum)
Mitigation	
DPD-MA70	Chemical selection procedure for all chemicals planned to be release to the marine environment
DPD-MA71	Calibrated chemical dosing system in place to ensure accuracy of chemical dosing
DPD-MA72	If contingency use and discharge of treated seawater is required, the lowest required concentration of treated chemical will be evaluated and used (up to a maximum of 550 ppm) in order to meet pipeline preservation requirements.
DPD-MA73	Release of treated seawater from pipeline will be through a valve orientated vertically to promote dispersion and direct discharge away from seabed
Monitoring	
DPD-MA74	In the unlikely event that the pipeline requires contingency filling and subsequent dewatering of treated seawater in response to a wet buckle event and prolonged repair, water quality monitoring at the discharge location will be conducted to confirm the concentration and dispersion of treatment chemicals.

Table 7-27: Additional management actions not adopted for contingency pipeline discharges

Additional management actions not adopted		Reasoning for rejection
1	Do not discharge treated seawater	Chemically treated seawater will be used as a last resort, should it be necessary to ensure the long-term integrity of the Nearshore GEP Pipeline. If recovery from a wet buckle does not occur within a short period (days to 1-2 weeks), then the risk of corrosion beyond that already that already allowed for in the pipeline design will need to be mitigated, with the displacement of any raw seawater with treated seawater. Company requires the ability to use treated seawater to protect the integrity of the pipeline to cover all possible scenarios.

7.6.9.2 Demonstration of ALARP and residual impact

Contingency treated seawater discharge is a planned response to prolonged wet buckling or a stuck pig which is an unplanned event. The use of chemically treated seawater will only occur if it is necessary to ensure the long-term integrity of the DPD Pipeline (NT). If recovery from a wet buckle does not occur within a short period (days to 1 – 2 weeks), then the risk of corrosion beyond that already allowed for in the pipeline design will need to be mitigated, with the displacement of any raw seawater with treated seawater. Santos requires the ability to use treated seawater to protect the integrity of the pipeline to cover all possible scenarios.

Standard management actions have been adopted to reduce the impact of treated seawater discharge. All feasible and cost-effective additional management actions have been adopted to manage the risks to ALARP. Additional management actions that have not been adopted are described in **Table 7-26**, with the reasoning for rejection.

The potential consequences of contingency pipeline discharges has been determined by discharge modelling and impacts are predicted to be minor and not significant. The assessed residual consequence for this impact cannot be reduced further and is considered ALARP and acceptable.

7.7 Unplanned event - risk management strategies

The Santos environmental assessment identified six unplanned events associated with for the activities to be undertaken in the Project Area. Risk management strategies have been adopted in this CEMP based on the ENVID undertaken for construction activities in June 2022 (Refer to **Section 6**).

7.7.1 Dropped objects

7.7.1.1 Environmental performance objectives, performance criteria and management actions

The EPO relevant to this impact, including performance criteria, are described in **Table 7-28**.

Table 7-28: Dropped objects (including accidental release of non-hazardous waste) EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
No environmental impact resulting from accidental release of non-hazardous solid waste and dropped objects	Zero incidents of loss of equipment/cargo overboard from vessels resulting in a consequence II – Minor or above	+ Incident records

These EPOs align with the following NT EPA Factor objectives (NT EPA 2022):

+ Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions for this unplanned risk are shown in **Table 7-29**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-29: Management actions for dropped objects

MA reference	Management Actions
Standard management actions	
Avoidance	
DPD-MA61	Vessels will comply with relevant Marine Orders, including: + Marine Order 95 – Marine Pollution Prevention: Garbage
DPD-MA75	Implementation of Santos approved standards and procedures for outboard lifts
DPD-MA76	All lifting and winching equipment will undergo inspection, testing and certification as per applicable Laws, Codes and Standards
Mitigation	
DPD-MA77	Dropped object recovered where safe and practicable to do so
DPD-MA78	Identification of no lift zones where relevant in proximity to subsea assets and infrastructure as documented in relevant lifting and operational procedure/s
DPD-MA79	No outboard lifting operations will be completed in Company defined "no lifting zones" which will be identified in navigational systems
DPD-MA80	Emergency response implemented to minimise potential for impacts in the event a dropped object causes a loss of containment from the existing Bayu-Undan GEP
Additional management actions	
Avoidance	
DPD-MA81	Pipeline installed along pre-approved route, which is designed where practicable to avoid the potential for impact to habitat / cultural seabed features or assets from a dropped object.
Additional management actions not adopted	

MA reference	Management Actions
N/A	

7.7.1.2 Demonstration of ALARP and residual risk

Table 7-17 details the management actions adopted to reduce impacts of dropped objects to ALARP. These control measures are well understood and defined through legislative requirements and are standard industry practice. With the above controls in place, Santos considers the residual risk arising from a dropped object is ALARP.

The activity, and management actions will be conducted in a manner that is acceptable under the Threat Abatement Plan for Impacts of Marine Debris on Vertebrate wildlife of Australia's coasts and oceans (Commonwealth of Australia, 2018), relevant recovery plans, conservation advice, and wildlife conservation plans.

With the controls in place to prevent accidental release of dropped objects the residual impact to the marine environment is considered low and reduced to a level that is considered acceptable.

7.7.2 Introduction of invasive marine species

7.7.2.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-30**.

Table 7-30: Introduction of invasive marine species EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Avoid introducing invasive marine species (IMS) into NT waters	+ DPD Project vessels assessed as low risk for IMS prior to entry into Project Area/Darwin Harbour + Ballast water management will be done according to the Australian Ballast Water Management Requirements	+ Records of vessel IMS risk assessment + Ballast water records system maintained by vessels

These EPOs align with the following NT EPA Factor objective (NT EPA 2022):

+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions for this unplanned risk are shown in **Table 7-31**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-31: Management actions for introduction of invasive marine species

MA reference	Management Action
Standard management actions	
Avoidance	
DPD-MA82	Vessels equipped with effective anti-fouling coatings as required for class
DPD-MA83	Ballast water management will comply with MARPOL requirements (as applicable to class), Australian Ballast Water Management Requirements and *Biosecurity Act 2015*
DPD-MA84	Apply risk-based IMS management for vessels and immersible equipment – vessel and immersible equipment mobilised from outside of the Project Area/Darwin Harbour must be assessed as having a low risk of IMS prior to entering the Project Area/Darwin Harbour
DPD-MA85	Vessels having suitable anti-fouling coating (marine growth prevention system) in accordance with the *Protection of the Sea Act 2006*

Table 7-32: Additional management actions not adopted for the introduction of invasive marine species

Additional management actions not adopted		Reasoning for rejection
1	Use of Australian vessels only	Not feasible to only use Australian vessels given constraints on availability and suitability. This also doesn't guarantee that a vessel is IMS free depending on where in Australia the vessel is mobilised.
2	All vessels to be dry docked, cleaned, and inspected for IMS	Santos requires a risk assessment to be undertaken for project vessels which considers factors that lessen the risk of IMS incursion and requires vessel to achieve a low risk score. These factors include a vessel's history of dry-docking, cleaning and IMS inspection but these activities are not necessarily mandatory depending upon vessel history and other risk factors. The costs of applying mandatory dry-docking and cleaning is considered disproportionate given the existing risk-based approach being applied.
3	Heat or chemical treatment of ballast water to eliminate IMS	Cost and effort is considered to outweigh benefits given existing regulatory requirements for ballast exchange will be adhered to

7.7.2.2 Demonstration of ALARP and residual risk

Vessels and submersible equipment are required for the DPD Project.

Ballast water exchange will be managed consistent with the Australian Ballast Water Management Requirements (Commonwealth of Australia, 2020a), and a vessel biosecurity risk assessment in accordance with the Santos IMSMP (EA-00-RI-10172) will be undertaken to demonstrate vessels have low risk of IMS introduction. The vessels and equipment that are internationally mobilised will meet Australian biosecurity requirements, and proposed management is consistent with National Biofouling Management Guidance for the Petroleum Production and Exploration Industry (Commonwealth of Australia, 2009c).

Santos has adopted a risk-based approach to managing biofouling. Such an approach is consistent with other petroleum operators and is beyond that enforced on the majority of commercial and recreational vessels that regularly transit the same bioregion. International vessels are given the highest priority to prevent the introduction of IMS into Australian waters. However, domestic vessels (interstate and locally sourced) mobilising from outside of the Project Area/Darwin Harbour are also risk-assessed to reduce the likelihood of spreading marine pest species already established in Australian waters. The biofouling risk assessment approach adopted by Santos will ensure the associated regulations prohibiting the introduction of non-endemic marine species will be met.

A combination of international and domestic vessels will be sourced for construction activities. Standard management actions to reduce the risk of an introduction of IMS to ALARP have been adopted. Other identified management actions were deemed not feasible and the reasoning for their rejection is provided in **Table 7-31**. Therefore, with the above management actions and adherence to legislation and regulations , the risk of introducing IMS has been reduced to ALARP. Therefore, the residual risk associated with IMS is considered by Santos to be environmentally acceptable.

Stakeholders have been informed throughout the preparation of the CEMP of the proposed vessel activities and the presence of the pipeline as detailed in **Section 9** and have not raised any concerns regarding this aspect.

7.7.3 Unplanned marine fauna interaction

7.7.3.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-33**.

Table 7-33: Unplanned marine fauna interactions EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Avoid interactions resulting in injury to or mortality of protected marine megafauna	Zero incidents of interactions resulting in the injury or mortality of marine megafauna	Number of recorded incidents relating to marine fauna injury or mortality MFO reports of sightings of live, injured or dead marine megafauna

These EPOs align with the following NT EPA Factor objective (NT EPA, 2022):

- Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions for this unplanned risk are shown in **Table 7-34**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-34: Management actions for marine fauna interaction

MA reference	Management Actions
Standard management actions	
Avoidance	
DPD-MA50	Vessel and helicopter contractor procedures will comply with Part 8 of the Environment Protection and Biodiversity Conservation Regulations 2000, which includes controls for minimising interaction with marine fauna
DPD-MA51	Personnel trained in marine fauna observation (MFO) will be present on pipelay, dredge and rock installation vessels during daylight hours, including one crew member with MFO training on the bridge at all times
DPD-MA63	Protection/screening of abstraction hose end to prevent fauna entrainment during water winning activities
DPD-MA82	Inductions to include observing marine fauna (e.g., crocodiles and shorebirds)
DPD-MA83	The TSHD shall be fitted with pre-sweeping mechanisms / chain curtains to mitigate turtle entrapment (fauna strike – unplanned)
Mitigation	
DPD-MA52	All marine fauna interactions and observations will be appropriately recorded and reported to DEPWS/NT EPA and DCCEEW
Additional management actions	
N/A	

Table 7-35: Additional management actions not adopted for unplanned marine fauna interactions

Additional management actions not adopted		Reasoning for rejection
1	Restrict the timing of activities to operate outside of known sensitive periods only. Flatback turtle peak nesting period is May to October and Dolphin peak calving is October to April	Project schedule is unable to avoid sensitive periods. Additionally, there is a low risk of impacts to individual fauna, and there is not expected to be an impact at population level or significant impacts on migratory or breeding behaviours. Beaches closest to the project area are also not considered significant turtle nesting beaches so this control is not considered relevant.
2	Activities will only occur during daylight hours	Construction works need to occur 24/7 to maintain project schedule. Increased project schedule may result in increase in vessel movements and potential for more cumulative impacts.

7.7.3.2 Demonstration of ALARP and residual impact

No alternative options to the use of vessels are possible in order to undertake the activity. Any impact caused by the physical presence of vessels is likely to be localised and temporary behavioural impacts only (e.g., avoidance behaviour) and are not expected to significantly impact any key life-cycle processes of marine fauna. Marine species are expected to resume normal behavioural patterns in the waters surrounding the Project Area in a short time frame following completion of the construction activities.

TSHD and water winning activities pose a risk of fauna entrainment. Dredging has been listed as a key threatening process for turtles (Commonwealth of Australia, 2017a) with dredging equipment potentially being the direct source of turtle mortality however the TSHD shall be fitted with pre-sweeping mechanisms / chain curtains to mitigate unplanned impact with turtles. Additionally, the abstraction hose for water winning activities will have protection/screening for marine fauna. This is considered to manage this to ALARP.

The inherent likelihood of encountering fauna in the Project Area is limited by the expected behaviour of individuals to move away from vessel noise. With low vessel speeds and compliance with fauna interaction procedures, including Regulation 8 of the EPBC Regulations 2000, which aim to prevent adverse interactions of vessels with marine megafauna, a fauna collision is considered very unlikely. With the controls adopted, the assessed residual risk for this impact is ALARP.

Marine fauna interaction risks are well understood and subject to regulation. The vessels and personnel that are mobilised will meet Australian requirements, and proposed management is consistent with relevant recovery plans, conservation advice, wildlife conservation plans, including the Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017a). Vessel personnel will complete Inductions outlining fauna interaction requirements and, there will be watchkeeping maintained from the vessel bridge further reducing the impact.

Stakeholders have been informed throughout the preparation of the CEMP of the proposed vessel activities and the presence of the pipeline as detailed in **Section 9**.

It is considered that the proposed controls will reduce the residual level of impact to minor. Therefore, the residual risk associated with marine fauna interactions is considered by Santos to be environmentally acceptable.

7.7.4 Release of liquid hazardous materials

This section does not include management strategies for the release of fuels due to a vessel bunkering incident or a vessel tank rupture; these risks are discussed in **Section 7.7.5**.

7.7.4.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-36**.

Table 7-36: Release of liquid hazardous materials EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Avoid significant environmental impact resulting from release of hazardous materials	Zero incidents of release of hazardous materials to the marine environment during DPD construction activities	+ Number of recorded incidents
	Response to incident implemented as per the relevant emergency response plans	+ Incident report including details of response

These EPOs align with the following NT EPA Factor objectives (NT EPA, 2022):

+ Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions for this unplanned risk are shown in **Table 7-37**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Santos

Table 7-37: Management actions for release of hazardous material

MA reference	Management actions
Standard management actions	
Avoidance	
DPD-MA84	Inspection and maintenance for all equipment containing chemicals/ hydrocarbons and chemical/ hydrocarbon storage areas
DPD-MA85	Santos chemical selection procedure applied for chemicals
DPD-MA86	ROV operations undertaken in accordance with good industry practice (in relation to hydraulic fluid control)
DPD-MA87	Procedures for helicopter refuelling
Mitigation	
DPD-MA88	Chemical storage areas designed to contain leaks and spills and inspected routinely
DPD-MA89	Spills will be managed in accordance with standard maritime practices as per vessel shipboard oil pollution emergency plan (SOPEP)
DPD-MA90	Spill clean-up kits available in high-risk areas
DPD-MA91	Bunding/secondary containment
Additional management actions	
N/A	

7.7.4.2 Demonstration of ALARP and residual impact

Storage and use of chemicals and hydraulic and lubricating oils or fluids for equipment and machinery, including for ROV operations, are required to undertake the DPD Project. While the use of hazardous chemicals cannot be avoided, the Santos chemical selection process will ensure that project chemicals are risk assessed and selected with consideration of alternatives, so hazardous chemicals are not discharged.

Only volumes of hazardous materials as required for maintaining vessel capabilities or for project-specific purposes will be stored or handled on-board the vessels. The vessels will implement safeguards, as per relevant AMSA Marine Orders/MARPOL and Santos requirements. Such safeguards include (but are not limited to) designated storage and handling areas, correct stowage, accurate labelling and marking, Safety Data Sheet (SDS) information, spill clean-up equipment and containment.

Other management actions will be implemented include vessel maintenance systems, chemical management procedures, and shipboard marine pollution emergency plan (SMPEP)/ spill response procedures included in shipboard oil pollution emergency plan (SOPEP) which will reduce the likelihood of an accidental release, and reduce the residual impact if a release does occur.

Containment of small spills and use of spill containment kits on-board vessels will reduce the risk of spills reaching the marine environment. The inspection and maintenance of bunding and drainage systems and of spill response kits provides assurance that these are available to contain spills. Hazardous liquids will be managed in accordance with relevant legislation and industry standards and Santos' procedures. Stakeholders have been informed throughout the preparation of the CEMP of the proposed vessel activities and the presence of the pipeline as detailed in **Section 9**.

The management actions proposed are in line with applicable actions described in relevant recovery plans and conservation advice to reduce the risk of habitat degradation and deteriorating water quality (for example, from pollution) to a level considered to be ALARP by Santos. The assessed residual risk for this impact is low. It is considered therefore that the impact of the activities conducted is ALARP.

With the management actions in place to prevent and mitigate accidental spills and the minor impacts predicted from a minor spill of hazardous chemicals/ hydrocarbons, the environmental risk is considered low. Potential risks are unlikely to be greater than those caused by other commercial marine vessels or offshore petroleum activities in deep water using the Project Area. Therefore Santos deems the risk acceptable.

7.7.5 Release of hydrocarbon (offshore vessel bunkering or vessel tank rupture)

7.7.5.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-38**.

Table 7-38: Hydrocarbon release (offshore vessel bunkering or vessel tank rupture) EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
No release of hydrocarbons to the marine environment as a result of the DPD Construction Activities	Zero incidents of unplanned discharge of hydrocarbons into the marine environment as a result of DPD construction activities	+ Number of recorded incidents

These EPOs align with the following NT EPA Factor objectives (NT EPA, 2022):

+ Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions for this unplanned risk are shown in **Table 7-39**. Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-39: Management actions for hydrocarbon release (offshore bunkering incident or vessel fuel tank rupture)

MA reference	Management Actions
Standard management actions	
Avoidance	
DPD-MA07	One vessel will act as a surveillance vessel within the operational area during gas export pipeline installation
DPD-MA92	Vessel-specific bunkering procedures and equipment consistent with Santos marine vessel vetting requirements including: + Use of bulk hoses that have quick connect ‘dry break’ couplings + Correct valve line-up + Defined roles and responsibilities, and the specific requirement for bunkering to be completed by trained personnel only + Visual inspection of hoses prior to bunkering to confirm they are in good condition + Testing of the emergency shutdown mechanism on the transfer pumps + Assessment of weather/sea state + Maintenance of radio contact with Vessel during bunkering operations + Bunkering checklist + Visual monitoring during bunkering + Ensuring deck drainage bungs are in place prior to bunkering + Marine Order 91 – Marine Pollution Prevention: Oil + Bunkering to commence in daylight hours
DPD-MA93	Vessel equipped and crewed in accordance with Australian maritime requirements
DPD-MA94	Safety exclusion zone around DPD Project construction vessels, e.g. pipelay vessels, and an NTM will be issued for offshore works advising all major shipping traffic formally. In addition, pipelay vessels will have attendant vessels that may act as guard vessels for work within the harbour
DPD-MA95	No intermediate fuel oil (IFO) or heavy fuel oil (HFO) will be used in activity vessels working in the Project Area

MA reference	Management Actions
Mitigation	
DPD-MA90	Spill clean-up kits available in high-risk areas
DPD-MA96	Implement tiered spill response as per DPD Project specific OPEP in the event of an MDO spill
Additional management actions	
Monitoring	
DPD-MA97	Santos to make oil spill tracking buoys available on primary project vessel/s with Santos CSR/s and/or at local supply base for immediate deployment to assist with tracking of an oil spill

Table 7-40: Additional management actions not adopted for release of hydrocarbon (offshore bunkering incident or vessel fuel tank rupture)

Additional management actions adopted		Reasoning for rejection
1	No bunkering of fuel during the pipeline installation activity	Vessels will routinely bunker when in port, as this is the safest and most cost effective means to refuel vessels. However due to the gas export pipeline installation method, the pipelay vessel cannot bunker alongside port facilities and requires bunkering within the operational area to undertake the activity. Following implementation of the selected existing controls, the risk reduction associated with eliminating bunkering at sea is considered to be negligible. The potential impacts to schedule and associated cost of implementing the control is considered to be grossly disproportionate to the reduction in risk. The control has not been adopted.
2	Bunkering only during daylight hours	Bunkering only during daylight hours increases the likelihood of detecting a leak, as surface hydrocarbon sheens are typically more visible under sunlight. Bunkering operations are typically completed during daylight hours; however, circumstances may occur where bunkering is required during darkness (e.g., large volume transfers at slow rates or when bunkering is safer to perform at night due to prevailing metocean conditions). Bunkering will only commence in daylight hours however. Following implementation of the selected existing controls, the risk reduction associated with prohibiting bunkering during darkness is considered to be negligible. The cost of implementing the control is considered to be grossly disproportionate to the reduction in risk. The control has not been adopted.
3	Schedule activities to avoid coinciding with sensitive periods for marine fauna present in the operational area	Project schedule is unable to avoid sensitive periods. Beaches closest to the Project Area are also not considered significant turtle nesting beaches. The cost of limiting the timing of activities would be excessive compared to the little to no reduction in risk of oil spill to significant turtle nesting beaches. Therefore, the impact to the Project schedule is greater than the environmental risk reduction.
4	Require all support vessels involved in the activity to be double hulled.	Cost and availability of double hulled vessels make this control not feasible.

7.7.5.2 Demonstration of ALARP and residual impact

The use of vessels is integral to activity and therefore risk of an unplanned hydrocarbon fuel releases cannot be eliminated completely.

Offshore vessel refuelling is standard industry practice and oil pollution legislation (*Protection of the Sea (Prevention of Pollution from Ships) Act 1983* and MARPOL Annex I) has been developed to safeguard against the risk of a hydrocarbon spill occurring during refuelling. Other hydrocarbon types such as heavy fuel oil and intermediate fuel oil have specifically been prohibited as DPD Project vessel fuels, only MDO/marine gas oil (MGO) and aviation fuel will be used in the Project Area to ensure potential environmental impacts are reduced to ALARP.

The combination of the standard prevention management actions (**Section 7.7.5**) (which reduce the likelihood of the event happening), the spill response strategies (which will reduce the consequence) together reduce the overall hydrocarbon spill risk. Management controls that will be implemented, including pre-bunkering checklists spill clean-up equipment and SMPEP/SOPEP not only to minimise the risk of an accidental release, but also to reduce the impact if a release does occur. In addition to the vessel's SMPEP/SOPEP, Santos will provide support as required to a shipboard spill through the implementation of its DPD Project OPEP (BAS-210 0026). Resources available to be deployed by Santos to support a vessel base spill include spill tracking buoys which will be located onboard primary project vessels.

Barriers in place to contain spills (e.g. ensuring deck drainage bungs are in place prior to start of bunkering and spill containment kits) would prevent spills from reaching the marine environment. A vessel will act as a surveillance/guard vessel during gas export pipeline installation which will prevent collisions with Project vessels and other marine users. Santos will implement a safety exclusion zone around DPD Project construction vessels e.g. pipelay vessels and issue an NTM for offshore works further preventing vessel collisions.

Additional controls have been identified and given the controls in place detailed in **Table 7-40**, the assessed residual risk for this impact is Low and cannot be reduced further. It is considered therefore that the impact of the activities conducted is reduced to ALARP.

The potential impacts from an MDO/MGO release from a vessel collision are acceptable based on the residual risk ranking.

Relevant requirements have been met, including Santos' internal processes, COLREGS, SOLAS, STWC Convention and related Marine Orders. Pollution, such as could occur from a hydrocarbon spill, is identified as a threat in conservation advice for several marine species that may occur in the Project Area and as a threat in the North Marine Parks Network Management Plan (2018). Santos considers the selected controls are effective in managing the risk to these species and the to a level that is acceptable.

7.7.6 Release of dry natural gas

7.7.6.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to this impact, including performance criteria, are described in **Table 7-41**.

Table 7-41: Release of dry natural gas EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Avoid environmental impacts from the accidental release of dry natural gas from Bayu-Undan to Darwin pipeline	No releases of gas from the Bayu-Undan pipeline to the environment as a result of impact/drag or dropped object from the DPD construction activity	+ Number of recorded incidents
	Response to incident implemented as per the relevant emergency response plans	+ Incident report including details of response

These EPOs align with the following NT EPA Factor objectives (NT EPA, 2022):

+ Air quality – Protect air quality and minimise emissions and their impact so that environmental values are maintained.
+ Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions considered for this unplanned risk are shown in **Table 7-42.** Environmental Performance Standards for these management actions will be defined and documented prior to finalisation of the CEMP.

Table 7-42: Management actions for release of dry natural gas

MA reference	Management actions
Standard management actions	
Avoidance	
DPD-MA75	Implementation of Santos approved standards and procedures for outboard lifts (including lifts over live infrastructure)
DPD-MA79	No outboard lifting operations will be completed in Company defined “no lifting zones”
DPD-MA80	Emergency response implemented to minimise potential for impacts in the event a dropped object causes a loss of containment from the existing Bayu-Undan GEP
DPD-MA98	Trenching will only occur within pre-programmed areas (using standard positional accuracy measures used in the industry)
DPD-MA99	Exclusion zones programmed on all primary vessels associated with the works to clearly indicate no entry zones and nearby pipelines – this will clearly identify areas for spud placement, anchor positioning and trenching activities
DPD-MA100	Navigation charts
Additional management actions	
Avoidance	
DPD-MA78	Identification of no lift zones where relevant in proximity to subsea assets and infrastructure as documented in relevant lifting and operational procedure/s

7.7.6.2 Demonstration of ALARP and residual impact

The proposed DPD pipeline will typically be within 100 m of the existing Bayu-Undan Pipeline; therefore vessels will be operating in the vicinity of the Bayu-Undan pipeline. Damage to the Bayu-Undan pipeline may be caused by structure impact/drag or a dropped object with potential to result in a release of dry gas to the environment. By having the DPD Project pipeline in close proximity (<100 m) to the Bayu-Undan pipeline, incursion into the shipping channel is reduced and seabed disturbance is concentrated adjacent to a previously disturbed corridor.

Stakeholders have been informed throughout the preparation of the CEMP of the presence of the pipeline as detailed in **Section 9**.

Implementation of the management actions relating to Santos standard lifting procedures and lifting procedures over live infrastructure and emergency response procedures reduces the risks to the environment and other users to ALARP. All additional management actions that were deemed feasible have been adopted to reduce the impact to ALARP (**Table 7-42**). There were no additional management actions that were identified and not adopted.

With the management actions in place to prevent an accidental release of dry natural gas, the likelihood level of ‘unlikely’ for a release and the minor impacts predicted from an unplanned release, the residual impact to sensitive receptors is reduced to very low and is environmentally acceptable.

8 Implementation strategy

This section presents the processes and procedures that will be implemented to ensure the environmental requirements within this CEMP will be met, including:

- Specific systems, practices and procedures that ensure both environmental impacts and risks are reduced to ALARP and Environmental Performance Objectives (EPOs), Performance Criteria and Performance Standards of this CEMP are being met;
- A clear chain of command, outlining roles and responsibilities of personnel involved in the implementation, management and review of this CEMP;
- Measures to ensure that employees and/or contractors working in relation to this activity are aware of their responsibilities regarding the environment and have the appropriate skill and training;
- Auditing, review and revision processes;
- Incident recording and reporting in line with Santos and regulatory requirements;
- Maintenance of quantitative records of discharges and emissions; and
- Details of emergency response and oil spill arrangements.

This implementation strategy is consistent with the Barossa Health, Safety & Environment Management Plan for Execute (BAA-200 0003).

Stakeholder engagement is assessed separately for the requirements of the activity. Ongoing stakeholder management strategies are discussed in **Section 9**.

8.1 Leadership, accountability and responsibility

To enable the DPD Project to succeed in meeting environmental objectives as outlined within this CEMP, the following measures apply:

- Appropriately skilled and qualified DPD Project team is established with HSE accountabilities, responsibilities, and resources clearly defined;
- Setting of EPOs and Performance Criteria (incl. Targets and Performance Indicators) and establishment of the practices and tools used to measure performance and drive continual improvement (**Section 7**); and
- Implementing HSE Leadership Teams with key contractors to discuss HSE performance and improvement

The Barossa Project Director is responsible for delivery of the Barossa Development, including the DPD Project, and has responsibilities for:

- Accountability for project HSE performance
- Demonstrating strong and visible HSE leadership
- Endorsing HSE performance indicators and targets
- Communicating HSE performance and events to the Chief Operating Officer, Upstream Oil & Gas
- and Group Executive Committee.
- Providing HSE resources.
- Engaging with senior regulatory managers.

The Barossa Project Director is supported by the Barossa Project Management Team. The effective implementation of this CEMP requires collaboration and cooperation among Santos Barossa Team personnel and contractors. The accountabilities of key Santos and contractor personnel in relation to the implementation, management and review of the CEMP is outlined in **Table 8-1**. Santos' OPEP will outline the roles and responsibilities in an emergency.

Table 8-1: Chain of command, key leadership roles and responsibilities

Title (role)	Environmental responsibilities
Office-based personnel	
Santos Barossa Subsea and Pipelines Manager	+ Confirm that the campaign is undertaken in accordance with this CEMP. + Provide sufficient resources to implement the management controls in this CEMP. + Confirm Contractor personnel attend an environmental induction (**Section 8.2.1**) upon commencing work on the campaign. + Action the management actions, as detailed in the EPSs in this CEMP (**Section 7**), as required, prior to the commencement of the activity. + Confirm the Contractor meets the requirements of the Santos management system and relevant standards/procedures.
Santos Barossa HSE Manager	+ Provide assurance that adequate resources are provided to support all environmental activities associated with this CEMP. + Develop a program to implement and monitor CEMP commitments. + Liaise with NT EPA, DITT, DCCEEW and other regulators. + Ensure incident notification process is in place and investigations completed to identify root causes. + Review and submit environmental performance reports and external environmental incident notification reports.
Santos Barossa GEP Package Lead	+ Confirm the campaign is undertaken in accordance with this CEMP. + Communicate any changes to the activity that may affect the risk and impacts assessment, EPOs, EPSs and MAs detailed in this CEMP to the Santos HSE team. + Coordinate resources required to enable the commitments in this CEMP to be maintained. + Confirm the reporting of environmental incidents meets both external and Santos' incident reporting requirements. + Liaise with Santos Environmental Advisor on environmental incidents and what constitutes a reportable incident. + Track and close out of any corrective actions raised from environmental audits as required by this CEMP.
Santos Marine Manager	+ Confirm vessel vetting as per the Santos Offshore Marine Assurance Procedure (SO 91 ZH 10001).

Title (role)	Environmental responsibilities
	+ Ensure relevant inspections are undertaken to confirm vessels comply with relevant Marine Orders and Santos marine standards/procedures and on boarding requirements to meet safety, navigation and emergency response requirements.
Santos Barossa Crisis and Emergency Management Specialist	+ Develop Santos Crisis Management and Emergency Response Plans and procedures. + Ensure emergency response drills are undertaken as per Santos Crisis Management and Emergency Response plans and procedures.
Santos Emergency Response Coordinator	+ Undertake Santos Incident Management Team (IMT) drills and exercises in accordance with the Crisis and Incident Management Exercise Schedule. + Undertake assurance activities on oil spill response arrangements. + Review Santos Emergency Response Plans and procedures.
Santos Barossa Environmental Advisor/s	+ Develop offshore environmental approval documents, including DPD Project EMPs and OPEP, for submission and acceptance by DITT. + Provide environmental inductions to contractor personnel. + Ensure environmental inspections and audits are undertaken against CEMP commitments as per the Barossa Project Environmental Compliance Assurance Plan (BAA-200 0635). + Review and approve chemical products that will be discharged to the marine environment and require assessment. + Review biofouling risk assessments undertaken by Contractors. + Prepare environmental performance reports. + Advise on environmental incident reporting requirements, including what constitutes a reportable incident
Santos Barossa External Relations Advisor	+ Prepare and implement the relevant and interested persons consultation program for the DPD activity. + Manage and report on any relevant and interested persons consultation received in relation to the activity. + Undertake ongoing engagement with relevant and interested persons, for the duration of the activity, as required.
Contractor Project Manager	+ Undertake the pipelay installation in accordance with this CEMP. + Provide the resources required to enable the commitments in this CEMP to be maintained. + Confirm vessel management system and procedures are implemented and comply with the requirements detailed in this CEMP. + Confirm personnel receive an environmental induction that meets the requirements outlined in this CEMP + Ensure invasive marine species and pests are risk assessment on all vessels mobilised to the operational area.

Title (role)	Environmental responsibilities
	+ Ensure that all crew attend HSE inductions and that attendance records saved. + Ensure incidents are reported and investigated, as required.
Site and offshore based personnel	
Santos Senior Client Site Representative	+ Confirm contractors undertake the activity in a manner consistent with the EPOs and environmental management procedures detailed in this CEMP. + Confirm the management measures detailed in this CEMP are implemented. + Communicate any changes to the activity to the Santos Environmental Advisor. + Confirm all subsea chemical components and other fluids that may be discharged to the marine environment are approved for use. + Confirm that the Vessel Master and all crew adhere to the requirements of this CEMP. + Advise the Santos GEP Package Lead of any changes in activities that may lead to nonconformance with the EPOs in this CEMP. + Report environmental incidents to Santos GEP Package Lead.
Vessel Master (contractor personnel)	+ Confirm vessel management system and procedures are implemented and comply with the requirements detailed in this CEMP. + Confirm personnel receive an environmental induction that meets the requirements outlined in this CEMP on commencing work on the vessel. + Confirm crew personnel are competent to undertake the assigned work tasks. + Confirm SOPEP drills are undertaken in accordance with the vessel's schedule. + Comply with vessel entry and movement requirements within exclusion zones. + Maintain ballast water management plan, valid ballast water management certificate, ballast water management records, and Antifouling System Certificate specific to the vessel. + Maintain records of fuel use and vessel discharges/ transfers (including waste, sewage and oily water) as per MARPOL and Santos requirements + Confirm vessel crew are provided with sufficient training to implement the SOPEP/SMPEP (as appropriate to vessel class). + Ensure supervision of all bunkering/transfer operations to the vessel. + Report any environmental incidents or non-conformance with the EPOs, EPSs or MA in this CEMP in accordance with Santos and statutory requirements.
Offshore Construction Superintendent	+ Responsible for ensuring that pipeline construction activities are performed in accordance with this CEMP.

Title (role)	Environmental responsibilities
(Contractor Personnel)	
Offshore HSE Advisors (Santos and/or Contractor)	+ Support the Santos Senior Client Site Representative to ensure that the controls detailed in this CEMP relevant to offshore activities are implemented and assist in collection and recording of evidence of implementation (other controls are implemented and evidence collected onshore). + Support the Santos Senior Client Site Representative to ensure environmental incidents or breaches of objectives and/ or standards outlined in this CEMP, are reported, and corrective actions for incidents and breaches are developed, tracked and closed out in a timely manner. + Ensure periodic environmental inspections/reviews are completed and corrective actions from inspections are developed, tracked and closed out in a timely manner. + Review Contractors procedures, input into Toolbox talks and JSAs. + Provide day to day environmental support for activities in consultation with the Santos Environmental Advisor.
All Project personnel	+ Act in an environmentally responsible manner. + Undertake work in accordance with accepted HSE systems and procedures. + Comply with this CEMP and all regulatory requirements as applicable to assigned role. + Report any unsafe conditions, near misses or environmental incidents immediately to supervisors. + Attend environmental inductions and HSE meetings, and complete training as required. + Report marine megafauna sightings as applicable to role in accordance with Project requirements

8.2 Workforce training and competency

This section describes the mechanisms that will be in place, so all Project personnel (including employee and contractor roles) are aware of his or her responsibilities in relation to the CEMP and has appropriate training and competencies.

8.2.1 Inductions

Santos and its contractors will develop a mandatory project induction, which will detail CEMP requirements. Project induction attendance will be logged and held with the Project Administration Assistant. Santos personnel will be required to complete required contractor site and facility inductions, including DLNG facility inductions, including permitting requirements, as applicable for working in and around the DLNG facility.

All Project site roles will complete an induction that will include a component addressing their CEMP responsibilities. Induction attendance records for all personnel will be maintained. Inductions will include information about:

+ Environment, Health and Safety Policy
+ Regulatory regime
+ Operating environment (for example, nearby marine protected areas)
+ Activities with highest risk
+ CEMP EPOs, Performance Indicators and management commitments
+ Incident reporting and notifications
+ Regulatory compliance reporting
+ Importance of marine communications regarding any potential interactions with other marine users
+ Process for assessing changes to CEMP activities
+ Oil pollution emergency response.

8.2.2 Training and competency

The implementation of training requirements will ensure project personnel have the skills, knowledge and competencies to conduct work in a safe manner without harm to their health or the environment.

All members of the workforce will complete relevant training and/or hold relevant qualifications and certificates for their roles.

Santos and its contractors are individually responsible for ensuring that their personnel are qualified and trained. The systems, procedures and responsible persons will vary and will be managed using online databases, staff on-boarding process and training departments, etc. Personnel qualification and training records will be sampled before and/or during an activity. Such checks may be performed during the procurement process, inductions, crew change, and operational inspections and audits.

Crew trained in marine fauna observation will ensure marine megafauna can be reliably identified to species during observation periods.

8.2.3 Workforce involvement and communication

Daily operational meetings will be held at which HSE will be a standing agenda item. It is a requirement that supervisors attend daily operational meetings and that all personnel attend daily toolbox or pre-shift meetings. Toolbox or pre-shift meetings will be held to plan jobs and discuss work tasks, including HSE risks and their controls.

HSE performance will be monitored and reported during the activity, and performance metrics (including environmental performance indicators and the number of environmental incidents) will be regularly communicated to the workforce. Workforce involvement and environmental awareness will also be promoted by encouraging offshore personnel to report marine fauna sightings and marine pollution (for example, oil on water, dropped objects). Findings, learnings and corrective actions identified from assurance activities and incident investigations will be communicated to project personnel to drive continuous improvement (e.g., through HSE Alerts, pre-shift / toolbox meetings).

8.3 Audits and inspections

Environmental Audits and Inspections undertaken to provide assurance of requirements within this CEMP are being met may include:

+ Vessel pre-mobilisation inspections
+ Routine vessel environmental inspections (weekly / monthly during Project execution)

+ Contractor Environmental Audits
+ Regulator Inspections and Audits (as required by Regulator)

For this CEMP the environmental audit and inspection processes are described in the Barossa Project Environmental Compliance Assurance Plan (BAA-200 0635).

An Environmental Assurance Activities Schedule (EAS) will be developed and maintained by the Barossa HSE Team which will align with the Barossa Project Integrated Audit Schedule. The EAS will provide an overview and schedule of assurance (verification) activities required to meet compliance for each activity (e.g., inspections, audits, assessments, and reviews). Additionally, it will allow Santos and the Barossa HSE Team to plan and resource appropriately to ensure all environmental assurance requirements can be met.

Audit criteria, as included within a terms of reference (ToR), will typically include a selection of management actions and environmental performance standards and outcomes; however, may also include parts of the activity description, stakeholder consultation and implementation strategies.

Audit findings may include opportunities for improvement and non-conformances (requirements not met). Audit non-conformances are managed as described in **Section 8.3.6**.

8.3.1 Environmental Incident Reporting

8.3.1.1 Internal incident reporting

All personnel will be informed through inductions and daily operational meetings of their duty to report HSE incidents and hazards. Reported HSE incidents and hazards will be shared during daily operational meetings and will be documented in the incident management systems as appropriate. HSE incidents will be investigated and reported in accordance with the Santos Incident Reporting and Investigation Procedure (SMS-HSS-OS07-PD01) and contractor procedures.

The incident reporting requirements will be provided to all crew on-board the facilities and support vessels with special attention to the reporting time frames to provide for accurate and timely reporting.

8.3.1.2 External incident reporting

Certain incidents will require notification to external Regulatory authorities under NT and Commonwealth legislation. This includes requirements below; additional requirements may apply as conditions of approval of the DPD Project.

8.3.2 Reportable incident – Petroleum (Submerged Lands) (Management of Environment) Regulations 1999 (Cth)

Reportable Incidents, defined as *"…an incident arising out of operations for the activity that is not within the parameters of the environmental performance standards in the environment plan in force for the activity"*, will be reported to DITT in accordance with Part 3 of the Petroleum (Submerged Lands) (Management of Environment) Regulations 1999 which requires the following:

+ The operator of an activity must give notice of a reportable incident (either oral or written), with all material details of the incident that are reasonably available to the operator, to the Designated Authority as soon as possible after the first occurrence of the incident.
+ The operator must give a written report of the incident to the Designated Authority:
    - if the Designated Authority specifies a reasonable period for giving the report — within that period; or

  - in any other case — as soon as practicable after the first occurrence of the incident.
+ The report must set out fully:
  - all the material facts and circumstances of the incident that the operator knows or is able, by reasonable search and inquiry, to find out; and
  - the action (if any) taken to avoid or mitigate any adverse effects of the incident on the environment; and
  - the corrective action that has been taken, or is proposed to be taken, to prevent another incident of that kind.
+ The operator must keep a record of reports of each reportable incident, and of the details, in each case, of any corrective action taken.

8.3.3 Reportable incident – Waste Management and Pollution Control Act 1998 (NT)

As per Part 3 Section 14 of the Waste Management and Pollution Control Act 1998 (WMPC Act 1998), incidents causing, or that may threaten to cause, pollution resulting in material environmental harm or serious environmental harm, will be reported to the NT EPA as soon as practicable after (and in any case within 24 hours after) becoming aware of the incident. An incident includes "*an accident, emergency or malfunction and a deliberate action, whether or not that action was taken by the person conducting the activity in the course of which the incident occurred*".

A notification to the NT EPA of an incident as per Part 3 Section 14 of the WMPC Act 1998 will specify:

+ the incident causing or threatening to cause pollution;
+ the place where the incident occurred;
+ the date and time of the incident;
+ how the pollution has occurred, is occurring or may occur;
+ the attempts made to prevent, reduce, control, rectify or clean up the pollution or resultant environmental harm caused or threatening to be caused by the incident; and
+ the identity of the person notifying.

8.3.4 Wildlife incident reporting

Any incident resulting in a significant impact to a species listed as threatened or migratory under the *Environmental Protection and Biodiversity Protection Act 1999* (EPBC Act 1999) is to be reported to DCCEEW as soon as practicable (and in any case within 24 hours) of becoming aware of the event occurring. For the Project Area, marine species listed as threatened or migratory under the EPBC Act include marine turtles (all species), dolphins, dugongs and crocodiles.

The report will contain:

+ time, location and description of the incident;
+ a summary of the response being undertaken; and
+ details of the relevant contact person.

Any occurrences of stranded, injured or entangled marine megafauna are also to be reported to NT Marine Wild Watch (1800 453 941) (DEPWS) as soon as practicable after observing.

8.3.5 Hydrocarbon/ hazardous substance spill reporting

External reporting requirements will include reporting to Darwin Port (for incidents within Darwin Port limits), NT EPA (as above) and the Australian Maritime Safety Authority (AMSA), including completion of a marine pollution report (POLREP). Oil spill reporting is to follow any additional reporting requirements outlined within the DPD Project Oil Pollution Emergency Plan (BAS-210 0026).

8.3.6 Corrective actions

Corrective actions identified from environmental assurance activities and incident investigations will be derived in collaboration with contractors. For this CEMP, corrective actions and contingency processes are described as per the Barossa Project Environmental Compliance Assurance Plan (BAA-200 0635) and Barossa Health, Safety & Environment Management Plan for Execute (BAA-200 0003).

CEMP non-conformances will be addressed and resolved by a systematic corrective action process as outlined in Santos' Management System. Santos' incident and action tracking management system (HSE Toolbox) will be used to track corrective actions in the following instances:

+ Where there has been or potentially been a reportable incident
+ Where there has been a non-compliance in accordance with a statutory plan
+ Where any corrective action requires notification to an external regulatory or statutory body
+ Where there are corrective actions from formal audits (Contractor Pre-Start Audit, external regulator audit etc.).

Once entered, corrective actions, time frames and responsible persons (including action owners and event validators) will be assigned. Corrective action 'close out' will be monitored using a management escalation process.

Environmental corrective actions identified through compliance assurance activities are to be promptly managed to ensure timeframes for external reporting are met and that decision making is made visible.

8.3.7 Continuous improvement

For this CEMP, continuous improvement will be driven by the list below and may result in a review of the CEMP, with changes applied in accordance with **Section 8.6.2**.

+ Improvements identified from the review of business-level HSE key performance indicators
+ Actions arising from Santos and departmental HSE improvement plans
+ Corrective actions and feedback from HSE audits and inspections, incident investigations and after-action reviews
+ Opportunities for improvement and changes identified during pre-activity reviews and MoC documents
+ Actions taken to address concerns and issues raised during the ongoing stakeholder management process (**Section 9**).

Identified continuous improvement opportunities will be assessed in accordance with the MoC process (**Section 8.6.2**) to ensure any potential changes to this CEMP are managed in a controlled manner.

8.4 Emergency preparedness and response

Emergency preparedness and response arrangements, applicable to activities covered by this CEMP, including for oil spill response, will be included in Santos and Contractor procedures.

8.4.1 Contractor emergency and oil spill response plans

DPD Project contractors are responsible for having comprehensive Emergency Response Plans (ERPs) that address emergency response actions associated with all credible incidents for the activity. These will describe the interface arrangements between Contractor and Santos Incident Management structures and cover all aspects of emergency response including technical, logistical and medical support.

Contractor ERPs will outline roles and responsibilities of contractor personnel for emergency events. The ERPs are accepted by Santos and reviewed on an annual basis by the contractor or if a significant change has occurred to the incident management or emergency response arrangements.

Scenario-based drills are performed to test the emergency response arrangements and updates are made to improve the ERPs, if required.

Contractor vessels undertaking activities covered by this CEMP are required, where applicable to vessel class, to have Shipboard Oil Pollution Emergency Plans (SOPEP) and/or Shipboard Marine Pollution Emergency Plans (SMPEPs) outlining hydrocarbon/ hazardous substance spill response arrangements, including response actions and equipment requirements. Vessels are required to conduct regular spill response drills as per arrangements detailed in these plans.

8.4.2 Santos incident management and oil spill response arrangements

Santos maintains Incident and Crisis Management Teams (IMT and CMT) and support arrangements to respond to all-hazard incidents, including oil spill incidents, at its sites and for activities under its control or influence, including activities covered under this CEMP. Santos' crisis and incident management arrangement are outlined within the Crisis, Incident Management & Emergency Response Procedure (SMS-HSS-OS05-PD01) and Incident Management Plan – Upstream Offshore (SO-00-ZF-00025). IMT and CMT training and exercise requirements, including OPEP exercises, are included within an annual training and exercise plan and schedule.

Specific oil spill response support strategies and arrangements for hydrocarbon spill scenarios covered in this CEMP will be outlined within the DPD Project Oil Pollution Emergency Plan (BAS-210 0026). This will include roles and responsibilities and response strategies / resources applicable for responding to worst case spill scenarios for DPD activities covered by this CEMP. The arrangements within the OPEP will provide support to, and interface with, response activities undertaken by onsite personnel (e.g., vessel oil spill response activities), as well as response activities coordinated by designated NT Control Agencies.

8.5 Reporting and notifications

Environmental reporting for the DPD Project construction activities will include reports between Subcontractors and Contractors, Contractors and Santos, and Santos and Stakeholders, including Regulatory authorities. Reports will be delivered within agreed upon timeframes. **Table 8-2** outlines an initial assessment of reporting requirements relevant to this CEMP.

External reporting requirements may be dictated by approval conditions associated with the DPD Project and finalisation of this CEMP will include all relevant external regulatory reporting requirements.

A detailed schedule of reporting requirements and submission dates for the DPD Project will be developed as per the Barossa Project Environmental Compliance Plan (BAA-200 0635).

Table 8-2: Summary of reporting requirements

Report/ Notification	Responsibility	Content	Frequency	Recipient
Pre-start				
OVID inspection reports	Santos Marine Assurance Team	Provides a summary of the findings of the support vessel inspection which assesses compliance with relevant international (e.g. MARPOL 73/78), Australian and Santos requirements.	Prior to commencement of the activity	Santos
Pre-start contractor audit	Santos Barossa Team	Confirmation of compliance with CEMP commitments relating to operational procedures and processes that Santos require to be in place prior to the commencement of the activity.	Prior to commencement of the activity	Santos
Pre-start notifications	Santos Barossa Team / Contractors	Details on DPD Project commencement to meet requirements of stakeholders (including Regulatory authorities)	Prior to commencement of the activity	Various stakeholders
Execution and completion				
Regular Stakeholder updates	Santos Barossa Team	Regular updates on DPD Project during planning and execution as per Stakeholder Management Plan (refer **Section 9**)	Throughout planning and execution	Various stakeholders
Contractor environmental execution audit	Santos Barossa Team	Confirmation of compliance with CEMP commitments relevant to execution of the activity.	Prior to completion of the activity	Santos
Vessel Daily Reports	Contractor Vessel Master	Update on day's activities, including any identified non-conformance against this CEMP, and any issues that may need addressing.	Daily	Santos

Report/ Notification	Responsibility	Content	Frequency	Recipient
Vessel Environmental Reports/Checklists	Contractor Vessel Master	Compliance against key regulatory and contractual commitments (including CEMP commitments). Reporting of fuel usage, vessel discharges and emissions etc.	Weekly/ Monthly[1]	Santos
HSE Meetings Records	Contractor and Santos Barossa Team	Monthly, dedicated HSE meetings are held with the offshore and Perth-based management (including contractor management) and advisors to address targeted health, safety and environment incidents and initiatives. Minutes of these meetings are produced and distributed as appropriate.	Monthly	Santos
Completion notifications	Santos Barossa Team /Contractors	Details on DPD Project completion to meet requirements of stakeholders (including Regulatory authorities)	Following completion of the activity	Various stakeholders
Unexpected Finds Notification	Contractor and Santos Barossa Team	Notification by Contractor of potential unexpected find of heritage value. Further notification to Maritime Archaeologist and NT Heritage Branch, as required, following Unexpected Finds Protocol.	Dependent upon occurrence of unexpected find of cultural value	NT Heritage Branch
Environmental Monitoring Reports	Santos Contractor and Santos Barossa Team /Environmental Monitoring Contractor	Reporting on the outcomes of environmental monitoring activities (including water quality and benthic habitat monitoring) associated with the DPD Project construction activities.	Various dependent upon program	Santos DEPWS DITT NT EPA DCCEEW (if required)

Report/ Notification	Responsibility	Content	Frequency	Recipient
Environmental Performance/ Compliance Assurance Report	Santos Barossa Team	Provides a summary of compliance performance, including the environmental performance objectives, standards and measurement criteria within this CEMP and any other conditions of approval on the DPD Project.	At completion of the activity and not less than annually	DITT NTEPA (DEPWS) DCCEEW (if required)
Incident reporting				
Incident Report – Internal	Contractor and Santos Barossa Team	Provides framework for Internal notification of incidents including spills. The first report contains tools for assessing the severity of the incident and escalating as per the incident notification procedure. Incident reporting will also be undertaken through Santos' online EHS Toolbox system.	Incident specific	Santos
Incident Report – Reportable Environmental Incident (P(SL)(MoE) Regs 1999)	Santos Barossa Team	Reporting of Reportable Incidents as per Part 3 of the Petroleum (Submerged Lands) (Management of Environment) Regulations 1999 (P(SL)(MoE) Regs 1999) (Refer **Section 8.3.2**)	Incident specific	DITT
Incident Report – Reportable Environmental Incident (WMPC Act 1998)	Santos Barossa Team	Reporting of Reportable Incidents as per Part 3 of the Waste Management and Pollution Control Act 1998 (WMPC Act 1998) (Refer **Section 8.3.3**)	Incident specific	NT EPA
Incident Report – Wildlife Incidents	Santos Barossa Team	Reporting of incidents involving EPBC Act species and reports of stranded, injured or entangled marine megafauna (Refer **Section 8.3.4**)	Incident specific	DCCEW DEPWS

Report/ Notification	Responsibility	Content	Frequency	Recipient
Incident Report – Hydrocarbon/ hazardous substance spill	Contractor and Santos Barossa Team	Reporting of NT oil spill incidents to Darwin Port (within port limits), AMSA and NT EPA. Additional oil spill reporting requirements as stated within the DPD Project Oil Pollution Emergency Plan (BAS-210 0026)	Incident specific	Darwin Ports AMSA NT EPA
Incident Report – Egress into wreck exclusion zone	Santos Barossa Team	Reporting of any egress into or disturbance of the exclusion zones of the Booya and Catalina 6 wrecks	Incident specific	Darwin Ports Harbour Master

1. As per the Barossa compliance assurance plan

8.6 Document management

This CEMP will be revised based on conditions of environmental approvals and/or licences and submitted to the appropriate regulator, for review and approval as required, prior to DPD Project implementation (i.e., commencement of construction activities).

8.6.1 Information management and document control

This CEMP, as well as any approved management of change (MoC) documents, are controlled documents and current versions will be available on Santos' document control system and made available to Project contractors.

As per the *Petroleum (Submerged Lands) (Management of Environment) Regulations 1999 (Cth)* the CEMP and all records associated with monitoring and reporting against CEMP commitments will be maintained for a period of five years. This includes revisions of the CEMP, and subordinate EMPs, written reports relating to environmental performance (monitoring, audit and review), records of emissions and discharges, records of calibration and maintenance of monitoring devices and records of reportable incidents.

The management and transfer of environmental assurance evidence between Santos and the primary construction contractor will be undertaken as per the Barossa Project Gas Export Pipeline (GEP) Environmental Compliance Assurance Plan (ECAP) Evidence Management and Transfer Procedure (BAS-210 0050).

8.6.2 Management of change

Following regulatory review and approval of this CEMP any changes to Project activities as described in this document, which have the potential to materially increase environmental impacts and risks, will be evaluated and controlled following the impact and risk assessment process followed in **Section 6**. The documentation and approval of management of change (MoC) assessments will follow the process outlined within the Santos Management of Change Procedure (SMS-LRG-OS01-PD04). MoC records will be retained and details of MoCs outlined within Regulatory compliance/performance reports.

As per the *Petroleum (Submerged Lands) (Management of Environment) Regulations 1999 (Cth)*, if a significant new environmental effect or risk is identified, or a significant increase in environmental effect of risk identified, which is not already provided for in the CEMP, a revision of the plan will be submitted to DITT as soon as practicable after the occurrence or identification of the significant effect or risk.

If there is a change in the petroleum instrument holder, or operator for the activity, a revision of the CEMP will be submitted to DITT as soon as practicable after the change.

8.6.3 Reviews

This CEMP addresses a temporary construction activity. Following approval, the CEMP will be reviewed annually, or as required in response to regulatory requirements and any changes to impacts, risks or management actions raised in Santos' assurance processes, incident response, stakeholder engagement or contractor engagement. These changes will be evaluated through the MoC process, and significant updates required to be communicated to regulators will be sent for review.

9 Stakeholder consultation

The stakeholder engagement approach used for the Project is in accordance with Santos's corporate approach to stakeholder engagement and industry leading standards and practice. The approach recognises and is aligned with the NT EPA's Guidance for Proponents – Stakeholder Engagement (NT EPA 2021a), the NT EPA's guidance for Preparing a Supplementary Environmental Report (NT EPA 2021b) and the International Association for Public Participation's (IAP2) Quality Assurance Standard for Community and Stakeholder Engagement (IAP2 2015).

Due to the iterative nature of the stakeholder process all relevant details have been contained in one document, the SER (BAS-210 0020), to contain updates to one location. The SER provides an outline of the objectives, process and key stakeholders consulted for the DPD Project. Additionally, the Stakeholder Engagement Plan (SEP) is attached to the SER. It details all consultation undertaken to date and information on future engagement activities.

In preparing the SER, and project management plans, Santos has considered and assessed each submission individually, and taken into consideration the issues raised when engaging with stakeholders to assess potential impacts and proposed management measures.

The SER provides a summary of the issues raised relevant to the Project and Santos' assessment and response to these issues. A full register, with all submissions and responses, is provided as an attachment to the SER.

Attachment 1 Santos Environment, Health and Safety Policies

Environment, Health & Safety

Policy

Our Commitment

Santos is committed to being the safest gas company wherever we have a presence and preventing harm to people and the environment

Our Actions

We will:

1. Integrate environment, health and safety management requirements into the way we work
2. Comply with all relevant environmental, health and safety laws and continuously improve our management systems
3. Include environmental, health and safety considerations in business planning, decision making and asset management processes
4. Identify, control and monitor risks that have the potential for harm to people and the environment, so far as is reasonably practicable
5. Report, investigate and learn from our incidents
6. Consult and communicate with, and promote the participation of all workers to maintain a strong environment, health and safety culture
7. Empower our people, regardless of position, to "Stop the Job" when they feel it necessary to prevent harm to themselves, others or the environment
8. Work proactively and collaboratively with our stakeholders and the communities in which we operate
9. Set, measure, review and monitor objectives and targets to demonstrate proactive processes are in place to reduce the risk of harm to people and the environment
10. Report publicly on our environmental, health and safety performance

Governance

The Environment Health Safety and Sustainability Committee is responsible for reviewing the effectiveness of this policy.

This policy will be reviewed at appropriate intervals and revised when necessary to keep it current.

Kevin Gallagher

Managing Director & CEO

Attachment 2 Summary of management actions

Management Action Reference	Management Action
Planned Events	
DPD-MA01	Intertidal and shoreline construction is in pre-disturbed area (DLNG footprint) with no public access
DPD-MA02	Installation of the pipeline within pre-agreed route, with minimal incursions into the shipping channel (as defined in consultation with the regional harbour master)
DPD-MA03	Anti-snag protection for mechanical support structures
DPD-MA04	Activity vessels equipped and crewed in accordance with Australian maritime requirements
DPD-MA05	Development and implementation of communication plan (including applicable notifications) for relevant stakeholders (including recreational and commercial fishing bodies and tourism operations) to minimise adverse impacts on other marine users
DPD-MA06	Implementation of cautionary zones around DPD Project vessel to mitigate against adverse interactions
DPD-MA07	One vessel will act as a surveillance vessel within the operational area during gas export pipeline installation and trenching activity
DPD-MA08	The proposed pipeline route will be marked on marine charts, in the same way that the existing pipelines are gazetted and marked on marine charts
DPD-MA09	Construction activities undertaken in accordance with Santos HSE management and marine vessel vetting processes
DPD-MA10	Causeway/s will be temporary structure/s and will be removed following trenching and pipeline installation
DPD-MA11	Pipeline will not be installed in the vicinity of the jewfish aggregation area within the Charles Point Wide RFPA
DPD-MA12	Trenching, stabilisation and freespan correction/ prevention will only be undertaken at identified areas (using standard positional accuracy measures used in the industry)

Management Action Reference	Management Action
DPD-MA13	Overflow from the TSHD will be undertaken through the adaptive management processes There will be 'environmental valve', 'green valve' where available (attached to O/F to reduce air entrained, to reduce billowing and facilitates sediment sinking) as standard which will be used as a first step
DPD-MA14	Standard operating procedure for spoil disposal will be used.
DPD-MA15	Spoil will not be disposed of in a single location, to avoid developing a single large mound.
DPD-MA16	Spoil will only be placed *in situ* within a short section of trenching within intertidal zones and will be removed subsequently where accessible by BHD and SHB for offshore disposal
DPD-MA17	When available, the base case is for the DP pipelay vessel to be used to install as much of the pipeline as depth allows DP vessel can be used in deeper water from KP23 (Territorial water boundary) to ~KP91.5 where the shallow water pipelay (<20 m) and associated anchoring will begin
DPD-MA18	Anchor management plans will be developed to allow safe anchoring of vessels undertaking pipelay, trenching and other support activities in the vicinity of sensitive habitats and nearshore heritage or sacred sites
DPD-MA19	Trained and competent anchor handling operators will be used
DPD-MA20	Anchors exclusion areas will be implemented to avoid sensitive habitats and heritage sites
DPD-MA21	Objects identified as cultural heritage objects that cannot be avoided will be managed as per NT Heritage Branch requirements
DPD-MA22	Differential global positioning system (DGPS) will be operational on the pipelay vessels to maintain accurate vessel position during installation
DPD-MA23	+ DGPS used to confirm ILT foundation structure position during installation + Underwater positioning system (USBL/ transponders) and ROV to confirm installation location and positioning (within required location accuracy to reduce disturbance to the seabed)

Management Action Reference	Management Action
DPD-MA24	Installation plan will be developed and include: + requirement for trained and experienced vessel crews + pipe to be installed in trench as per approved design
DPD-MA25	Span-specific rectification plans developed that include: + pre-span method selection + real-time monitoring of span rectification + post-rectification inspections
DPD-MA26	Permanent rock installation will be limited to only those pipeline sections requiring stabilization and/or anchor protection, as informed by a quantitative risk assessment
DPD-MA27	Causeway/s will be temporary structure/s and will be removed following trenching and pipeline installation
DPD-MA28	Adaptive management process will be implemented as defined within the TSDMMP (BAS-210 0023) which will include environmental monitoring of water quality with management measures applied if water quality exceeds trigger levels
DPD-MA29	Continuous monitoring of anchor wire tensions to prevent anchor drag on seabed and wire length measurement of the winch will be monitored to prevent anchor drag
DPD-MA30	Pre-lay surveys will confirm the nature of the seabed within the ILT foundation location to ensure the structure is installed on bare area of the seabed. Post-lay surveys will allow verification of the impact assessment
DPD-MA31	Where practicable rock installation will not exceed seabed level within practical installation tolerances.
DPD-MA32	Restrict disturbance to within the onshore Project Area and existing DLNG site area
DPD-MA33	Establish appropriate access restrictions into the onshore Project Area

Management Action Reference	Management Action
DPD-MA34	Direct stormwater runoff from the open trench to filter through the rock causeway, when present
DPD-MA35	Leave trench open at both ends to allow any fauna to egress freely
DPD-MA35	Install geotextiles under primary construction area (i.e., site pad)
DPD-MA36	Return area to natural grade to match existing topography
DPD-MA37	All personnel to complete the DLNG HSE site induction
DPD-MA38	Maintain larger batters on trench entry and exit suitable for fauna to exit the trench or include fauna ladders or similar
DPD-MA39	Implement ASS and groundwater management and monitoring requirements within the ASSDMP (BAS-210-0049). The ASSDMP includes requirements for: + Soil stockpiling, laboratory testing and treatment, dependent upon location of work and encountering of ASS + Groundwater laboratory testing and treatment, if groundwater is reached Maintenance of testing and inspection records
DPD-MA40	Plan onshore works to minimise the amount of time soil is exposed to the air
DPD-MA41	Trench inspections to be performed daily to check for trapped wildlife
DPD-MA42	Insert caps on ends of pipe if the pipe is to be unattended for periods >12 hours; to prevent fauna ingress.
DPD-MA43	Ensure any native vertebrates injured by DPD construction activities are referred to an appropriate wildlife carer group or veterinarian
DPD-MA44	Limit vehicles to access roads, prepared site pad or defined boundaries within the onshore Project Area/DLNG disturbance
DPD-MA45	Use water truck for dust suppression
DPD-MA46	Establish and implement vehicle speed controls

Management Action Reference	Management Action
DPD-MA47	Wet parking area will be monitored daily, with photographs taken.
DPD-MA48	Observation and shut-down zones for marine fauna have been developed based on noise modelling results and standard protocols
DPD-MA49	Vessel inductions for all crew will address marine fauna risks and the required management controls
DPD-MA50	Vessel and helicopter contractor procedures will comply with Part 8 of the Environment Protection and Biodiversity Conservation Regulations 2000, which includes controls for minimising interaction with marine fauna
DPD-MA51	Personnel trained in marine fauna observation (MFO) will be present on pipelay, dredge and rock installation vessels during daylight hours, including one crew member with MFO training on the bridge at all times
DPD-MA52	All marine fauna interactions and observations will be appropriately recorded and reported to DEPWS/NT EPA and DCCEEW
DPD-MA53	Soft-start procedures for rock breaking (BHD) for night-time activities where observation is not possible
DPD-MA54	Vessels will adhere to Port of Darwin vessel speed limits
DPD-MA55	Maintenance of vessel, vehicle and equipment combustions engines and vessel incinerators as per planned maintenance system
DPD-MA56	Observation and shut-down zones for marine fauna have been developed based on noise modelling results for trenching and standard protocols and include: + Observation (150 m) and exclusion (50 m) zones for marine mammals and turtles. + Observation zone monitored for 10 minutes prior to commencing trenching. A Marine Megafauna Observation and Adaptive Management Protocol will be included within the MMNMP (BAS-210 0045)
DPD-MA57	Soft start (ramp-up) of hydraulic tools (rock breaking) by BHD Soft start (ramp-up) of trenching equipment, where practicable, will apply to the CSD and TSHD
DPD-MA58	Pipelay vessels will have enclosed pipe welding decks

Management Action Reference	Management Action
DPD-MA59	Shielding, where practicable, and/or orienting operational lights (excluding navigational lighting) on vessels to limit light spill to the environment
DPD-MA60	Housekeeping measures will be adopted, including requiring all crew to keep shutters on windows closed at night, to limit light emissions from vessels
DPD-MA61	Vessel searchlights will only be operated in an emergency situation.
DPD-MA62	Santos will document vessel light spill on Darwin Harbour turtle nesting beaches as part of the DPD Project's environmental monitoring program
DPD-MA63	Vessels will comply with relevant Marine Orders with respect to planned discharges, including: + Marine Order 91 – Marine Pollution Prevention: Oil, which implements Annex I of the MARPOL + Marine Order 96 – Marine Pollution Prevention: Sewage, which implements Annex IV of the MARPOL
DPD-MA64	Santos Marine Assurance Process
DPD-MA65	Protection/screening of abstraction hose end to prevent fauna entrainment
DPD-MA66	Backflush water will be discharge onto existing disturbed shore crossing construction site so that it drains into the intertidal area and solids disperse with tidal movement, minimising turbidity effects
DPD-MA67	Where possible, and dependant on the progress of shore crossing rock installation at time of FCGT activities, backflush water will be discharged onto installed rock, to baffle the flow of discharged backflush water
DPD-MA68	Atmospheric emissions from combustion, incinerators and ODS managed in accordance with standard maritime practice (MARPOL) MARPOL standards include no incineration in harbour
DPD-MA69	Monitoring and reporting of fuel consumption and calculated GHG emissions

Management Action Reference	Management Action
DPD-MA70	Use of low sulphur diesel
DPD-MA71	Pipeline installation procedures Maintenance requirements for pipelaying equipment to minimise risk of operational failure Redundancy in nearshore pipelay vessel anchors Pipelay vessel will have redundancy in station keeping capabilities in operating in DP2 (as a minimum)
DPD-MA72	Chemical selection procedure for all chemicals planned to be release to the marine environment
DPD-MA73	Calibrated chemical dosing system in place to ensure accuracy of chemical dosing
DPD-MA74	If contingency use and discharge of treated seawater is required, the lowest required concentration of treated chemical will be evaluated and used (up to a maximum of 550 ppm) in order to meet pipeline preservation requirements.
DPD-MA75	Pipeline dewatering of treated seawater will be through valve orientated vertically to promote dispersion and direct discharge away from seabed
DPD-MA76	In the unlikely event that the pipeline requires contingency filling and subsequent dewatering of treated seawater in response to a wet buckle event and prolonged repair, water quality monitoring at the discharge location will be conducted to confirm the concentration and dispersion of treatment chemicals.
Unplanned Events	
DPD-MA07	One vessel will act as a surveillance vessel within the operational area during gas export pipeline installation
DPD-MA50	Vessel and helicopter contractor procedures will comply with Part 8 of the Environment Protection and Biodiversity Conservation Regulations 2000, which includes controls for minimising interaction with marine fauna
DPD-MA51	Personnel trained in marine fauna observation (MFO) will be present on pipelay, dredge and rock installation vessels during daylight hours, including one crew member with MFO training on the bridge at all times

Management Action Reference	Management Action
DPD-MA52	All marine fauna interactions and observations will be appropriately recorded and reported to DEPWS/NT EPA and DCCEEW
DPD-MA63	+ Vessels will comply with relevant Marine Orders, including: + Marine Order 95 – Marine Pollution Prevention: Garbage
DPD-MA65	Protection/screening of abstraction hose end to prevent fauna entrainment during water winning activities
DPD-MA77	Implementation of Santos approved standards and procedures for outboard lifts
DPD-MA78	All lifting and winching equipment will undergo inspection, testing and certification as per applicable Laws, Codes and Standards
DPD-MA79	Dropped object recovered where safe and practicable to do so
DPD-MA80	Identification of no lift zones where relevant in proximity to subsea assets and infrastructure as documented in relevant lifting and operational procedure/s
DPD-MA81	No outboard lifting operations will be completed in Company defined "no lifting zones" which will be identified in navigational systems
DPD-MA82	Emergency response implemented to minimise potential for impacts in the event a dropped object causes a loss of containment from the existing Bayu-Undan GEP
DPD-MA83	Pipeline installed along pre-approved route, which is designed where practicable to avoid the potential for impact to habitat / cultural seabed features or assets from a dropped object.
DPD-MA84	Vessels equipped with effective anti-fouling coatings as required for class
DPD-MA85	Ballast water management will comply with MARPOL requirements (as applicable to class), Australian Ballast Water Management Requirements and *Biosecurity Act 2015*
DPD-MA86	Apply risk-based IMS management for vessels and immersible equipment – vessel and immersible equipment mobilised from outside of the Project Area/Darwin Harbour must be assessed as having a low risk of IMS prior to coming onto activity

Management Action Reference	Management Action
DPD-MA87	Vessels having suitable anti-fouling coating (marine growth prevention system) in accordance with the *Protection of the Sea Act 2006*
DPD-MA88	Inductions to include observing marine fauna (e.g., crocodiles and shorebirds)
DPD-MA89	The TSHD shall be fitted with pre-sweeping mechanisms / chain curtains to mitigate turtle entrapment (fauna strike – unplanned)
DPD-MA90	Inspection and maintenance for all equipment containing chemicals/ hydrocarbons and chemical/ hydrocarbon storage areas
DPD-MA91	Santos chemical selection procedure applied for chemicals
DPD-MA92	ROV operations undertaken in accordance with good industry practice (in relation to hydraulic fluid control)
DPD-MA93	Procedures for helicopter refuelling
DPD-MA95	Chemical storage areas designed to contain leaks and spills and inspected routinely
DPD-MA96	Spills will be managed in accordance with standard maritime practices as per vessel shipboard oil pollution emergency plan (SOPEP)
DPD-MA97	Spill clean-up kits available in high-risk areas
DPD-MA98	Bunding/secondary containment
DPD-MA99	Vessel-specific bunkering procedures and equipment consistent with Santos marine vessel vetting requirements including: + Use of bulk hoses that have quick connect 'dry break' couplings + Correct valve line-up + Defined roles and responsibilities, and the specific requirement for bunkering to be completed by trained personnel only + Visual inspection of hoses prior to bunkering to confirm they are in good condition + Testing of the emergency shutdown mechanism on the transfer pumps + Assessment of weather/sea state

Management Action Reference	Management Action
	+ Maintenance of radio contact with Vessel during bunkering operations + Bunkering checklist + Visual monitoring during bunkering + Ensuring deck drainage bungs are in place prior to bunkering + Marine Order 91 – Marine Pollution Prevention: Oil + Bunkering to commence in daylight hours
DPD-MA100	Vessel equipped and crewed in accordance with Australian maritime requirements
DPD-MA101	Safety exclusion zone around DPD Project vessels and Notice to Mariners will be issued for offshore works advising all major shipping traffic formally. In addition, pipelay vessels will have attendant vessels that may act as guard vessels for work within the harbour
DPD-MA102	No intermediate fuel oil (IFO) or heavy fuel oil (HFO) will be used in activity vessels working in the Project Area
DPD-MA103	Implement tiered spill response as per DPD Project specific OPEP in the event of an MDO spill
DPD-MA104	Santos to make oil spill tracking buoys available on primary project vessel/s with Santos CSR/s and/or at local supply base for immediate deployment to assist with tracking of an oil spill
DPD-MA105	Trenching will only occur within pre-programmed areas (using standard positional accuracy measures used in the industry)
DPD-MA106	Exclusion zones programmed on all primary vessels associated with the works to clearly indicate no entry zones and nearby pipelines – this will clearly identify areas for spud placement, anchor positioning and trenching activities
DPD-MA107	Navigation charts
