EXECUTIVE SUMMARY

Santos is exploring options for the Darwin Pipeline Duplication (DPD) Project associated with development of the Barossa gas field in northern Australia. The pipeline would run from the point where the Barossa gas export pipeline (GEP) intersects the existing Bayu-Undan (BU) pipeline (kilometre point (KP) 0), running alongside the existing BU GEP into Darwin LNG plant at Wickham Point in Darwin Harbour (KP122.5). The pipeline would be trenched using a dredge in areas within the harbour and then laid on the seabed offshore outside of the harbour. Dredge spoil will be placed at an offshore dredge spoil disposal site adjacent the existing INPEX spoil ground outside the harbour in Northern Territory waters. As such, baseline information on the benthic habitats, sediment composition (including contaminant concentrations), macroinvertebrate (infaunal) assemblages, and water quality was required along the pipeline route and in the proposed spoil ground. The surveys were undertaken between 14–22 October 2022, 6–10 January 2022 and 6–10 June 2022.

During the surveys, 99 × 0.1 m^2 van Veen grab samples (in October 2021), 111 subsea video deployments (69 in October 2021 and 42 in June 2022), 34 water samples (in October 2021) and 27 core samples (in January 2022) were collected. The pipeline survey area extended from approximately 3 km west of KP0 to KP120.6 (near the KP122.5 Darwin Harbour shore crossing) and included a potential spoil ground outside of Darwin Harbour port limits.

Key conclusions from the surveys are:

- Eight overarching benthic habitat types were identified from subsea video surveys of the offshore pipeline route, spoil ground and pipeline route in Darwin Harbour. Benthic habitats comprised soft sediment habitat types outside of Darwin Harbour, and a mosaic of hard and soft substrate habitats within the harbour. Highest densities of epibiota were associated with hard substrates (consolidated rocky seabed and low-profile reef).
- Sediments in the survey area were represented by slightly gravelly muddy sands to gravelly sands.
- Infaunal analysis indicated that the number of species (S), abundance (N), species richness (d) and diversity (H') indices varied between different sampled areas. Comparison with historic data (INPEX Browse Ltd, 2010) indicated that the lowest values of these indices were likely to be within Darwin Harbour, with highest values recorded for the offshore pipeline section (~KP-3 to KP90). Infaunal assemblages were characteristic of soft sediment habitat.
- Macroinvertebrate assemblages were dominated by crustaceans (mainly amphipods, tanaids and isopods) and annelid polychaetes (mainly deposit-feeding tube worms and free-living taxa), with crustacea (mainly amphipods). Characteristic taxa included Anthuridae (elongate isopods), polychaetes (*Lumbrineris* sp., spionids, *Nephthys* sp., *Axiothella* sp. and *Eunice* sp.), brittlestars (Ophiuroidea) and other echinoderms, sipunculids, molluscs and chordates were also represented.
- Multivariate analysis identified that the sampled areas (offshore pipeline and spoil ground) were significantly different.
- The silt/clay and gravel components indicated a transition in benthic sediments from the tie-in point at KP0 to the shore crossing at KP122.5. Sampled areas (the offshore pipeline, the spoil ground, the sand wave dredge area in the northern part of Darwin Harbour and the pipeline route in southern Darwin Harbour (near the shore crossing)) were all significantly different in terms of particle size distribution, with clay/silt and gravel per cent contributions highest in Darwin Harbour. Similar transitional patterns were observed for infaunal biological assemblage composition along the offshore pipeline route and at the spoil ground. It is likely that other unmeasured factors, e.g. current speeds/site energy, riverine input into Darwin Harbour (e.g. freshwater, silt), salinity profiles up the river and sediment chemistry, also contribute, and that there is likely to be seasonal variability in the distribution and composition of benthic faunal assemblages.

- Sediment sampling and analysis was conducted in line with the National Assessment Guidelines for Dredging. Analysis of metals and metalloids in sediments along the pipeline route and at the spoil ground indicated elevated concentrations of arsenic greater than the relevant National Assessment Guidelines for Dredging screening levels. Elevated levels of arsenic were found both along the pipeline route and at the proposed dredge spoil disposal ground indicating a naturally high background concentration and have been previously recorded in Darwin Harbour sediments. This is expected as arsenic is considered to have become concentrated in sedimentary rocks through sedimentation processes in this region. The fine-grained clastic sediments have higher arsenic concentrations than the coarse-grained sediments.
- Total petroleum hydrocarbons (TPH), total recoverable hydrocarbons (TRH) and benzene, toluene, ethylbenzene, xylenes and naphthalene (BTEXN) were detected at 35 of the Darwin Harbour sites, at low levels. Normalised TPH and TRH concentrations met the relevant guidelines across all sites. PAH concentrations at these 35 sites were below the laboratory limit of reporting.
- Concentrations of naturally occurring radioactive materials, pesticides and tributyl tin (TBT) were all below limits of detection in harbour sediments. There is low potential for acid sulfate soils as, although inorganic sulfur is present in the sediments, there is significant acid neutralising capacity kinetically available to neutralise the oxidation products from the inorganic sulfur.
- No contaminants of concern were found in the sediments along the pipeline route or at the potential spoil disposal ground, with elevated levels of arsenic considered to be naturally occurring. Therefore the sediments along the pipeline route are considered to be suitable for unconfined ocean disposal, as per the National Assessment Guidelines for Dredging and Guidelines for the Environmental Assessment of Marine Dredging in the Northern Territory.
- Water column profiles at sites along the offshore pipeline and at the spoil ground showed no indications of stratification of the water column.
- Analysis of contaminants in water quality samples identified several exceedances of the relevant guideline values:
  - Three copper samples from the surface waters
  - One lead sample from surface waters
  - A total of 35 total nitrogen and total phosphorous samples.

In summary, the results of the Barossa DPD surveys contributed to the understanding of seabed habitat chemico-physical and biological composition in the study area. The Barossa DPD pipeline route is a transitional environment, with soft sediment habitats along the offshore pipeline route and spoil ground, and with areas of both soft and hard substrate habitat within Darwin Harbour.

1 INTRODUCTION

Santos is exploring options for the Darwin Pipeline Duplication (DPD) Project associated with development of the Barossa gas field in northern Australia. The pipeline would run from the point where the existing approved Barossa gas export pipeline (GEP) reaches the existing approved Bayu-Undan pipeline (kilometre point (KP) 0), running alongside the existing Bayu-Undan GEP into Darwin LNG plant at Wickham Point in Darwin Harbour (KP122.5). The pipeline will be trenched using a dredge in areas within the harbour, where required, and then laid on the seabed further offshore outside of the harbour. Dredge spoil will be placed at an offshore dredge spoil disposal site adjacent the existing INPEX spoil ground outside the harbour in Northern Territory waters. Rock sourced from a local quarry will be used to backfill the trench once the pipeline has been laid. These activities have potential to cause environmental impacts that must be identified, quantified, mitigated, and managed to acceptable levels.

In support of environmental approvals for the DPD project, Santos has engaged RPS to conduct a baseline environmental survey for the project, designed to fill gaps in the existing dataset. Sampling sites have been selected to ensure representation of the different sections of the pipeline route and to investigate features identified from interpretation of geophysical data, stakeholder consultation and existing marine habitat mapping.

The baseline survey included the following areas:

- The pipeline route from KP0 (equivalent to Bayu-Undan pipeline kilometre point (KP) 380) to ~KP91 (Darwin Harbour port boundary)
- The proposed spoil ground
- The pipeline route within Darwin Harbour (KP91 to KP122.5)
- The proposed pipeline trenching areas within Darwin Harbour
- Habitat areas identified from existing Darwin Harbour habitat mapping
- The Charles Point Wide Reef Fish Protection Area.

1.1 Objectives

The Barossa DPD offshore survey objectives were to:

- Undertake water quality, sediment quality and benthic habitat and communities assessments along the proposed pipeline route and at the spoil ground.
- Identify any areas of higher environmental value or sensitivity to inform the Environmental Impact Assessment (EIA) for the project.
- Collect additional samples and benthic habitat imagery during other surveys to augment the benthic dataset.

1.2 Purpose

- The purpose of this field survey report is to provide a summary of the field survey activities and results from the field surveys, including a brief description of the key features and benthic habitats along the pipeline route and at the spoil ground area.

2 METHODS

2.1 Surveys

2.1.1 October 2021 survey

2.1.1.1 Sampling sites

The sediment grab and video surveys were carried out between 14 and 22 October 2021. The survey design was supplemented in the field with additional sites based on any potential features identified during the Fugro geophysical scope. The survey was divided into three sampling areas and the samples coded accordingly; the offshore pipeline (OP; KP0 to ~KP91), Darwin Harbour pipeline (HS; ~KP91 to KP122, including the sand wave dredge areas), and the spoil ground (SG; Figure 2-1). The sampling sites were based on historical geophysical data (see Figure 2-1, Figure 2-2, Figure 2-3 and Figure 2-4) and therefore considered representative of the full pipeline corridor, including the anchoring areas either side of the proposed pipeline route. The sampling was conducted as per requirements of NAGD and NT EPA dredging guidelines, ensuring sufficient sites were sampled in a standard method. Further details about the survey sites, including the relative KP Points are in Appendix A.

Table 2-1: Sample naming conventions for the Barossa DPD survey

Sample location	Sample type	Sample ID	Number of sites
Offshore pipeline	Sediment (grabs)	OP	33
	Drop video	OP	9
	Video transect	V	17
	Surface water	OP S	10
	Bottom water	OP B	10
Spoil ground	Sediment (grabs)	SG	13
	Drop video	SG	13
	Surface water	SG S	7
	Bottom water	SG B	7
Darwin Harbour	Sediment (grabs)	HS	53
	Sediment (cores)	KP	17
	Video transect	HS	30

2.1.2 January 2022 sediment survey

A sediment survey was undertaken between 6–10 January 2022. The sediment survey was undertaken during a geotechnical survey conducted by Fugro, which collected the cores and positional data, and CDM Smith, which processed the core samples aboard the survey vessel.

2.1.3 Sediment sampling and analysis

The sampling and analysis was conducted as per requirements of National Assessment Guidelines for Dredging (NAGD; CoA, 2009) and Guidelines for the Environmental Assessment of Marine Dredging in the Northern Territory (NT EPA, 2013). This ensured sufficient sites were sampled and appropriate analytes were identified. Further details about the survey sites, including the relative KP locations are in Appendix A.

2.1.3.1 Sampling sites

Sediment cores were collected at pre-determined sites, with samples separated into 0–50 cm and >50 cm core depth intervals (below sediment surface) for processing and laboratory analysis. A total of 29 sediment core samples were collected from 17 sampling locations inside Darwin Harbour (Figure 2-1).

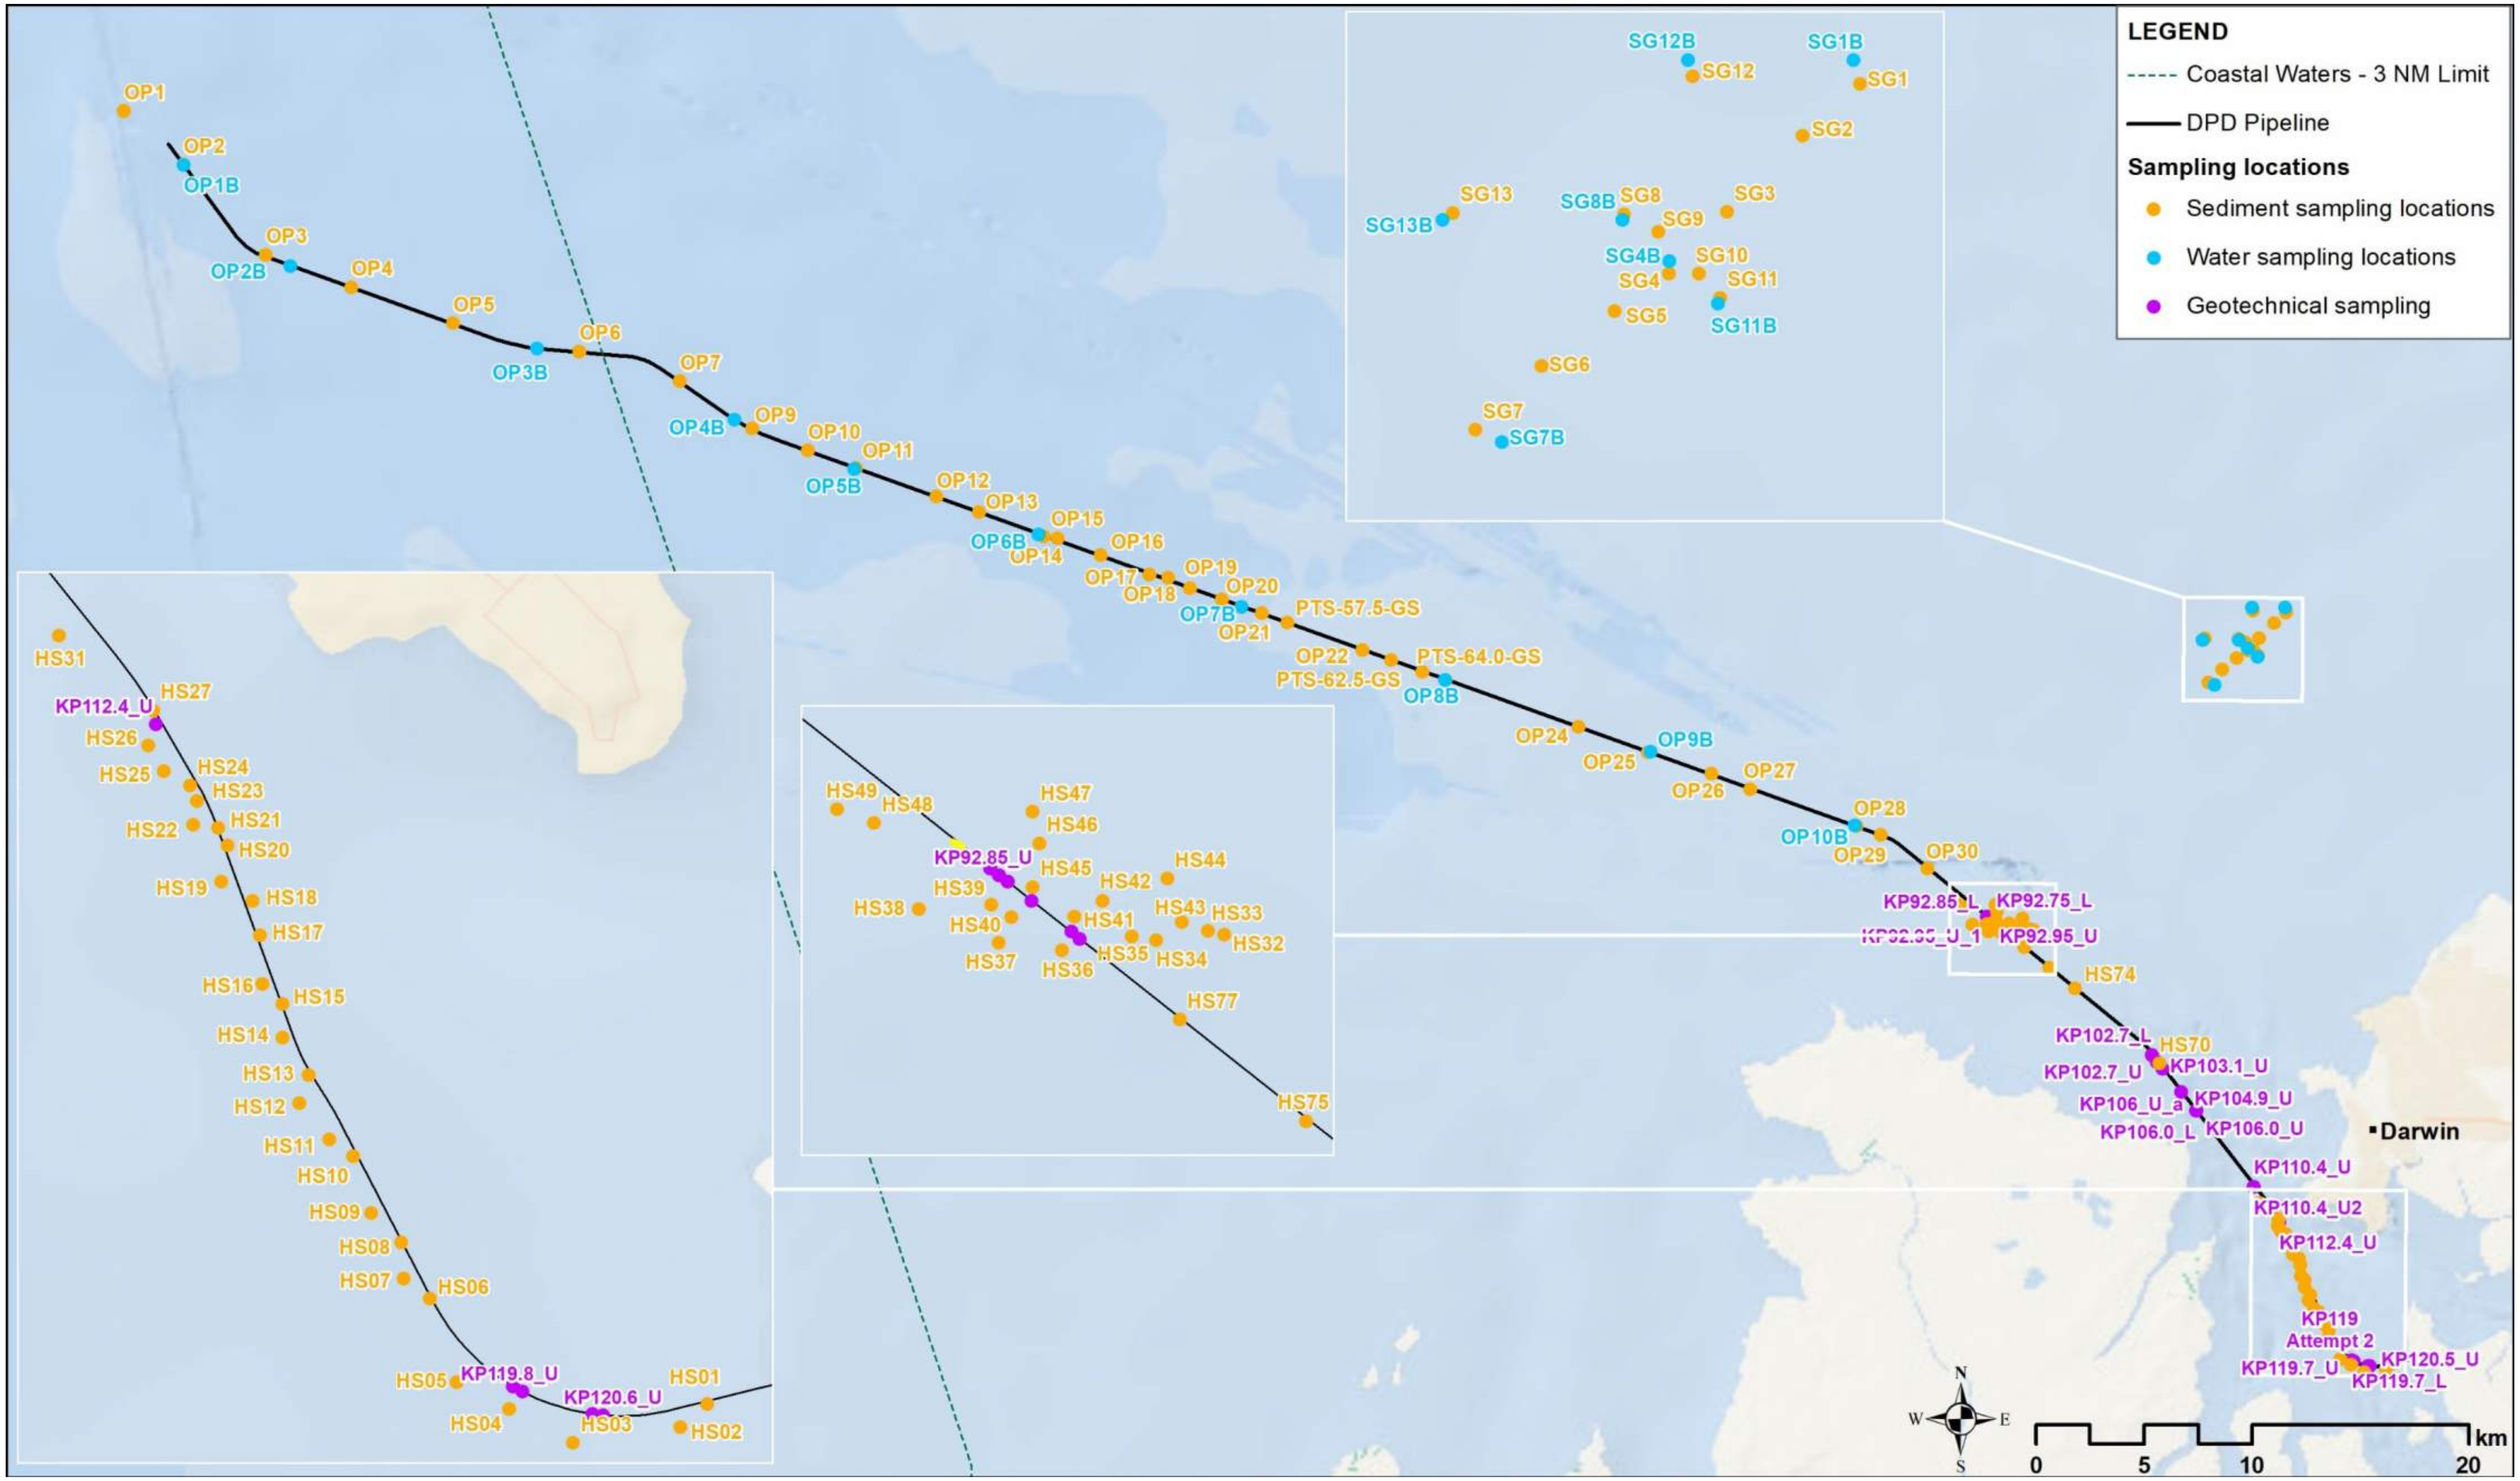

Figure 2-1: Sediment and water quality sampling sites (November 2021) and sediment core sampling sites collected during geotechnical sampling sites (January 2022) along the proposed Barossa pipeline route and at the proposed spoil ground (SG)

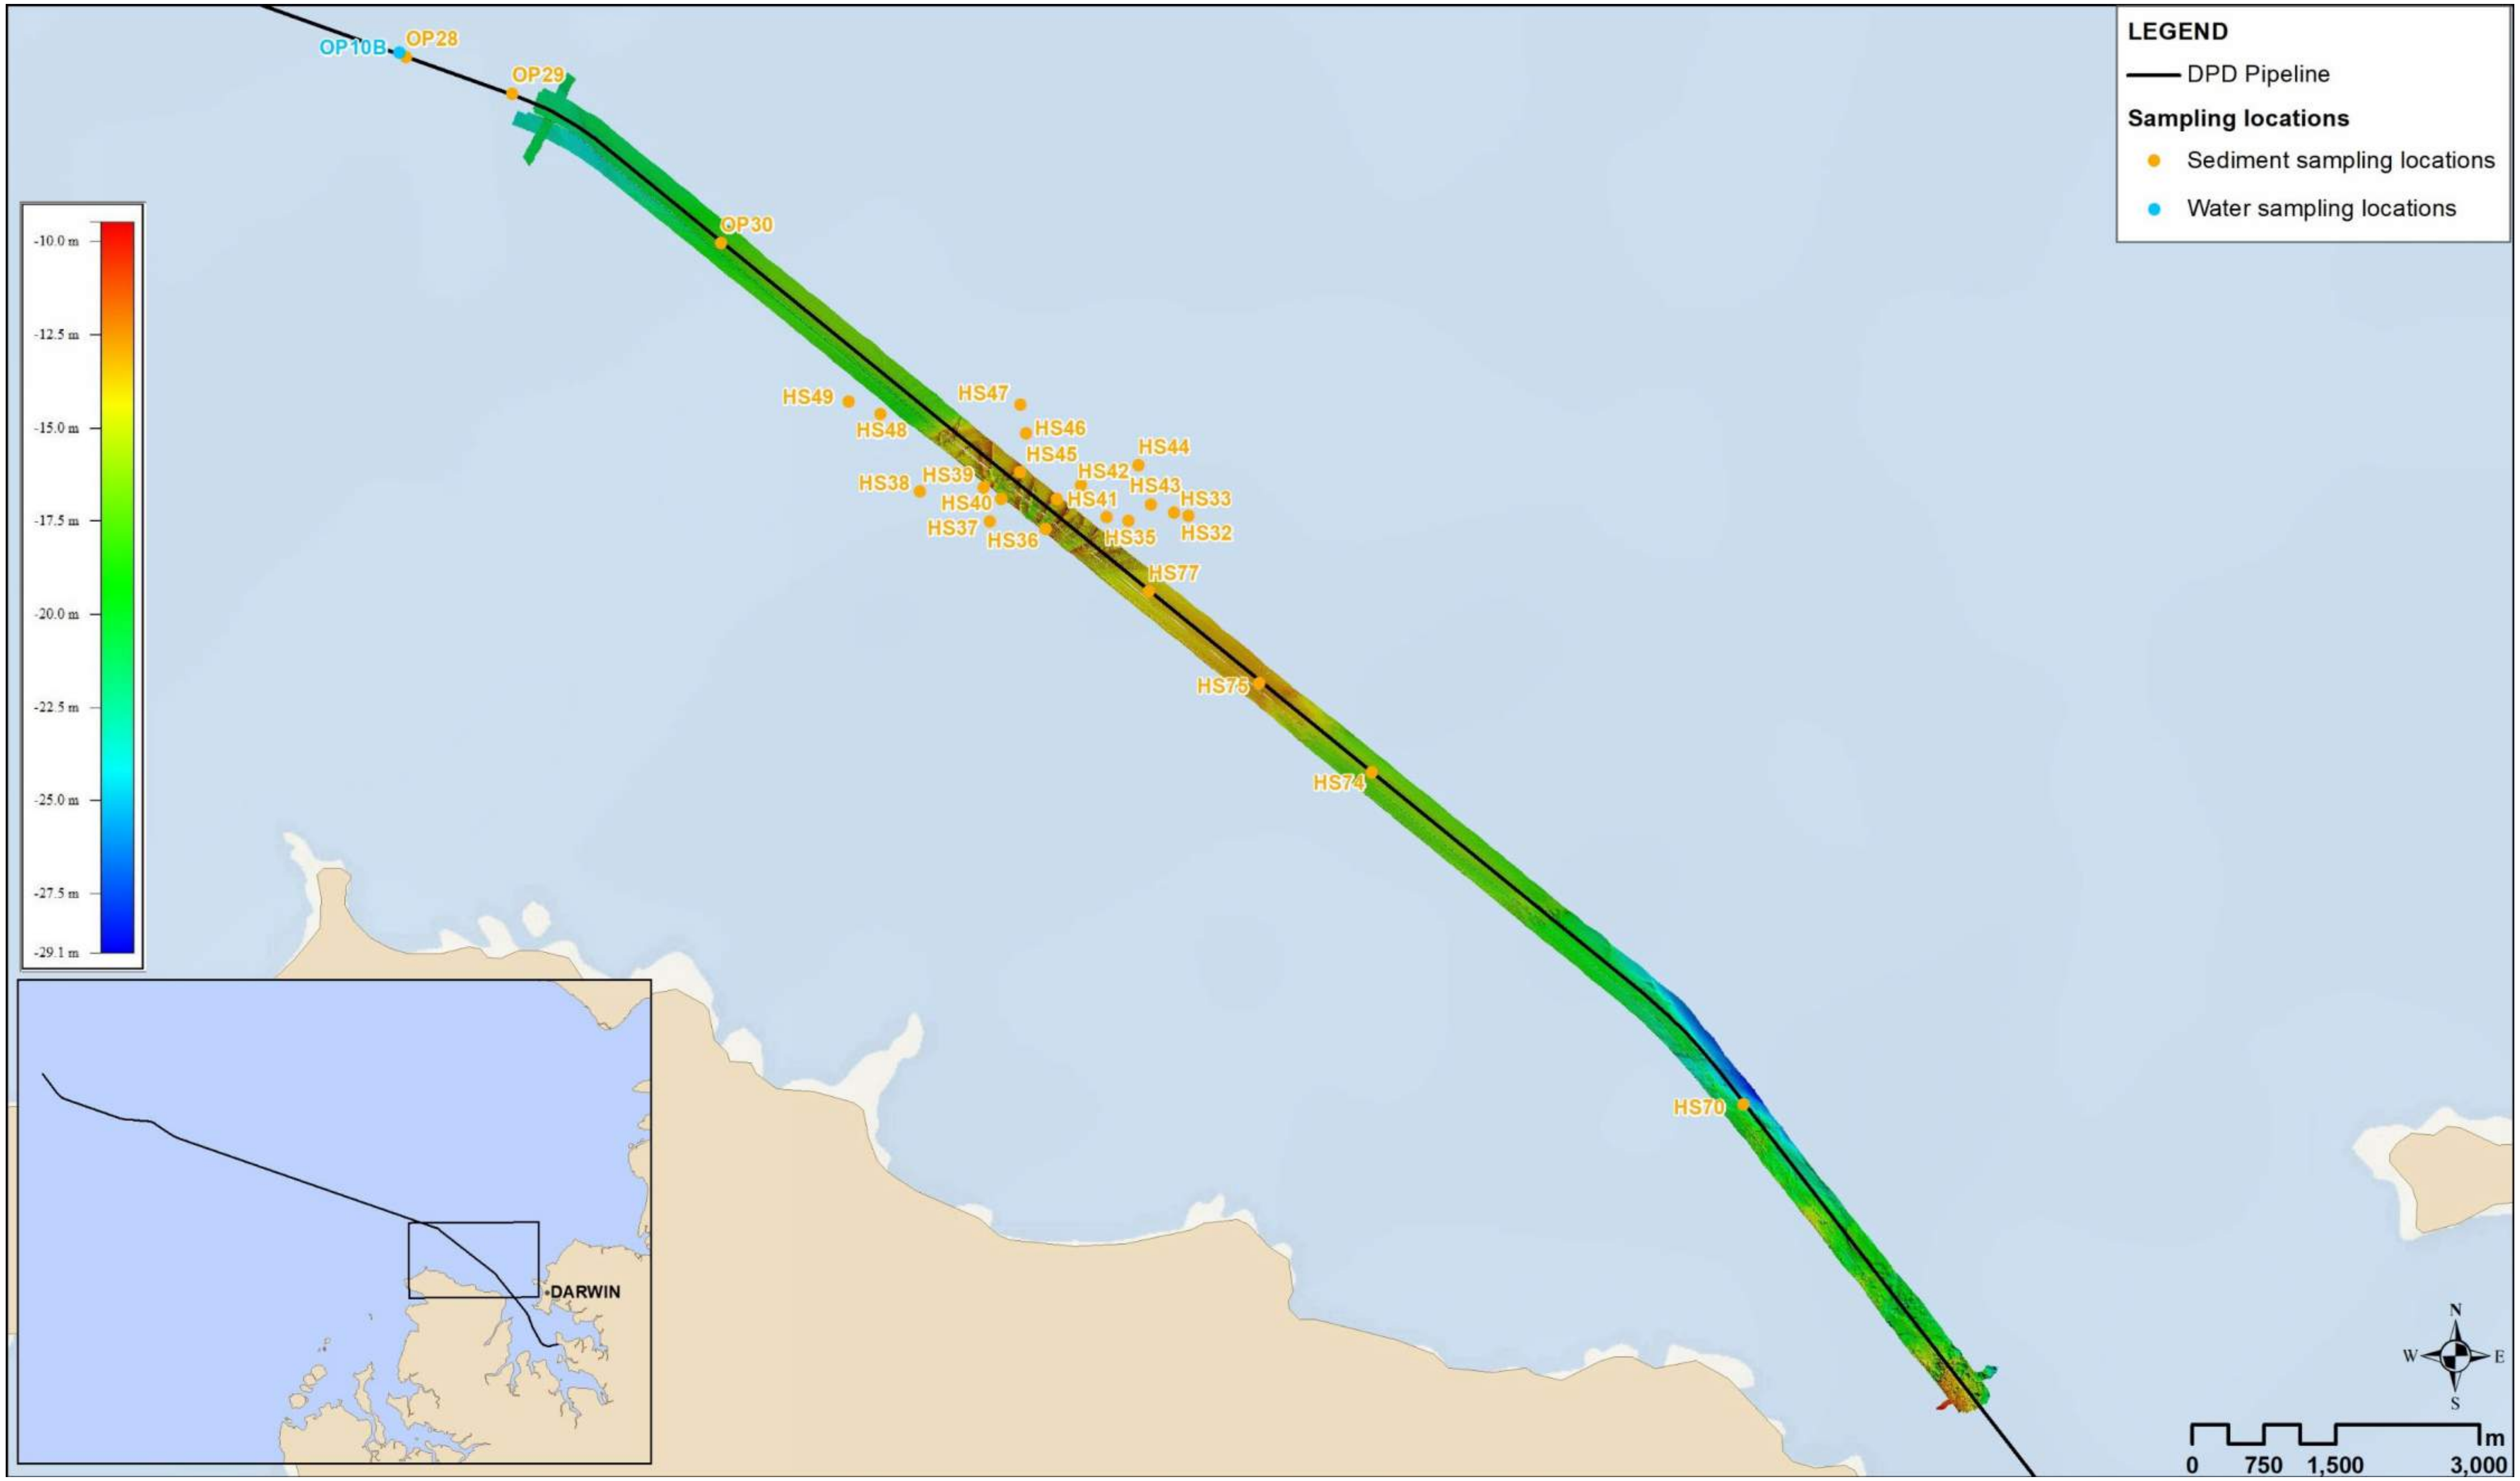

Figure 2-2: Sediment and water quality sampling sites from outer Darwin Harbour to sand wave area, showing with 2021 multi-beam bathymetric data

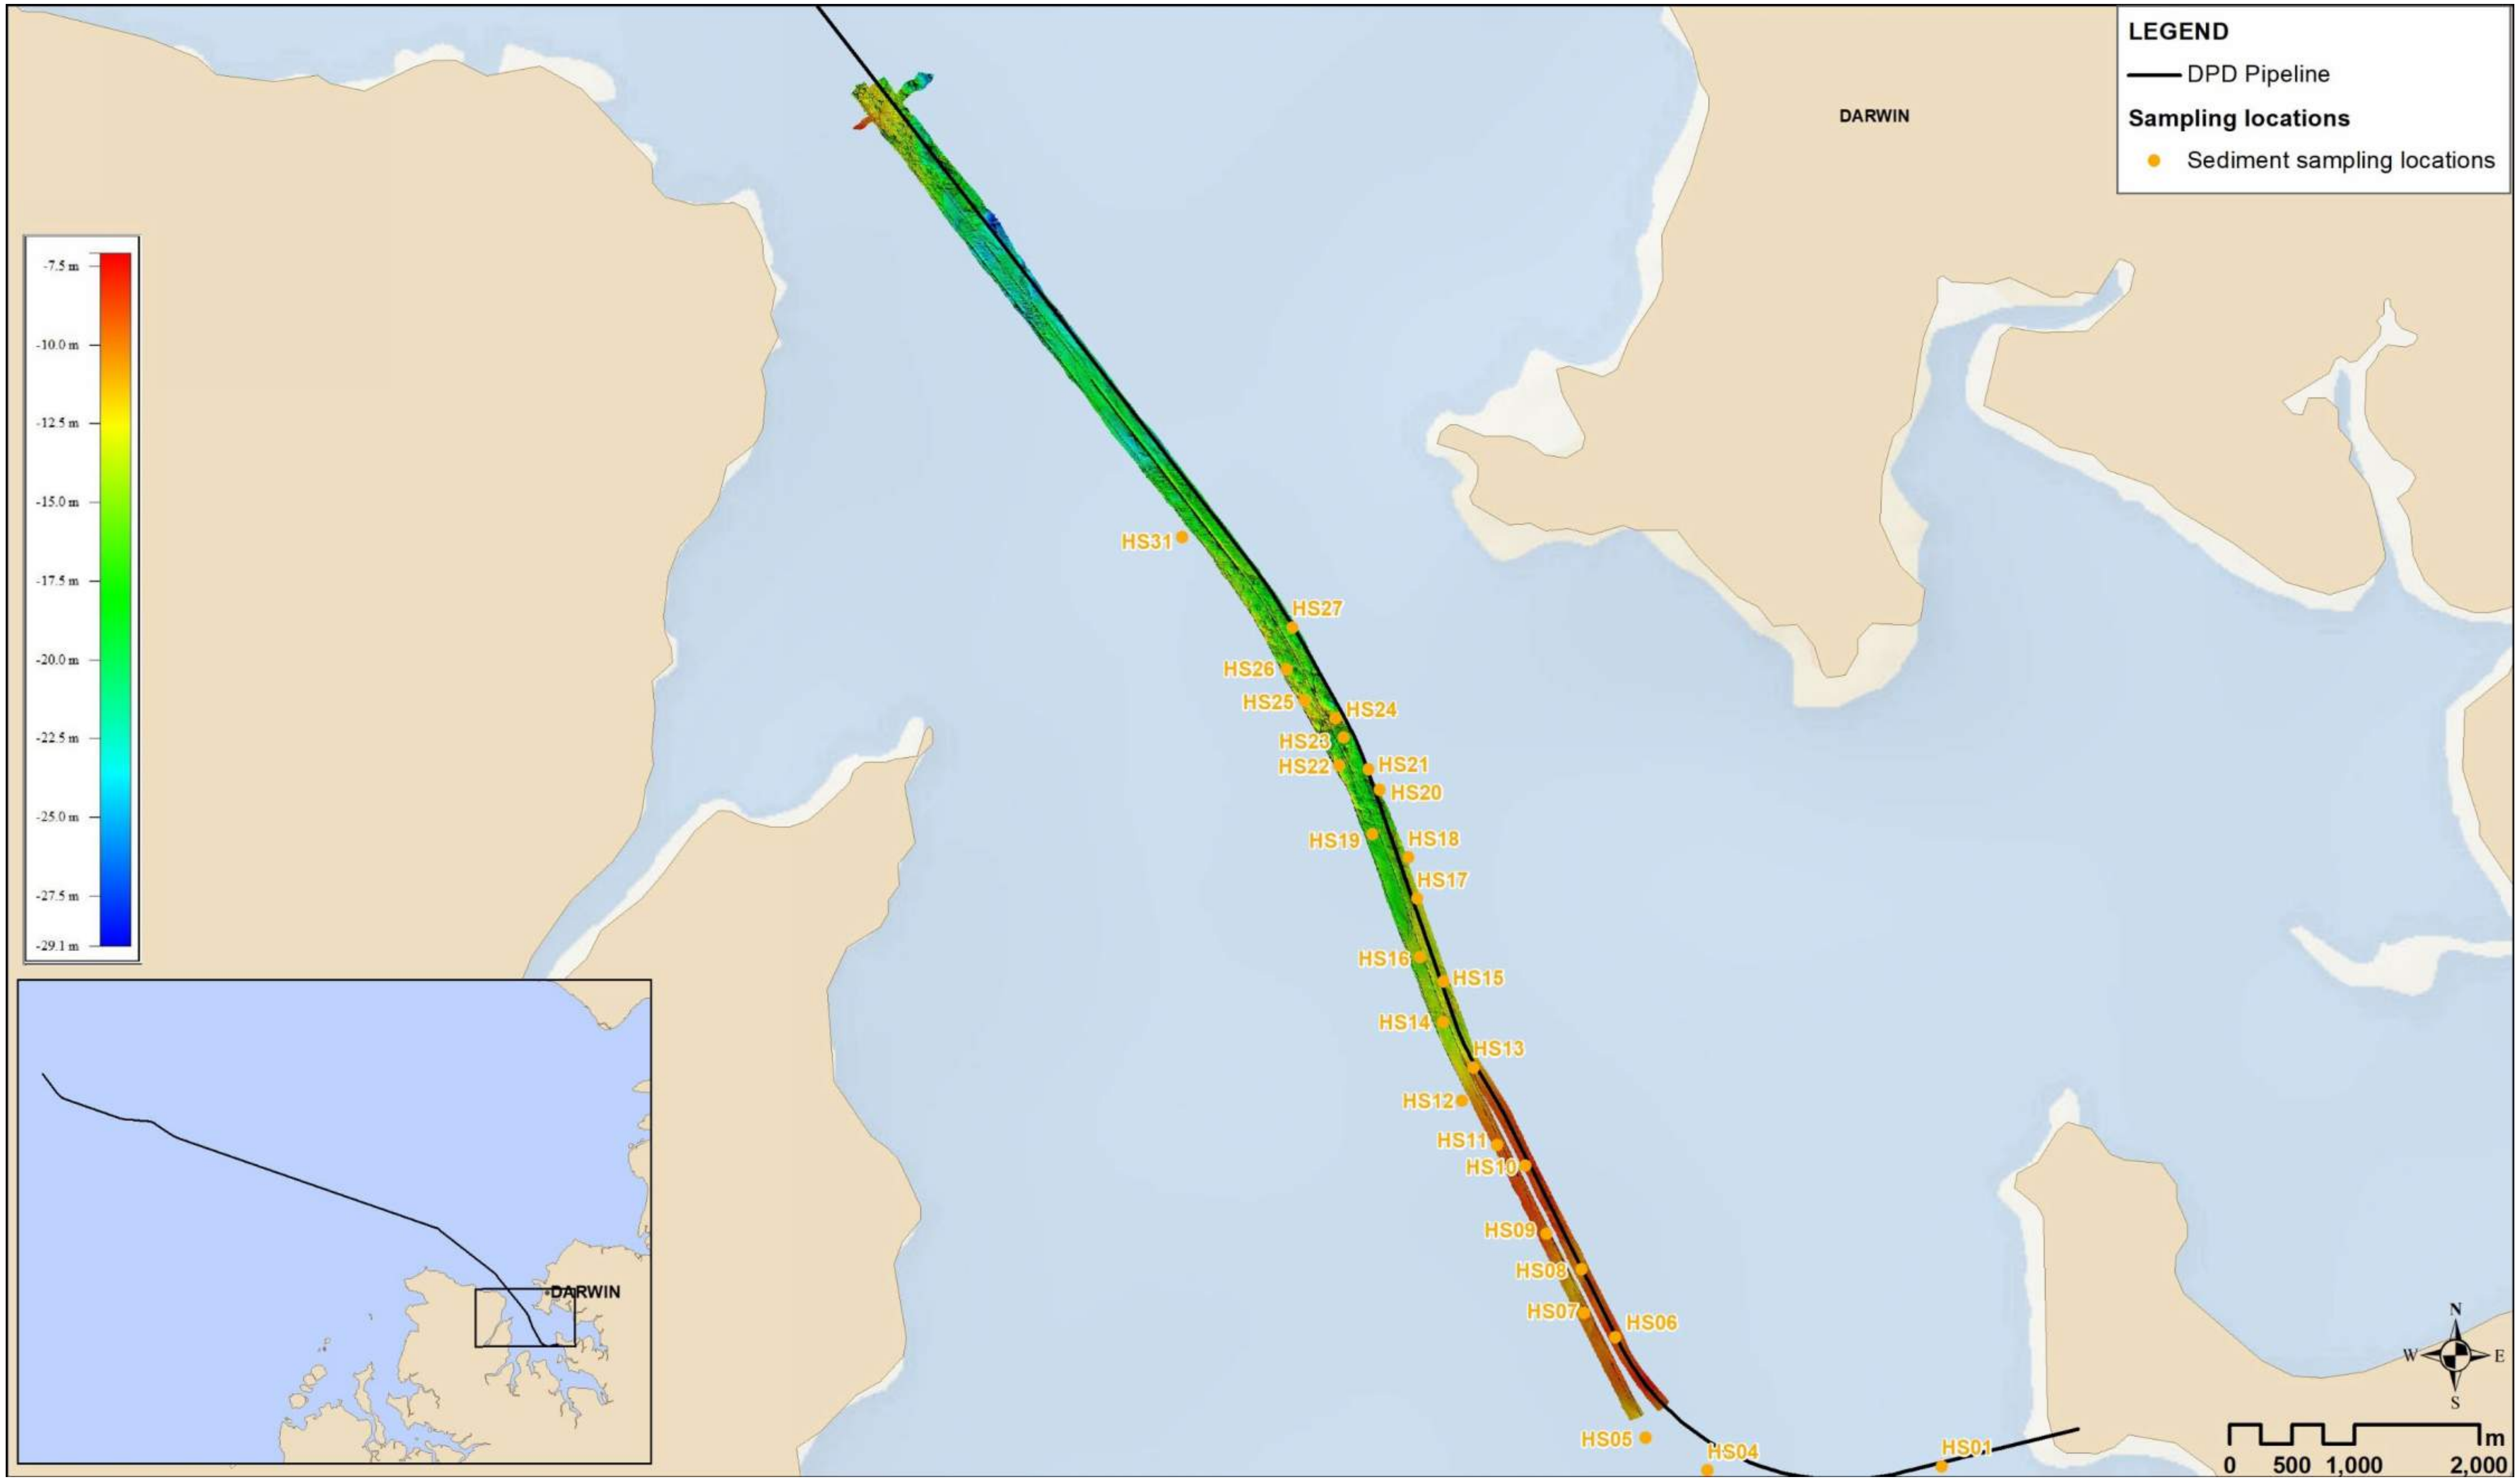

Figure 2-3: Sediment quality sampling sites in inner Darwin Harbour, with 2021 multi-beam bathymetric data

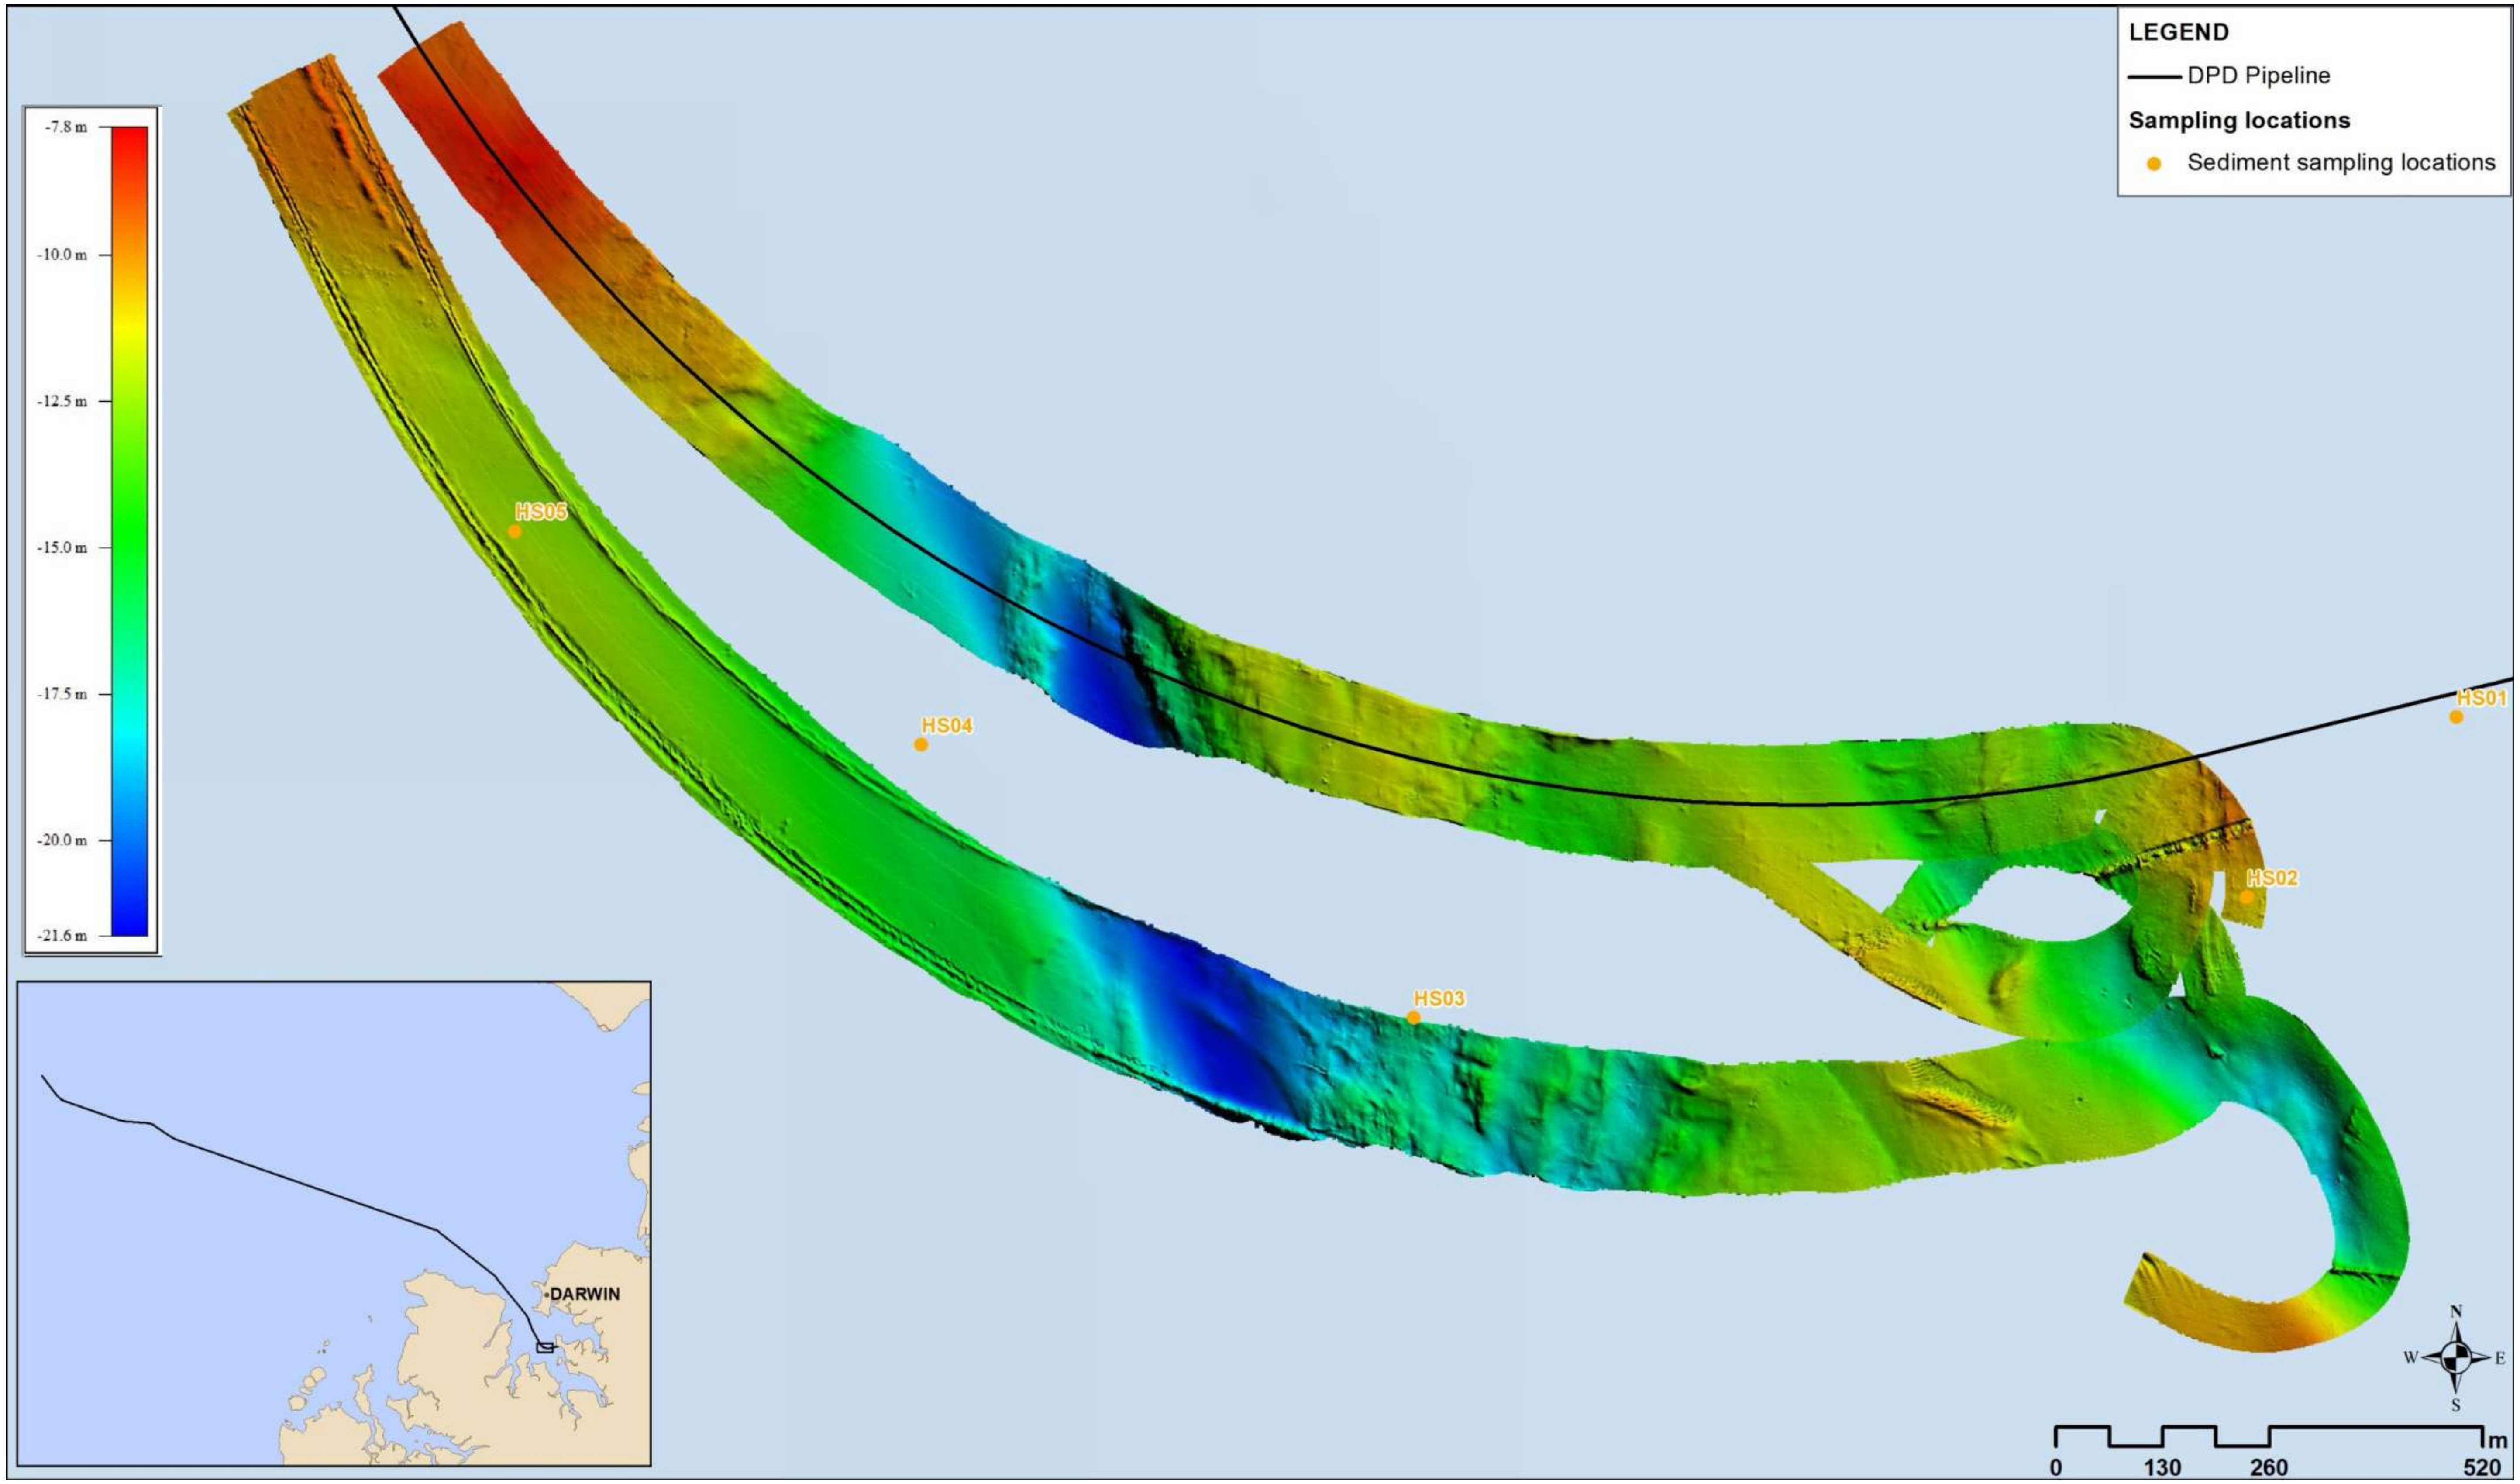

Figure 2-4: Darwin Harbour sediment quality sampling sites near the shore crossing, with 2021 multi-beam bathymetric data

2.1.4 June 2022 survey

An additional video transect survey was conducted between 6 and 10 June 2022. RPS designed and conducted the remote operated vehicle (ROV) benthic imagery. The objective for this survey was to further ground truth the 2019 and 2021 AIMS benthic habitat data around the pipeline route offshore and in Darwin Harbour (including the sand wave dredge areas). The survey was undertaken in conjunction with a marine archaeological survey.

2.1.4.1 Sampling sites

The video transect survey was divided into three general sampling areas: the offshore pipeline, outer Darwin Harbour pipeline and inner Darwin Harbour (Figure 2-5). The sampling sites were based on historical AIMS 2019 and 2021 benthic surveys and the proposed location of the DPD, including key ecological and historical locations. A total of 42 transects were analysed during the survey; 12 at the offshore pipeline, 15 near at outer Darwin Harbour and the remaining 15 at inner Darwin Harbour. Further details about the survey sites are included in Appendix A.

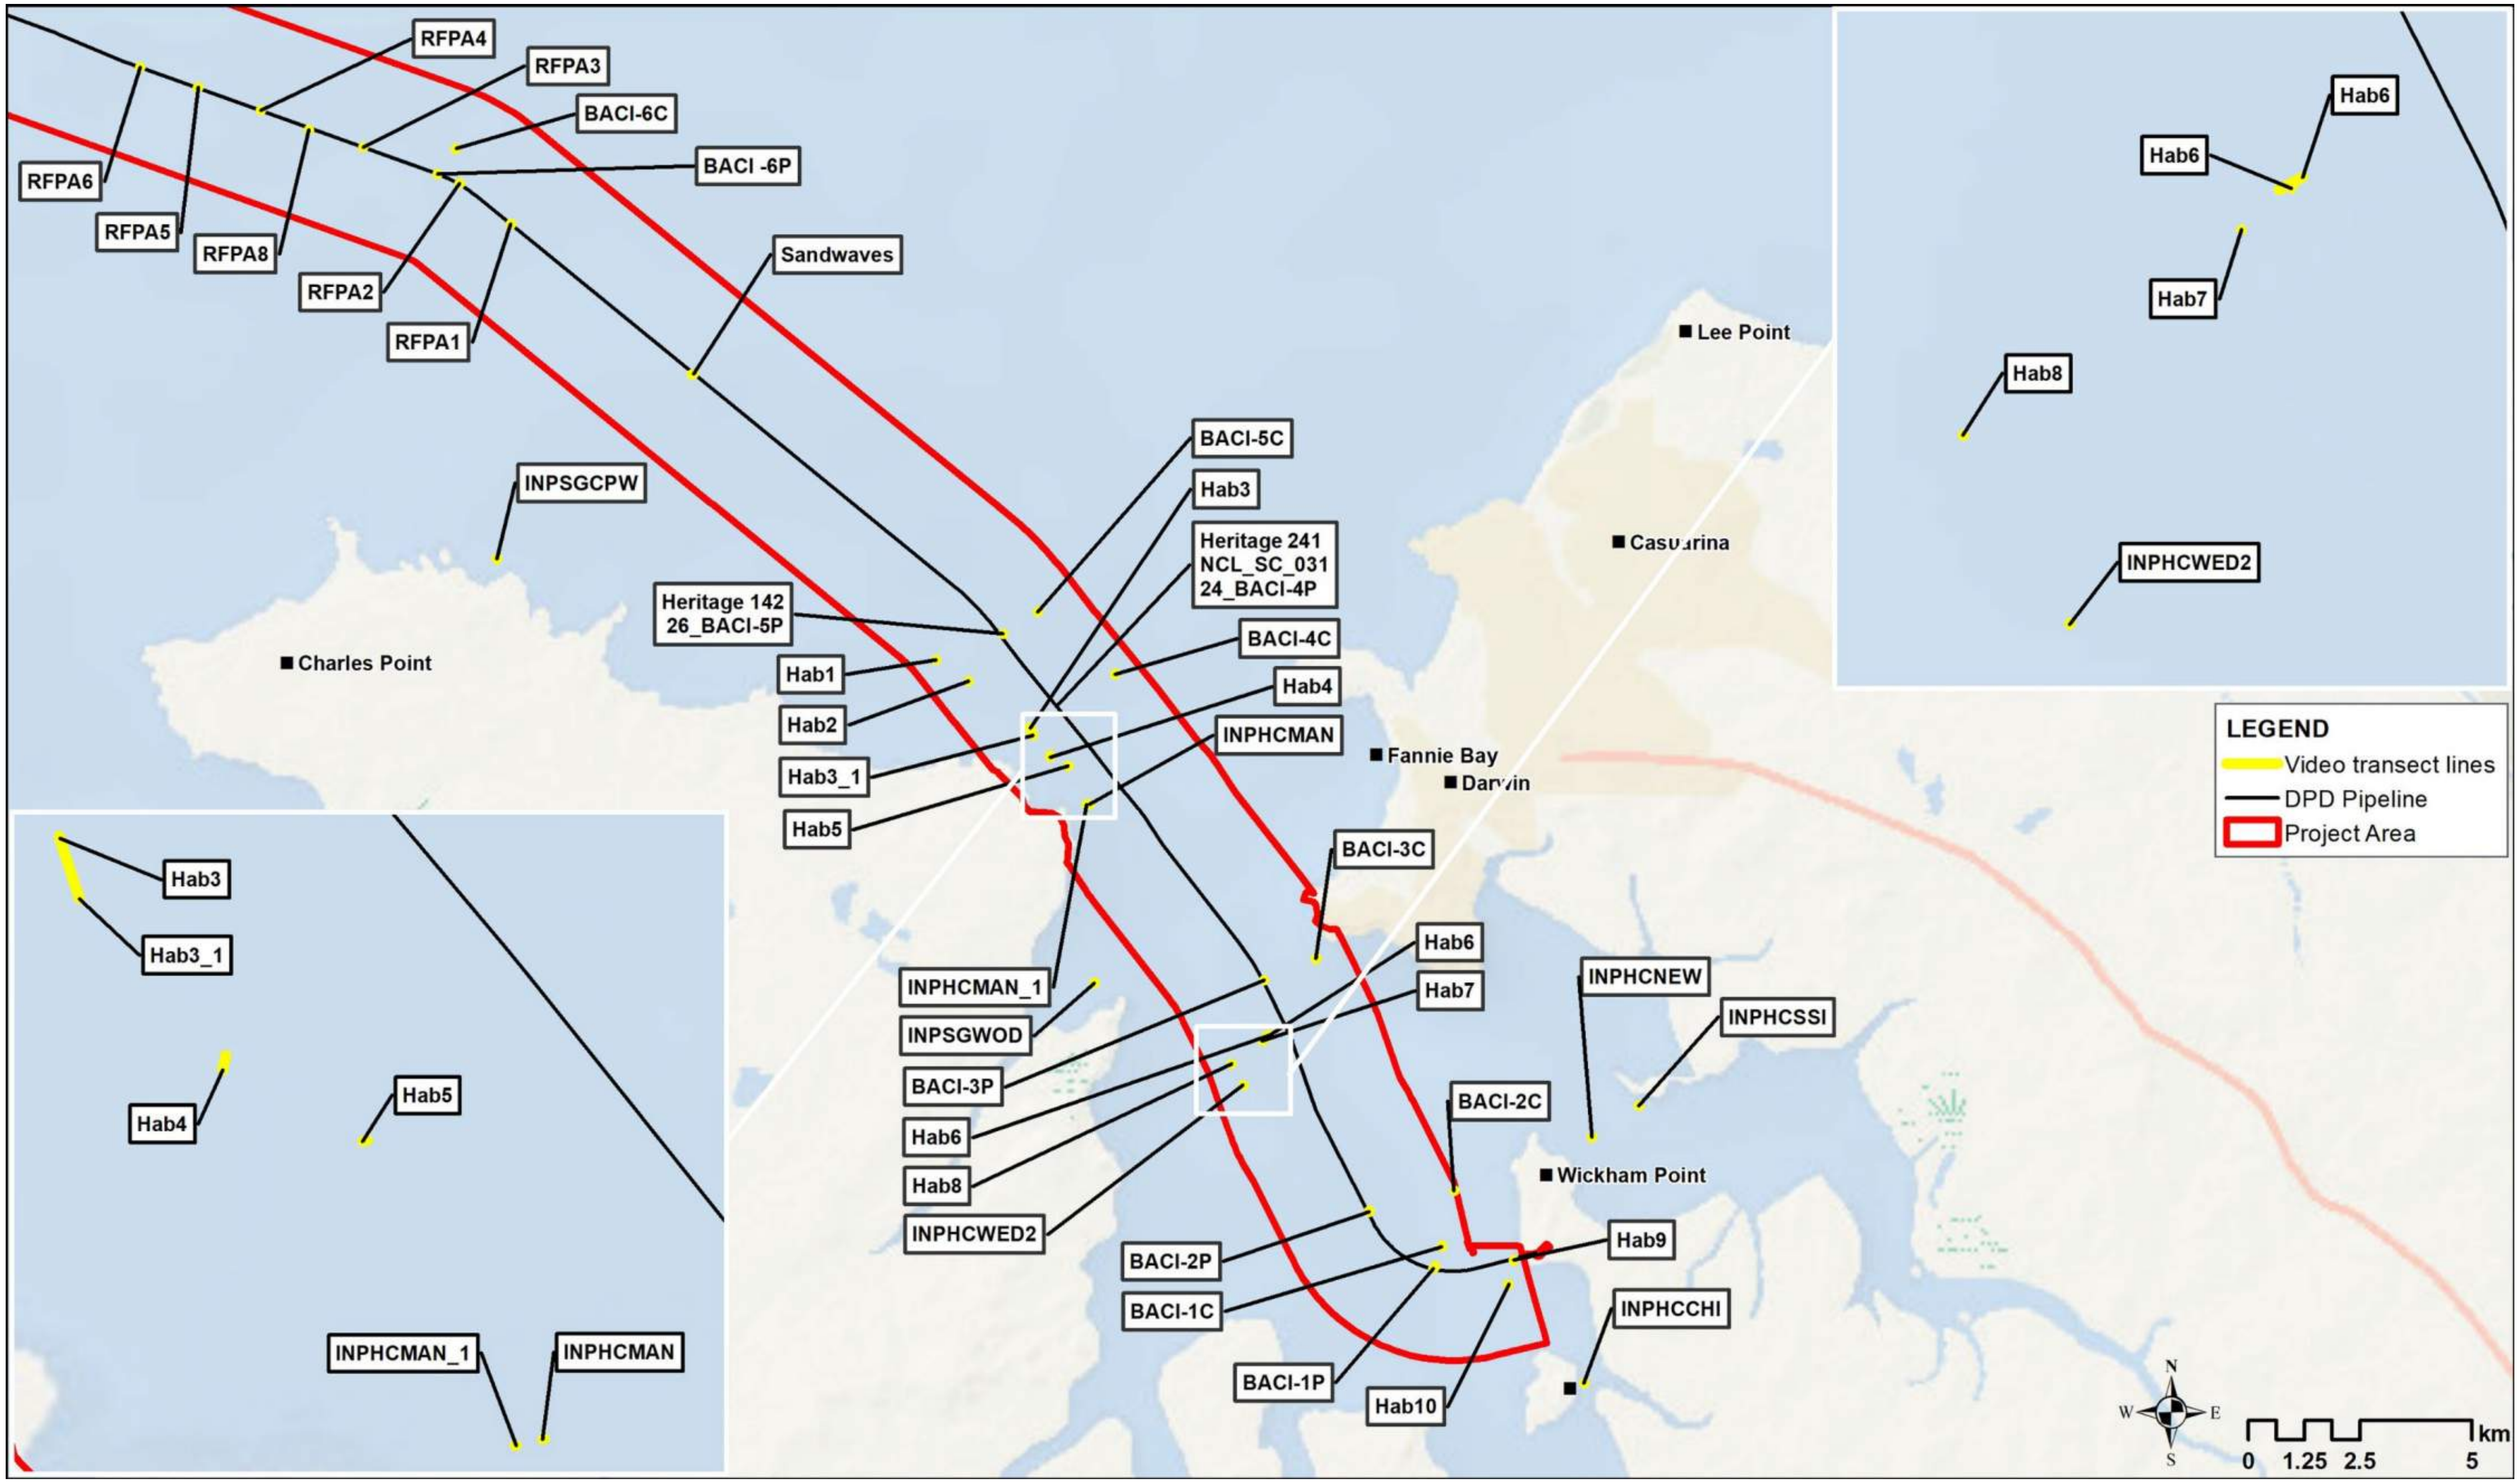

Figure 2-5: Darwin Harbour benthic habitat survey video transect sites (June 2022)

2.2 Subsea video

A SeaSpyder subsea video system mounted on a drop camera frame was used to collect digital video and stills imagery (Plate 2-1). The colour video camera was fitted with a zoom lens controllable from the surface control unit and live imagery was transmitted to the control room on the vessel via a load-bearing umbilical. Imagery was also recorded for subsequent analysis. The system also comprised a stills camera, lighting system and lasers (spaced 20 cm apart).

The benthic habitats observed and recorded during each camera drop were described by RPS' marine scientists during the survey. ESRI's ArcPad software was used to record the positional data for the tracklog of the towed video transect and the spot-point positions for each still image taken. During the video deployments, vessel speed did not exceed ~1.5 knots. The imagery collected was subsequently analysed in detail by RPS' marine scientists to characterise topographic features, benthic habitats and macrofaunal communities.

The video system was deployed at sites across the pipeline route and spoil ground (October 2021 and June 2022). Video site locations were initially based on positions of seabed features derived from the original Bayu-Undan geophysical survey data. Areas of interest were then identified in the field, using the 2021 Fugro geophysical survey data, and the video site locations and transects were adjusted accordingly.

Plate 2-1: SeaSpyder camera system

2.3 Sediment quality

2.3.1 Sample collection

During the October 2021 survey, sediments were sampled via van Veen grab sampler at 30 offshore pipeline locations, an additional three offshore pipeline locations for particle size distribution only (at the request of Santos), 13 spoil ground locations and 53 Darwin Harbour locations. During the January 2022 survey, sediment cores were collected from 17 Darwin Harbour core sample locations. The sampling and analysis sediments was conducted as per the NAGD (CoA, 2009) and NT EPA (2013) dredging guidelines.

Grab samples were collected using a double van Veen grab mounted in a single frame (with a sampled surface area of each grab of 0.1 m^2), which was deployed and retrieved by Fugro's personnel. An optimal sample processing area was identified as part of strict contamination risk management protocols. GPS position, depth, time and date were recorded every time the grab reached the seabed. Upon retrieval to deck, each sample was photographed with a video slate showing the project name, site, sample number and date (see Appendix B and Appendix C). Each sample was then characterised to document any conspicuous biota, sediment type, presence of visible anoxic layers, hydrocarbons or anthropogenic material. If samples could not be obtained at the site (after three attempts), then the site was moved and sampled nearby (within 50 m).

Core samples were collected using a gravity piston corer with plastic liners. The level of sediment penetration was estimated from sediment smears on the outside of the liner. Where no smear was present, the depth of recovery was given as the penetration depth.

Samples were taken for laboratory analysis of the following:

- Particle size distribution (PSD)
- Infauna (offshore pipeline and spoil ground only)
- total Organic Carbon (TOC)
- Metals and metalloids (Al, Sb, As, Ca, Cr, Co, Cu, Fe, Pb, Mn, Hg, Ni, Ag, Zn)
- Nutrients (total phosphorous (TP), total Kjeldahl nitrogen (TKN))
- Total recoverable hydrocarbons (TRH) and benzene, toluene, ethylbenzene, xylenes and naphthalene (BTEXN)
- Polycyclic aromatic hydrocarbons (PAH), where TRHs are above limits of detection)
- Naturally occurring radioactive materials (NORMs; radium^{226}, radium^{228} and thorium^{228}).

The following additional analytes were included in laboratory analysis for Darwin Harbour grab and core samples:

- Tributyltin (TBT)
- Acid sulphate soils (ASS)
- Organochlorine pesticides
- Polychlorinated biphenyls (PCBs).

2.3.1.1 Subsampling – sediment contaminants

Subsamples for contaminants were taken from the top 2–5 cm of grab samples, excluding the surficial sediments within 5–10 mm of the sides of the grab (to reduce the risk of contamination). Cores were separated into 0–50 cm and (where at least 1 m of sediment was collected) >50 cm horizons. The entire sediment sample for one horizon was processed for laboratory analysis.

Sediment was removed from the grab or core sleeve using a stainless-steel scoop and placed in a glass bowl for mixing. All implements had been pre-cleaned with Decon-90 prior to each site.

Once homogenised, samples were placed in the appropriate laboratory-supplied sample containers. The PSD sample was also taken from surficial sediments / relevant core horizons to allow direct comparison between contaminants and sediment grain sizes.

For all samples:

- Sterile gloves were always worn when collecting and processing samples. These were changed between samples.
- The insides of sample lids did not come into contact with anything potentially contaminated.
- Jars and bags were sealed, correct labelling confirmed, and then stored in an esky with ice blocks.

At the end of each shift, samples were stored as identified in Table 2-2.

2.3.1.2 Sampling – infauna

A full 0.1 m^2 van Veen grab sample was collected for infaunal assessment at offshore pipeline (OP) and spoil ground (SG) sites. The infauna sample was carefully emptied into a fish tray and then placed into the infauna processing table (Plate 2-2). The sample was carefully washed using sea water from the deck hose, with the washings flowing out through the sluice gate and draining through a 1 mm mesh sieve. The rate of flow through the sluice was managed by controlling the volume of water within the table and by using the sluice door to control the amount of water flowing through the sluice gate. The sieve was rotated and shuffled to prevent clogging. When the sieve was almost full, the sluice gate was shut to stop the flow, and the full sieve swapped out for a replacement empty sieve. A puddling bin was used to remove as much remaining sediment as possible through the sieve. Samples were then carefully washed out into a plastic Ziplock bag and preserved with 100% ethanol (to a final concentration of ~80% in seawater).

Infauna were picked from the sediment retained on the sieves by Benthic Australia. They were then analysed to the lowest practicable taxonomic level, with the abundance of each taxa recorded from each sample.

Plate 2-2: Infauna filtering table and puddling bin set up on the *Lauri-J*

2.3.2 Offshore pipeline and spoil ground

Sediment samples for contaminants, particle size distribution and infauna were collected from 29 offshore pipeline sites (with an additional three PSD sites were added during the survey) and 13 spoil ground sites (Table 2-2).

Table 2-2: Sediment quality sampling summary for offshore pipeline and spoil ground sites

Sample	Total samples (spoil ground)*	Total samples (offshore pipeline)*	Total samples	Laboratory	Lab LOR†	Container	Volume	Storage method	Holding time
PSD	13	29	42	MAFRL	NA	Ziplock bag	250 ml	Freeze	Five years

*Sample numbers do not include quality assurance/quality control samples

†LoR = limit of reporting.

2.3.3 Darwin Harbour pipeline

Sediment samples for contaminants and PSD were collected from 50 sites along the pipeline route in Darwin Harbour (Table 2-3). Of these, TRHs were at or above limits of detection in 35 sites, and so PAH analysis was undertaken on these samples.

Table 2-3: Sediment quality sampling summary for Darwin Harbour pipeline sites

Sample	Total samples*	Laboratory	Lab LOR†	Container	Volume	Storage method	Holding time
PSD	50	MAFRL	NA	Ziplock bag	250 ml	Freeze	Five years
TBT	50	ALS	NA	Glass jar	250 ml	Cold	Fourteen days

*Sample numbers do not include quality assurance/quality control samples

†LoR = limit of reporting.

2.3.4 Darwin Harbour pipeline sediment survey

A total of 24 sediment core samples were collected from 17 sites along the Darwin Harbour pipeline route (Table 2-4).

Table 2-4: Sediment quality sampling summary for Darwin Harbour DPD sediment core samples

Sample	Total samples*	Laboratory	Lab LOR†	Container	Volume	Storage method	Holding time
PSD	24	MAFRL	NA	Ziplock bag	250 ml	Freeze	Five years
TBT	24	ALS	NA	Glass jar	250 ml	Cold	Fourteen days

Metals and metalloids (Ag, Al, As, Ca, Co, Cr, Cu, Fe, Hg, Mn, Ni, Pb, Sb, Zn)			Depends on metal; 0.01–50 mg/kg				
Nutrients (TP)			2 mg/kg				
Nutrients (TKN)			20 mg/kg				
TRH and BTEXN			0.2–5 mg/kg, 1%				
PAH (where TRHs are above LORs)	18		4–5 µg/kg				
ASS	24	ALS	0.1 pH Uni	Zip-lock	250 ml	Freeze	Fourteen days
Organochlorine pesticides	24	ALS	0.25–0.5 µg/kg	Glass jar	250 ml	Cold	Fourteen days
Polychlorinated biphenyls	24	ALS	5 µg/kg				

*Sample numbers do not include quality assurance/quality control samples

†LoR = limit of reporting.

2.4 Water quality

2.4.1.1 Water column profiling

Water column profiling was undertaken using a calibrated SeaBird SBE19plusV2 conductivity, temperature depth (CTD) profiler lowered through the water column at a rate of half a metre per second at each of the 17 water quality sampling locations. The maximum deployment depth (the position of the profiler above the seabed) was determined from the vessel echosounder prior to deployment. The following parameters were recorded in each profile:

- Pressure (to derive depth)
- Conductivity (to derive salinity)
- Temperature
- pH
- Dissolved oxygen
- Turbidity
- The data was downloaded off the SeaBird after each profile.

2.4.1.2 Sample collection

Water samples were collected at the sea surface (1–5 m below sea level (BSL)) and near the seabed (5 m above seabed (ASB)) using ten-litre Niskin bottles.

Phytoplankton and total suspended solids (TSS) samples were collected by filtering a 3 L sample of water through a filter tower (Plate 2-3). Phytoplankton samples were collected through a 0.8–1.2 µm filter, whilst TSS samples were filtered through a pre-weighed filter (stored in an envelope until used). Each filter paper was folded into quarters and wrapped in a dry piece of filter paper and placed back in the envelope for storage. Filtered metal samples were drawn through filter using a syringe. These samples were then transferred to a small pre-labelled sample jar. All other samples were placed in pre-labelled containers.

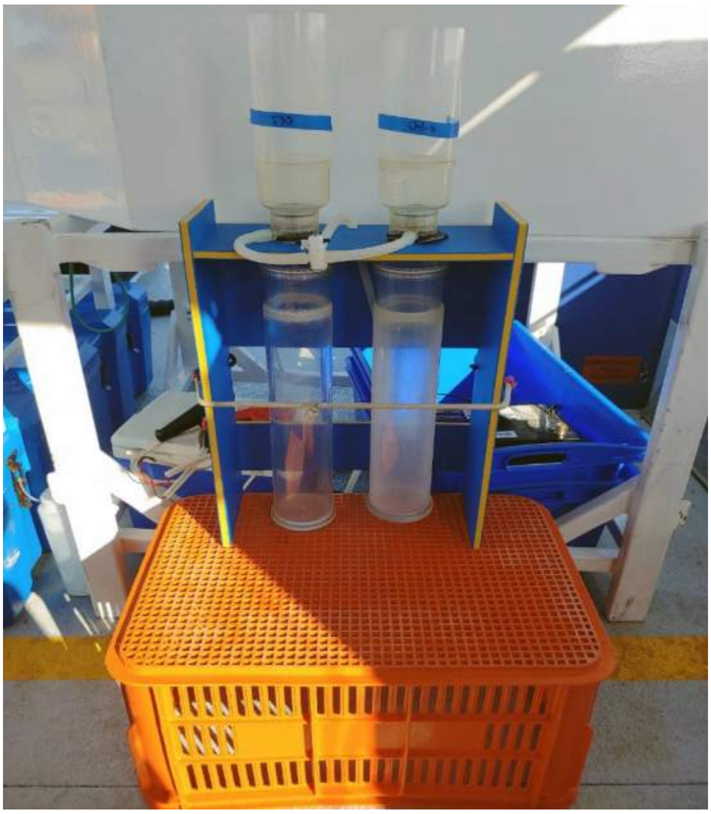

Plate 2-3: Water quality filtering station set up on the *Lauri-J*

Table 2-5: Water quality sampling summary for offshore pipeline and spoil ground sites

Analyte	Total samples (spoil ground)	Total samples (offshore pipeline)	Total samples	Laboratory	Lab LOR	Container	Volume	Storage method	Holding time
TSS	14	20	34	MAFRL	1 mg/L	Filter paper placed in Ziplock bag	NA	Cold	Seven days
Nutrients (TP and TN)	14	20	34	MAFRL	5 µg.P/L/50 µg.N/L	PP container	125 ml	Freeze	One month
Orthophosphate	14	20	34	MAFRL	2 µg.P/L	PP tubes	10 ml		
Nitrite and nitrate (NO_2 and NO_3)	14	20	34		2 µg.N/L				
Ammonium (NH_4+)	14	20	34		3 µg.N/L				
Phytoplankton pigments (Chlorophyll-a and Phaeophytin-a)	14	20	34	MAFRL	0.1 mg/L	Filter paper placed in Ziplock bag	NA	Freeze (in dark)	One month
Unfiltered metals and metalloids (As, Ca, Cr, Co, Cu, Pb, Ni, Zn)	14	20	34	MAFRL	0.05–1 µg/L	PP tube	10 ml	Cold	Two weeks
Unfiltered Hg	14	20	34	MAFRL	0.1 µg/L	Dark bottles	125 ml	Cold	Two weeks
Filtered metals and metalloids (As, Ca, Cr, Co, Cu, Hg, Pb, Ni, Zn)	14	20	34	MAFRL	0.05–1 µg/L	PP container	125 ml	Cold	Two weeks
Filtered Hg	14	20	34	MAFRL	0.1 µg/L	Dark bottles	125 ml	Cold	Two weeks
TRH and BTEXN	14	20	34	ALS	1–100 µg/L	Purple glass vials (sulfuric acid)	2 × 40 ml	Cold	One week
PAH (where TRH above LORs)	0	0	0	ALS	0.5–1 µg/L	Orange glass bottle	100 ml	Cold	One week
NORMS (Ra^{226}, Ra^{228}, Th^{228})	7	10	17	SGS	0.05, 0.1, 0.03 Bq/L	Plastic container	1000 ml	Nitric acid	Six months

2.5 Quality assurance and quality control

Prior to sampling, the deck area was assessed for potential sources of contamination. Where there had been clear wash-out of the surficial sediments in grab samples (e.g. due to a shell or rock caught in the jaws of the grab) the sample was discarded and classed as a failed attempt. Similarly, if water from the winch wire was observed dripping into the sample, the sample was discarded as it was potentially contaminated by hydrocarbons from the winch.

RPS requires that laboratories use NATA-accredited methods and have a Quality Assurance and Quality Control (QA/QC) program, where possible. Pre-cleaned sample containers for chemical analyses were provided by the laboratories for this survey. The following control process were undertaken to quantify potential within-laboratory variability in analysis and any potential sample contamination that could have occurred during sample collection, handling, storage or transport. All samples were transported with relevant and fully completed Chain of Custody (CoC) documentation.

2.5.1 Triplicates/duplicates

Triplicate sediment and water samples were collected at the offshore pipeline and spoil ground sites, while duplicates were collected within the Darwin Harbour sites, to determine potential within-laboratory variability in analyses. At least one triplicate or duplicate sample was collected for every 20 primary samples. Triplicates and duplicates were collected from the same bulk sediment sample as the primary sample and were labelled appropriately. The labelling code for triplicates allowed RPS to identify the collection site but it was not apparent to the laboratories.

2.5.2 Trip blanks

Trip blanks, or transport blanks, are used to assess potential contamination of samples during transport and storage. Trip blanks were supplied by the laboratory and consisted of plastic jars pre-filled with deionised water. They remained unopened during sampling. Rinsate water was used rather than inert sediment as it is considered to be a more sensitive test.

2.5.3 Field blanks

Field blanks detect contamination from sample handling, dust and other atmospheric fallout during the sampling process. Laboratory-supplied deionised water was decanted and stored in the same containers and in the same way as for the sediment samples and left open during sediment sampling. Water was used rather than inert sediment as it is considered to be a more sensitive test.

2.5.4 Equipment blanks

Equipment blanks measure contamination introduced through contact with sampling equipment. The samples were taken after the grab sampler had been decontaminated with Decon-90. After decontamination, the operator thoroughly rinsed the grab with seawater, then rinsed it again with the laboratory-supplied deionised water, which was captured in a laboratory-supplied sample container. This will detect potential contamination from the stainless-steel grab sampler.

2.5.5 Sample preservation and storage

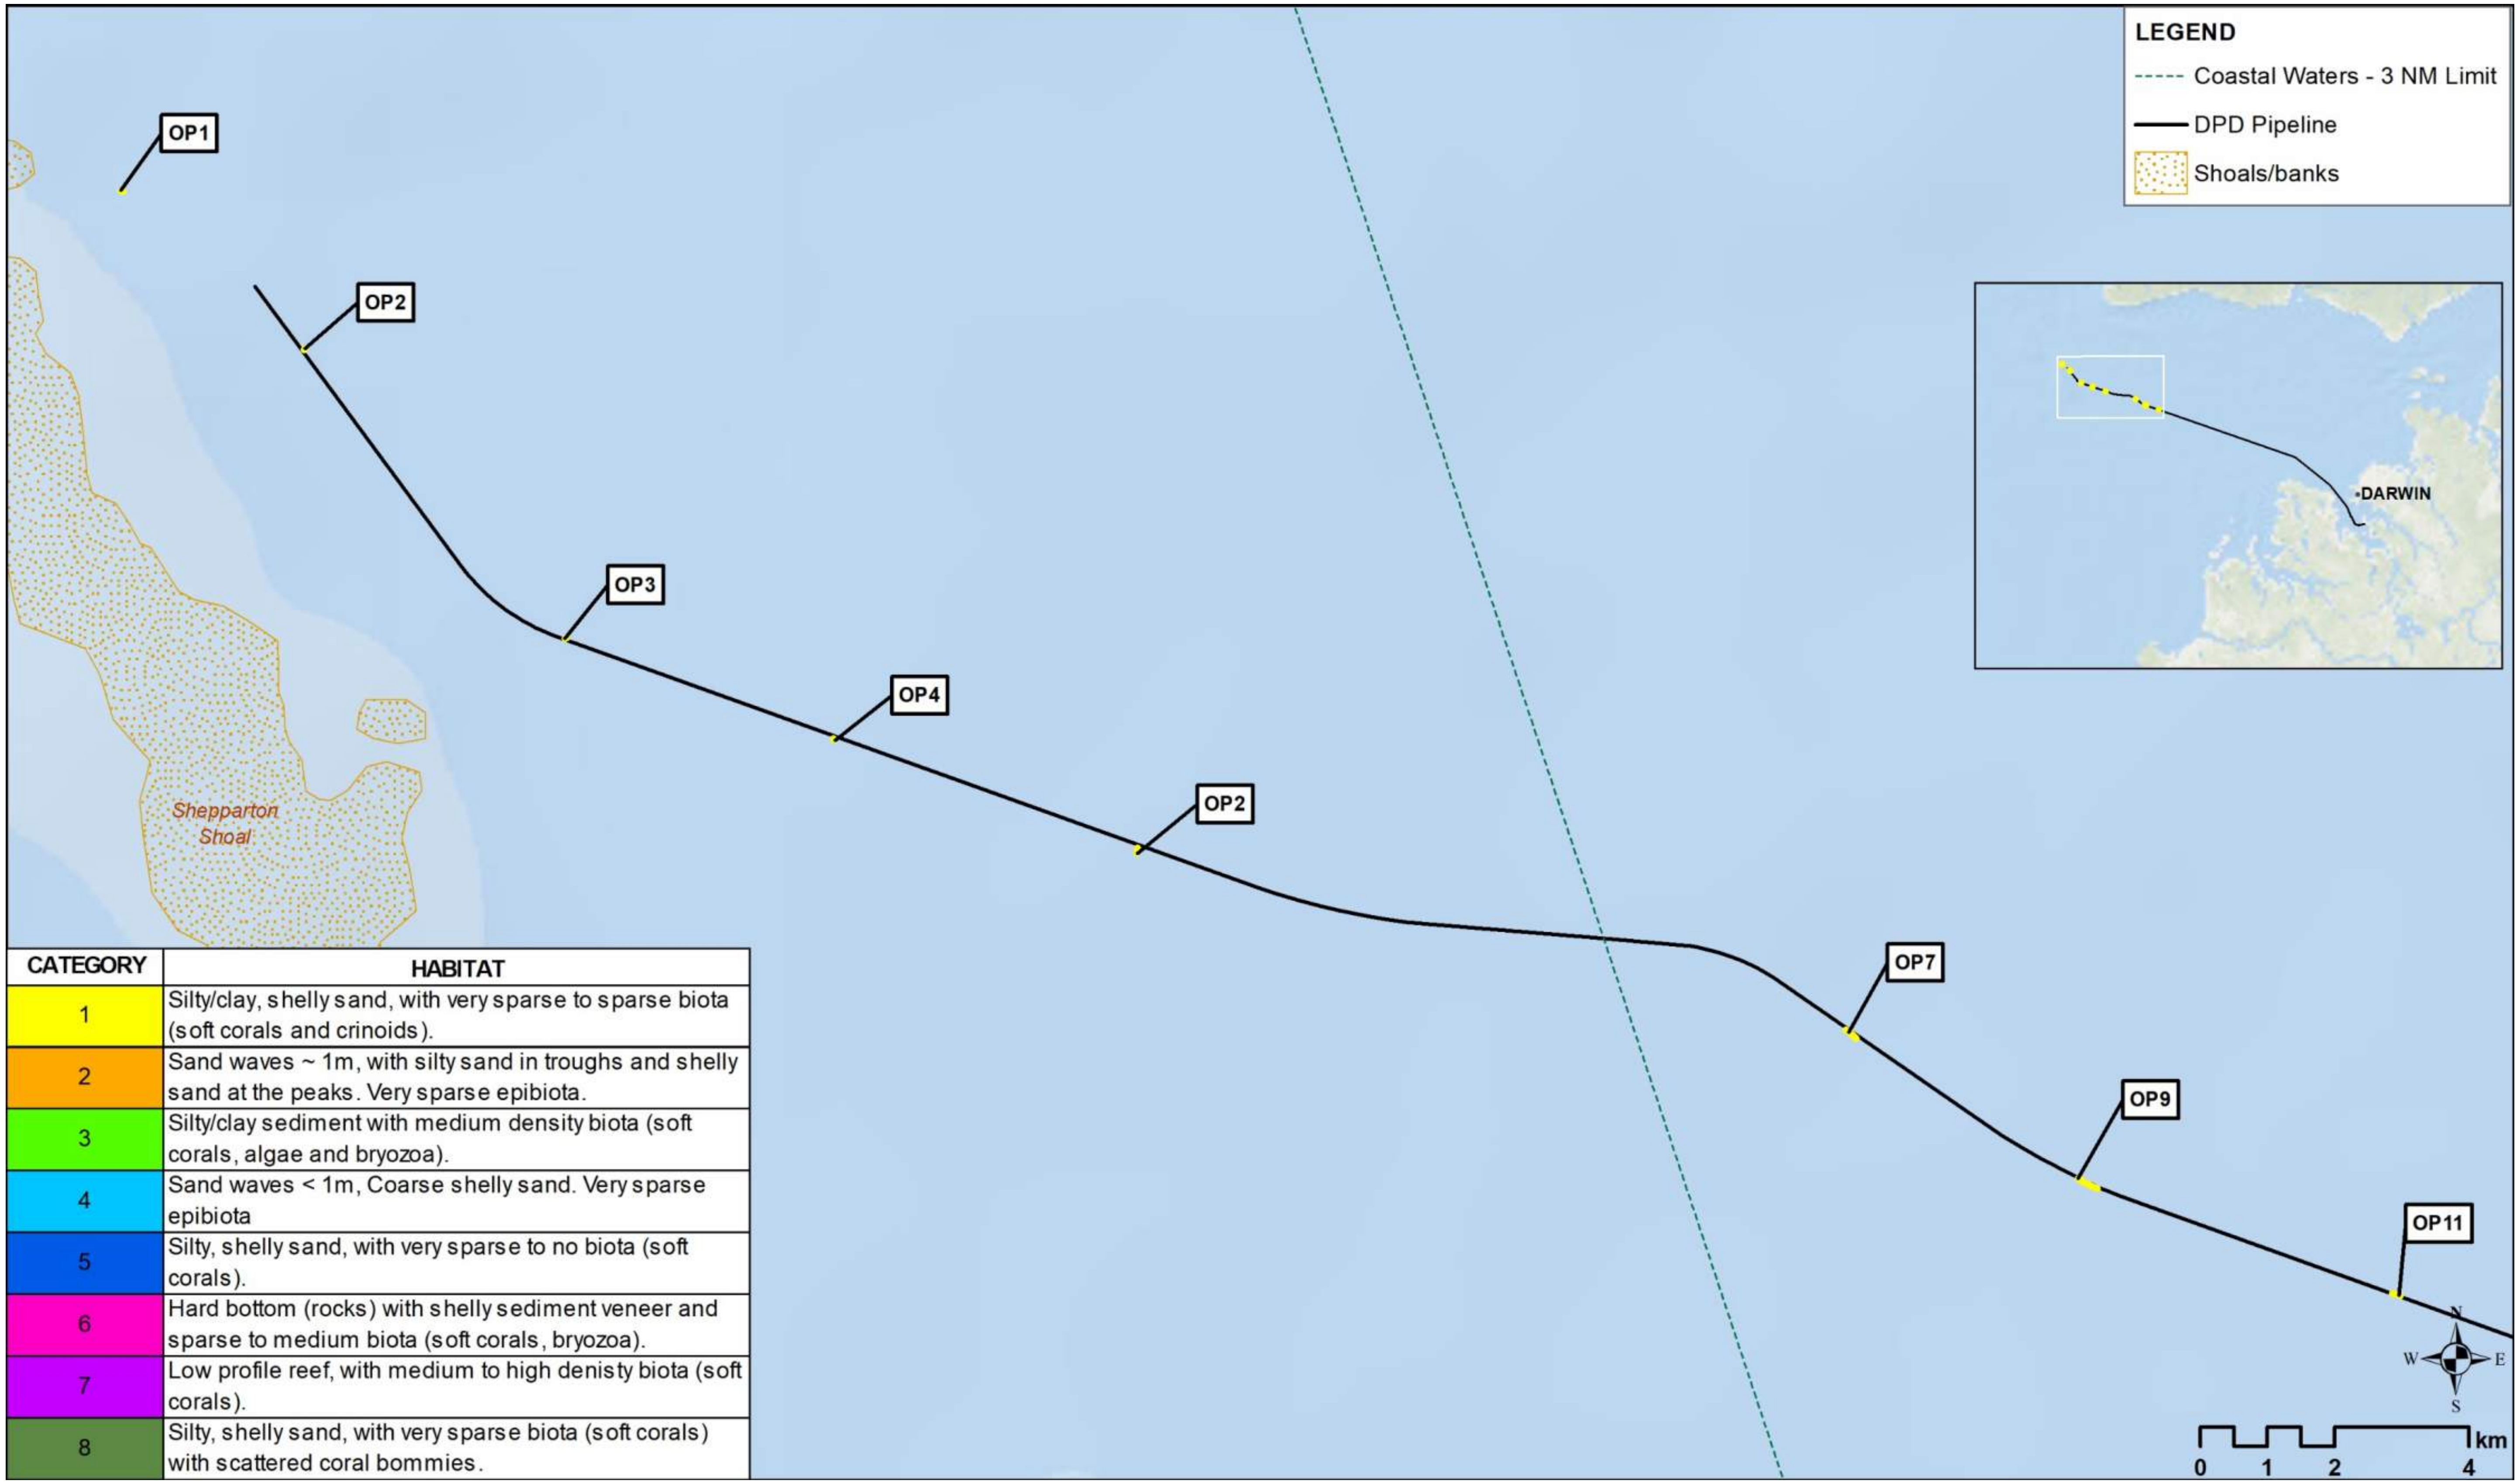
Water containers were filled to ~80% to leave a head-space sufficient to allow for expansion of the sample during freezing. Samples were stored during each of the surveys as required in Table 2-2–Table 2-5. During vessel demobilisation, samples were separated based on the laboratory they were being shipped to and transferred to clean eskies containing ice blocks for delivery to the laboratory. CoCs were filled out for each laboratory and sent with the relevant eskies.

3 RESULTS

3.1 Benthic habitat

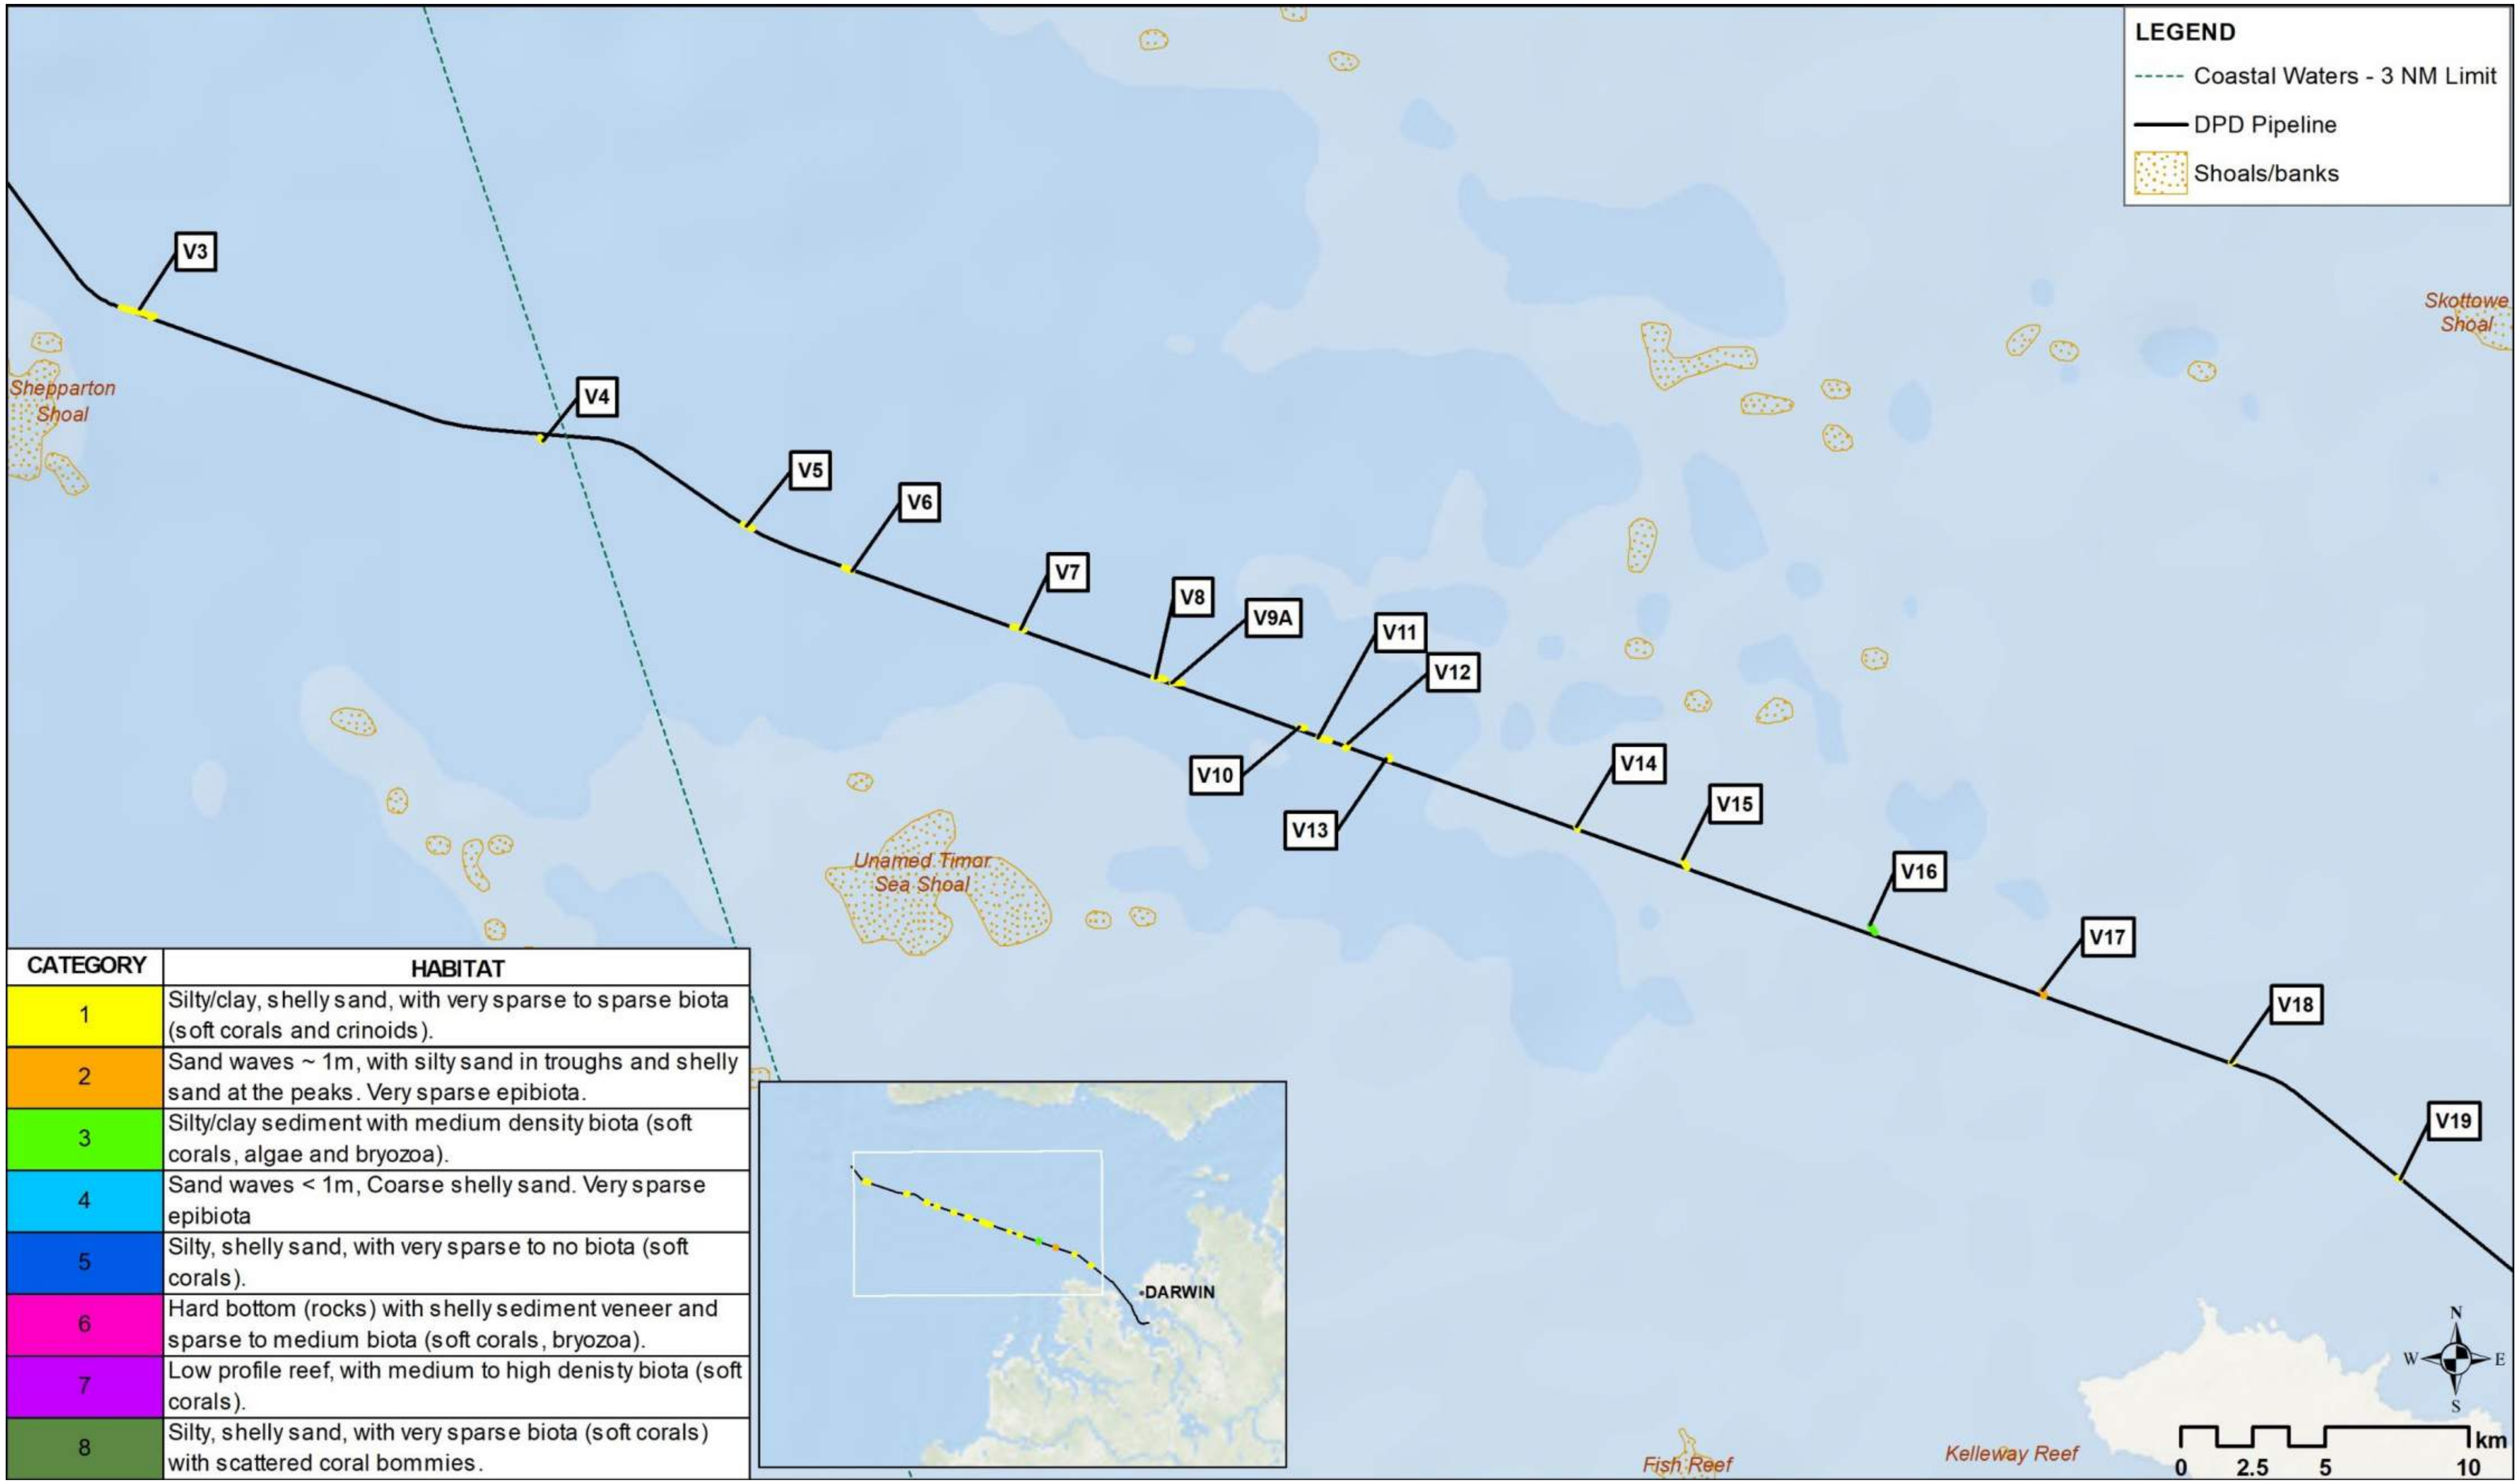
3.1.1 October 2021 survey

Eight high-level habitat types were identified along the Barossa DPD pipeline route and in the spoil ground area. This comprised six soft substrate habitats and two hard substrate habitats, with the offshore pipeline route and spoil ground dominated by particulate sediments with sparse to medium-density epibiota (Figure 3-1, Figure 3-2 and Figure 3-3). The hard substrate habitats were limited to the Darwin Harbour section of the pipeline route (Figure 3-4 and Figure 3-5). Offshore fishing sites were commonly identified with known shoals and were not identified along the pipeline route (Figure 3-1 and Figure 3-2). Inside Darwin Harbour, higher densities of fishing sites were located in close proximity to areas identified as hard substrate (Figure 3-4 and Figure 3-5).



CATEGORY	HABITAT
1	Silty/clay, shelly sand, with very sparse to sparse biota (soft corals and crinoids).
2	Sand waves ~ 1m, with silty sand in troughs and shelly sand at the peaks. Very sparse epibiota.
3	Silty/clay sediment with medium density biota (soft corals, algae and bryozoa).
4	Sand waves < 1m, Coarse shelly sand. Very sparse epibiota
5	Silty, shelly sand, with very sparse to no biota (soft corals).
6	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
7	Low profile reef, with medium to high denisty biota (soft corals).
8	Silty, shelly sand, with very sparse biota (soft corals) with scattered coral bommies.

Figure 3-1: Benthic habitat types identified along the furthest offshore pipeline route (October 2021)



CATEGORY	HABITAT
1	Silty/clay, shelly sand, with very sparse to sparse biota (soft corals and crinoids).
2	Sand waves ~ 1m, with silty sand in troughs and shelly sand at the peaks. Very sparse epibiota.
3	Silty/clay sediment with medium density biota (soft corals, algae and bryozoa).
4	Sand waves < 1m, Coarse shelly sand. Very sparse epibiota
5	Silty, shelly sand, with very sparse to no biota (soft corals).
6	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
7	Low profile reef, with medium to high denisty biota (soft corals).
8	Silty, shelly sand, with very sparse biota (soft corals) with scattered coral bommies.

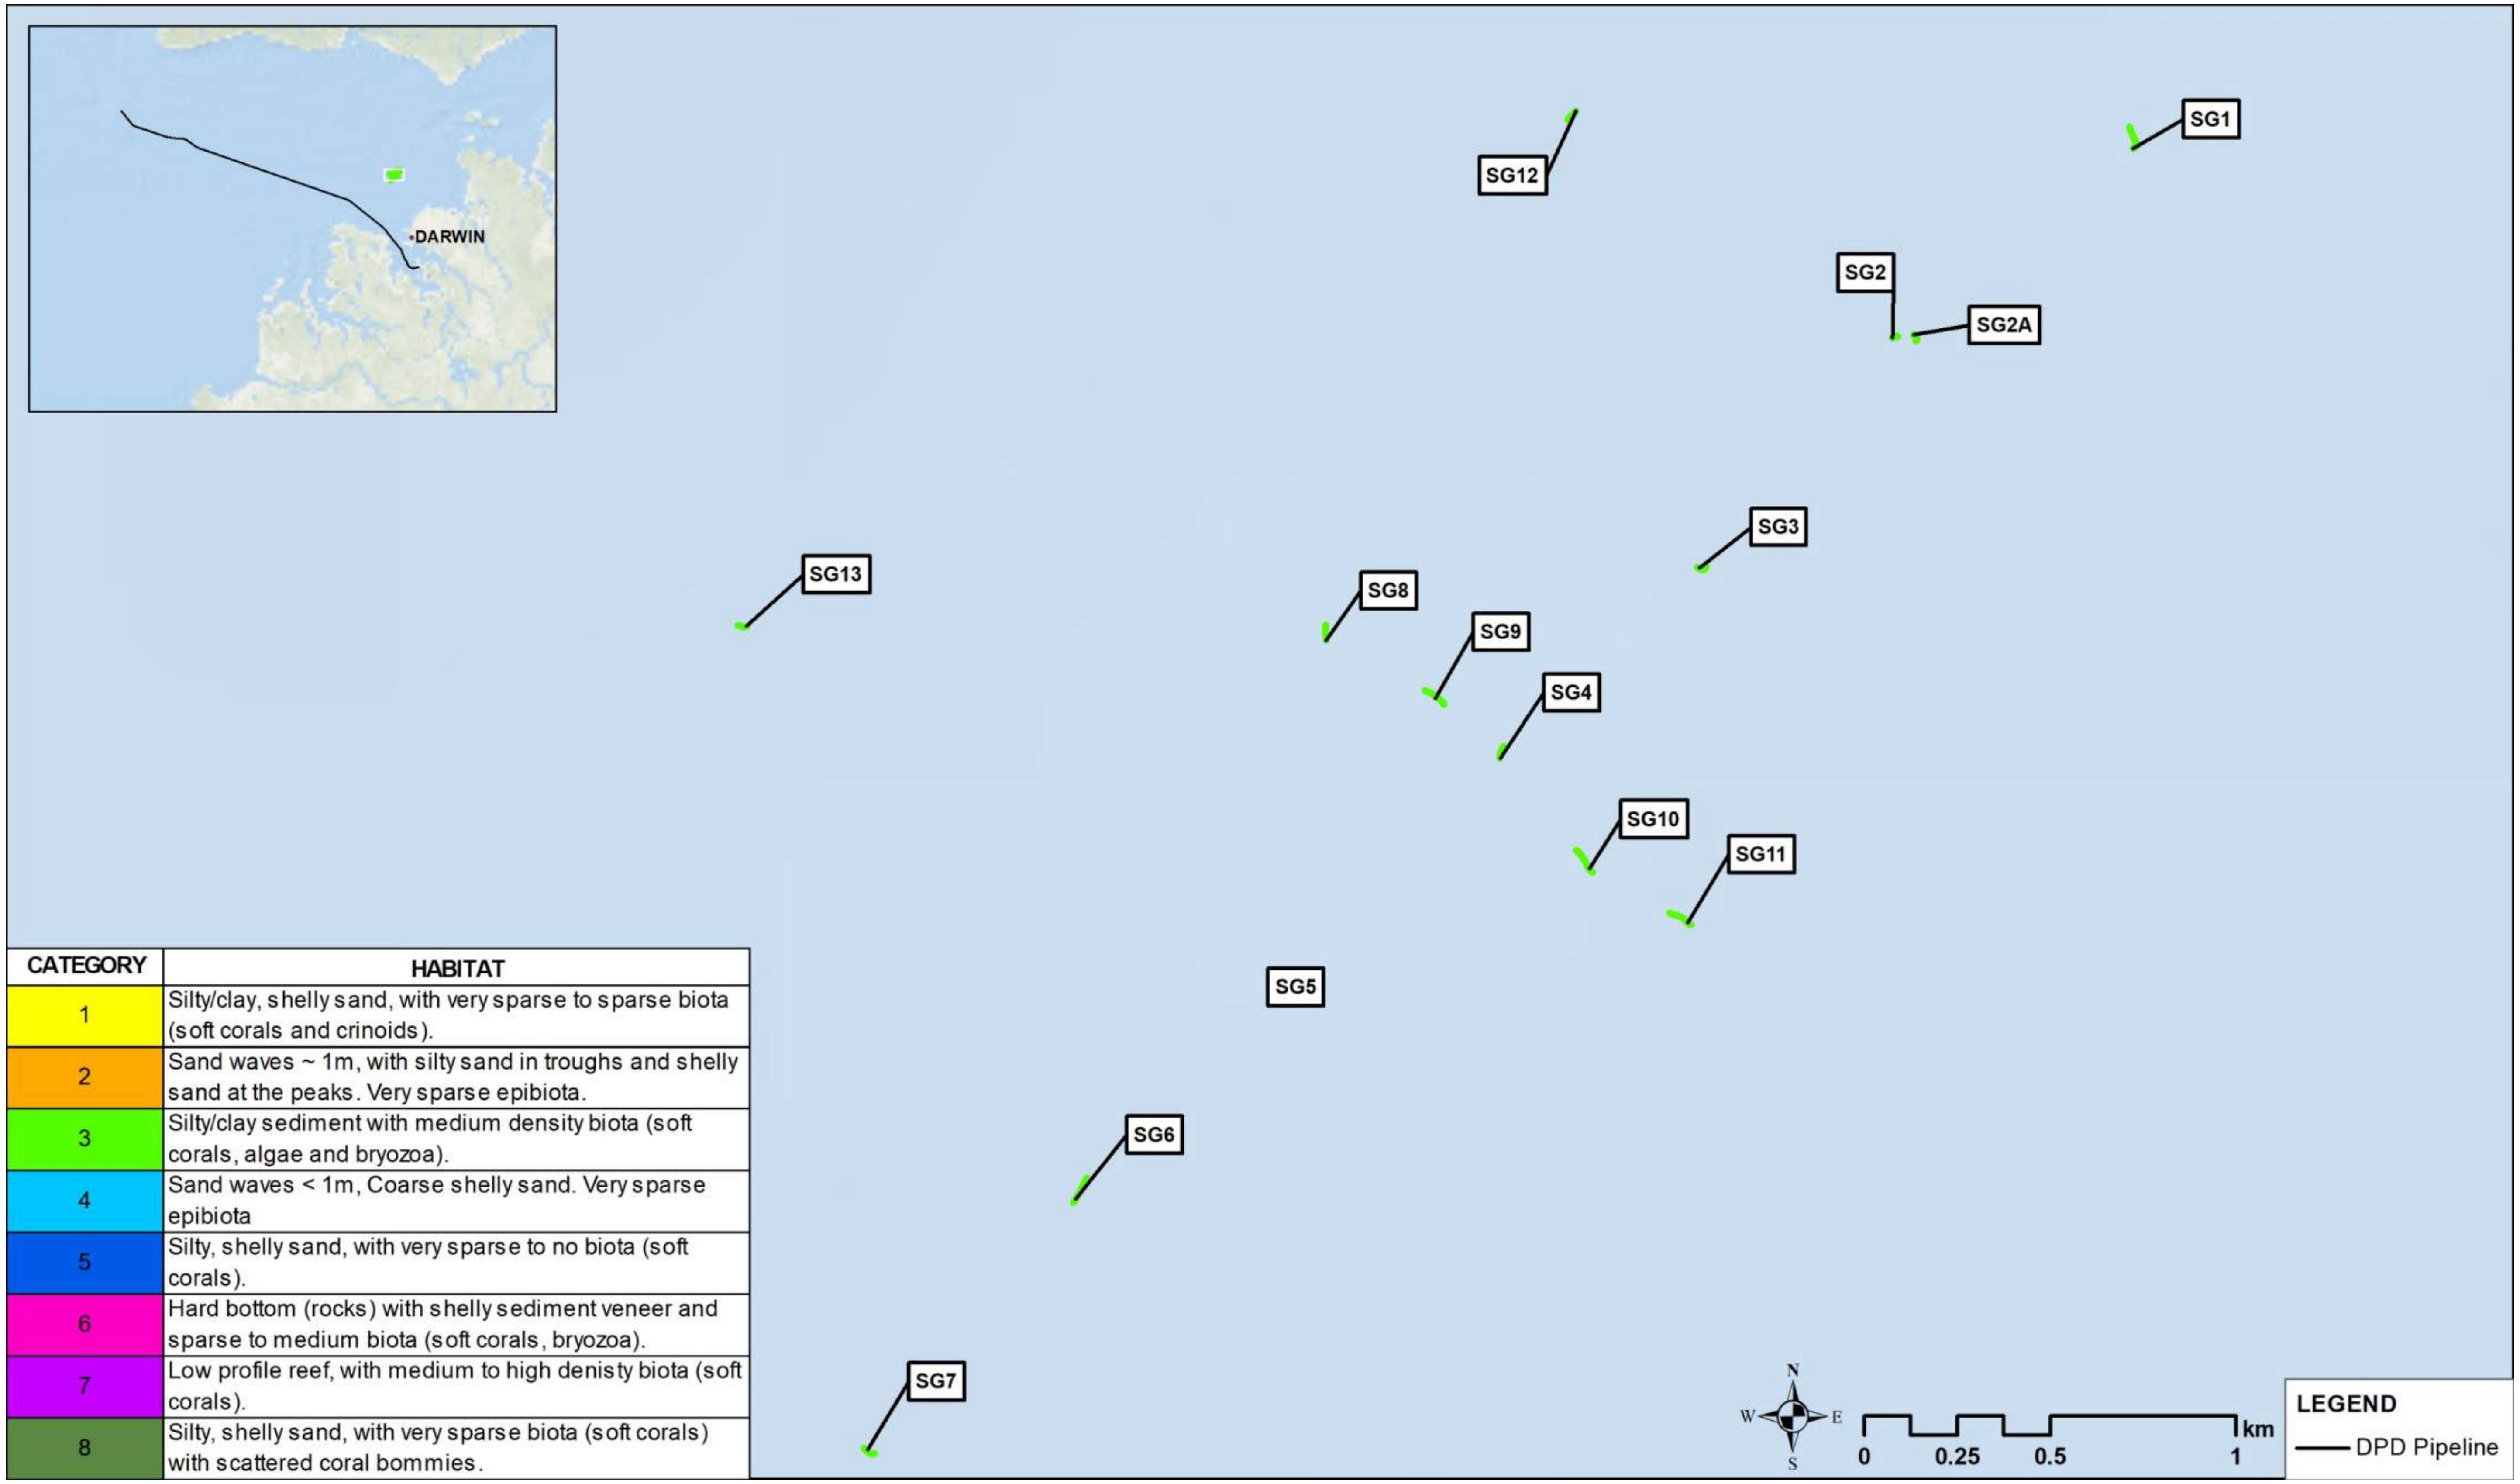

Figure 3-3: Benthic habitat types identified within the spoil ground (October 2021)

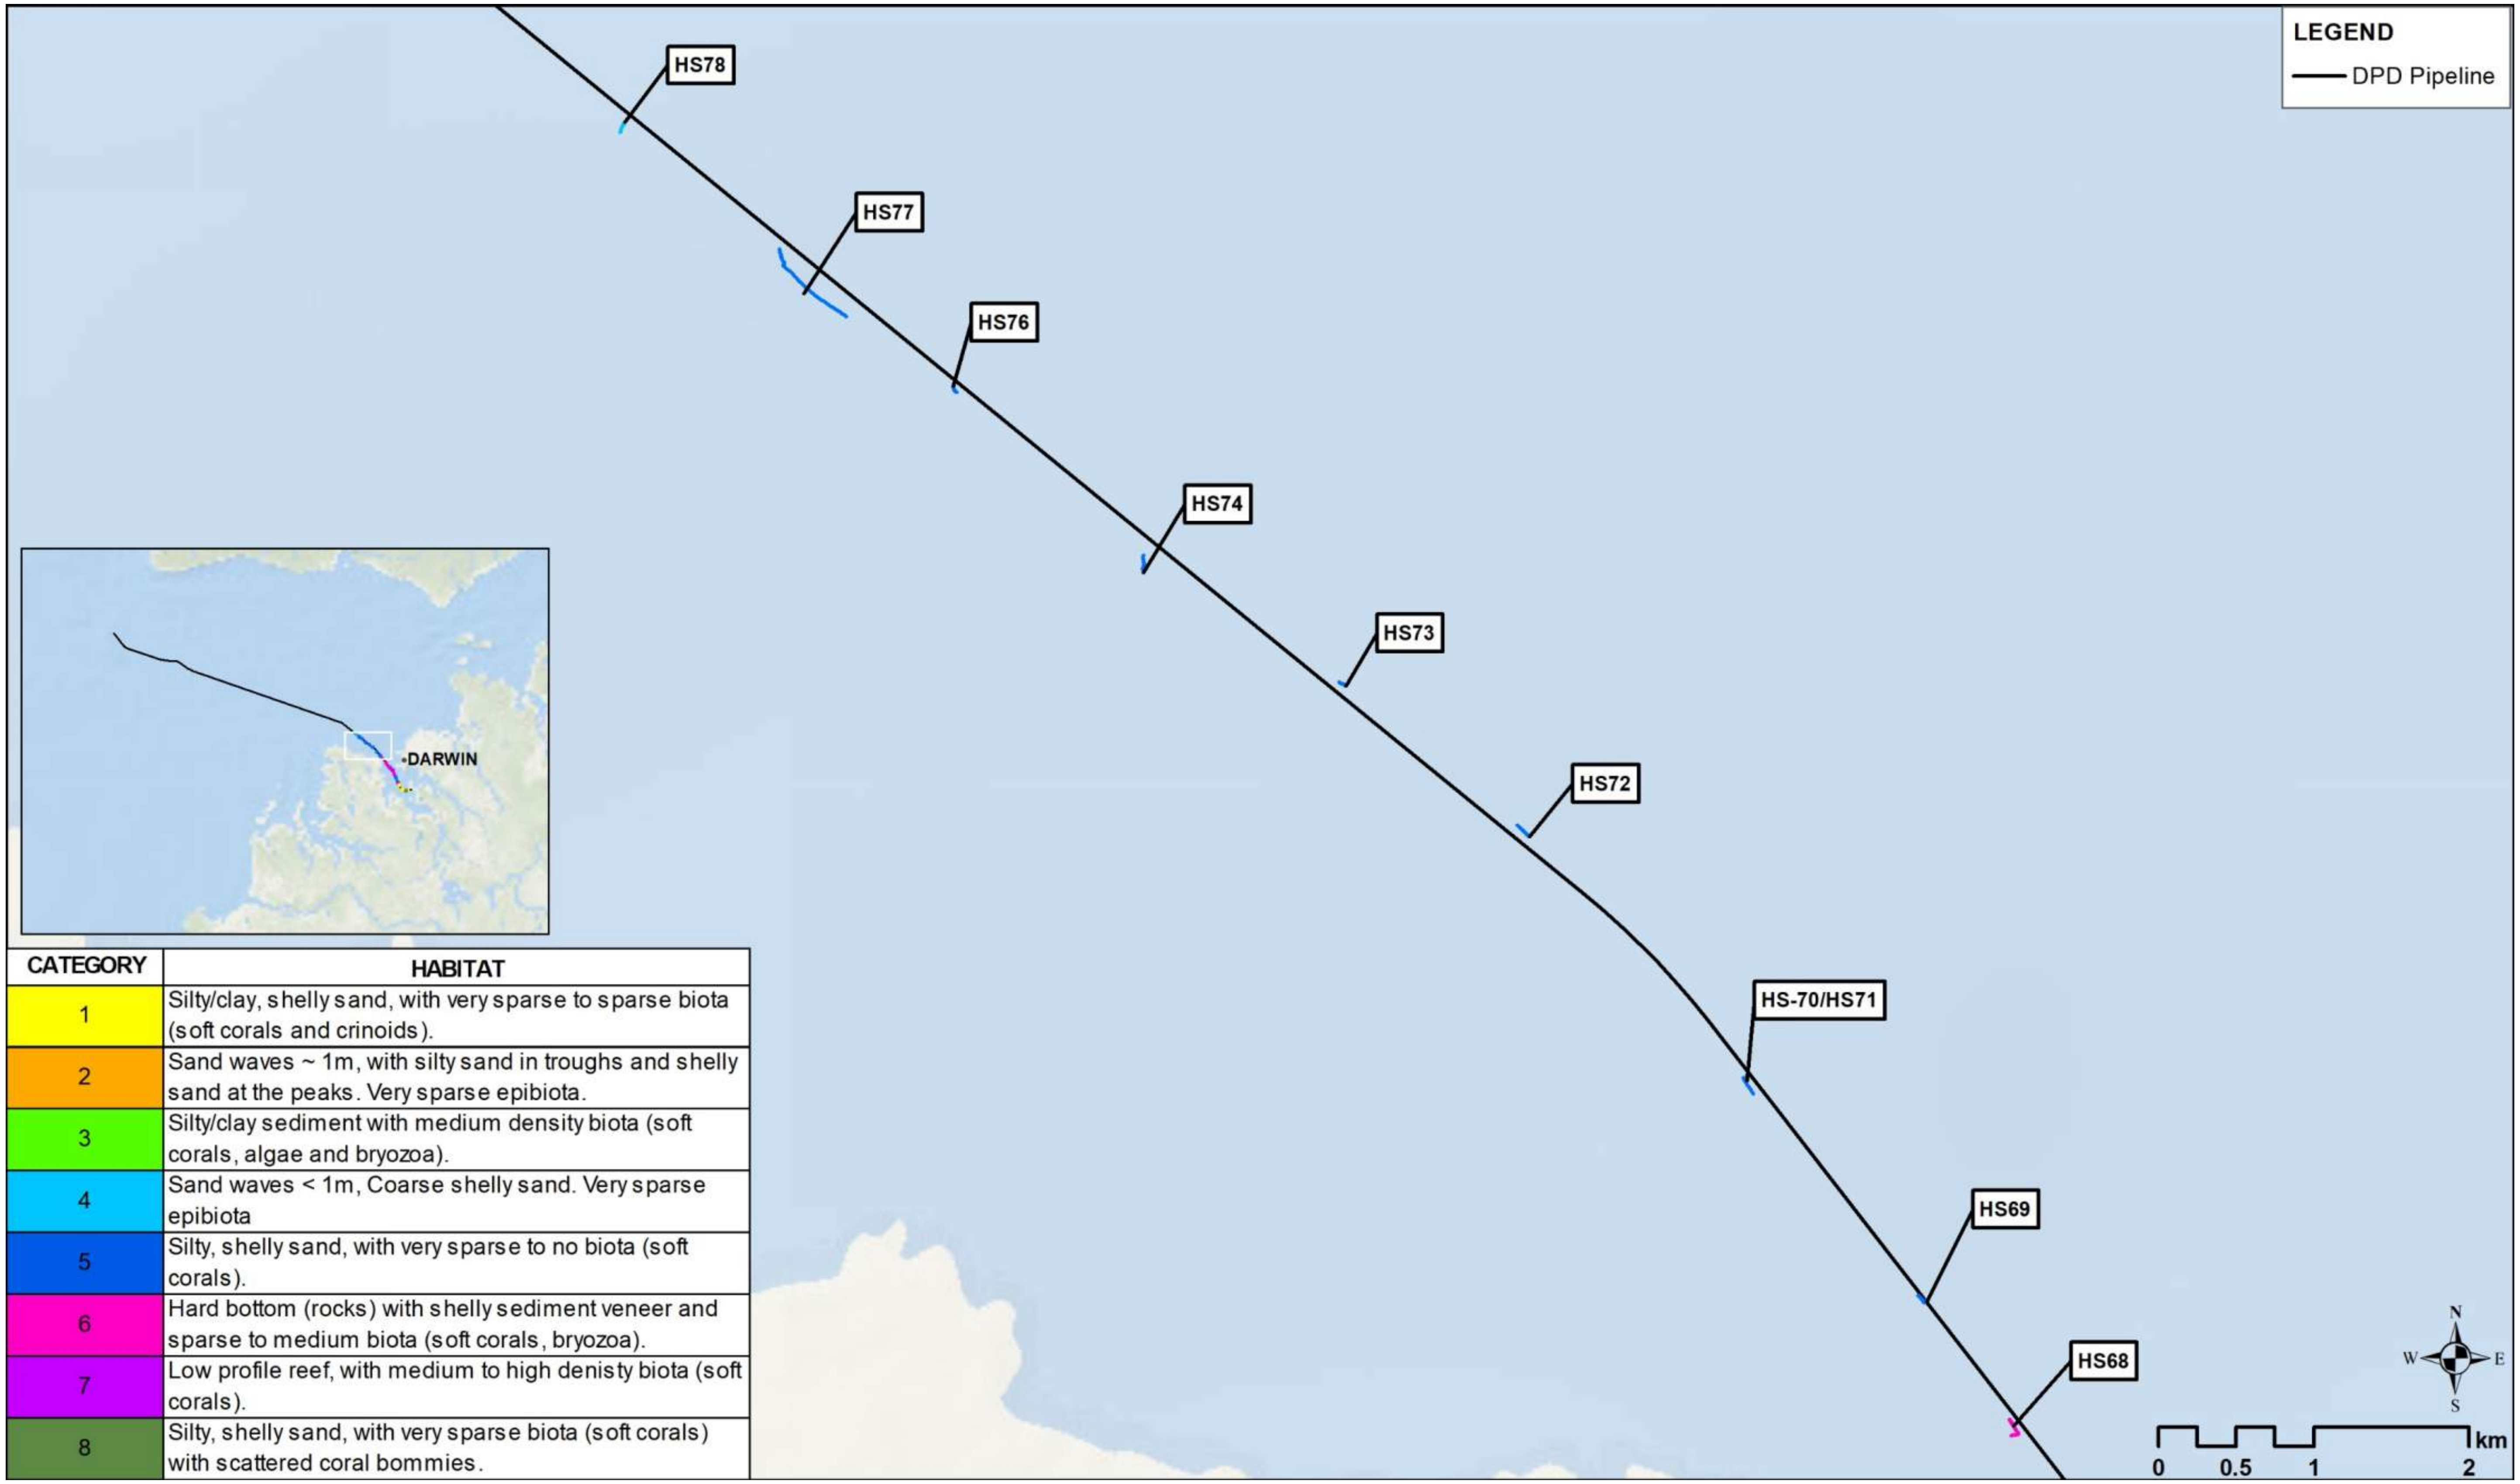

Figure 3-4: Benthic habitat types along the pipeline route in northern Darwin Harbour (October 2021), including the Reef Fish Protection Area

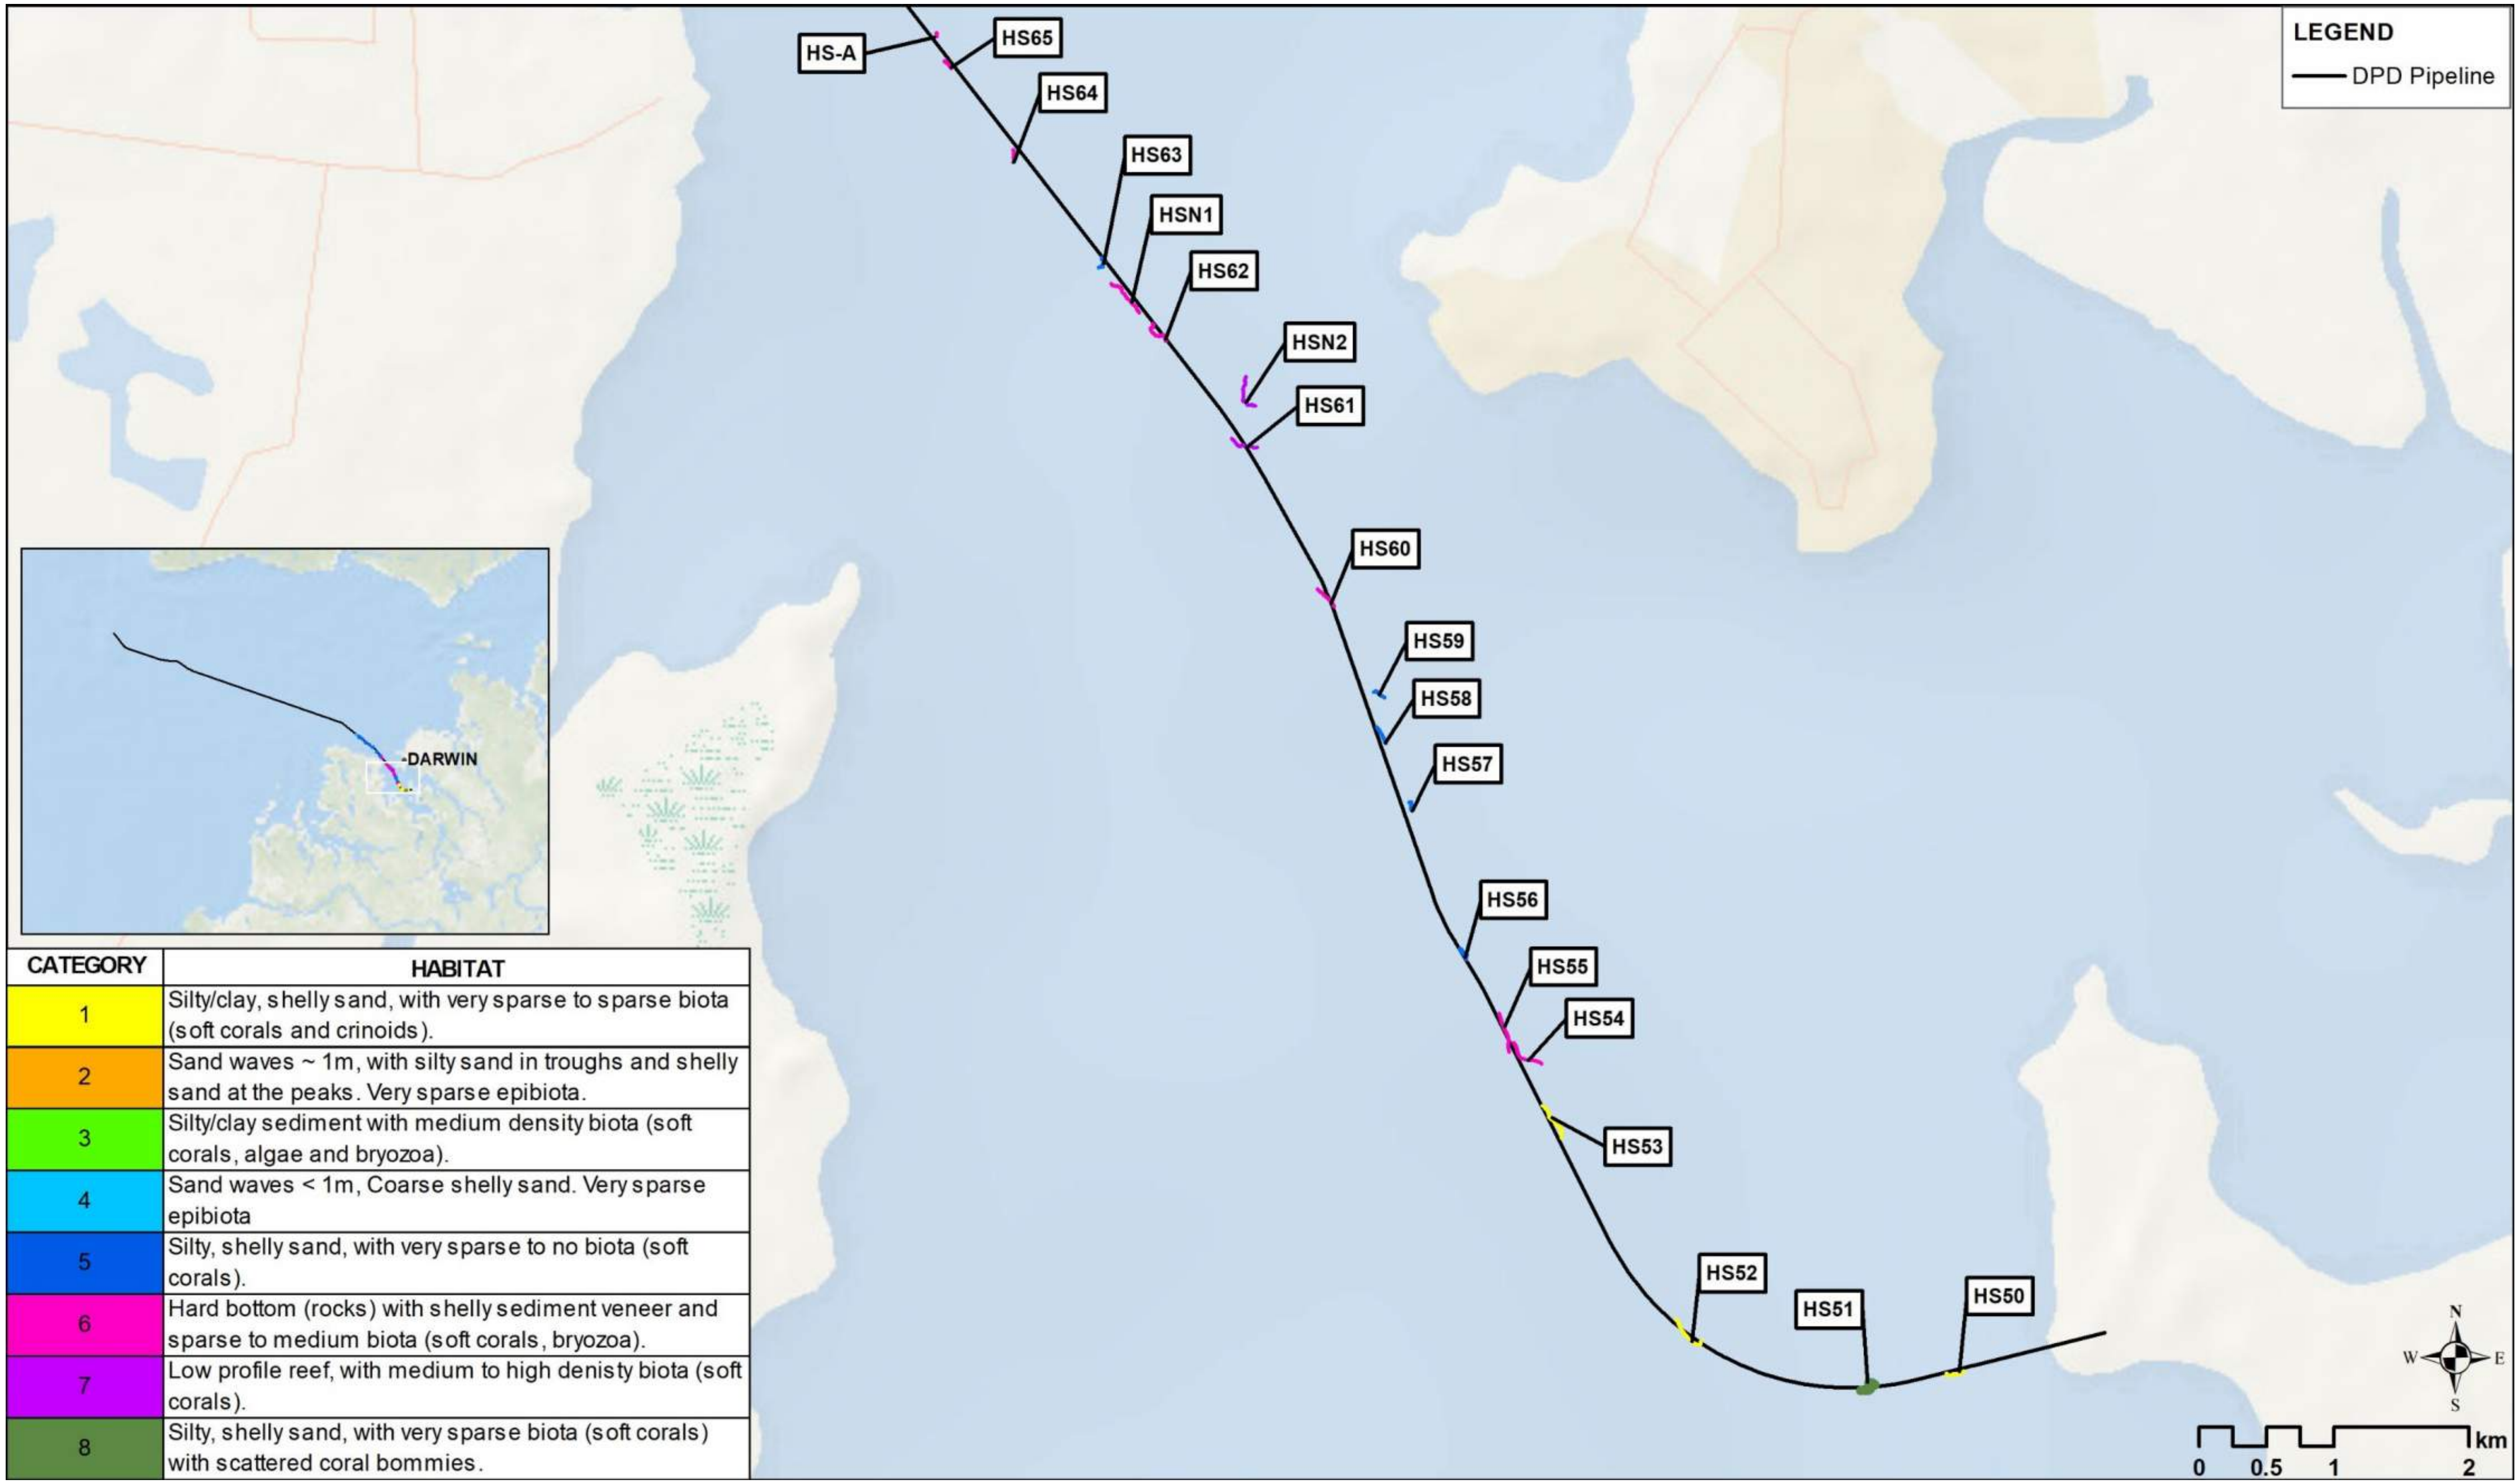

CATEGORY	HABITAT
1	Silty/clay, shelly sand, with very sparse to sparse biota (soft corals and crinoids).
2	Sand waves ~ 1m, with silty sand in troughs and shelly sand at the peaks. Very sparse epibiota.
3	Silty/clay sediment with medium density biota (soft corals, algae and bryozoa).
4	Sand waves < 1m, Coarse shelly sand. Very sparse epibiota
5	Silty, shelly sand, with very sparse to no biota (soft corals).
6	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
7	Low profile reef, with medium to high denisty biota (soft corals).
8	Silty, shelly sand, with very sparse biota (soft corals) with scattered coral bommies.

Figure 3-5: Benthic habitats along the southernmost section of the pipeline route in Darwin Harbour (October 2021)

3.1.1.1 Soft substrate habitats

3.1.1.1.1 Offshore pipeline

Offshore seabed habitats were characterised by silty/clay shelly sand from KP0 to KP65 (Plate 3-1), with very sparse to sparse conspicuous epibiota (mainly soft corals and crinoids). This soft sediment habitat was identified again at the shoreward end of the pipeline route (near the shore crossing). Biota commonly associated with this habitat type included:

- Soft corals, including gorgonians, sea whips (*Junceella* spp.), Neptheidae and Alcyoniidae (Plate 3-2)
- Echinoderms including sea urchins, sea stars, sea cucumbers and crinoids (Plate 3-3)
- Molluscs, including squid
- Crustaceans including shrimp and the painted pebble crab (*Leucosia anatum*)
- Burrows and polychaete tubes.

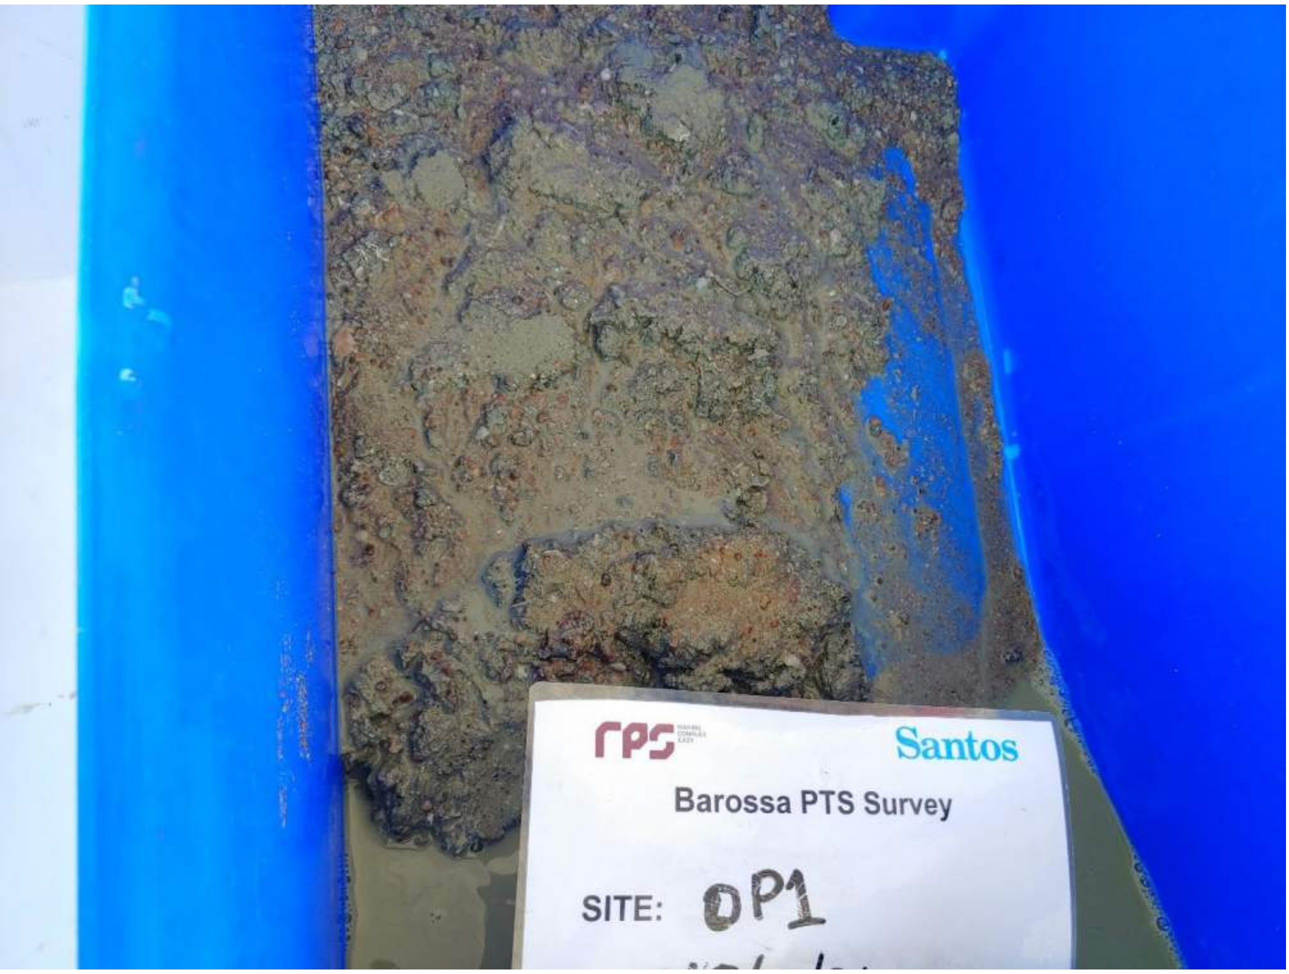

Plate 3-1: Grab sample from site OP1, showing silty shelly sand with clumps of clay

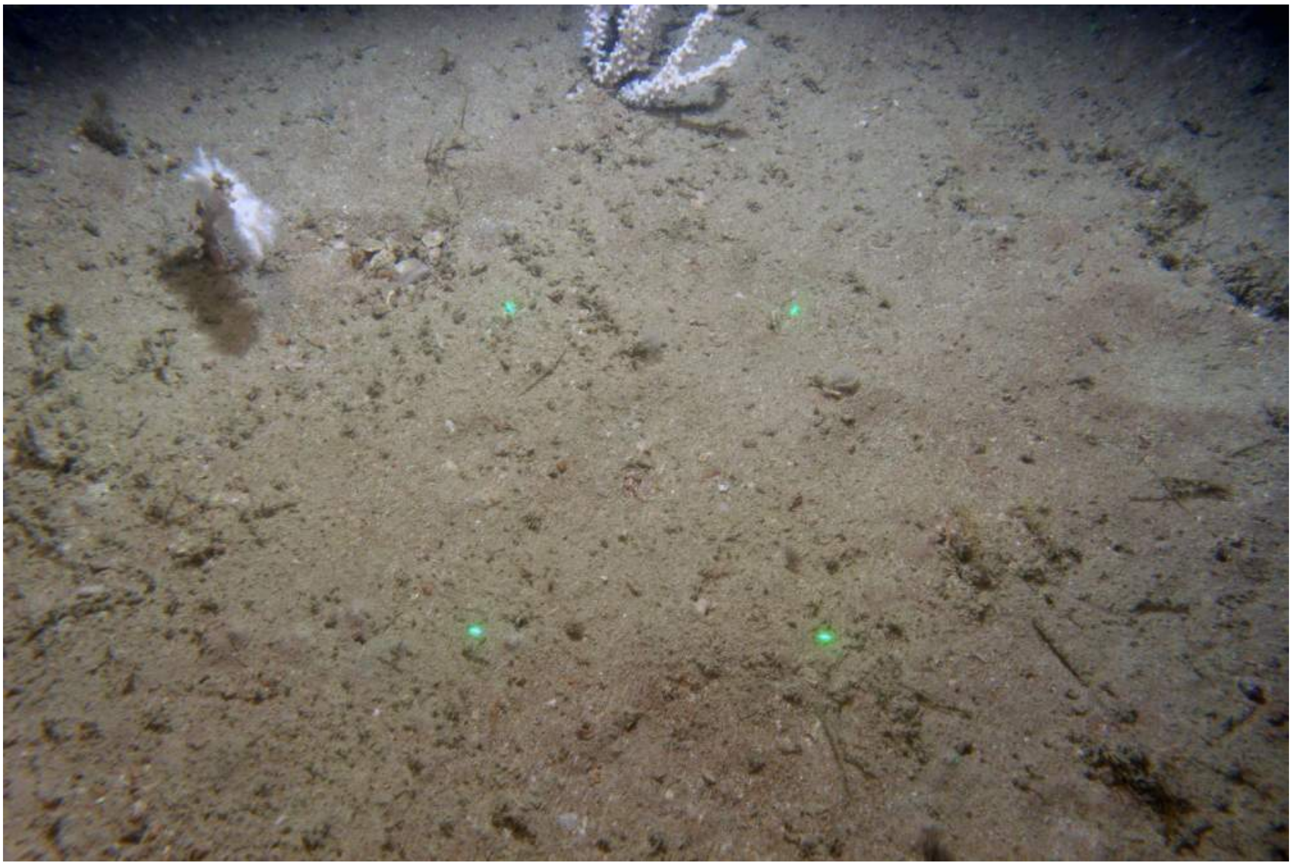

Plate 3-2: Silty, shelly sand with very sparse soft corals (Alcyoniidae) at site OP1

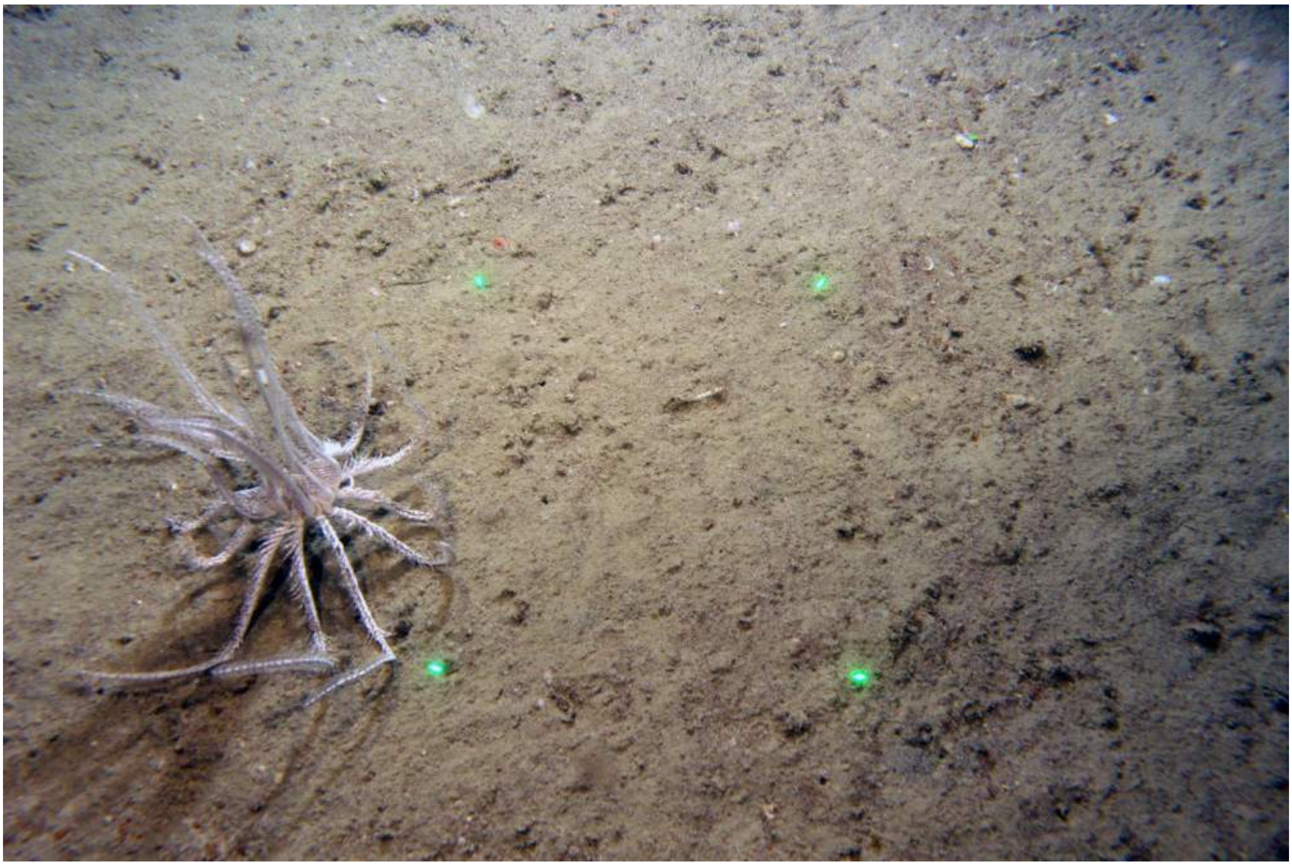

Plate 3-3: Silty/clay sand with a motile crinoid at site V12

Sand waves were recorded at three offshore silty/clay shelly sand sites (V10, V11 and V12), roughly 1 m in height, with silty sand in the troughs and coarse shelly sand at the crests (Plate 3-4). This substrate was associated with very sparse epibiota.

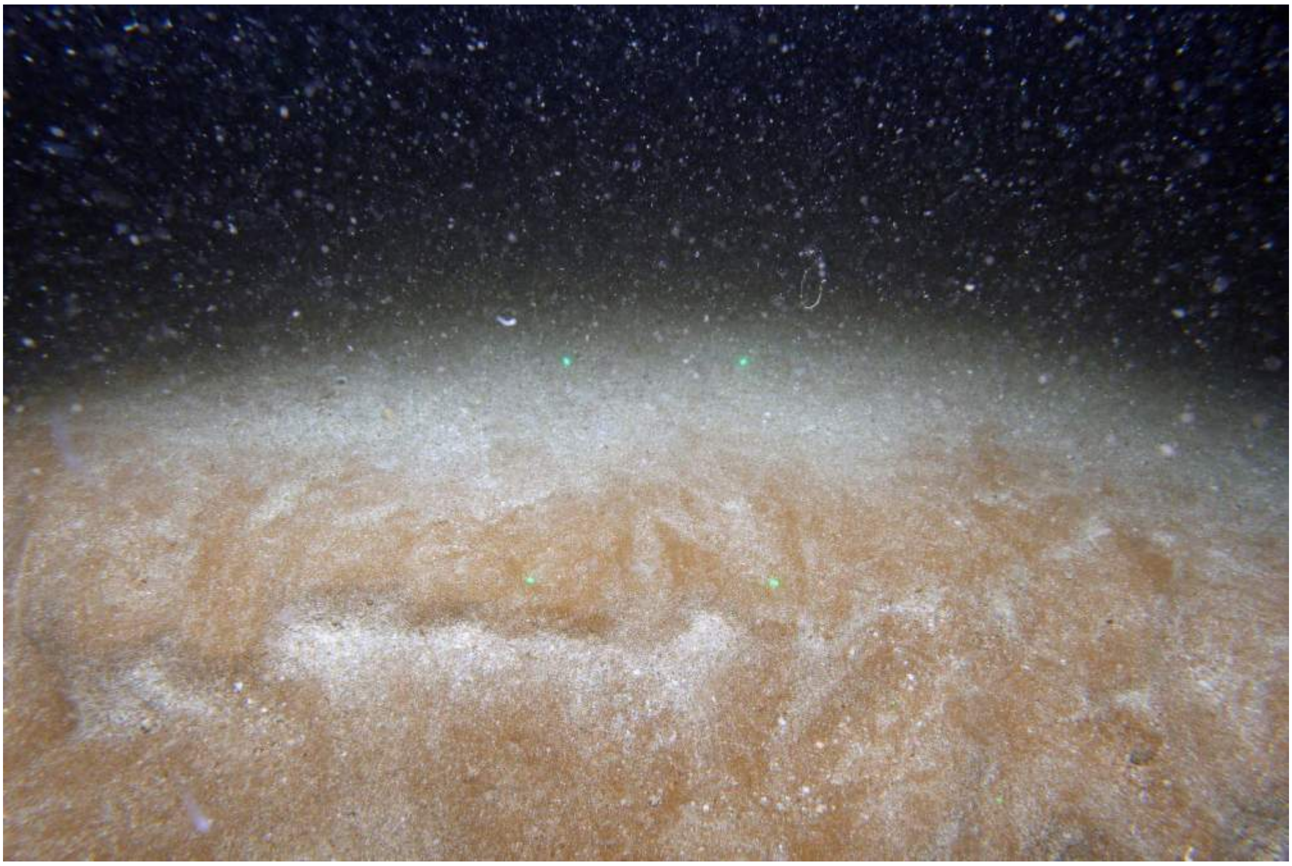

Plate 3-4: Small sand wave at site V11, with coarse, shelly sand at the crest

3.1.1.1.2 Spoil ground

The spoil ground sites all consisted of soft substrate habitat, which was only identified at one other site along the offshore pipeline route (V16). This habitat is defined by silty/clay sediment with medium density biota (soft corals, algae and Bryozoa). Biota commonly associated with this habitat were soft corals (gorgonians, *Junceella* spp. and Alcyoniidae), branching and encrusting sponges, Bryozoa (lace corals), invertebrate burrows, polychaete tubes, brown algae and occasional motile crinoids.

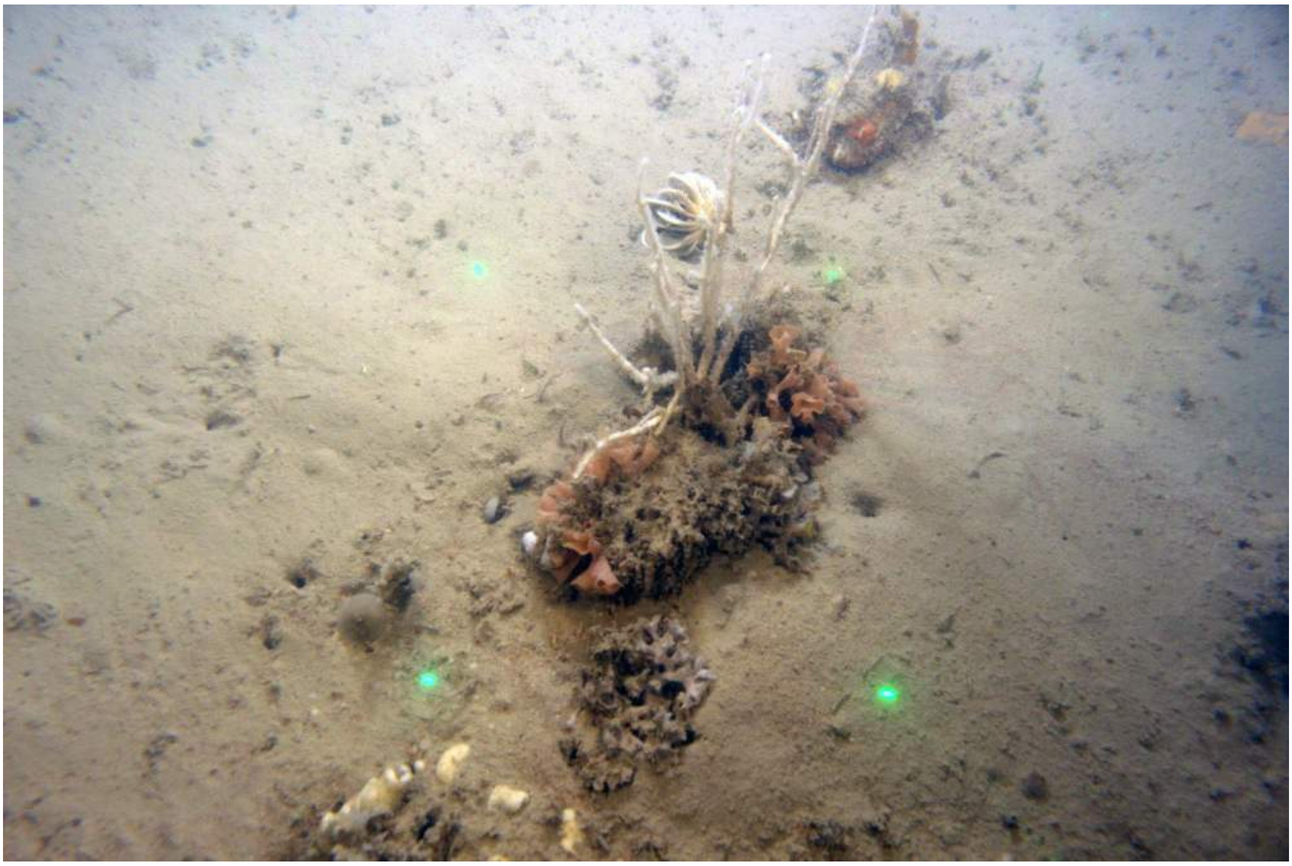

Plate 3-5: Silty/clay sediment with soft corals, Bryozoa (lace coral) and a motile crinoid at site SG10

3.1.1.1.3 Darwin Harbour

There were three main soft substrate habitat types identified in Darwin Harbour. The first comprised coarse shelly sand waves, less than 1 m in height with very sparse epibiota (Plate 3-6). This habitat was only recorded at three sites (HS78, HS79 and HS80), all of which were in the potential sand wave rectification zone at the outer edges of Darwin Harbour (Plate 3-7). While this habitat is very sparse in conspicuous epibiota, grab samples from one of the sites in this area (HS33) retrieved a very high density of hermit crabs (Plate 3-8), with over 100 crabs recorded from each grab.

The most common soft substrate habitat type within Darwin Harbour consisted of silty, shelly sand, with very sparse soft corals to no conspicuous epibiota (Plate 3-9). The epibiota recorded from this habitat included hydroids, occasional soft corals and sea pens (gorgonians, Pennatulacea, *Junceella* spp. and Alcyoniidae), Bryozoa (lace corals), sea urchins and sea stars.

The third habitat identified was a mixed habitat of silty shelly sand, with very sparse biota (soft corals) with scattered bombora was recorded at only one site, HS51 (Plate 3-10). The bombora supported assemblages of hydroids, soft corals (gorgonians), anemone colonies and encrusting sponges.

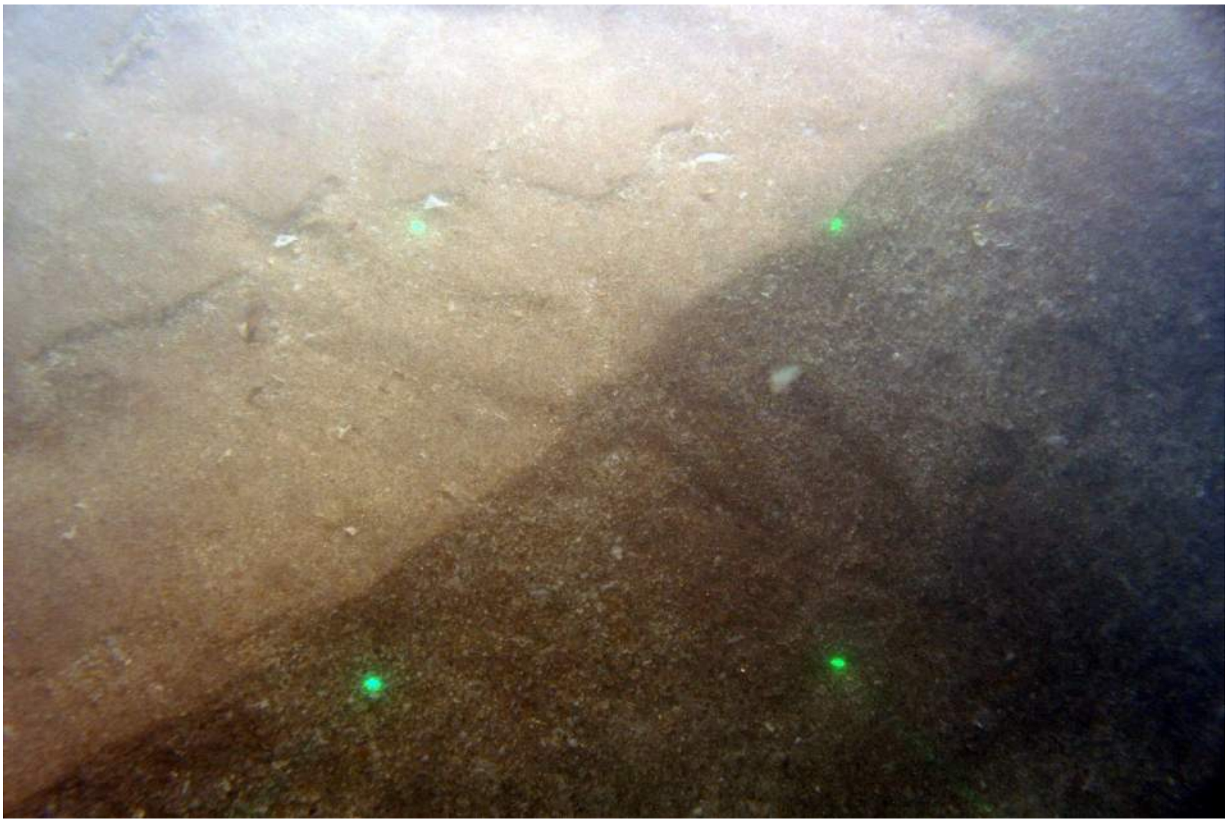

Plate 3-6: Coarse shelly sand waves with very sparse epibiota at site HS78

Plate 3-7: Coarse shelly sand from site HS34, inside the potential sand wave dredging zone at the outer edge of Darwin Harbour

Plate 3-8: Hermit crabs from site HS33

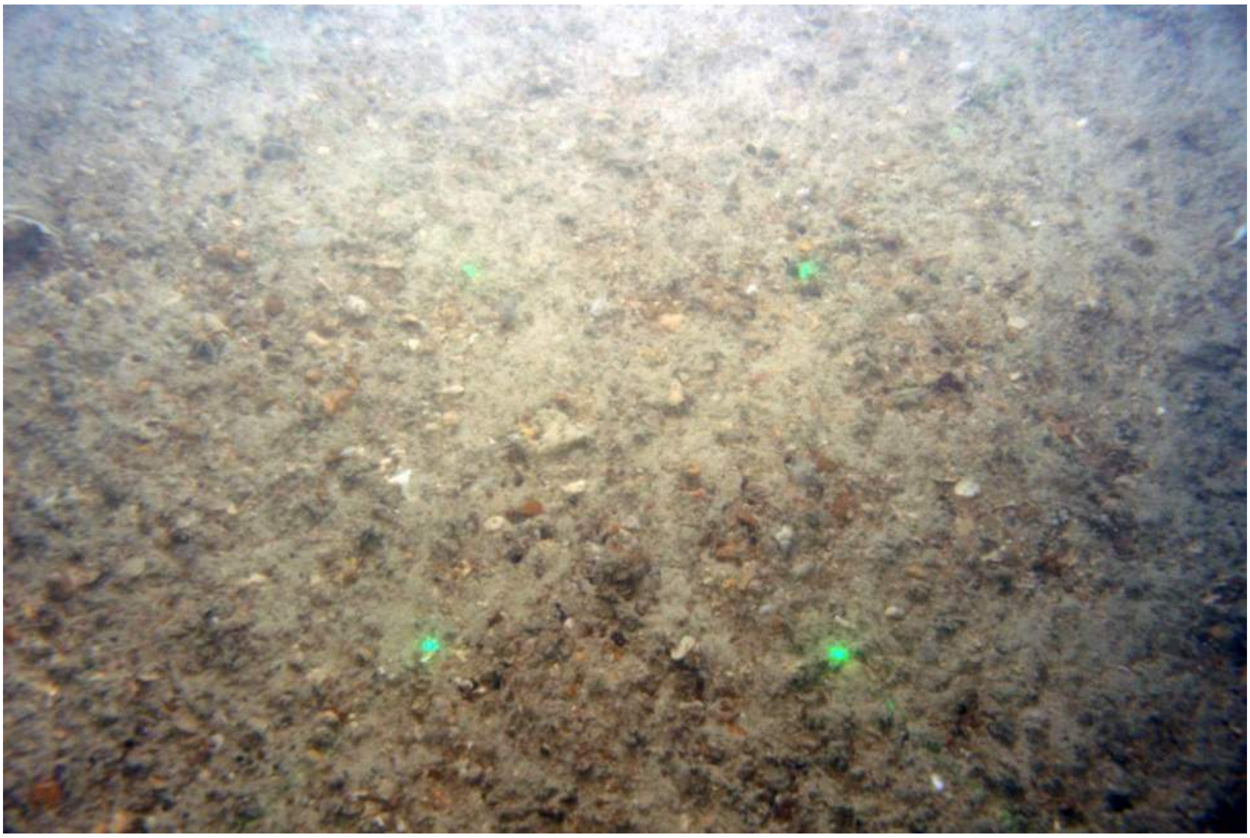

Plate 3-9: Silty shelly sand, with very sparse to no conspicuous epibiota at site HS73

Plate 3-10: Silty shelly sand and part of a bombora supporting assemblages of sponges, anemones and soft corals at site HS51

3.1.1.2 Hard substrate habitats

3.1.1.2.1 Darwin Harbour

The majority of hard substrates were recorded along the section of the pipeline route offshore from Fannie Bay with a number also recorded in the inner harbour. Most of these sites were hard bottom (consolidated rocks) with a shelly coarse sediment veneer and sparse to medium conspicuous epibiota (mainly soft corals and bryozoans) (Plate 3-11). However, low profile reef was recorded at sites HS61 and HSN2, with medium to high density epibiota. The epibiota associated with this habitat type included hydroids, soft corals (gorgonians, *Junceella* spp.), brown algae, bryozoans (lace corals), ascidians, and encrusting, digitate and globular sponges.

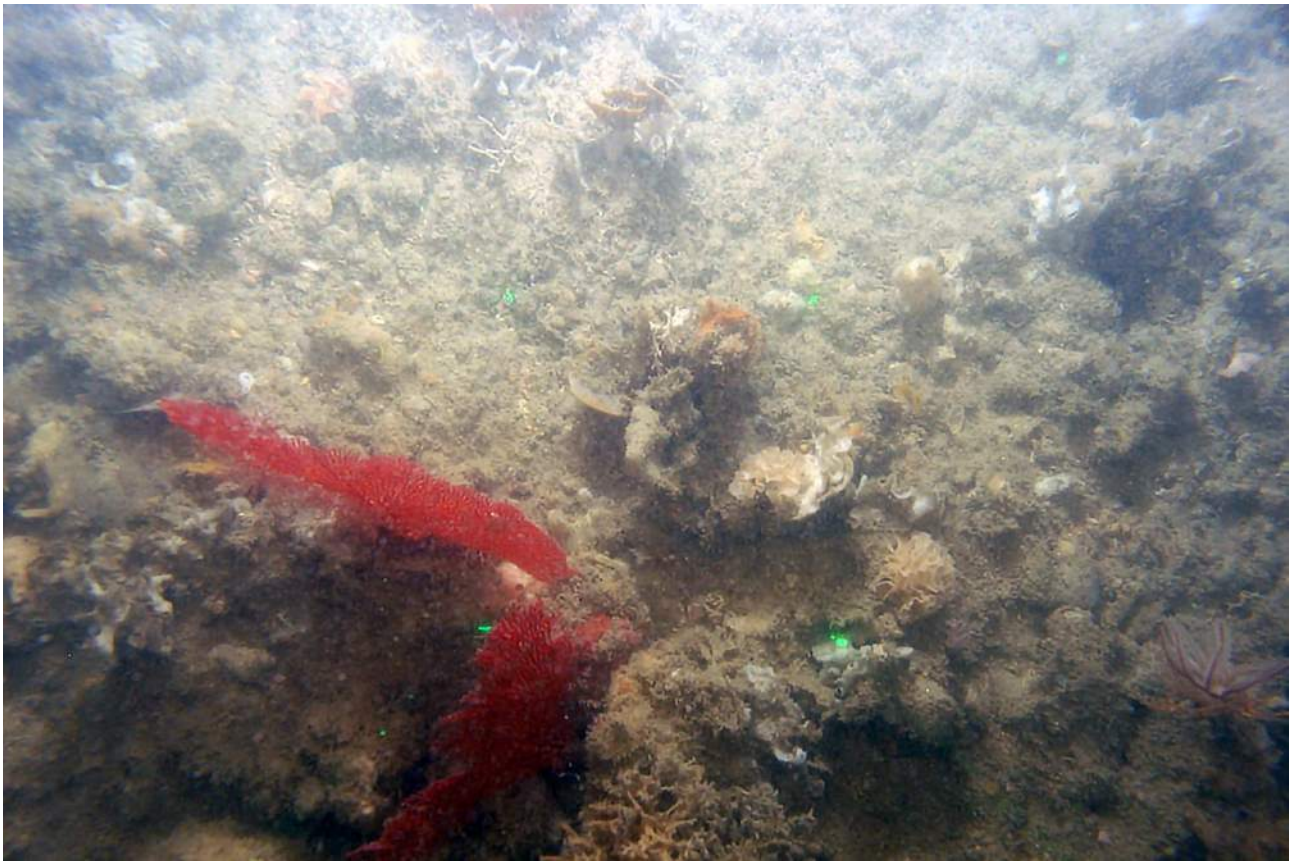

Plate 3-11: Hard bottom (consolidated granite rocks) with a shelly sediment veneer supporting gorgonians and bryozoans (lace corals) at site HS68

Plate 3-12: Low-profile reef with medium density gorgonians and sponges at site HSN2

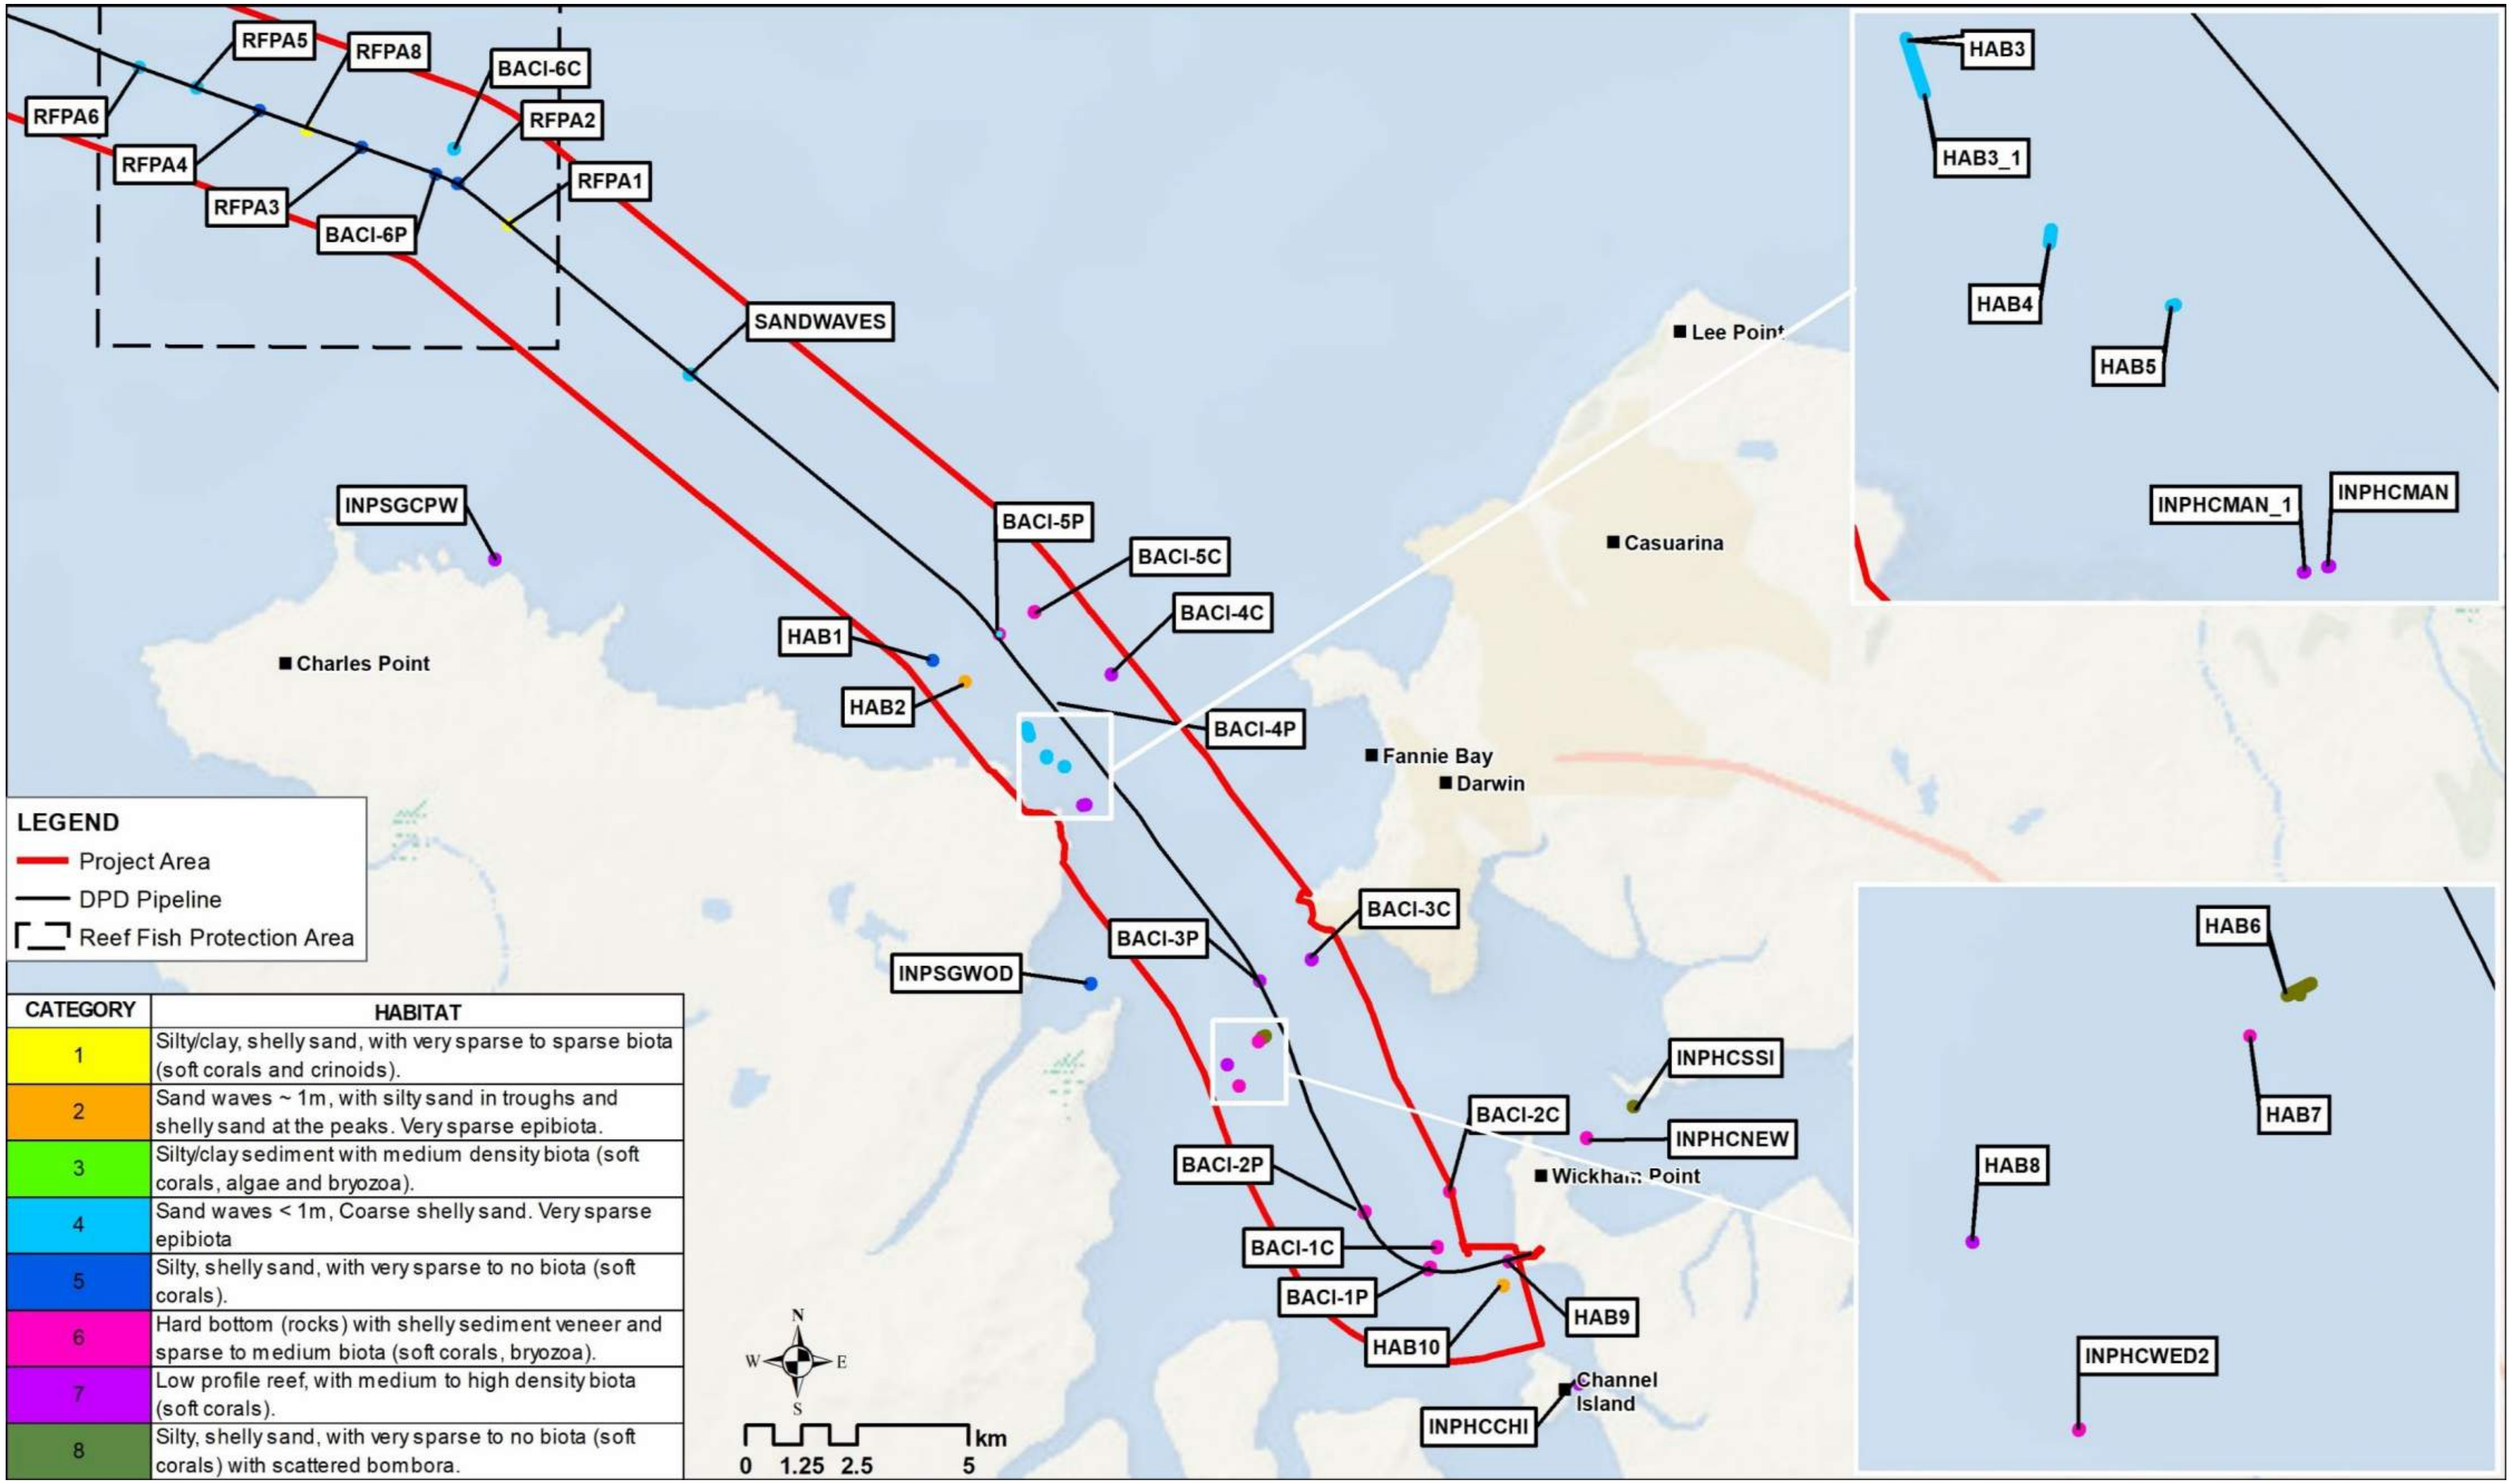
3.1.2 June 2022 survey

The June 2022 showed similar results to the October 2022 video transect surveys. Each site was evaluated in detail, and then sorted into the same broad habitat categories outlined for the October 2021 survey (Table 3-1). The harder substrates were limited to the inner Darwin Harbour and the coastal areas, while the offshore pipeline was dominated by silty sand substrate (Figure 3-6). Epibiota density also increased towards the inner Darwin Harbour, with the densest area surveyed occurring in rocky reefs located outside the project area, in the shallow protected areas of the inner harbour (Figure 3-6). The outer Darwin Harbour had more variation, and represented more of a transitional habitat, containing some area of rocky rubble and increased epibiota density, with large areas of bare silty sand with sparse epibiota (Figure 3-6). Overall, biota density and diversity were greatest in the rocky/hard substrate, which was predominantly located in the inner portions of Darwin Harbour, while the outer/offshore sections of the pipeline consisted mainly of silty to coarse sands.

Table 3-1: Transects conducted in June 2022 survey, describing substrate and predominate biota and the mapping habitat classification

Transect	Substrate	Biota	Mapping habitat classification
BACI_1C	Thin silt/shelly sand veneer over bedrock, some rock and boulders.	Turf with low to medium density epibiota (5–15%); gorgonians (sea fans and sea whips–some with crinoids attached), hydroids. Fish in burrows	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
BACI_1P	Rock, boulders, cobbles; broken low relief rock pavement; mixed sediments	Turf with low to medium density epibiota (5–15%); gorgonians (sea fans and whips- some with crinoids attached), sponges (encrusting), hydroids, sea pens). Fish in burrows.	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
BACI_2C	Medium sand veneer with gravel, over bedrock	Bioturbation (burrows and mounds), low density epibiota (1–2%); gorgonians (sea whips and fans), sponge (fan)	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
BACI_2P	Fine sand veneer, with gravel and some rubble	Bioturbation (fish burrows and mounds), very low density epibiota (<1–2%); soft corals (sea whip, sea fan, sea pen), hydroids	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
BACI_3C	Rock reef (medium relief), muddy shelly sand veneer, rocks/boulders	Turf with medium to dense large epibiota (20–70%); sponges (multiple forms: 60% cover), soft corals (sea fans and whips: 20–30% cover), hydroids (<1%), hydroid/bryozoan turf (60–80%)	Low profile reef, with medium to high density biota.
BACI_3P	Rock reef (high relief), muddy shelly sand veneer, rocks/ boulders	Turf with dense large epibiota (40–80%); sponges (multiple forms), soft corals (sea fans and whips). Hydroid/bryozoan turf (40–80%), Fish (big school of snapper, batfish). Areas of shelly sand and rubble with little conspicuous epibiota (<1–2%); hydroids	Low profile reef, with medium to high density biota.
BACI_4C	High profile reef with sediment veneer	Turf with dense large epibiota (40–60% cover); hydroids, sponges (large, with diverse morphologies on reef (up to 60% cover), gorgonians (mainly large sea fans (20% cover) and branching forms with fewer sea whips on reef), hydroid/bryozoan turf (<20%)	Low profile reef, with medium to high density biota.
BACI_4P	Rock, boulders, cobbles; broken low relief rock pavement; mixed sediments	Low density epibiota (5–30% cover). Hydroids and encrusting biota (inc. calcareous tube worms, <1% cover). Hydroid/bryozoan turf (40–100% cover). Rare to low density gorgonians (branching, sea fans: 20–30%) and sponges (tube and burrowing types: <5% cover). Occasional crinoids on larger epibiota.	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
BACI_5C	Thin silt/shelly sand veneer over bedrock	Turf and large epibiota; hydroids, sponges (erect forms: 10–20%, low forms <20% cover), gorgonians (sea fans and sea whips rare), hydroid/bryozoan turf (60-80%)	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, Bryozoa).
BACI_5P	Thin silt/shelly sand veneer over bedrock	Turf with low density large epibiota; hydroids, sponges (tubular form: 20%, coned/spherical forms: ~5%, encrusting sponge: 40–60% coverage), gorgonians (sea fans and sea whips; often patchy/rare: <10% coverage), crinoids on sea whips, hydroid/bryozoan turf (70–90%)	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
BACI_6C	Fine, rippled sand with rubble	Very sparse epibiota (<1%); soft corals, digitate sponges, brown macroalgae, sea pen, bivalve, hydroids, fish in burrows, octopus. Bryozoan turf (<1%)	Sand waves < 1m, Course shelly sand. Very sparse epibiota.
BACI_6P	Fine sand with rubble	Bioturbation. Low density epibiota (1–5%); Soft corals and gorgonians (1–5%), hydroids (<1%), brown macroalgae (<1–2%), ascidians (<1%), encrusting and digitate sponges (<1%), crinoid, starfish, bryozoan turf (<1%)	Silty, shelly sand, with very sparse to no biota (soft corals).
Fish aggregation site	Rock reef (medium relief), mixed sand veneer, rocks/boulders	Bioturbation, turf and medium density large epibiota (10–40%); soft corals (gorgonians: 10%), crinoids (1–2%), sponges (multiple morphotypes: 5–10%), ascidians, fish (golden snapper, cod, butterflyfish, stingray). Hydroids/bryozoan turf (40–60%)	Low profile reef, with medium to high density biota.
Hab1	Rippled sand, sand bank; sand ridges	Rare, low density soft corals/gorgonians (<1%)	Silty, shelly sand, with very sparse to no biota (soft corals).
Hab2	Rippled sand, sand bank; sand ridges and large sand waves.	Generally, no conspicuous epibiota; except for some very low-density turf epibiota (1–2% coverage) and two soft corals/gorgonians recorded.	Sand waves ~ 1m, with silty sand in troughs and shelly sand at the peaks. Very sparse epibiota.
Hab3	Coarse sand/shell, coarser with increased depth. Sand waves/ripples and large sand ridges, sand bank	Very low-density turf epibiota (1–2% coverage), single branched brown macroalgae and single large burrowing anemone (<1% coverage); rare soft corals (gorgonians: 1–3% coverage). Single crab.	Sand waves < 1m, Course shelly sand. Very sparse epibiota.
Hab4	Medium sand with some gravel. Sand ripples	Rare gorgonians (<1% coverage) and very rare macroalgae (<1% coverage)	Sand waves < 1m, Course shelly sand. Very sparse epibiota.
Hab5	Medium sand with some gravel. Sand ripples	Bioturbation. No conspicuous epibiota.	Sand waves < 1m, Course shelly sand. Very sparse epibiota.
Hab6	Mobile sediments, reef (high and low relief) and patchy rock	Turf (40–50% cover) and large epibiota on bedrock (10–15%); hydroids, sponges (multiple forms), gorgonians (sea fans and sea whips), anemones, hydroid/bryozoan turf, hard coral (1–5%)	Silty, shelly sand, with very sparse biota (soft corals) with scattered bombora.
Hab7	Patchy rock (occasional high relief ridges and outcrops) with thick coarse sediment veneer	Dense turf (60% cover) and moderate density large epibiota on bedrock (15–20% cover); hydroids, sponges (multiple forms), soft corals and gorgonians (sea fans and sea whips), hard coral (10–20% cover), hydroid/bryozoan turf (60% cover), starfish, bivalve	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
Hab8	Patchy rock (frequent high relief ridges and outcrops) with thick coarse sediment veneer	Dense turf (70% cover) and dense large epibiota on bedrock (20–60% cover); hydroid/bryozoan turf (10–50%), sponges (branching: 5–20%; encrusting: 30–65%; burrowing: 5%; stalked: 5–10%; tubular: 3–5%), hard coral (5–10%), echinoderm (sea star), gorgonians (3–5%), macroalgae (green 1–7%; brown <2%), fish	Low profile reef, with medium to high density biota (soft corals).
Hab9	Sand veneer with patches of rocks	Bioturbation (mounds and burrows). Low to medium density large epibiota (5–40%); soft corals (gorgonian fans: 1–2%), anemones, brown macroalgae (20%), sponges (multiform: 10–20%)	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
Hab10	Shelly coarse sand, large/wide sand waves	Bioturbation (burrows and mounds), little conspicuous epibiota- crinoids and soft coral (sea whips) (<1%), hydroid (1–2%), crab	Sand waves ~ 1m, with silty sand in troughs and shelly sand at the peaks. Very sparse epibiota.
Heritage_147	Thin silt/sand veneer over bedrock (areas of high relief); Areas of low relief flat bedrock	Dense turf and diverse large epibiota (40–60%); holes lined with stones; Lots of gorgonians (40%), some with crinoids. Schools of fish.	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
Heritage_031	Rock with boulders and sediment veneer; change to thicker rippled sand veneer with exposed cobbles and epibiota	Medium density epibiota (20–50%); sponges (fans) and soft corals (sea fans), bryozoa turf (30–60%); less (patchier) epibiota (10–30%) on rippled sand; soft coral (sea whip), burrowing sponges, hydroids/bryozoans	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).

Transect	Substrate	Biota	Mapping habitat classification
Hertage_241	Rock with boulders and sediment veneer; depression	Low density sea fans (1–2%), tube and burrowing sponges, gorgonians, dense bryozoa turf (70%)	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
INPHCCHI	Low profile rocky reef, with thin shelly sediment veneer	Medium density epibiota (20–60%); brown algae (5–10%), hard corals (encrusting, foliose, massive: 10–50%), soft corals (sea fans and whips: 5–10%), sponge (multiple forms: 10–30%). Bryozoan turf (20–40%)	Low profile reef, with medium to high density biota.
INPHCNEW	Rock with patchy sand veneer	Low to medium density epibiota (20–60%); large soft corals (sea whips, fans: 2–10%) and sponges (diverse morphotypes: 10–40%), hard coral (encrusting: 1–5%) anemone, fish (butterflyfish, wrasse).	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
INPHCMAN	Low to medium profile rocky reef, with thin shelly sediment veneer	Turf with medium to high density large epibiota (30–60%); sponges (multiple forms: 5–40%), soft corals (gorgonian fans and sea whips: 1–10%), hydroids (<1–15%), Bryozoan turf (40–70%)	Low profile reef, with medium to high density biota.
INPHCMAN_1	Low to medium profile rocky reef, with thin shelly sediment veneer	Turf with medium to high density large epibiota (40–80%); sponges (multiple forms: 5–40%), hard corals (1–10%), soft corals (gorgonian fans and sea whips: 1–20%), hydroids (<1–15%). Bryozoan turf (40–70%)	Low profile reef, with medium to high density biota.
INPHCSSI	Fine sediment with patchy/scattered rocks	Bioturbation. Areas with no conspicuous epibiota. Patches of low to high density epibiota (20–80%); soft corals (10–20%), sponges (multiple morphotypes: 10–30%), gorgonians, hard coral (encrusting and massive: 20–60%), brown (10–60%) and green macroalgae (inc. *Halimeda* spp) (1–5%), ascidians, anemone, bivalves fish (wrasse, pufferfish, butterflyfish, shark (whaler sp. or Bull shark) Bryozoan turf (20–60%)	Silty, shelly sand, with very sparse to no biota (soft corals) with bombora.
INPSGCPW	Bedrock (inc. medium relief reef) with coarse shelly sand veneer (occasional rippled sand); scattered bombora; low relief reef	Bioturbation. Medium to high density epibiota (20–80%); coral (inc. plate, foliose, encrusting and massive corals: 40–90%). Gorgonians (fans and whips: 1–5%), ascidians, *Halimeda* spp. (green macroalgae: 2–10%), patchy coral, sponges (digitate and basket), fan worm. turf (10–30%). No conspicuous epibiota on rippled sand areas	Low profile reef, with medium to high density biota.
INPHCWED2	Fine sand veneer, some rubble and small rocks	Bioturbation, turf and low density epibiota (1–40%); soft corals (sea whips:1–5%) and sponges (multiple forms: 1–15%), hard coral (plate, encrusting: 1–30%), brown macroalgae (20–40%), green macroalgae (*Halimeda spp.* 1–2%), bryozoan turf (10–30%). Fish (snapper, wrasse, damselfish)	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
INPHCWOD	Rippled coarse sand, occasional shelly rubble	Bioturbation (large, deep burrows and large mounds), Low density seagrass (possibly *Halodule spp.*: 5–15%) along entire transect	Silty, shelly sand, with very sparse to no biota (soft corals).
RFPA1	Fine sediment with small rubble/rock	Bioturbation. Often no conspicuous epibiota. Hydroids (1–2%), soft corals (<1%), starfish, tubeworm, fish (blenny or goby)	Silt/clay, shelly sand, with very sparse to sparse biota (soft corals and crinoids).
RFPA2	Fine sand veneer, some rubble and small rocks	Bioturbation. Low density epibiota (1–10%); Soft corals (1–5%), sponges (encrusting, digitate and branching: 1–5%), ascidians, crinoids, hydroids (1–2%), bryozoan turf (20–80%), starfish	Silty, shelly sand, with very sparse to no biota (soft corals).
RFPA3	Fine sand with scattered rocks and rubble	Bioturbation. Low density epibiota (1–15%); ascidians, crinoids, sponges (digitate and branching:1–5%) soft corals (fans and sea whips: 1–10%), white ascidians (patches: <1–5%), crinoids (<1–2%)	Silty, shelly sand, with very sparse to no biota (soft corals).
RFPA4	Mainly fine sand with occasional coral rubble	Bioturbation. Low density epibiota (<1–10%); soft corals (sea fans and whips), sponges (encrusting and branching), crinoids	Silty, shelly sand, with very sparse to no biota (soft corals).
RFPA5	Coarse, shelly rippled sand, sand waves	Areas of no conspicuous epibiota, bioturbation, fish; very low density/patchy epibiota (<1–2%); soft corals, macroalgae, hydroids, crinoids, sponges	Sand waves < 1m, Course shelly sand. Very sparse epibiota.
RFPA6	Coarse, shelly rippled sand, sand waves	Bioturbation; low density/rare epibiota (<1–5%); soft corals, hydroids, brittle star, starfish, macroalgae, crinoid, stingray, tube worms, blennies.	Sand waves < 1m, Course shelly sand. Very sparse epibiota.
RFPA8	Fine sediment, occasional rock	Bioturbation. Low density epibiota (<1–5%); soft corals (gorgonians: <1–2%), sponges (branching and encrusting), hydroids (1–2%), ascidians, nudibranch, starfish, brown macroalgae (1–2%), sea pens	Silt/clay, shelly sand, with very sparse to sparse biota (soft corals and crinoids).
Sand waves	Rippled coarse shelly sand; sand waves; occasional coral rubble	Mainly no conspicuous epibiota; sparse soft corals (<1%), ascidians, crinoids (1–2%), polychaete tubes	Sand waves < 1m, Course shelly sand. Very sparse epibiota.



CATEGORY	HABITAT
1	Silty/clay, shelly sand, with very sparse to sparse biota (soft corals and crinoids).
2	Sand waves ~ 1m, with silty sand in troughs and shelly sand at the peaks. Very sparse epibiota.
3	Silty/clay sediment with medium density biota (soft corals, algae and bryozoa).
4	Sand waves < 1m, Coarse shelly sand. Very sparse epibiota
5	Silty, shelly sand, with very sparse to no biota (soft corals).
6	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
7	Low profile reef, with medium to high density biota (soft corals).
8	Silty, shelly sand, with very sparse to no biota (soft corals) with scattered bombora.

Figure 3-6: Benthic habitats along the proposed Barossa GEP pipeline, including outer pipeline, outer Darwin Harbour and inner Darwin Harbour survey sites (June 2022), including the Reef Fish Protection Area

3.1.2.1 Offshore pipeline

Similar to the October 2021 survey, the offshore seabed habitats were characterised by silty shelly sand from RFPA1 to RFPA8, including BACI_6C/P and Sand waves (Plate 3-13), with very sparse to sparse (1–5% coverage) epibiota (mainly soft corals, crinoids and sponges). Courser patches of sand where also observed in the outer offshore pipeline region. Areas of soft silty and shelly sand were also observed in the inner portions of Darwin Harbour, and near Wickham Point. Biota commonly associated with this habitat type included:

- Soft corals, including gorgonians, sea whips (*Junceella* spp.), Neptheidae and Alcyoniidae
- Sponges, including digitate and branching
- Echinoderms including sea urchins, sea stars, sea cucumbers and crinoids
- Crustaceans including shrimp
- Burrows and polychaete tubes.

Plate 3-13: Silty shelly sand with sparse soft corals at RFPA3

3.1.2.2 Outer Darwin Harbour

The outer Darwin Harbour region represented a transition between hard and soft substrates. Sites Hab1–Hab5 were located just on the opening of Darwin Harbour with substrate ranging from rippled sand to medium sand with gravel toward the harbour opening. These sites had epibiota less than 1% coverage, consisting mainly of sparse anemone, soft corals and macroalgae (Plate 3-14). The further south sites, such as INPHCMAN, had rockier substrate and increased epibiota (Plate 3-15). This region was dominated by sponges (diverse morphotypes), soft corals, macroalgae, echinoderms with some fish and crustacean presence.

Plate 3-14: Rippled course shelly sand with no to very sparse epibiota at Hab3

Plate 3-15: Rocky reef with medium to high density epibiota, including large soft corals (gorgonian fans and sea whips), hydroids, sponges (multiple morphotypes) and occasional hard coral at INPHCMAN

3.1.2.3 Inner Darwin Harbour

The inner portions of Darwin Harbour consisted of mainly hard rocky substrates, other than sites near Wickham Point. Hab6-Hab8 had increasingly rocky substrate and increasing biodiversity and epibiota density, similar to INPHCMAN (Plate 3-15), while Hab-9-Hab10 had decreasing epibiota density and increased potions of silty mobile sand towards Whickham Point (Plate 3-16). The sites located outside of the project area in the shallower protected areas of Darwin Harbour boasted the greatest epibiota densities and diversity, including sponges, soft and hard corals, echinoderms and schools of fish (Plate 3-17).

Plate 3-16: Coarse shelly sand with sparse epibiota and moderate bioturbation at Hab10

Plate 3-17: Rocky reef with diverse sponges, soft and hard corals, macroalgae and fish at INPHCCHI

3.2 Sediment quality

3.2.1 Offshore pipeline

3.2.1.1 Particle size distribution

Laboratory PSD results can be found in Appendix D. The data were analysed to characterise sediment samples in terms of Wentworth size classifications, which classify particle size into total clay (0-4 µm), total silt (4–63 µm), total sand (63–2000 µm) and total gravel (>2000 µm) (Table 3-2).

The offshore pipeline route was predominantly sand. The northern end of the pipeline route was gravelly silty sand, which became less gravelly and much siltier, with higher proportions of clay, towards the eastern end of the offshore pipeline route (Figure 3-7). The westernmost site (OP1) had 9.29% silt and 16.2% gravel, compared with the southernmost site (OP30) which had 39.22% silt and 0.28% gravel (Table 3-2). Proportions of clay in the sediment ranged from 1.86% at OP9, to 7.03% at OP30.

Table 3-2: Sediment particle size characteristics along the offshore pipeline route (from west (OP1) to Darwin Harbour limits (OP30)

Site	Total% clay (0–4 µm)	Total% silt (4–63 µm)	Total% sand (63–2000 µm)	Total% gravels (>2000 µm)

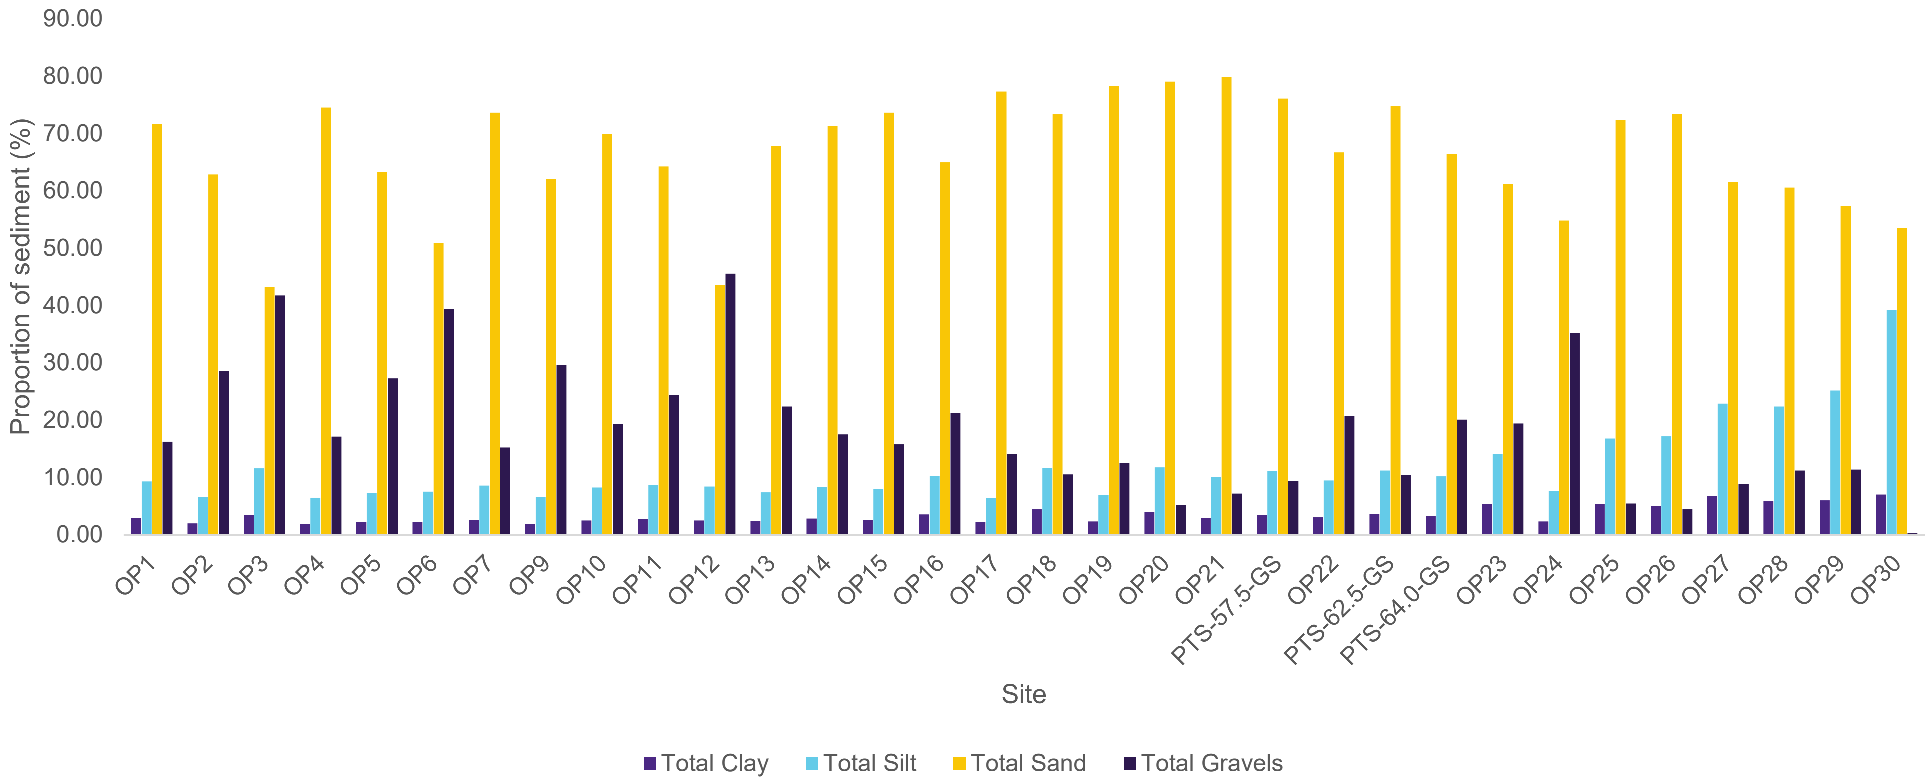

Figure 3-7: Sediment sample particle size characteristics along the offshore pipeline route

3.2.1.2 Infauna

A total of 744 individuals from ten phyla were recorded from the 29 offshore pipeline samples analysed. The dataset was dominated by crustaceans (350 individuals) and annelids (polychaete worms; 313 individuals). Crustaceans were the most abundant phylum at 16 of the 29 OP sites (55.2%), with Annelids the most abundant phylum at the other 13 sites (44.8%). The next most numerous phyla were an order of magnitude lower in abundance (Sipuncula, Echinodermata, Mollusca and Chordata, represented by 32, 23, ten and eight individuals, respectively). The remaining phyla, Brachiopoda, Cnidaria, Echiura, and Porifera, were only represented by doubletons (i.e. two individuals per phyla). The full dataset can be found in Appendix E.

Descriptive statistics of infaunal community data describing the number of species (S), abundance (N), Margalef's species richness (d), Pielou's evenness (J'), Shannon-Weiner diversity (H') and Simpson's alpha diversity index (1-λ) are presented in Table 3-3. All metrics were lowest at site OP30 (three individuals from one taxa). The number of species, Margalef's species richness and Shannon-Weiner diversity were greatest at site OP9 (39 individuals from 26 taxa). Abundance was greatest as site OP15 (n = 53), and Pielou's evenness and Simpson's index were greatest at sites OP25 and OP26 (J' = 1, 1- λ = 1).

Table 3-3: Descriptive statistics of offshore pipeline (OP) infaunal data

Site	Species (S)	Abundance (N)	Margalef's species richness (d)	Pielou's evenness (J')	Shannon-Weiner diversity (H')	Simpson's alpha diversity index (1-λ)
OP01	19	42	4.816	0.886	2.609	0.9233

Cluster analysis of with Similarity Profiles (SIMPROF) of offshore pipeline infauna data indicated that sites were clustered into three significant groupings with three outliers, which were 'groups' A to C (sites = OP30, OP20 and OP25; Figure 3-8).

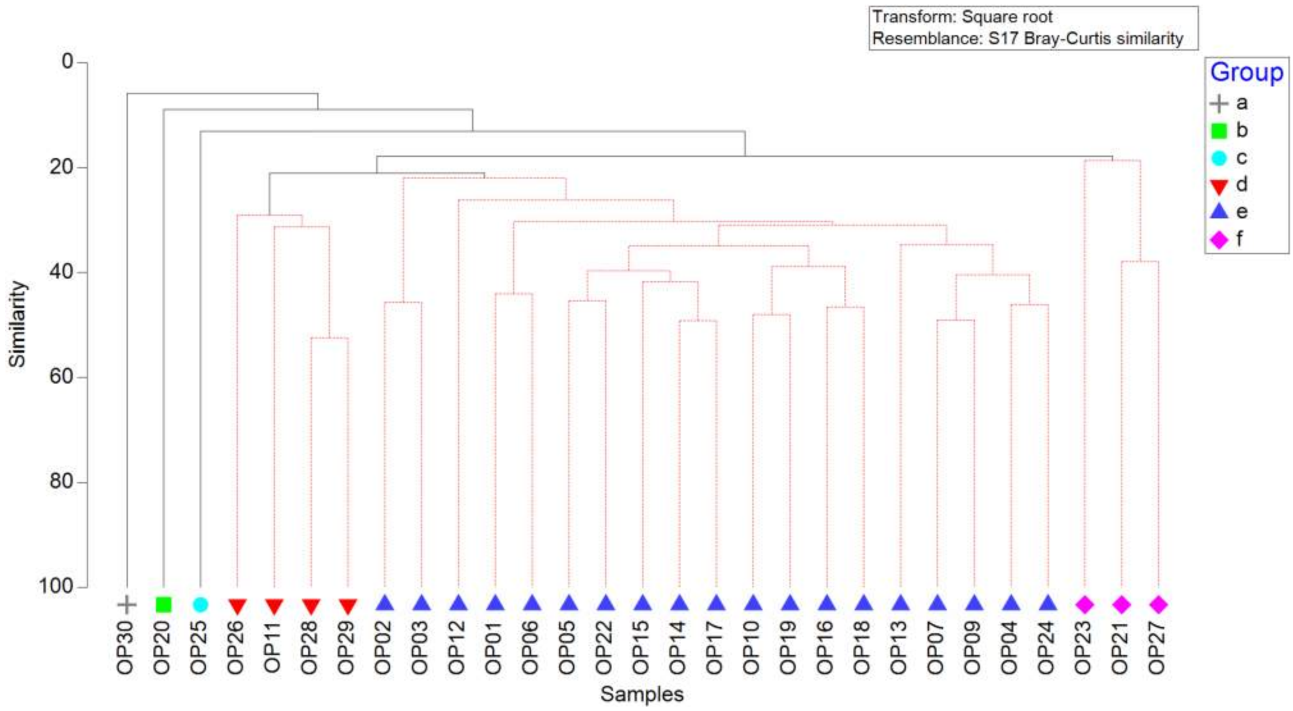

Figure 3-8: Offshore pipeline infaunal SIMPROF cluster groups

Group D – sites OP11, OP26, OP28 and OP29

This group was dominated by Anthuridea (elongate isopod crustaceans) and polychaete worms (*Eunice* sp., *Axiothella* sp. and *Nepthys* sp.). The average abundance of these taxa are higher than, e.g. group F, which is likely due to a greater range of particle sizes in the substrate, as indicated by the dominance of Anthuridea, which live in crevices, empty calcareous worm tubes or structurally complex epibiota. Review of the particle size data (Section 3.2.1.1) indicated sediment at these sites had a higher % gravel component, but also a higher silt component than Group F.

Group E – sites OP1 to OP7, OP9, OP10, OP12 to OP19, OP22, OP24

Group E was characterised by a much more diverse community, with 30 taxa comprising the top 90% of taxa characterising the biological assemblage (as opposed to four and five taxa for Groups D and F, respectively). The crustaceans (mainly amphipods, tanaids and isopods) and polychaetes (mainly deposit-feeding tube worms and free-living taxa) were the dominant taxa, with echinoderms (Ophiuroidea) and sipunculids also represented. Group E was the coarsest sediment in terms of particle size, and with the lowest silt/clay component which would have provided a more complex substrate and potentially better sediment oxygenation in surficial sediments.

Group F – sites OP21, OP23 and OP27

This group was dominated by brittlestars (Ophiuroidea) and polychaetes (*Lumbrineris* sp., spionids, *Nephtys* sp. and *Axiothella* sp.). These taxa are generally surface deposit feeders and/or carnivores/scavengers, with several capable of interface feeding (switching between e.g. deposit feeding and suspension/filter feeding), which is a trait often associated with harsh or nutrient-poor environments, such as the fine or sandy sediments these taxa inhabit.

3.2.1.3 Metals

The metals and metalloid concentrations for all sites (see Appendix G) were compared to the NAGD screening levels (CoA, 2009). Of the metals and metalloids in the sediments sampled from offshore pipeline route; only mercury was below the LoR for all sites.

Aluminium concentrations were all above the LoR and ranged from 3,500 to 12,000 mg/kg. There is no NAGD screening level for aluminium in marine sediments.

Arsenic concentrations were all above the LoR and ranged from 7 mg/kg to 35 mg/kg. There were 13 sites that had arsenic concentrations above the NAGD screening level of 20 mg/kg but were below the Sediment Quality Guideline (SQG)-High value of 70 mg/kg. Most of these sites were towards the western end of the offshore pipeline (Figure 3-9).

Barium concentrations were all above the LoR and ranged from 5.5 to 13 mg/kg, except for one outlier site (OP19) which had a barium concentration of 81 mg/kg. This outlier is potentially an error and was removed from the graphs. Barium concentrations were higher at the southern end of the offshore pipeline route (towards Darwin Harbour) (Figure 3-9). There is no NAGD screening level for barium in marine sediments.

Cadmium concentrations were all above the LoR, except for oner site (OP27). Concentrations were relatively consistent along the offshore pipeline route and ranged from <0.1 to 0.3 mg/kg. All sites had cadmium concentrations below the NAGD screening level of 1.5 mg/kg (Figure 3-9).

Chromium concentrations were all above the LoR and ranged from 11 to 26 mg/kg. All concentrations were well below the NAGD screening level of 80 mg/kg.

Cobalt concentrations were all above the LoR and ranged from 2.6 to 6.3 mg/kg. There is no NAGD screening level for cobalt in marine sediments (Figure 3-9).

Copper concentrations were all above the LoR and ranged from 1.2 to 4.7 mg/kg. Copper concentrations were higher at the southern end of the offshore pipeline route (towards Darwin Harbour). All concentrations were well below the NAGD screening level of 65 mg/kg (Figure 3-9).

Iron concentrations were all above the LoR and ranged from 8,300 to 15,000 mg/kg. There is no NAGD screening level for iron in marine sediments. Iron concentrations were lowest at site OP1 (Figure 3-9).

Nickel concentrations were all above the LoR and ranged from 4 mg/kg to 8.7 mg/kg. All sites were below the NAGD screening level of 21 mg/kg (Figure 3-9).

Zinc concentrations were all above the LoR and ranged from 4.5 to 16 mg/kg. Zinc concentrations were higher at the southern end of the offshore pipeline route (towards Darwin Harbour). All concentrations were well below the NAGD screening level of 200 mg/kg (Figure 3-9).

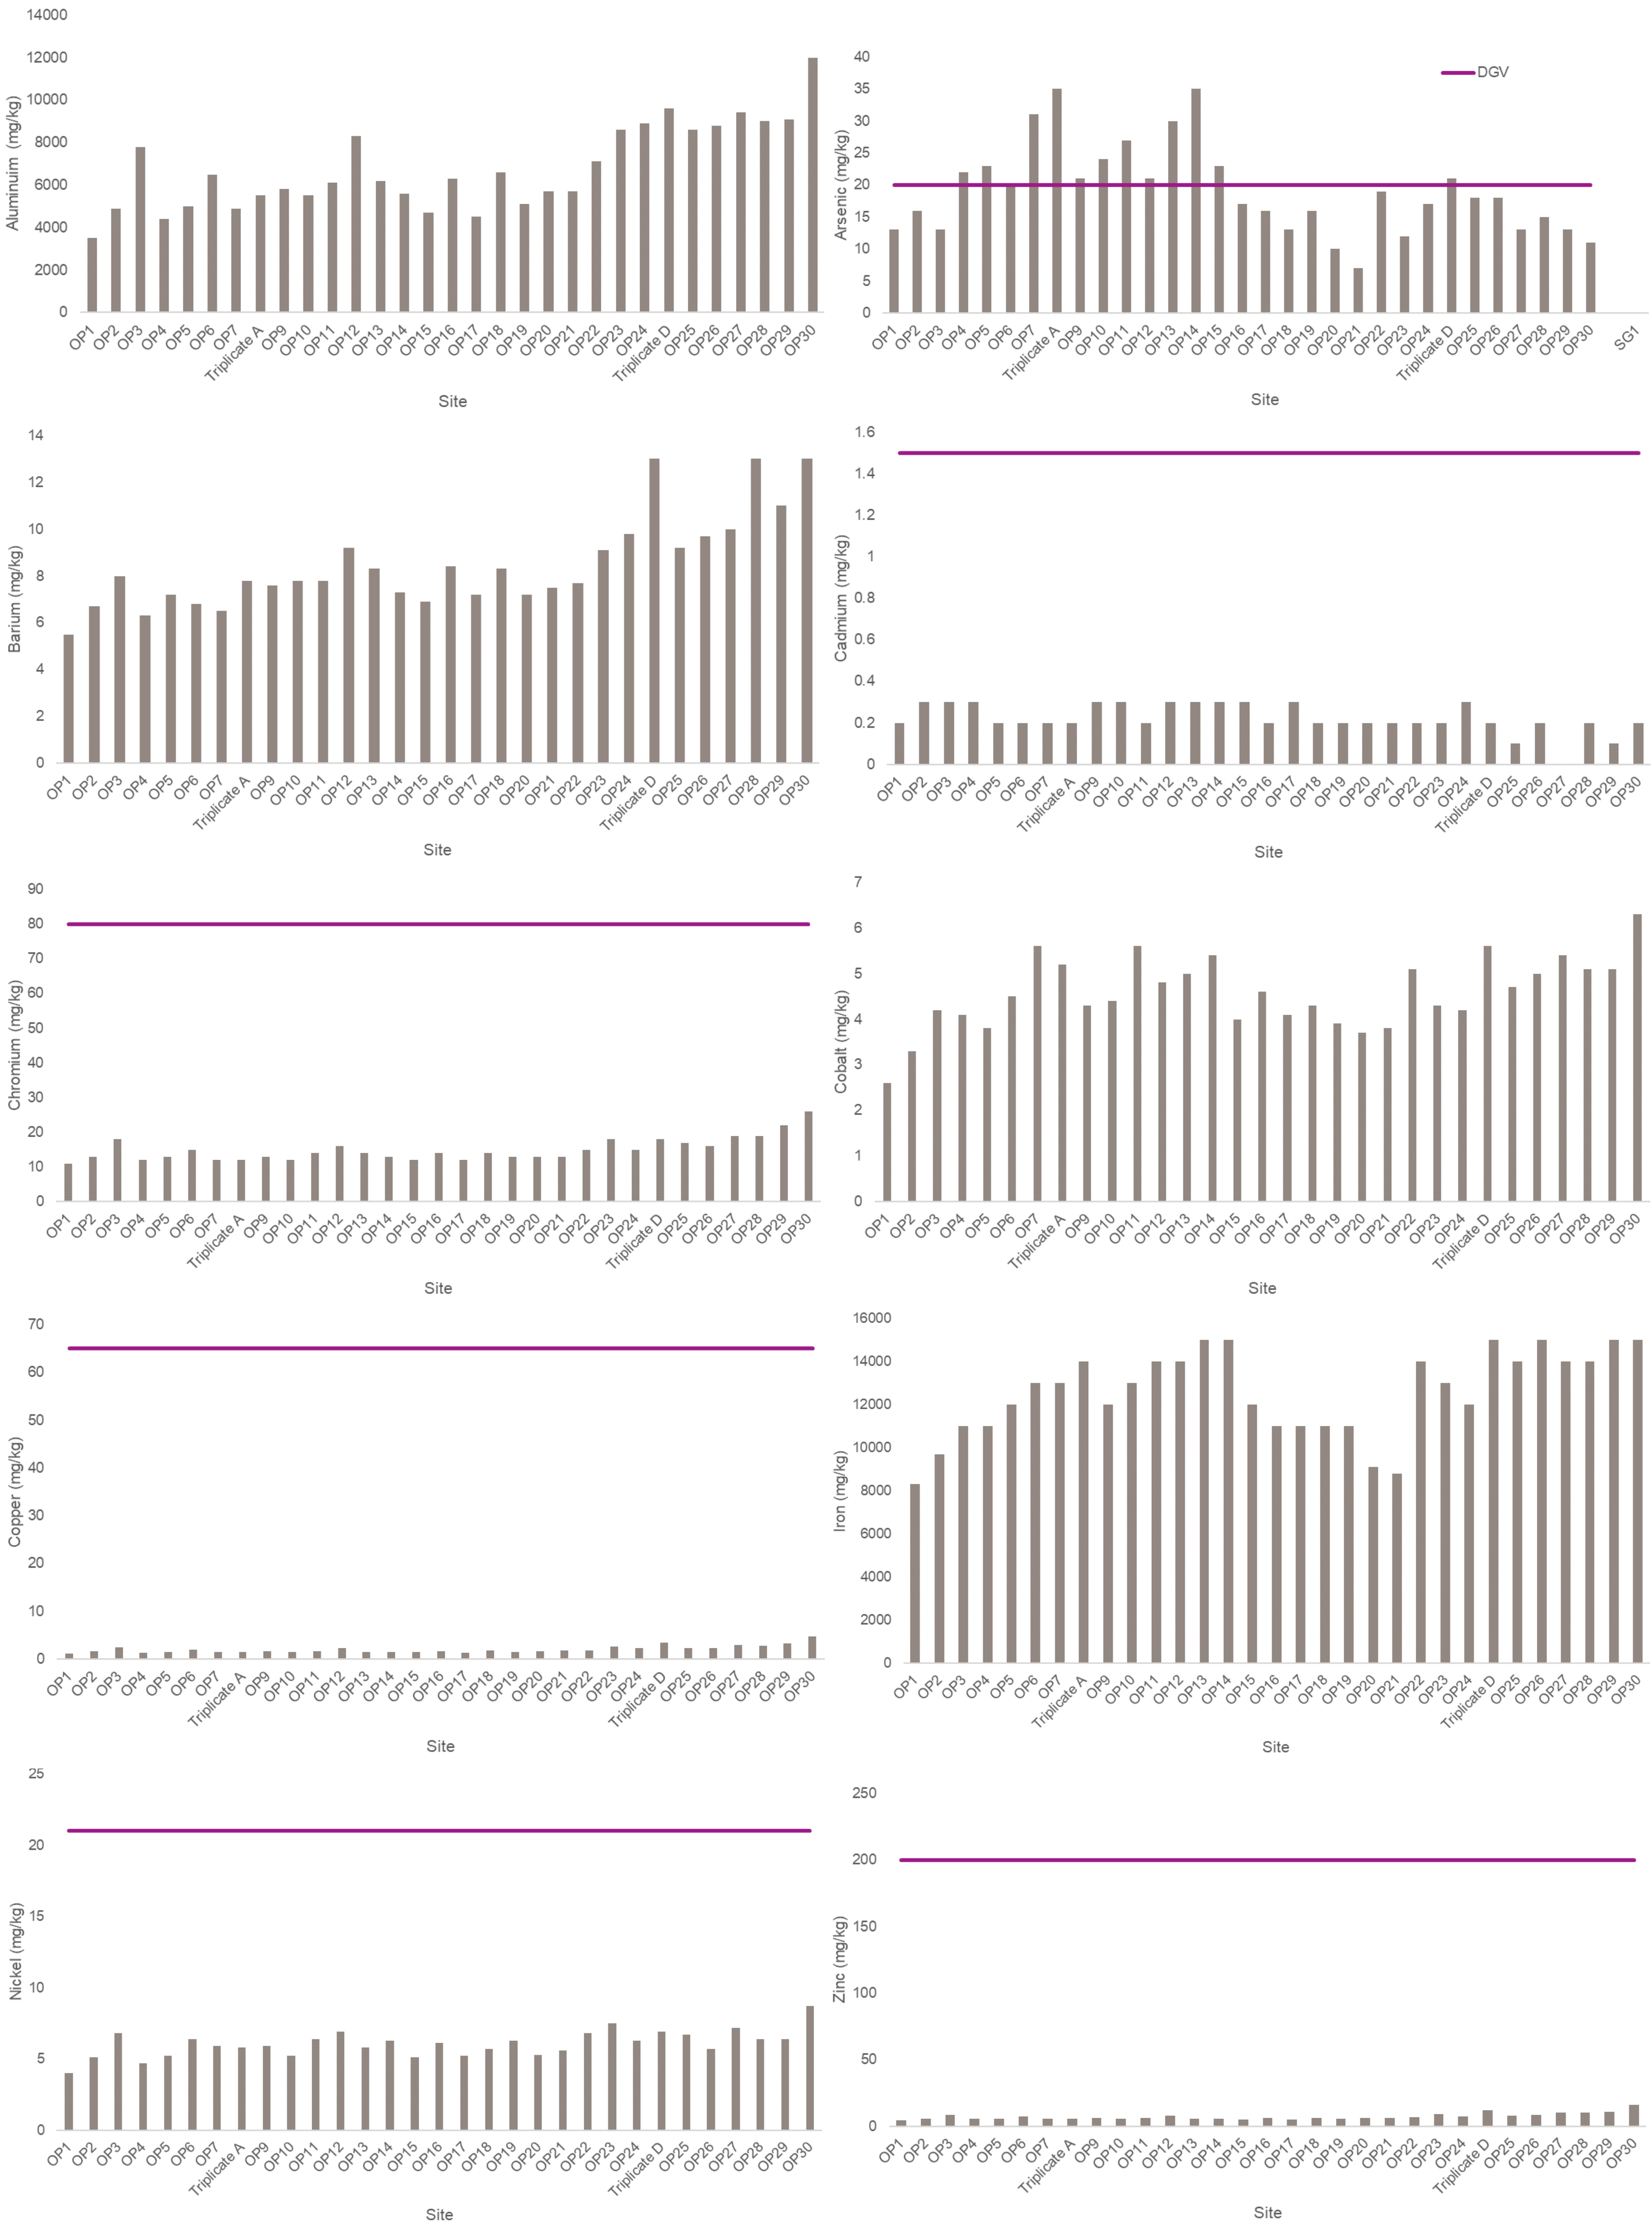

Figure 3-9: Metal concentrations along the offshore pipeline route (from west (OP1) to east (OP30))

Arsenic is considered to become concentrated in sedimentary rocks through sedimentation processes. Studies have shown that iron formations and iron rich sediments can contain very large concentrations of natural arsenic (Tanaka, 1988). Thirteen samples had arsenic concentrations above the NAGD screening level (Figure 3-9). Arsenic concentrations were therefore plotted against iron concentrations along the offshore pipeline route to determine if there was a correlation between arsenic and iron. A weak positive polynomial correlation between iron concentrations and arsenic concentrations was identified (R^2 value of 0.2) (Figure 3-10).

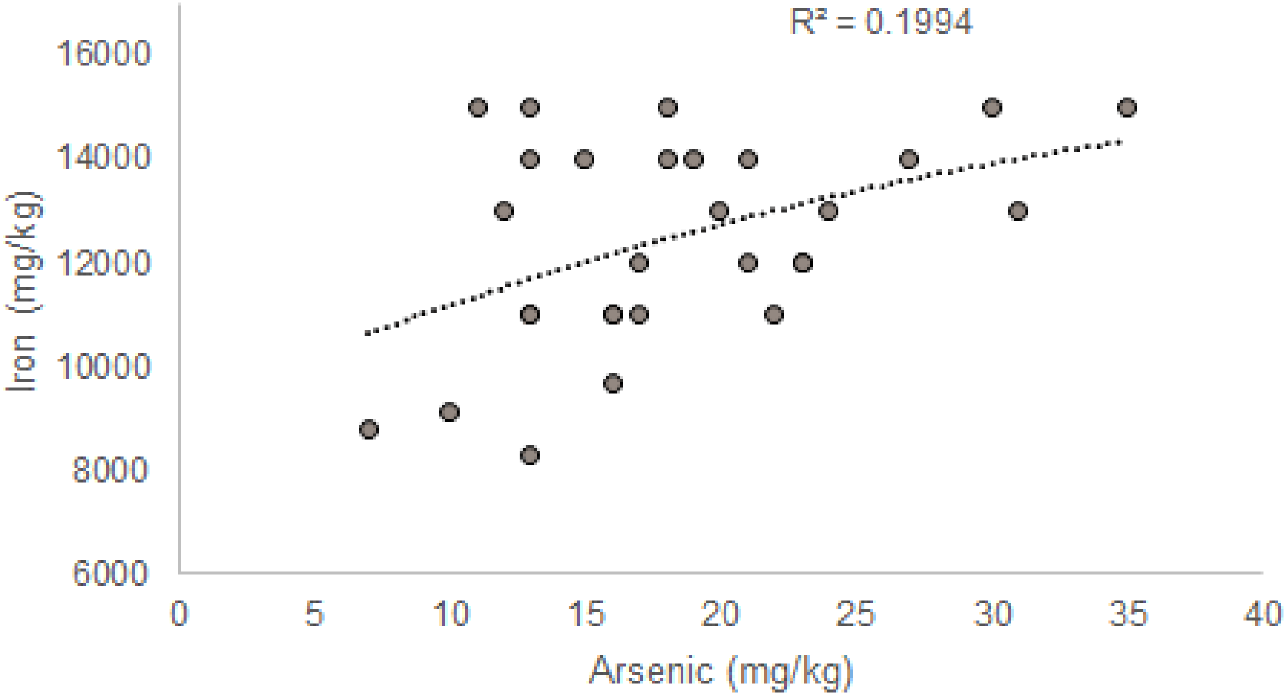

Figure 3-10: Correlation between iron and arsenic concentrations along the offshore pipeline route

3.2.1.4 Nutrients

TKN concentrations exhibited low variability across sites, ranging from 0.3 to 0.6 mg.N/g (Table 3-4; Appendix G). TP concentrations also exhibited low variability across sites, ranging from 0.36 to 0.59 mg.P/g (Table 3-4). TOC concentrations were also low, ranging from 0.2 to 0.5%. Levels were generally higher at the eastern (Darwin Harbour) end of the offshore pipeline route.

3.2.1.5 Hydrocarbons

TRH and BTEXN concentrations at offshore pipeline sites were below the LoR for all samples (Appendix H). Therefore, no PAH analysis was undertaken at these sites.

3.2.1.6 Naturally occurring radioactive materials

All samples taken along the offshore pipeline route had NORMs concentrations above the LoR for all three analytes (radium-226, radium-228 and thorium-228; Appendix F). Radium-226 concentrations ranged from 3.6 to 17.0 Bq/kg, radium-228 concentrations ranged from 4.2 to 26.0 Bq/lg and thorium-228 concentrations ranged from 4.3 to 24.0 Bq/kg (Figure 3-11). These results were calculated with a 95% level of confidence, with the measurement uncertainty ranging from ± 0.4 to 3.0 Bq/kg. All concentrations were well below the guideline value of 35 Bq/g (=35,000 Bq/kg) screening level (effects range-low) (CoA 2009).

The concentrations of all three NORMs analytes were lower further offshore and increased towards Darwin Harbour (Figure 3-11).

Table 3-4: Total Kjeldahl nitrogen, total phosphorus and total organic carbon concentrations along the offshore pipeline route

Site	Total Kjeldahl nitrogen as N (mg.N/g)	Total phosphorus as P (mg.P/g)	Total organic carbon (%)

3.2.2 Darwin Harbour pipeline

3.2.2.1 Particle size distribution

Laboratory PSD results can be found in Appendix D. The data were analysed to characterise sediment samples in terms of Wentworth size classifications, which classify particle size into total clay (0–4 µm), total silt (4–63 µm), total sand (63–2000 µm) and total gravel (>2000 µm).

The particle size distribution varied from south to north along the pipeline route in Darwin Harbour. The northernmost site (HS49) had a very high proportion of silt (46%) and clay (10%) (Table 3-5), similar to high silt and clay content found at the southern end of the offshore pipeline route (OP30, Section 3.2.1.1). The sand wave dredge area (HS48–HS32) had very high proportions of sand (68–93%), while the southern end of the pipeline route consisted of gravelly silty sand (Figure 3-12).

Table 3-5: Sediment particle size characteristics along the Darwin Harbour pipeline route (from south (HS01) to north (HS49)

Site	Total clay % (0-4 µm)	Total silt% (4–63 µm)	Total sand% (63–2000 µm)	Total gravels % (>2000 µm)

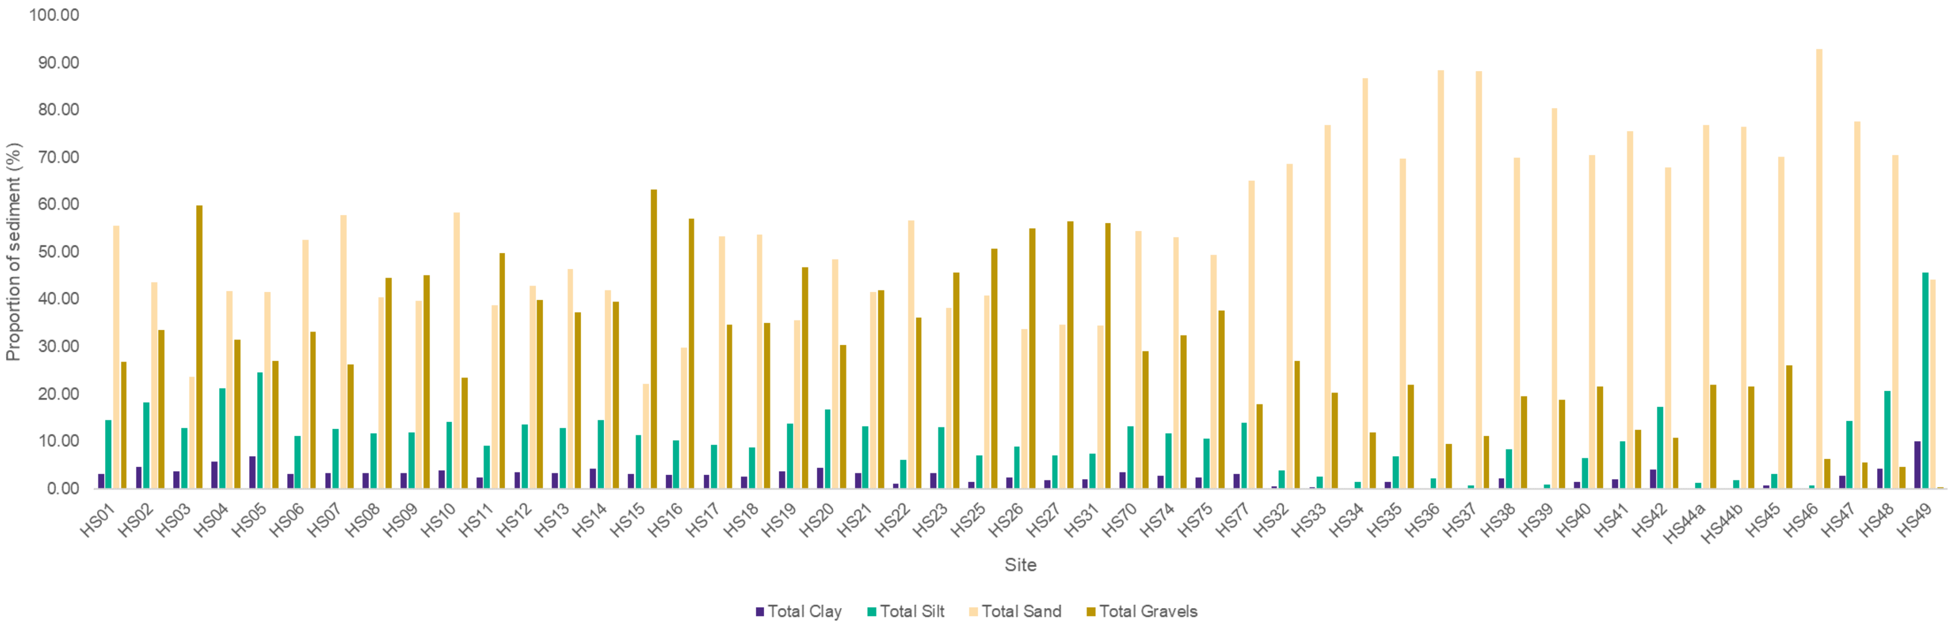

Figure 3-12: Sediment sample particle size characteristics inside Darwin Harbour (from south (HS01) to north (HS49))

3.2.2.2 Metals

The metals and metalloid concentrations for all sites (see Appendix G) were compared to the NAGD screening levels (CoA, 2009), where available. Of the metals and metalloids in the sediments sampled from Darwin Harbour; cadmium, mercury and silver were below the LoR for all sites.

Aluminium concentrations were all above the LoR and ranged from 1,330 to 14,600 mg/kg. There is no NAGD screening level for aluminium in marine sediments (Figure 3-13).

Antimony concentrations were above the LoR at 18 sites, ranging from <0.5 to 1.07 mg/kg (Figure 3-13). All the sites in the potential sand wave dredging area were below the LoR. All samples were below the NAGD screening level for antimony of 2 mg/kg (Figure 3-13).

Arsenic concentrations were found to be very high inside Darwin Harbour. All samples were above the LoR, and only seven samples were below the NAGD screening level of 20 mg/kg., all of which were within the potential sand wave dredging area. Arsenic concentrations ranged from 8.27 to 108 mg/kg, with a total of nine samples (HS06, HS07, HS08, HS09, HS10, HS11, HS12, HS20 and HS24) above the NAGD SQG-High of 70 mg/kg (Figure 3-13).

Chromium concentrations were above the LoR at all sites and ranged from 6.9 to 114 mg/kg. Only one sample (HS31) was above the NAGD screening level of 80 mg/kg (Figure 3-13). However the 95% upper confidence limit of the samples in the Darwin Harbour pipeline (32.6 mg/kg) meet the NAGD screening level.

Cobalt concentrations were above the LoR at all sites, ranging from 1 to 10.9 mg/kg. There is no NAGD screening level for cobalt in marine sediments. Cobalt concentrations were generally high at the southern end of the pipeline, with lower concentrations found within the potential sand wave dredging area (Figure 3-13).

Eleven sites had copper concentrations below the LoR. These sites were all within the potential sand wave dredging area. Copper concentrations within Darwin Harbour ranged from <1 to 7.6 mg/kg. All sites were well below the NAGD screening level 65 mg/kg (Figure 3-13).

Iron concentrations were all above the LoR at all sites and ranged from 8,140 to 58,100 mg/kg. There is no NAGD screening level iron in marine sediments. Iron concentrations were lowest within the potential sand wave dredge area (Figure 3-13).

Lead concentrations were all above the LoR and ranged from 1.6 to 28 mg/kg. All sites were below the NAGD screening level of 50 mg/kg. Lead concentrations were slightly lower within the sand wave dredge area (Figure 3-13).

Manganese concentrations were variable across Darwin Harbour but were generally high within the proposed sand wave dredging area. Manganese concentrations were all above the LoR and ranged from 169 to 800 mg/kg (Figure 3-13). There is no NAGD screening level for manganese in marine sediments.

Nickel concentrations were all above the LoR at all sites and ranged from 1.6 to 9.8 mg/kg. All sites were below the NAGD screening level of 21 mg/kg (Figure 3-13).

Zinc concentrations were all above the LoR at all sites and ranged from 2 to 20.3 mg/kg. All sites were all below the NAGD screening level of 200 mg/kg (Figure 3-13).

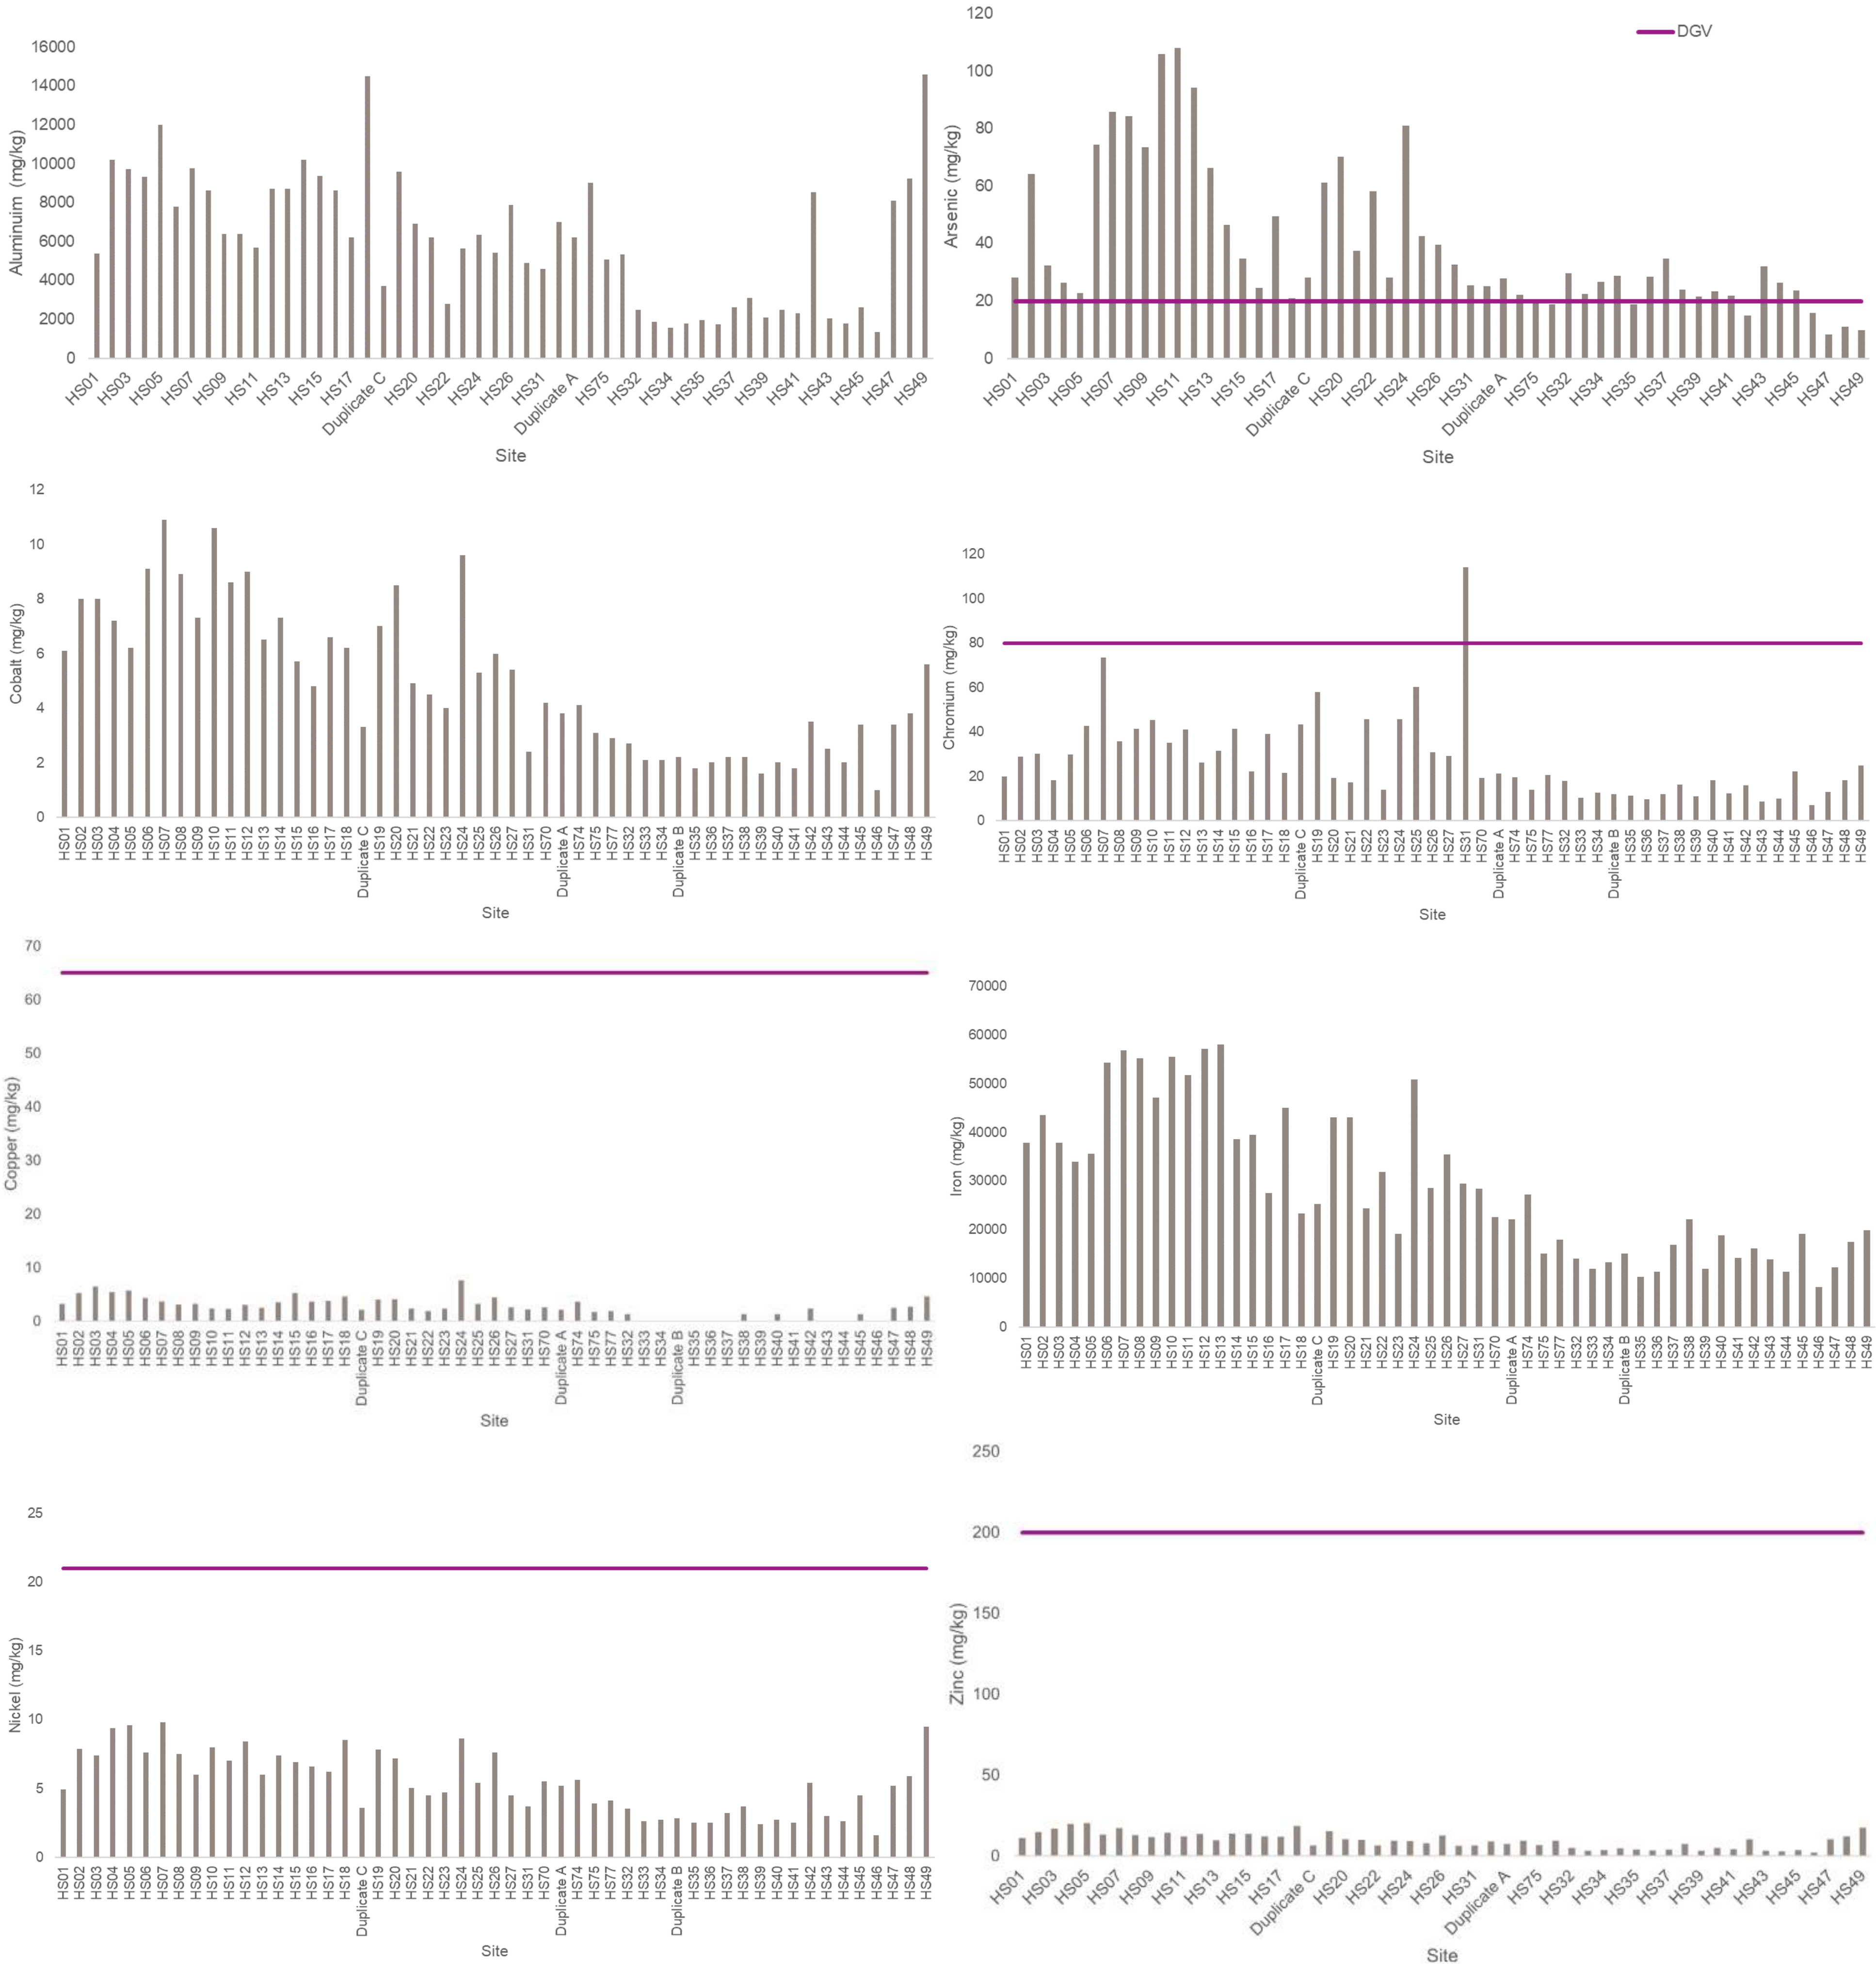

Figure 3-13: Metal concentrations along the offshore pipeline route (from south (HS1) to north (HS49))

Arsenic concentrations were plotted against iron concentrations along the Darwin Harbour pipeline route to determine if there was a correlation between arsenic and iron. A strong positive polynomial correlation between iron concentrations and arsenic concentrations was identified (R^2 value of 0.76) (Figure 3-14).

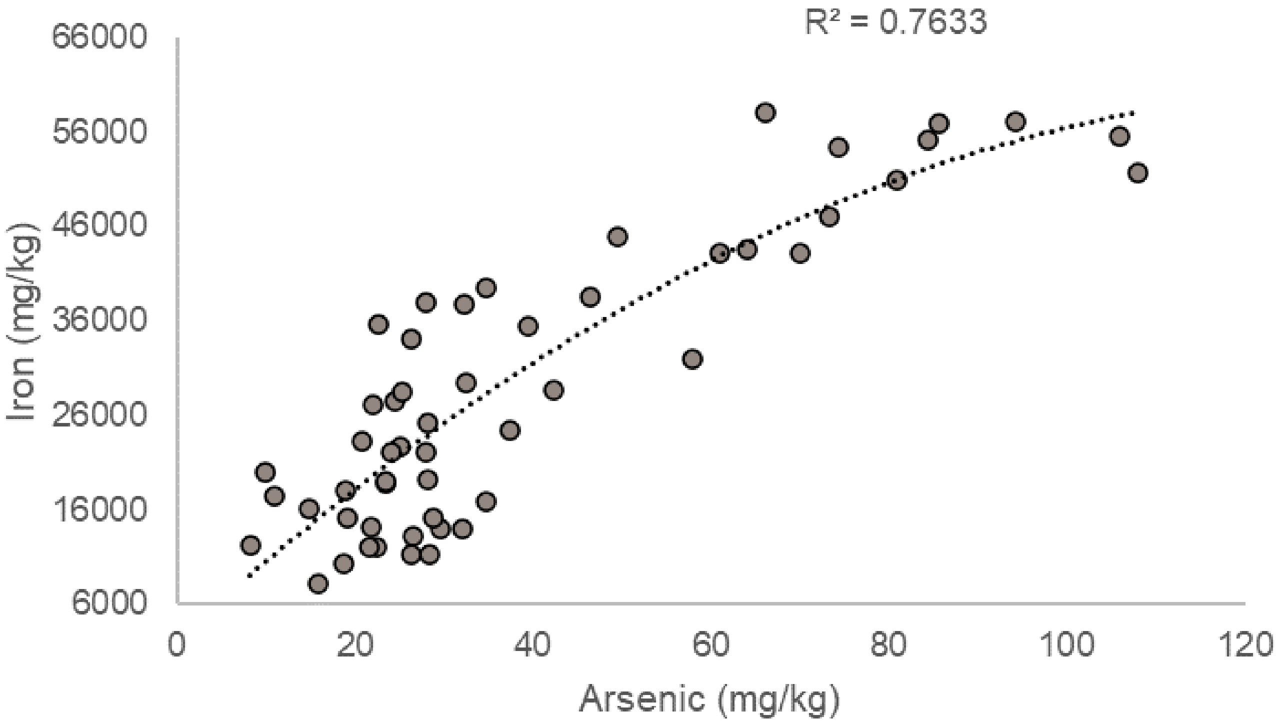

Figure 3-14: Correlation between iron and arsenic concentrations along the Darwin Harbour pipeline route (HS1 to HS49)

3.2.2.3 Nutrients

TKN concentrations exhibited high concentrations and variability across sites (Table 3-6; Appendix G). TKN in Darwin Harbour ranged from 20 to 540 mg/kg. TP concentrations also exhibited high concentrations and variability across sites, ranging from 86 to 1,130 mg/kg. TKN and TP concentrations were generally lower within the proposed sand wave dredging area. TOC concentrations were also variable, ranging from 0.08% to 2.24%, and with peak concentrations much higher than recorded for the offshore pipeline section.

3.2.2.4 Hydrocarbons

Total petroleum hydrocarbons (TPH) and TRH were detected at 35 of the 53 Darwin Harbour sites, these ranged from <3 to 9 mg/kg (raw data) (Table 3-7; Appendix H). TPH and TRH results were normalised to 1% total organic carbon (TOC). The normalised TPH and TRH concentrations were below the Default Guideline Value (DGV) of 280 mg/kg across all sites (Figure 3-15). Analysis of PAHs were requested for these 35 sites. All PAH concentrations were below the LoR.

Table 3-7: Total recoverable hydrocarbons detected above the LOR in Darwin Harbour sediments, normalised to 1% TOC

Note duplicate samples were collected from the site directly to the left of the duplicate reference code

Figure 3-15: Total recoverable hydrocarbons (normalised to 1% TOC) in Darwin Harbour (from south (HS01) to north (HS49)

3.2.2.5 Pesticides

Pesticide analysis was undertaken for 33 out of the 53 Darwin Harbour sediment samples across the study area. All pesticide chemicals analysed were below the LoR across all sites (Appendix I).

3.2.2.6 Tributyltin

Tributyltin concentrations were below the limit of reporting (LOR) of 0.5 µg/kg in all sediment samples and thus well below the NAGD screening level of 9 µg.Sn/kg (Appendix J).

3.2.2.7 Naturally occurring radioactive materials

All samples had NORMs concentrations above the LoR for all three analytes (radium-226, radium-228 and thorium-228). radium-226 concentrations ranged from 5.2 to 79.1 Bq/kg, radium-228 concentrations ranged from 5.6 to 59.5 Bq/lg and thorium-228 concentrations ranged from 5.8 to 63.8 Bq/kg (Figure 3-16). These results were calculated with a 95% level of confidence, with the measurement uncertainty ranging from ± 1.1 to 6.7 Bq/kg. All concentrations were well below the guideline value of 35,000 Bq/kg NAGD screening level (effects range-low) (CoA 2009).

NORMs concentrations were relatively consistent between HS01 and HS27 (radium-228 and thorium-228) and HS28 (radium-226), then peaked at sites HS27 and HS31 along the pipeline route. The laboratory report for NORMs analysis is in Appendix F.

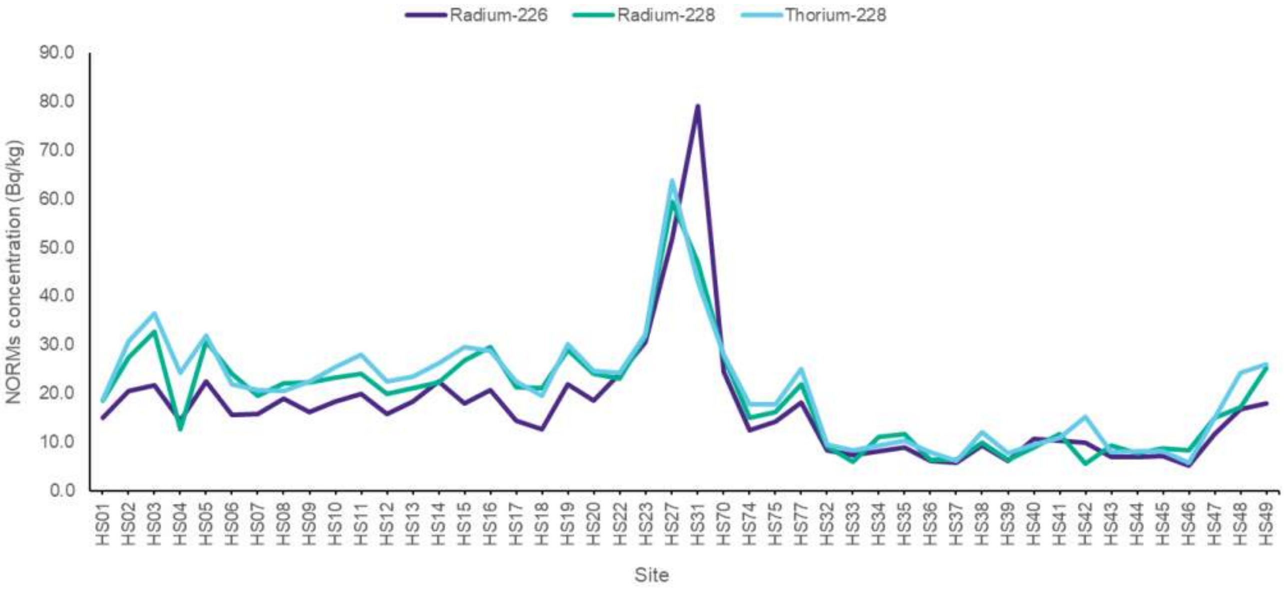

Figure 3-16: NORMs concentrations along the Darwin Harbour section of the pipeline route (from South (HS01) to North (HS49))

3.2.3 Spoil ground

3.2.3.1 Particle size distribution

Laboratory PSD results can be found in Appendix D. The data were analysed to characterise sediment samples in terms of Wentworth size classifications, which classify particle size into total clay (0–4 µm), total silt (4–63 µm), total sand (63–2000 µm) and total gravel (>2000 µm).

The particle size distribution was consistent across the spoil ground, comprising of sandy sediment with some gravel and silt (Figure 3-17). The total proportion of sand ranged from 51.75 to 72.79% across the spoil ground (Table 3-8).

Table 3-8: Sediment particle size characteristics at the spoil ground

Site	Total clay % (0–4 µm)	Total silt % (4–63 µm)	Total sand % (63–2000 µm)	Total gravels % (>2000 µm)
SG1	4.58	12.82	64.00	18.60

SG13	4.89	15.85	61.69	17.57

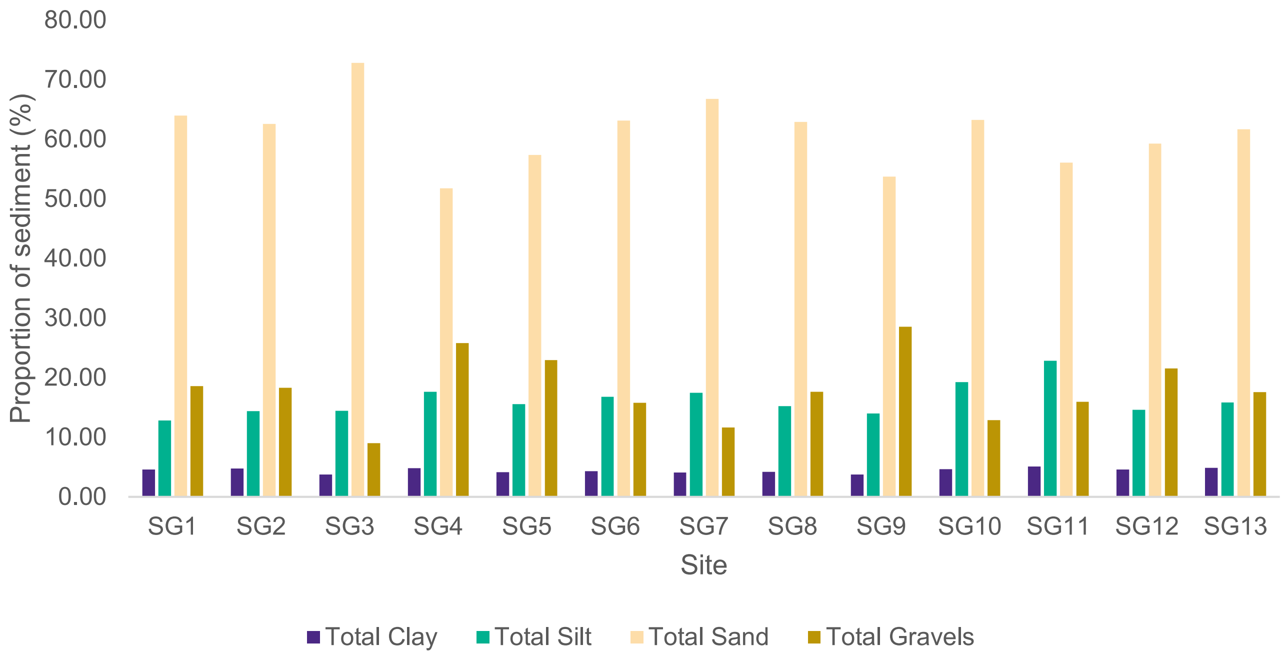

Figure 3-17: Sediment sample particle size characteristics at the spoil ground

3.2.3.2 Infauna

A total of 185 individuals from five phyla were recorded from the 13 spoil ground samples analysed. The dataset was dominated by crustaceans (107 individuals) and annelids (polychaete worms; 55 individuals), with the next most numerous phyla being Echinodermata, Sipuncula and Nematoda, represented by 16, six and one individual, respectively). The full dataset can be found in Appendix E.

Descriptive statistics of infaunal community data describing the number of species (S), abundance (N), Margalef's species richness (d), Pielou's evenness (J'), Shannon-Weiner diversity (H') and Simpson's alpha diversity index (1-λ) are presented in Table 3-9. The number of species, Margalef's species richness and Shannon-Weiner diversity were all greatest as site SG11 (S = 21, d = 6.002, H' = 2.936 and 1- λ = 0.9735). Abundance was greatest at site SG13 (one of the control sites; N = 30). Pielou's evenness and Simpson's index were greatest at site SG12 (the other control site; J' = 1, 1- λ = 1). All metrics were lowest at site OP30 (three individuals from one taxa). The number of species, Margalef's species richness and Shannon-Weiner diversity were greatest at site OP9 (39 individuals from 26 taxa).

Table 3-9: Descriptive statistics of spoil ground infaunal data

Site	Species (S)	Abundance (N)	Margalef's species richness (d)	Pielou's evenness (J')	Shannon-Weiner diversity (H')	Simpson's alpha diversity index (1-λ)
SG01	6	8	2.404	0.9306	1.667	0.8929
SG02	5	6	2.232	0.9697	1.561	0.9333

SG10	6	11	2.085	0.8597	1.54	0.8
SG11	21	28	6.002	0.9644	2.936	0.9735
SG12	3	3	1.82	1	1.099	1
SG13	11	30	2.94	0.8243	1.976	0.8322

No significant clusters of spoil ground infaunal samples were found following cluster analysis with SIMPROF (in PRIMER v7). Analysis of the ranked total abundance and frequency of occurrence of each taxa identified that the spoil ground was characterised by crustaceans, echinoderms and polychaete worms. Pseudozeuthidae (tanaids) were both the most abundant (35 individuals from the 13 samples, with a maximum abundance of 11 individuals at any one site) and frequently-occurring taxa (11 of 13 samples, or 84.6%).The spoil ground was also characterised by Anthuridae (elongate isopods; 17 individuals between seven sites or 53.8% of samples), Ophiuridae (brittlestars; 13 individuals between six sites or 46.2% of samples), Ampeliscidae (tube-building amphipods; 11 individuals between six sites or 46.2% of samples), *Nephtys* sp. (catworms; eight individuals between four sites or 30.8% of samples) and Meltidiae (amphipods; eight individuals between two sites or 15.4% of samples).

3.2.3.3 Metals

The metals and metalloid concentrations for all sites (see Appendix G) were compared to the NAGD screening levels (CoA, 2009, where available. Of the metals and metalloids sampled at the Spoil Ground, mercury was the only one below the LoR at all sites.

Aluminium concentrations were all above the LoR and ranged from 6,200 to 10,000 mg/kg. There is no NAGD screening level for aluminium in marine sediments (Figure 3-18).

Arsenic concentrations were all above the LoR and ranged from 18 to 38 mg/kg. There were 12 sites that had arsenic concentrations above the NAGD screening level of 20 mg/kg but were below the NADG SQG-High value of 70 mg/kg (Figure 3-18).

Barium concentrations were all above the LoR and ranged from 11 to 15 mg/kg. There is no NAGD screening level for barium in marine sediments (Figure 3-18). Cadmium concentrations were all above the LoR and ranged from 0.1 to 0.3 mg/kg. Cadmium concentrations were all well below the NAGD screening level of 1.5 mg/kg (Figure 3-18).

Chromium concentrations were all above the LoR and ranged from 14 to 20 mg/kg. Chromium concentrations were all well below the NAGD screening level of 80 mg/kg (Figure 3-18). Cobalt concentrations were all above the LoR and ranged from 4.2 to 5.8 mg/kg. There is no NAGD screening level for cobalt in marine sediments (Figure 3-15).

Copper concentrations were all above the LoR and ranged from 2.2 to 4.7 mg/kg. Copper concentrations were all well below the NAGD screening level of 65 mg/kg (Figure 3-18). Iron concentrations were all above the LoR and ranged from 14,000 to 23,000 mg/kg. There is no NAGD screening level for iron in marine sediments. Iron concentrations were highest at site SG2 (Figure 3-18).

Nickel concentrations were all above the LoR and ranged from 5.3 to 7.3 mg/kg. Nickel concentrations were all below the NAGD screening level of 21 mg/kg (Figure 3-18). Zinc concentrations were all above the LoR and ranged from 8.7 to 12.0 mg/kg. Zinc concentrations were all well below the NAGD screening level of 200 mg/kg (Figure 3-18).

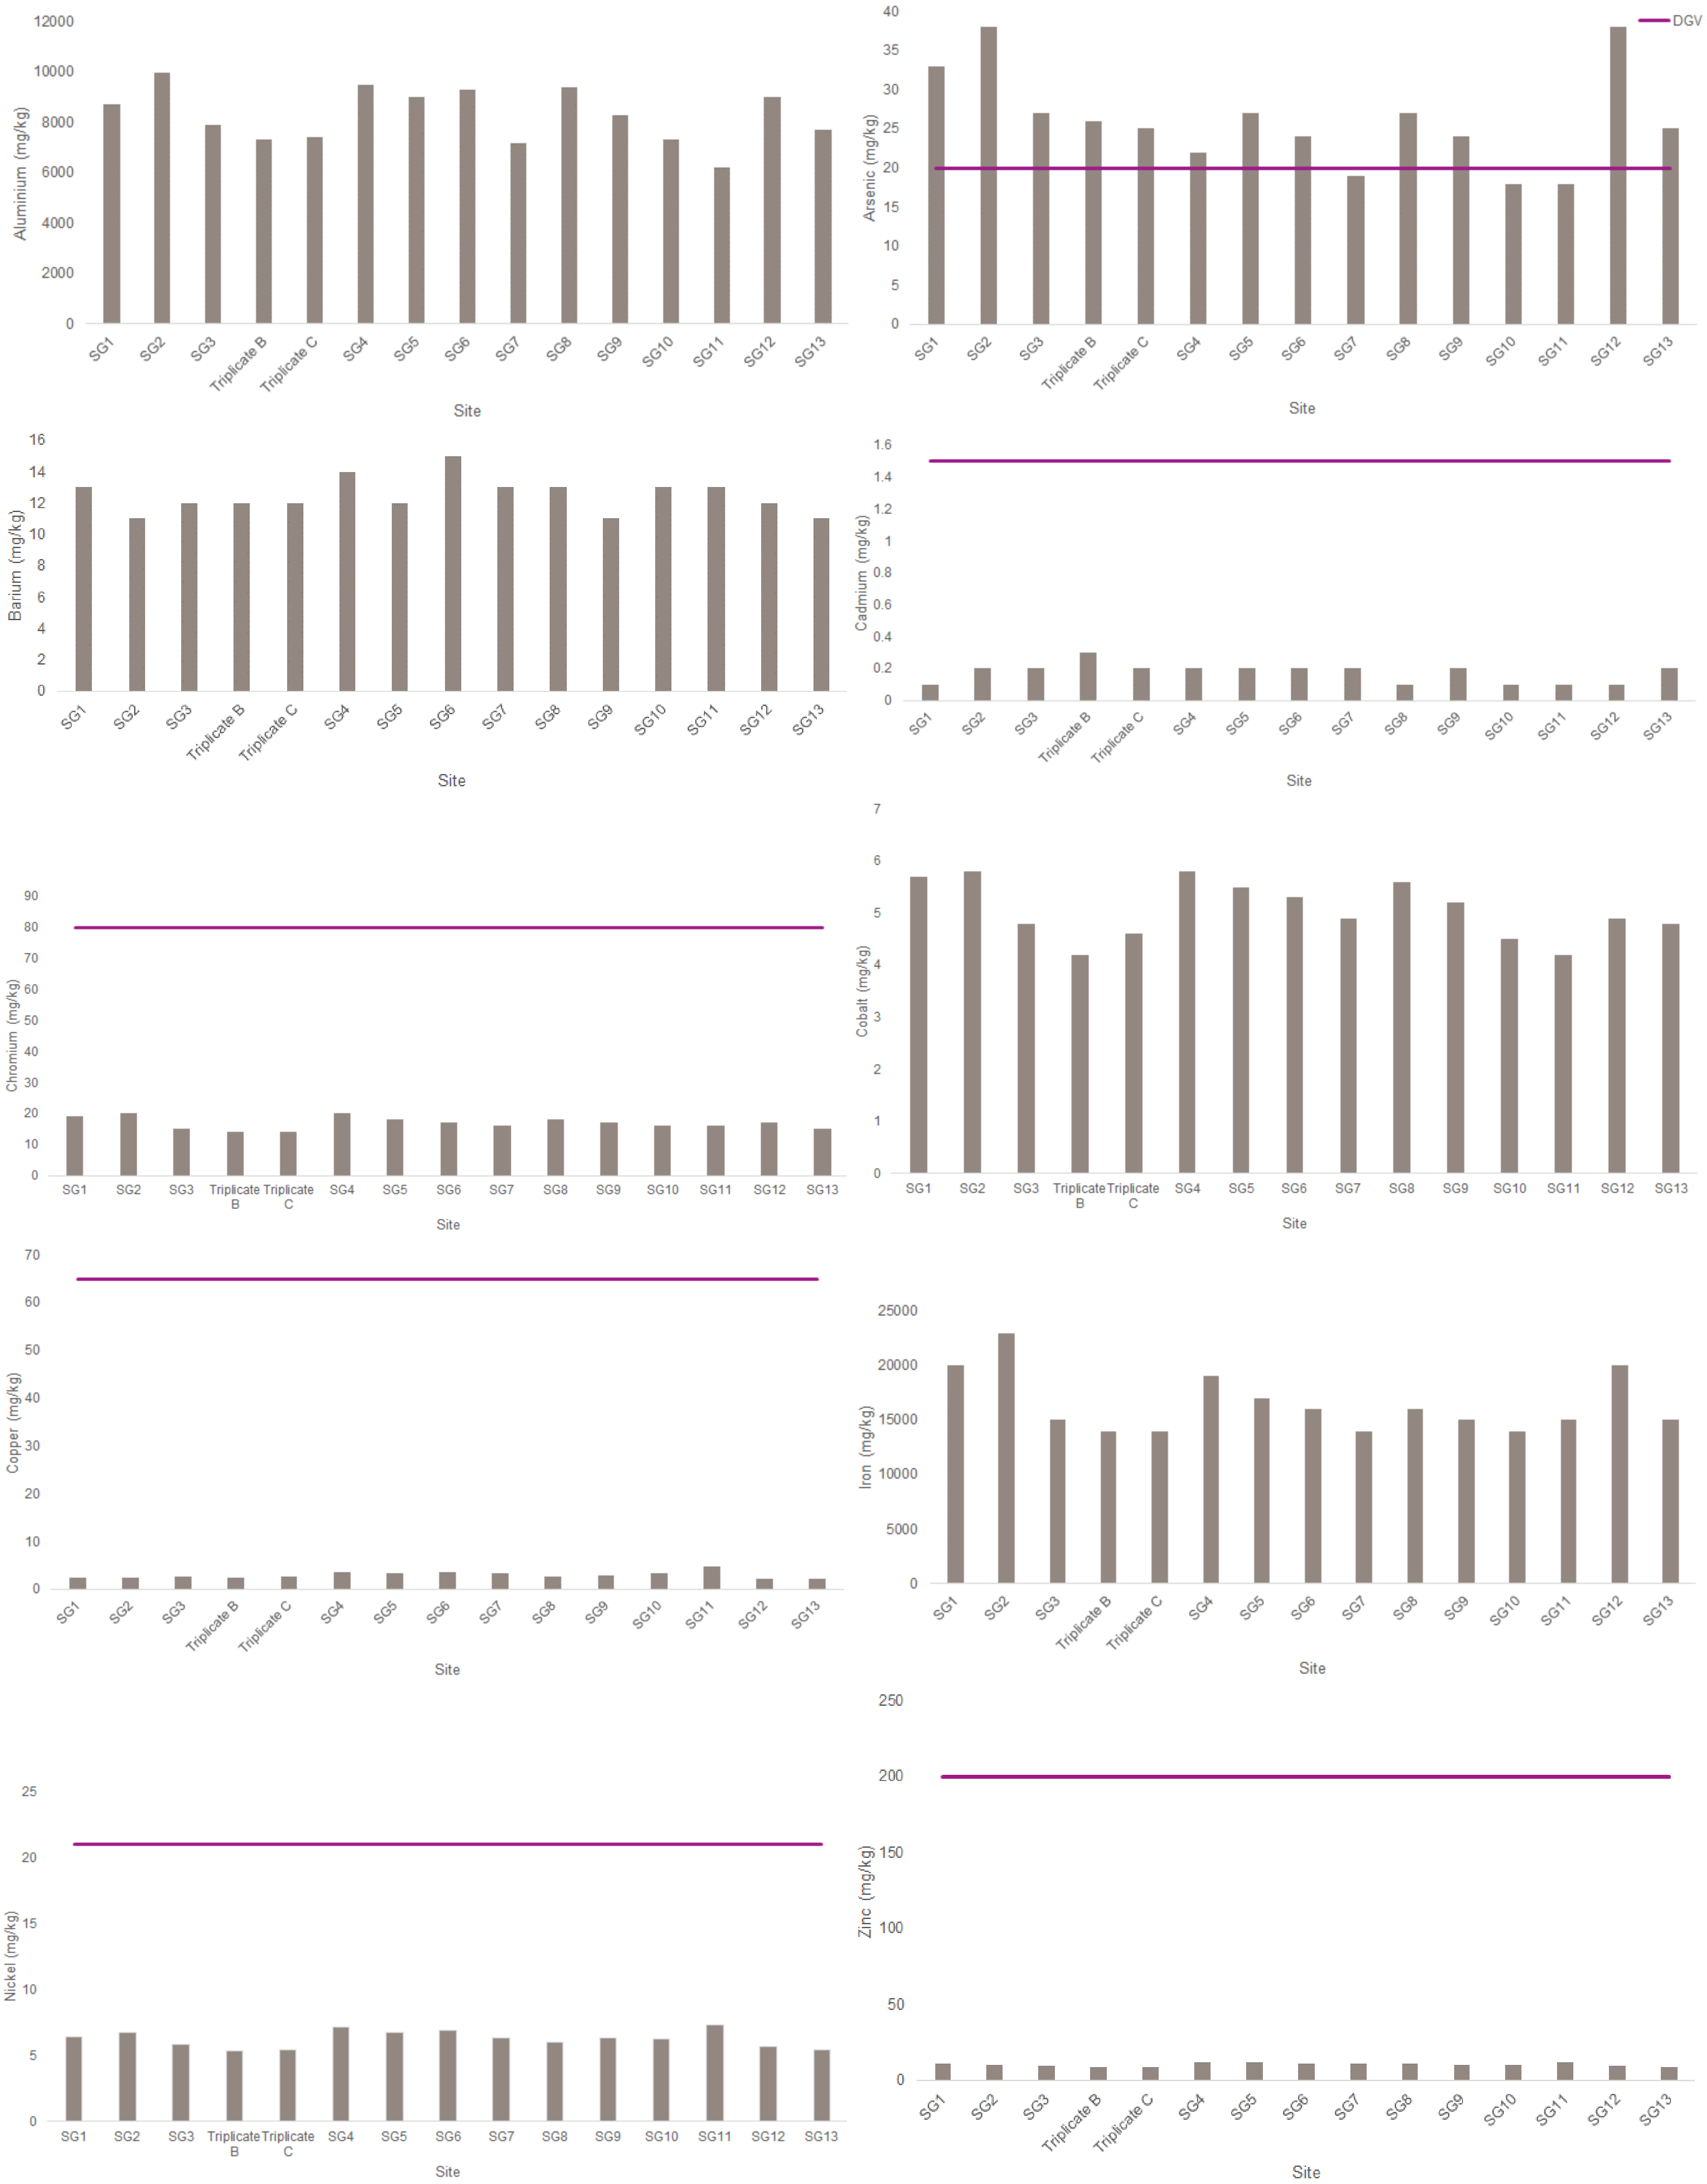

Figure 3-18: Metal concentrations at the spoil ground

Arsenic is considered to have a geological source (see Section 3.2.1.3). Twelve samples had arsenic concentrations above the NAGD screening level (Figure 3-18). Arsenic concentrations were therefore plotted against iron concentrations along the offshore pipeline route to determine if there was a correlation between arsenic and iron. A strong positive polynomial correlation between iron concentrations and arsenic concentrations was identified (R^2 value = 0.73) (Figure 3-19).

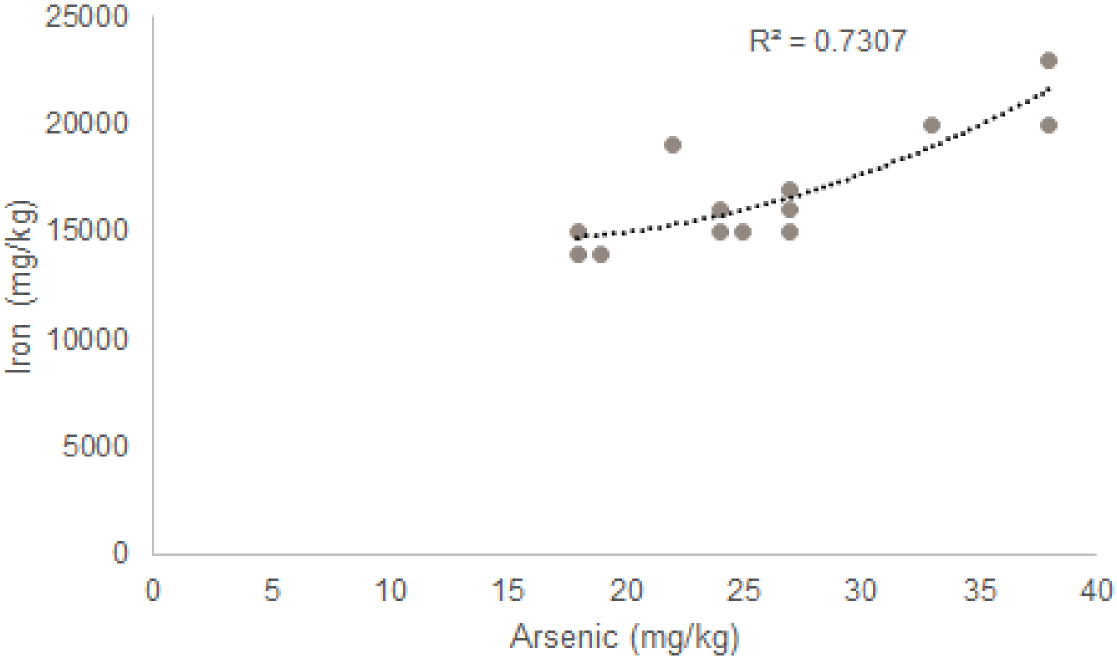

Figure 3-19: Correlation between iron and arsenic concentrations inside the spoil ground

3.2.3.4 Nutrients

TKN concentrations exhibited low variability across sites, ranging from 0.3 to 0.5 mg.N/g (Table 3-10; Appendix G). TP concentrations also exhibited low variability across sites, ranging from 0.37 to 0.62 mg.P/g (Table 3-10). Similarly, variability in TOC concentrations between sites was low, with TOC ranging from 0.2% to 0.4%.

Table 3-10: Total Kjeldahl nitrogen, total phosphorus and total organic carbon concentrations at the spoil ground

Site	Total Kjeldahl nitrogen as N (mg.N/g)	Total phosphorus as P (mg.P/g)	Total organic carbon (%)
SG1	0.4	0.59	0.3
SG2	0.4	0.6	0.3
SG3	0.4	0.5	0.3
Triplicate B	0.4	0.51	0.3
Triplicate C	0.4	0.53	0.2
SG4	0.4	0.48	0.4
SG5	0.4	0.5	0.3
SG6	0.4	0.45	0.3
SG7	0.4	0.45	0.3
SG8	0.4	0.58	0.3
SG9	0.4	0.51	0.4
SG10	0.3	0.38	0.3
SG11	0.3	0.37	0.3
SG12	0.4	0.62	0.3
SG13	0.5	0.54	0.4

3.2.3.5 Hydrocarbons

The spoil ground TRH and BTEXN concentrations were below the limit of reporting (LoR) for all samples (Appendix H). The spoil ground samples were, therefore, not tested for PAHs.

3.2.3.6 Naturally occurring radioactive materials

All samples taken at the spoil ground had NORMs concentrations above the LoR for all three analytes (radium-226, radium-228 and thorium-228; Appendix F). radium-226 concentrations ranged from 0.8 to 15.0 Bq/kg, radium-228 concentrations ranged from 1.1 to 19.0 Bq/lg and thorium-228 concentrations ranged from 1.4 to 21.0 Bq/kg (Figure 3-20). Site SG1 had considerably lower levels of radium-226, radium-228 and thorium-228 than any other sample. For example, radium-226 at SG1 was 0.8 Bq/kg, compared with the next lowest 9.0 Bq/kg art SG13 (Figure 3-20).

These results were calculated with a 95% level of confidence, with the measurement uncertainty ranging from ± 0.09 to 3.0 Bq/kg. All concentrations were well below the NAGD screening level of 35,000 Bq/kg (NAGD screening levels (effects range-low) (CoA 2009).

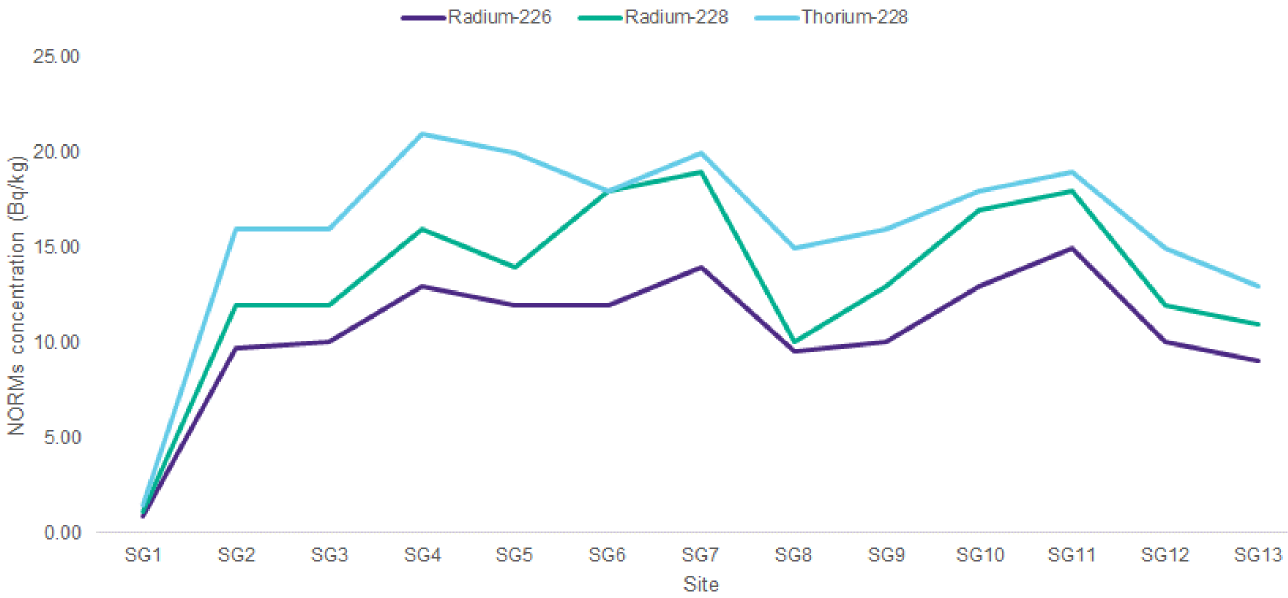

Figure 3-20: NORMs concentrations at the spoil ground

3.2.4 Darwin Harbour sediment survey

3.2.4.1 Particle size distribution

Laboratory PSD results can be found in Appendix D. The data were analysed to characterise sediment samples in terms of Wentworth size classifications, which classify particle size into total clay (0–4 µm), total silt (4–63 µm), total sand (63–2000 µm) and total gravel (>2000 µm) (Table 3-11, Figure 3-21).

The particle size distribution across the sediment survey area followed the same trend as the Darwin Harbour pipeline PSD results (Section 3.2.2.1). The northern side of the Darwin Harbour pipeline route had a very high proportion of sand (89.34% at the most northern site, KP92-75_L), with low proportions of gravel (8.41%) and silt (1.95%). These proportions shift towards the southern end of the pipeline route, from site KP102-7, to much higher proportions of gravel (40.66% at KP102-7_U).

Table 3-11: Sediment particle size characteristics from the sediment survey

Sample	Total clay (%)	Total silt (%)	Total sand (%)	Total gravels (%)
KP92-75_U	0.42	2.65	86.35	10.58
KP92-75_L	0.31	1.95	89.34	8.41

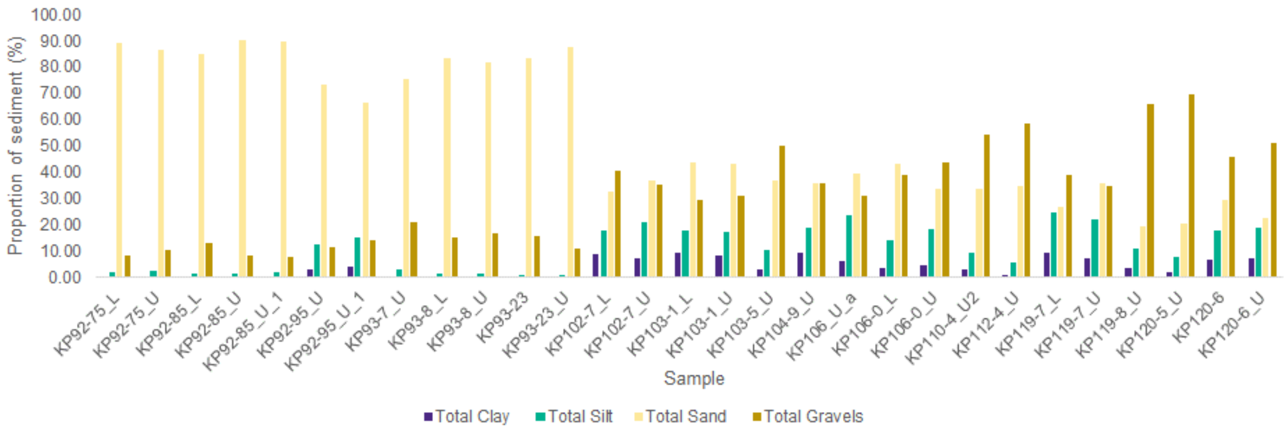

Figure 3-21: Sediment sample particle size characteristics at the sediment sampling sites (from north to south)

3.2.4.2 Metals

The metals and metalloid concentrations for all sites (see Appendix G) were compared to the NAGD screening levels (CoA, 2009), where relevant. Of the metals and metalloids in the sediments sampled from Darwin Harbour; antimony, cadmium and silver were below the LoR for all sites. Mercury was at or below the LoR for all samples except sample KP106.0 L (>0.5 m core depth) where a concentration of 0.02 mg kg was recorded (Figure 3-22). This value was below the guideline value of 0.15 mg/kg (ANG, 2018).

Aluminium concentrations were all above the LoR and ranged from 340 to 9,520 mg/kg (Figure 3-22). There is no NAGD screening level for aluminium in marine sediments.

All arsenic concentrations were above the LoR and ranged from 8.27 to 108 mg/kg (Figure 3-22). Four samples (KP93.8_U, KP119-7_U, KP119-7_L and KP119-8_U) were above the NAGD screening level of 20 mg/kg, but all were below the GV-High value of 70 mg/kg.

Chromium concentrations were above the LoR at all sites and ranged from 1.7 to 37 mg/kg (Figure 3-22). All samples were below the NAGD screening level of 80 mg/kg.

All but one cobalt concentration were above the LoR at all sites, ranging from 0.5 to 8.7 mg/kg (Figure 3-22). There is no NAGD screening level for cobalt in marine sediments.

Five samples had copper concentrations below the LoR. These sites were all within the potential sand wave dredging area. Copper concentrations within Darwin Harbour ranged from <1 to 6.1 mg/kg (Figure 3-22). All sites were well below the NAGD screening level of 65 mg/kg.

Iron concentrations were all above the LoR at all sites and ranged from 1,680 to 32,300 mg/kg (Figure 3-22). There is no NAGD screening level for iron in marine sediments.

Lead concentrations were all above the LoR and ranged from 1.9 to 24.1 mg/kg. All sites were below the NAGD screening level of 50 mg/kg.

Manganese concentrations were all above the LoR and ranged from 10 to 710 mg/kg. There is no NAGD screening level for manganese in marine sediments.

Nickel concentrations were all above the LoR at all sites and ranged from 1 to 9.8 mg/kg (Figure 3-22). All sites were below the NAGD screening level of 21 mg/kg.

Zinc concentrations were all above the LoR at all sites and ranged from 1.3 to 17.2 mg/kg (Figure 3-22). All sites were all below the NAGD screening level of 200 mg/kg.

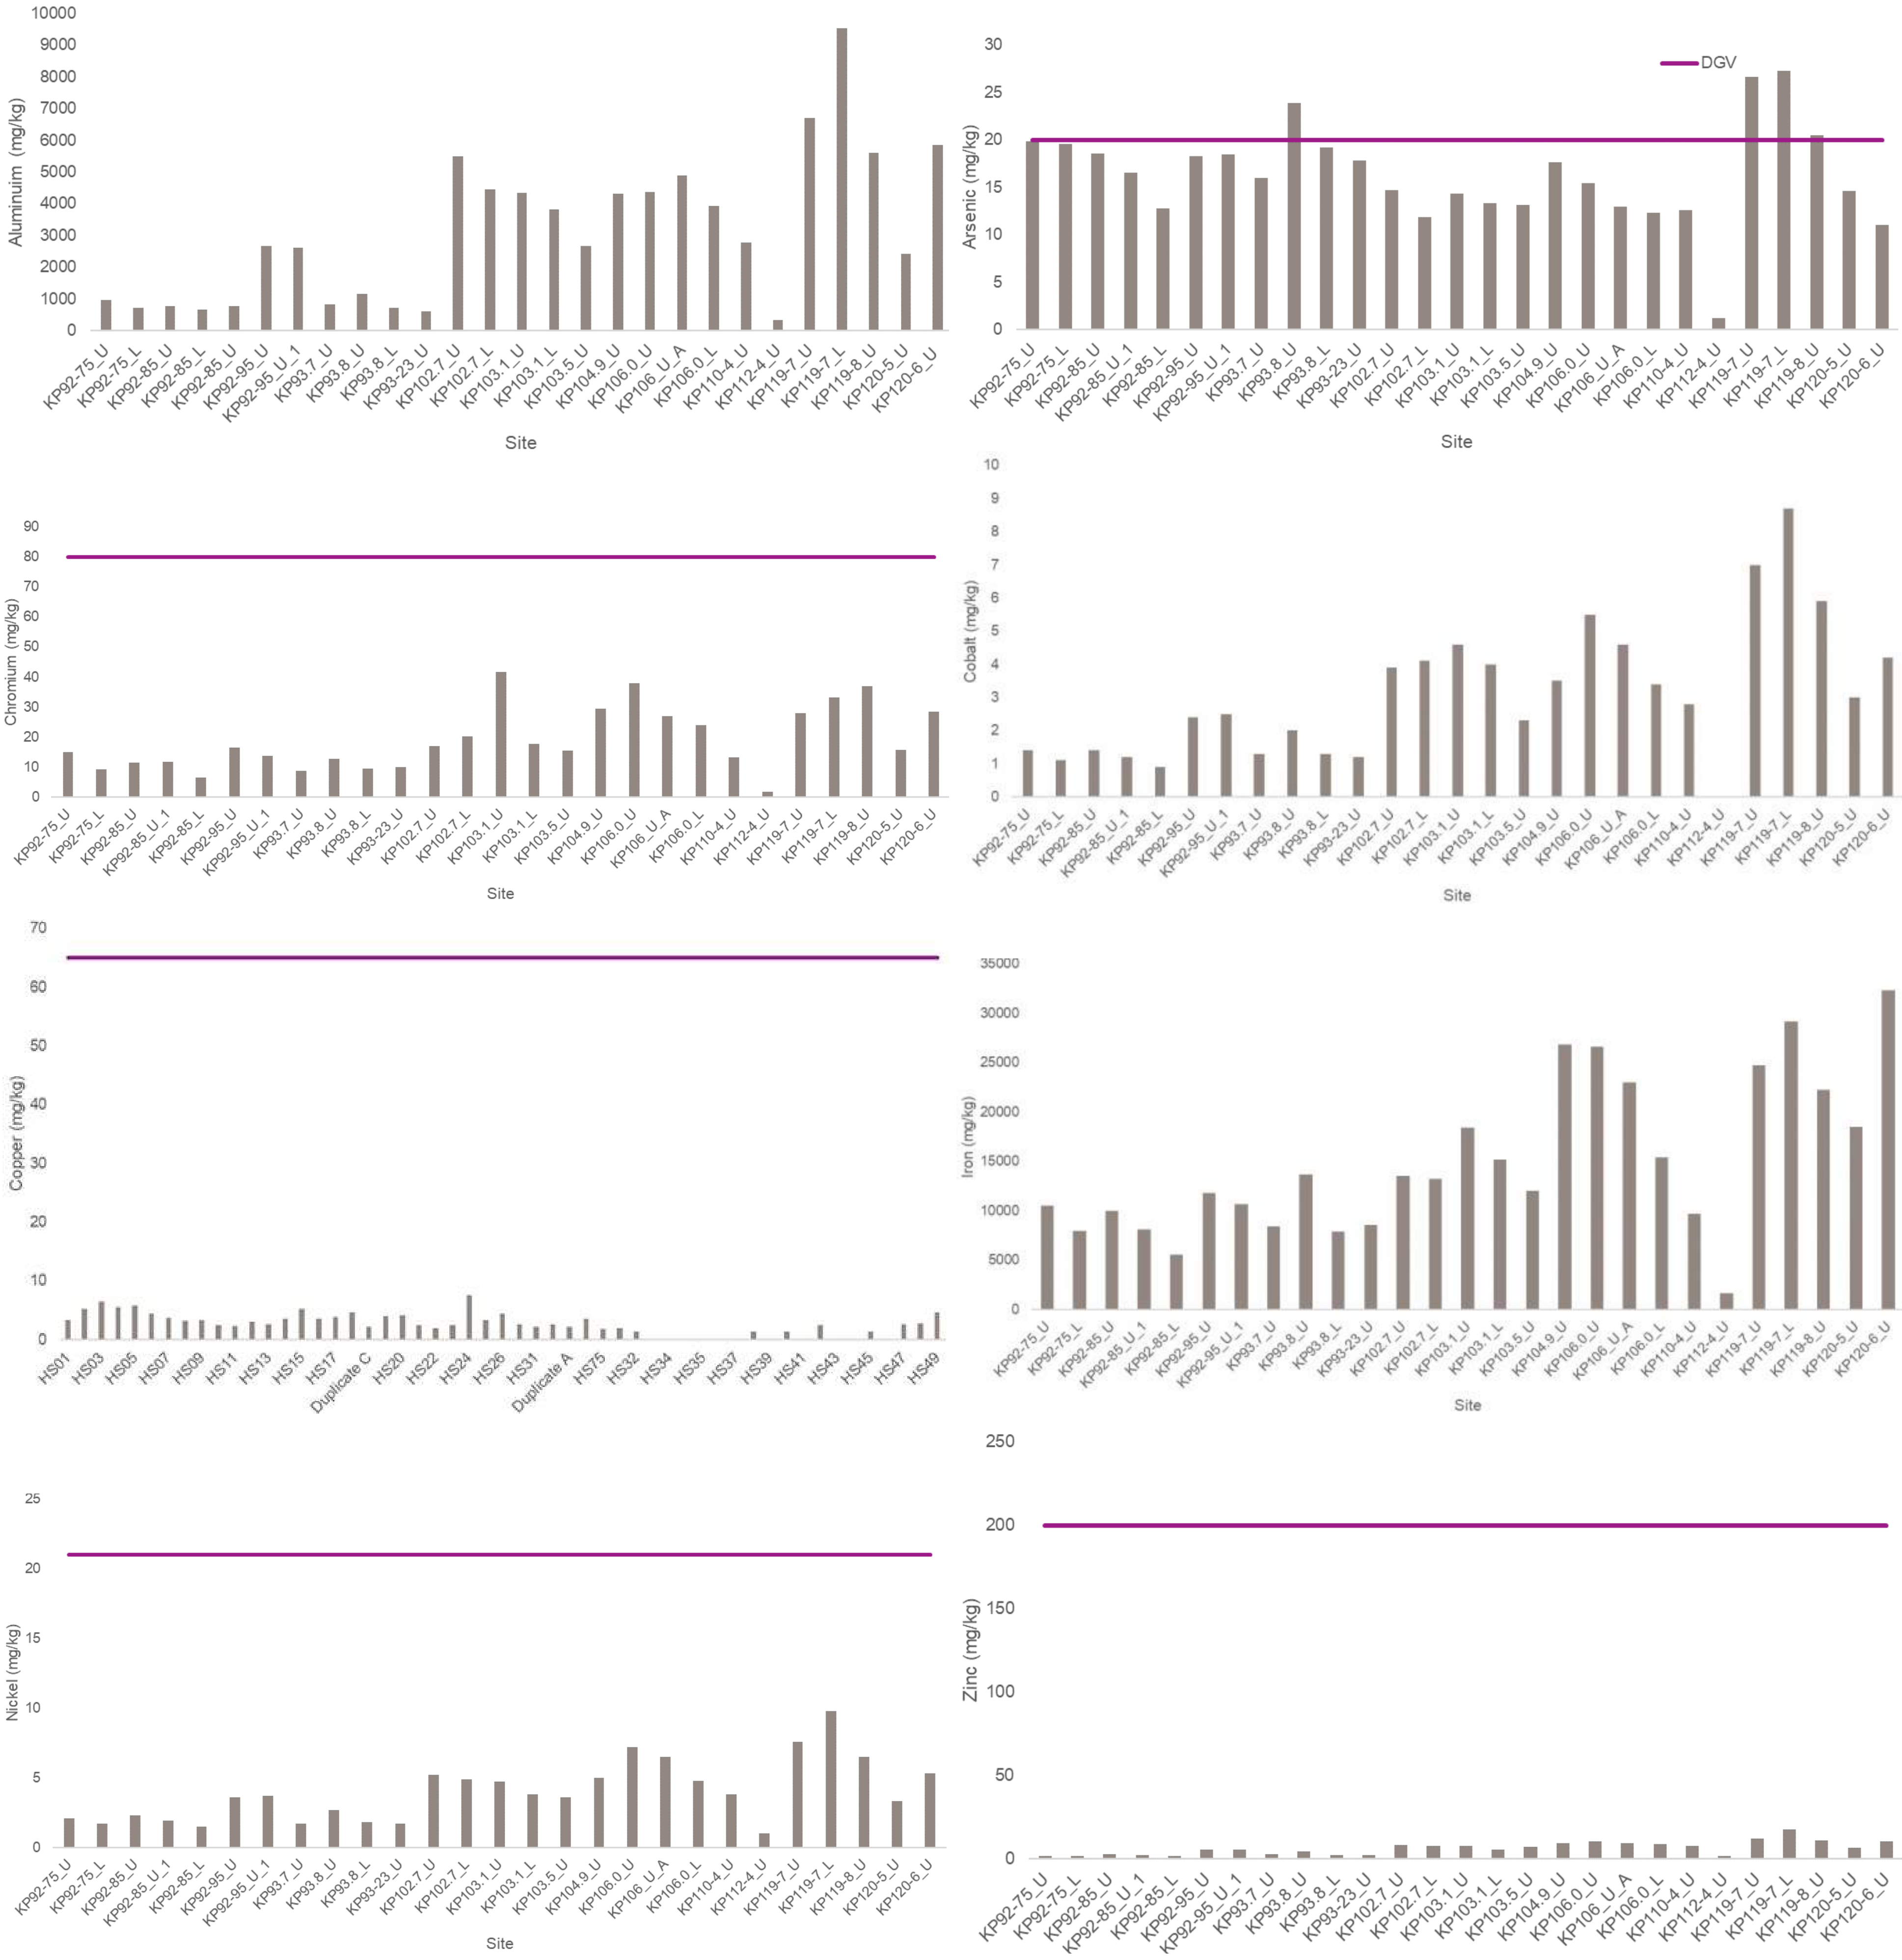

Figure 3-22: Metal concentrations along the Darwin Harbour sediment cores (L = lower (0 to 50 cm core depth), U = upper (>50 cm))

Arsenic concentrations were therefore plotted against iron concentrations along the offshore pipeline route to determine if there was a correlation between arsenic and iron. A weak positive polynomial correlation between iron concentrations and arsenic concentrations was identified (R^2 value of 0.099) (Figure 3-10).

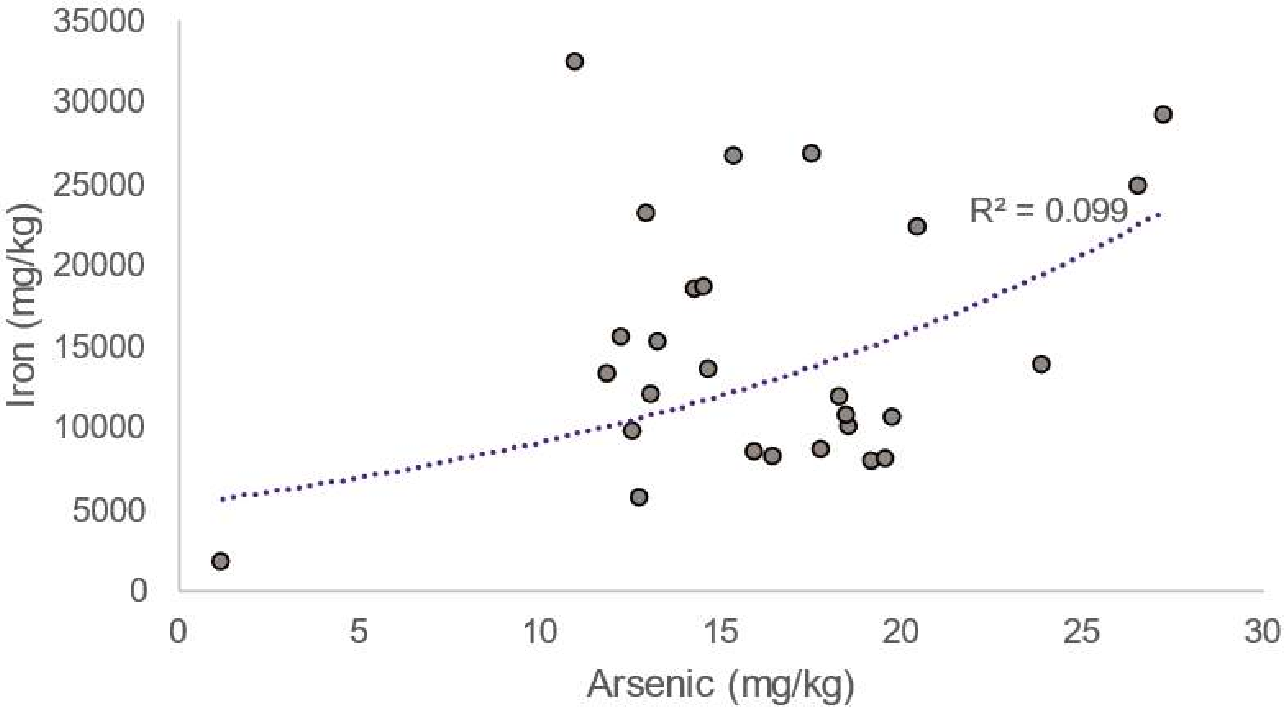

Figure 3-23: Correlation between iron and arsenic concentrations in Darwin Harbour sediment core samples

3.2.4.3 Nutrients

Total Kjeldahl nitrogen (TKN) concentrations exhibited high concentrations and variability across sites (Table 3-12; Appendix G). TKN in Darwin Harbour ranged from 40 to 240 mg/kg. Total phosphorus (TP) concentrations also exhibited high concentrations and variability across sites, ranging from 27 to 647 mg/kg. Total organic carbon (TOC) was generally very low and ranged from 0.02% to 0.6%.

3.2.4.4 Hydrocarbons

Total petroleum hydrocarbons (TPH) and total recoverable hydrocarbons (TRH) were detected above LoRs in 21 of the 27 Darwin Harbour samples, these ranging from <3 to 22 mg/kg (raw data). TPH and TRH results were normalised to 1% Total organic carbon (TOC). The normalised TPH and TRH concentrations were below the NAGD screening level of 550 mg/kg across all samples (Table 3-13; Appendix H). Polycyclic aromatic hydrocarbons (PAHs) were requested for these samples. All PAH concentrations were below the LoR.

3.2.4.5 Pesticides

Pesticide analysis was undertaken for all 27 of the Darwin Harbour sediment core samples. All pesticide chemicals analysed were below the LoR in all samples (Appendix I).

3.2.4.6 Tributyltin

Tributyltin concentrations were below the limit of reporting (LOR) in all core samples and thus well below the NAGD screening level of 9 µg.Sn/kg (Appendix J).

3.2.4.7 Potential for acid sulfate soils

Net acidity results were all below the LoR (0.02% S) (Table 3-14; Appendix K). The highest net acidity excluding acid neutralising capacity) and potential acidity (CRS) values recorded were 0.53% S (KP119-7_L). Titratable Actual Acidity (TAA) concentrations for all samples were below the LoR (0.02% pyrite S), likely due to the Acid Neutralising Capacity (ANC) present in the samples. All pH results were indicative of non-acid sulfate soils (ASS) being present – i.e. >4 pH units. All samples were found to contain significant levels of Acid Neutralising Capacity (ANC). The highest ANC concentration was 15.6% S, with the mean concentration being 10.8% S. The amount of ANC present is likely to buffer inorganic sulfur acidity within the samples. Although significant amounts of ANC are present in all samples; these are potentially an over estimation of ANC due to the crushing of large shell grit and other carbonate material during analysis – increasing the reactive surface area. The data supports a conclusion that although inorganic sulfur is present in the sediments, there is significant ANC kinetically available to neutralise the oxidation products from the inorganic sulfur.

Table 3-12: Total Kjeldahl nitrogen, total phosphorus and total organic carbon concentrations in Darwin Harbour

Liming rate excluding ANC	kg CaCO3/t		25	5.2

*The minimum pH result has been reported, representing the most acidic (i.e. maximum) sample

3.2.5 Soft substrate benthic habitats across the study area

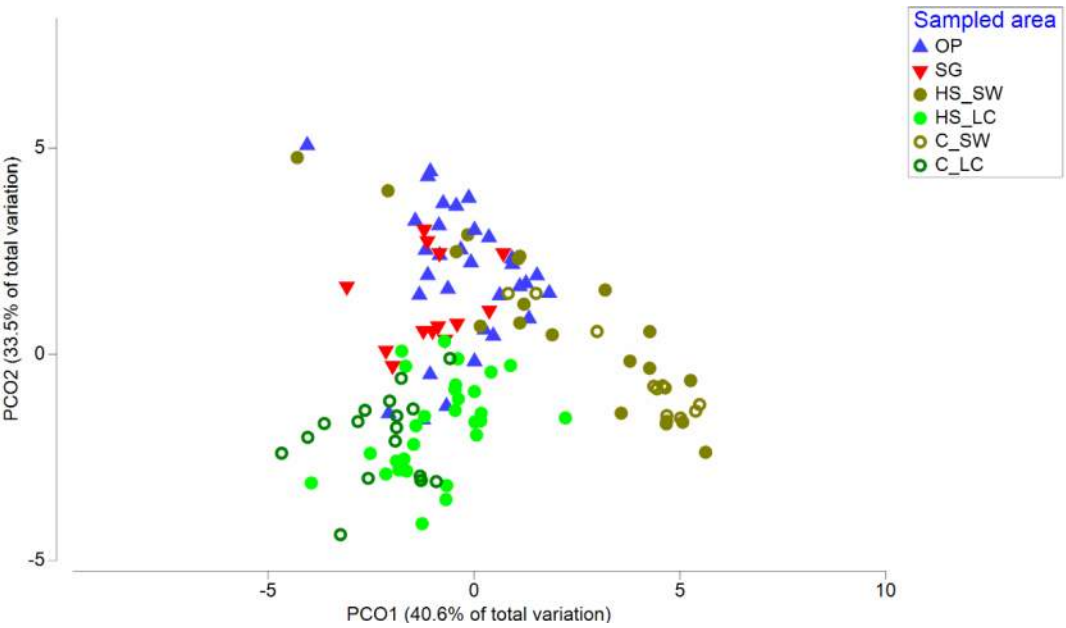
Additional comparison of particle size distributions and infauna between study areas was undertaken where relevant to provide additional understanding of broad-scale local to regional context of the seabed sediment characteristics, relative changes in substrate along the pipeline route and benthic assemblages.

3.2.5.1 Particle size distribution

Particle size data was collected from four different study areas, with two different sampling methods used in areas identified for potential dredging/trenching (both in line with the National Assessment Guidelines for Dredging (NAGD; CoA 2009). For the purposes of undertaking comparisons between the four study areas, these were defined as:

- Offshore pipeline route (OP) (from ~KP-3 to ~KP89)
- Potential spoil ground (SG)
- Darwin Harbour samples (from ~KP90 to KP122), comprising van Veen grab samples (HS#) and core samples (KP#):
  - Potential sand wave (SW) rectification area (between KP91 and KP95)
  - Landward/(shore) crossing (LC) dredging/trenching area (between KP95 and KP122.5).

Principal coordinates ordination of the particle size data from all grab and core samples indicated there were differences between the study areas, and that 74.1% of the total variation could be identified by the PCO1 and PCO2 axes (Figure 3-24). Therefore, the majority of variation can be identified from trends that can be observed in the ordination plot. For example, PCO1 identified 40.6% of total variation. By looking at trends along the x-axis, it appeared that the largest contributor to variation is the relative difference of the sand wave samples (to the right of the x-axis) to all other samples within and outside of Darwin Harbour. There also appeared to be some difference between the results of the grab sample data and core data closest to the shore crossing (e.g. KP119 and KP120, and HS1–HS5). A permutational multivariate analysis of variance (PERMANOVA) in PRIMER 7 was used to test for significant differences between the study areas (Anderson 2008). The results confirmed a significant difference in particle size distribution between study areas (Pseudo-F = 20.755, P(perm) = 0.001). Pairwise analysis in PERMANOVA identified that all sampled areas were significantly different (P(perm) = <0.05). To simplify further interpretation of relationships between grouping, cluster analysis was undertaken on the ‘average distance between/within groups’ resemblance matrix, which is one of the outcomes of the PERMANOVA pairwise comparison test (Figure 3-25). Although all groups are significantly different, the cluster analysis provided context of relative difference between each group. This showed that the particle size distribution data from the sand wave area (both grab and core samples) were less dissimilar from each other than from the other sampled areas. The cluster diagram then split, separating the offshore pipeline and spoil ground samples from the landward Darwin Harbour/shore crossing samples. The sand wave samples were characterised by very low average silt content (<2%), in contrast to the other sampled areas (>10%).



Key: OP = offshore pipeline, SG = spoil ground; HS_SW = Darwin Harbour grab sample in the sand wave area; HS_LC = Darwin Harbour grab sample in the lower harbour / shore crossing area; C_SW = core samples in the sand wave area; C_LC = core samples in the lower harbour / shore crossing area

Figure 3-24: Principal coordinates ordination (PCO) plot showing particle size distribution samples by study area

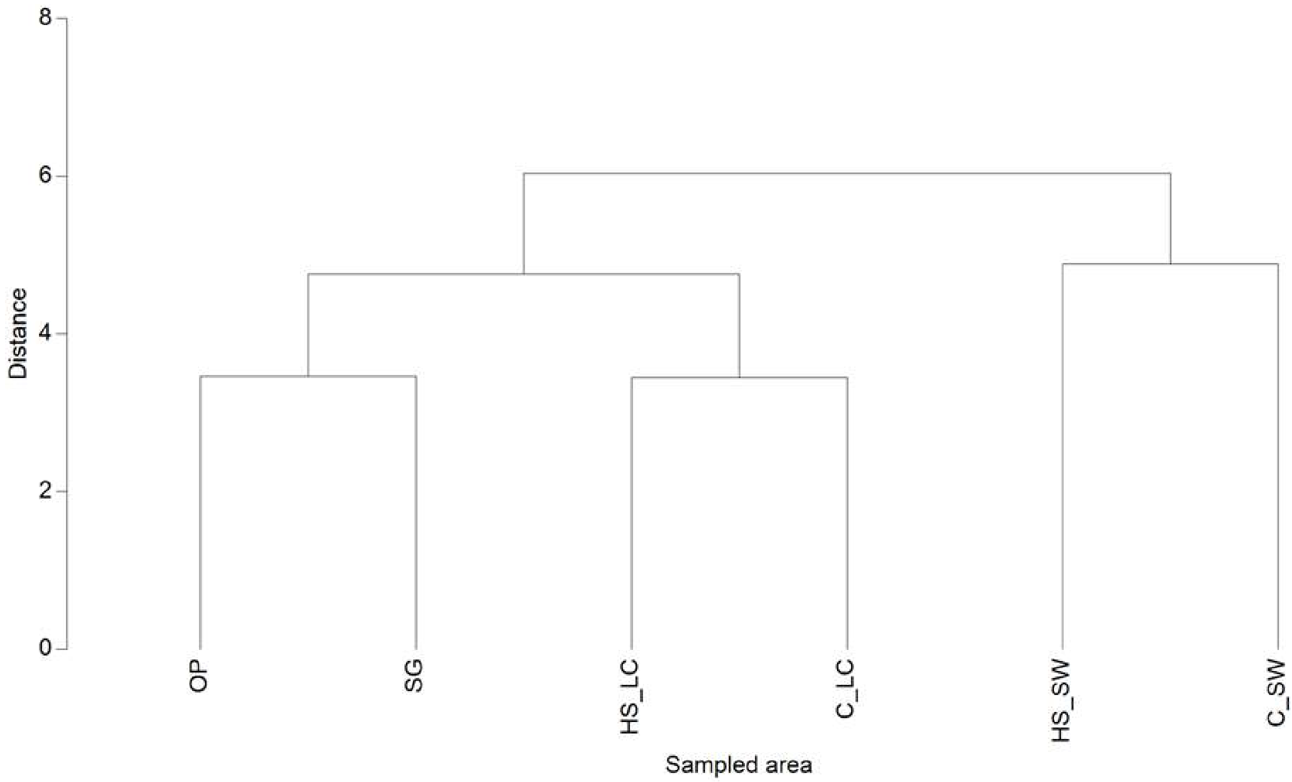


Figure 3-25: Cluster analysis of average distance between/within study area groups

3.2.5.2 Infauna

Infauna analysis was completed in two study areas: the offshore pipeline and potential spoil ground. The infaunal assemblages in these areas were dominated by crustaceans and polychaetes. Amphipod crustaceans were commonly recorded as the dominant characteristic taxa in the assemblages. These observations were consistent with investigations of soft substrate infaunal assemblages within Darwin Harbour previously completed as part of the INPEX Ichthys project baseline studies (INPEX Browse Ltd, 2010). The INPEX study recorded 416 individuals from 17 families from a total of 39 × ~0.15 m^2 van Veen grab samples (total sampled area = 5.85 m^2). This equates to an average of approximately 71.1 individuals and 2.9 families per m^2 of seabed. In the present study, 29 × 0.1 m^2 van Veen grab samples were collected from the offshore pipeline route (outside of the Darwin Port limit) with a total of 744 individuals from 81 families, which equates to approximately 256.6 individuals and 27.9 families per m^2. The thirteen 0.1 m^2 van Veen grab samples collected from the potential spoil grounds contained 185 individuals from 45 families, equating to approximately 142.3 individuals and 34.6 families per m^2. These results indicate that the soft sediment benthic habitats of the offshore pipeline route and potential spoil ground are more abundant and diverse than the Darwin Harbour soft sediment habitats reported by INPEX Browse Ltd (2010).

The results from the offshore pipeline and spoil ground infaunal analysis herein indicated a difference between the two study areas and PERMANOVA confirmed a significant difference between the two datasets (Pseudo-F = 3.4179, p(perm) = 0.001). A PCO was used to visualise the differences between datasets, and to identify the variation explained by individual axes (Figure 3-26). A total of 24.2% of the total variance is identified by the PCO1 and PCO2 axes. Similarity percentages breakdown (SIMPER) analysis was used to characterise the taxa contributing to the variability between the two datasets. Of the top 70% of taxa contributing to the variation between the two datasets, 26 OP taxa (11 crustaceans, 14 polychaetes and two sipunculids representing 53.61% of 70.17%)) were identified as different by virtue of greater abundance. The remaining 16.56% of the variation was comprised of crustacean (three taxa), echinoderm (one taxa) and polychaetes (three taxa) taxa with increased abundance in the SG sites.

This difference between the OP and SG sites is likely to be due to a combination of factors. For example, there were more than twice as many OP sites collected over a much greater spatial area (>90 km of the proposed pipeline route), along a transitional environment (the Beagle Gulf) between the eastern area influenced by the narrows and Darwin Harbour to the western area, influenced by the open ocean. In contrast, the SG sites were collected over an area of generally flat seabed (in terms of relief) of approximately 5 km by 5 km and therefore the potential for seabed and infaunal community heterogeneity is therefore much more limited.

The transitional environment of the Beagle Gulf and along the proposed pipeline route was also evident in the particle size data (refer to Sections 3.2.5.1). Sediments in Darwin Harbour and in the spoil ground were characterised by mixed sediments, with relatively high silt/gravel to sand contributions (silt = 16.4% and 19.2%, respectively; gravel = 50.7% and 31.7%, respectively; sand = 30.6% and 49.1%, respectively). The western sediments were dominated by the sand fraction (average ~60%), and with lower silt (~11.4%) and gravel content (~29%). Infauna community composition is influenced by environmental factors such as PSD, and therefore PSD is both an indicator of a transitional habitat and a contributory cause of infaunal community heterogeneity in the dataset.

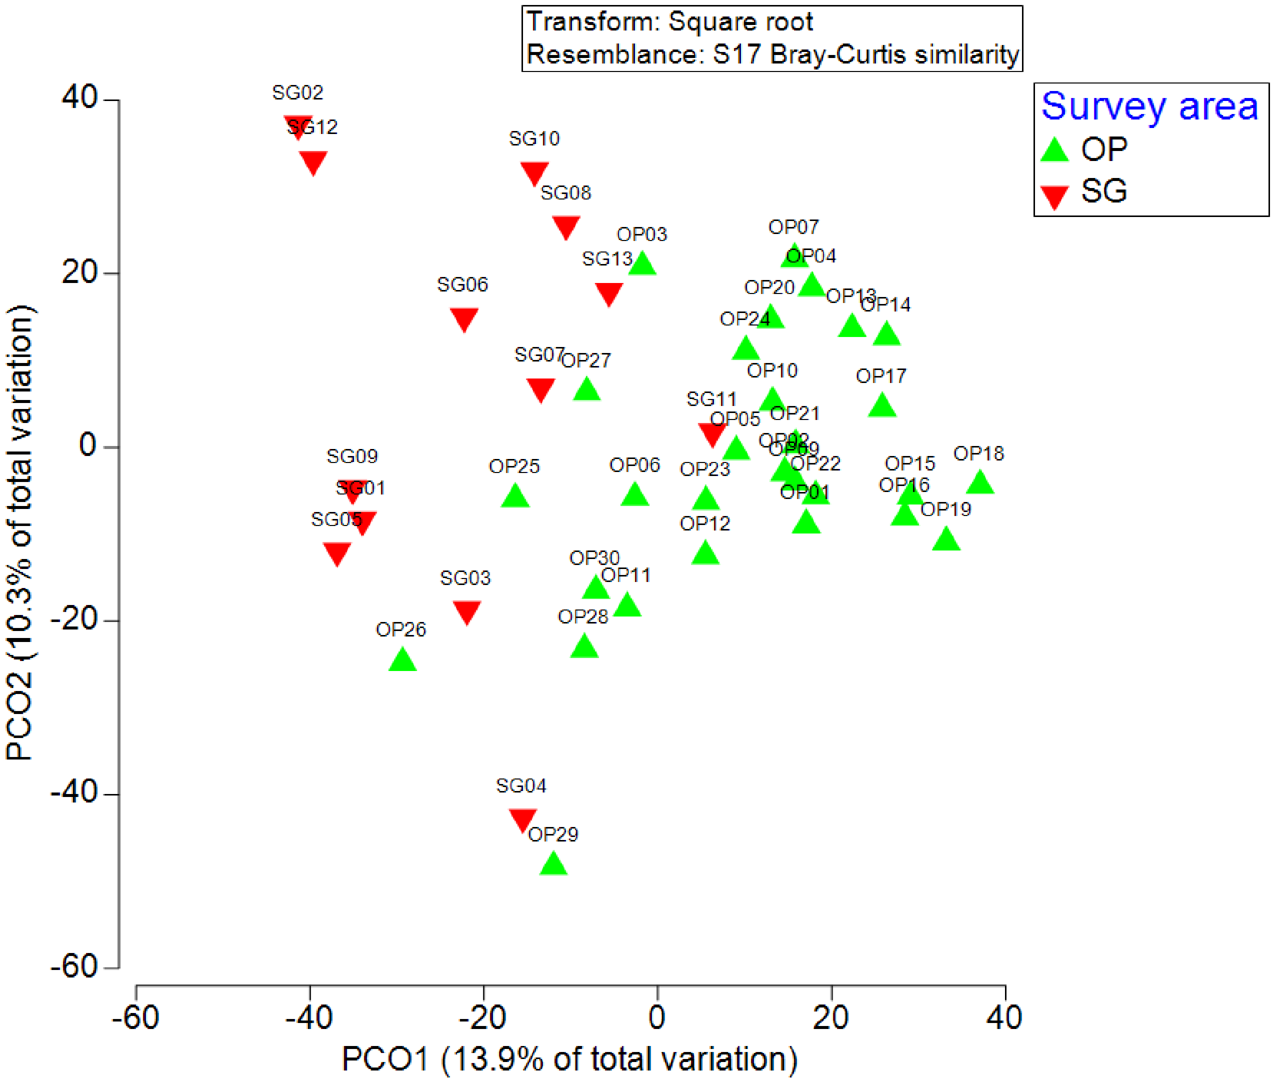

Figure 3-26: Principal coordinates ordination (PCO) of offshore pipeline (OP) and spoil ground (SG) infaunal data

3.3 Water quality

3.3.1 Offshore pipeline

3.3.1.1 CTD Data

CTD profile data from the offshore pipeline water sampling locations are presented in Figure 3-27 to Figure 3-36. Temperature was either consistent with depth at sample sites or decreased by up to >1 degree over >40 m depth range (e.g. OP2).

Salinity was either consistent or changed marginally over depth – except at sites OP1b and OP2b, where an increase in salinity was recorded over the 0–10 m depth range (particularly notable at site OP1).

Turbidity at sites OP1 to OP6 (except OP2) decreased in the 0 to 15–20 m depth range, then gradually increased with increasing depth. A similar trend may occur at sites OP7, but less obviously. Turbidity at sites OP2 and OP8 were relatively consistent over the depth profile. Turbidity increased with depth at site OP10.

Oxygen levels tended to increase with increasing depth at sites OP1 to OP4 and sites OP7 to OP10. At site OP5, oxygen increased between the surface and around 20 m, with gradually decreased with increasing depth. At site OP6, oxygen levels decreased between the surface and around 10 m, then remained fairly consistent through the water column.

pH decreased with increased depth at sites OP1, OP3, OP4, OP7, OP8 and OP9. In contrast, pH profiles increased with increasing depth at sites OP6b and OP10. At site OP2, pH gradually increased with depth. But an increase in pH was recorded between ~25 m and ~35 m, before decreasing. At site OP5, pH was relatively consistent throughout the water column, except at depths ~15 to 20 m and ~35 m to >50 m where there was a relatively large drop from a pH of 11.5 to 9.5.

3.3.1.2 Metals

Five of the filtered and unfiltered metals and metalloids were below the LoR for all sites, except OP1S. These were cadmium (Cd), chromium (Cr), cobalt (Co), nickel (Ni) and mercury (Hg). OPS1 had filtered nickel and unfiltered chromium concentrations that were above the LoR (1.5 µg/L and 0.3 µg/L, respectively; Appendix G).

Filtered and unfiltered copper (Cu) concentrations ranged from <0.2 to 8.4 µg/L (Figure 3-37). Three of the copper samples were above the ANZG (2018) DGV (for slightly to moderately Figure 3-37 disturbed marine offshore ecosystems, at the 95% species protection level) of 1.3 µg/L, in slightly to moderately disturbed marine offshore ecosystems, at the 95% species protection level (Figure 3-37). These results were for unfiltered copper at OP1S and Triplicate B (taken from sample OP8S), and for filtered copper at OP2S. The highest filtered copper concentration was recorded at OP2S (8.4 µg/L), while all other samples had copper concentrations under 1.6 µg/L.

Unfiltered zinc (Zn) concentrations ranged from <1 to 9 µg/L and were at or above the ANZG (2018) DGV of 8 µg/L at two sites (OP1S and OP5S). Filtered zinc concentrations ranged from 1 to 9 µg/L, with three samples being at or above the DGV (Figure 3-37). The filtered and unfiltered arsenic (As) concentrations were very similar. Samples ranged from 1.3 to 1.9 µg/L, with all recorded concentrations below the ANZG (2018) DGV of 4.5 µg/L (Figure 3-37). Filtered and unfiltered lead (Pb) concentrations ranged from <0.1 to 5.4 µg/L (Figure 3-37). Ten unfiltered lead samples below the LoR, whilst six filtered lead samples were below the LoR. One sample of filtered lead (OP5S) was above the ANZG (2018) DGV of 4.4 µg/L in slightly to moderately disturbed marine offshore ecosystems, at the 95% species protection level.

3.3.1.3 Nutrients and pigments

3.3.1.3.1 Nitrogen

The test for total nitrogen provided data for all nitrogen compounds in the water samples, namely nitrite (NO_2), nitrate (NO_3), ammonia (NH_4+) and organic nitrogen compounds (Appendix G).

Nitrite and nitrate were recorded at detectable levels at all sites, except for site OP8S/B. Nitrite and nitrate were recorded at concentrations of <2 to 15 µg.N/L in the bottom water samples, with all surface samples being below the LoR. These values are below the ANZG (2018) DGV for physical and chemical stressors in the Anson Beagle bioregion for nitrate in summer of 0.181 µmol NO_3-N/L (11.22 µg.N/L) in surface waters and 1.717 µmol NO_3-N/L (106.46 µg.N/L) in bottom waters.

Ammonia was detected in 11 samples, with ten of those being bottom (near seabed) samples. Only one surface sample had detectable concentrations of Ammonia (OP5S), with a concentration of 7 µg.N/L being recorded from this sample. All samples were below the ANZG (2018) DGV (for slightly to moderately disturbed marine offshore ecosystems, at the 95% species protection level) of 910 µg.N/L.

Total nitrogen concentrations indicated the presence of other organic nitrogen compounds, with no samples (excluding the field and transport blanks) being below the LoR concentration of 50 µg.N/L. Total nitrogen concentrations ranged from 80 to 150 µg.N/L. There is no ANZG (2018) default guideline value for total nitrogen.

3.3.1.3.2 Phosphorus

The results for TP comprise the concentration of phosphorus that occurs in orthophosphate and organic phosphate compounds (Appendix G).

Orthophosphate (filterable reactive phosphorus) concentrations ranged from <2 to 8 µg.P/L. All but two samples were above the LoR, and both samples were surface samples (OP3S and OP4S). No samples exceeded the ANZG (2018) DGV for physical and chemical stressors in the Anson Beagle bioregion for phosphate of 0.209 µmol PO_4-P/L (19.85 µg.P/L) in surface waters and 0.427 µmol PO_4-P/L (40.55 µg.P/L) in bottom waters for summer.

TP concentrations ranged from 9 to 17 µg.P/L. There is no ANZG (2018) default guideline value for TP.

3.3.1.3.3 Pigments

Chlorophyll-a concentrations were used as an indicator of the likely level of phytoplankton biomass across the offshore pipeline area. Chlorophyll-a concentrations ranged from 0.4 to 1.5 µg/L (Figure 3-38; Appendix G). All concentrations were below the ANZG (2018) DGV for physical and chemical stressors in the Anson Beagle bioregion value for chlorophyll-a of 2.568 µg/L in summer. Concentrations were variable across surface and bottom samples.

Phaeophytin-a was also sampled as this pigment is a breakdown product of chlorophyll-a and can be used to indicate if phytoplankton are blooming or declining. Phaeophytin-a was detected in ten samples, the majority of which were at the surface (Figure 3-38). Concentrations ranged from <0.2 µg/L (i.e. below the LoR) to 0.6 µg/L. There is no ANZG (2018) default guideline value for phaeophytin-a.

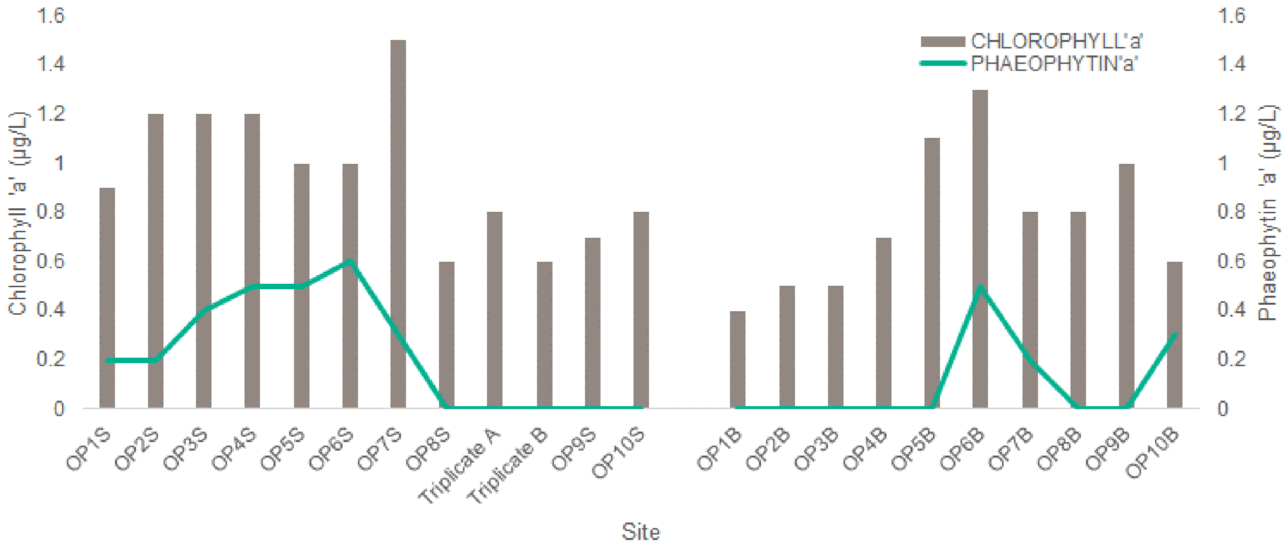

Figure 3-38: Surface and bottom chlorophyll-a and phaeophytin-a concentrations along the offshore pipeline route

3.3.1.3.4 Total suspended solids

Total suspended solid (TSS) concentrations were all above the LoR (0.5 mg/L) and ranged from 1.7 to 8.6 mg/L (Appendix G). Most sites had TSS between 1.7 and 4 mg/L, however site OP10S/B was much higher, with 8.6 mg/L at the surface and 7.7 mg/L at the bottom. OP10S/B was the closest water quality site to Darwin Harbour but was sampled on an incoming tide. There was no correlation between depth and TSS.

3.3.1.4 Hydrocarbons

The offshore pipeline TRH and BTEXN concentrations were below the limit of reporting (LoR) for all samples (Appendix H). The offshore pipeline samples were, therefore, not tested for PAHs.

3.3.1.5 Naturally occurring radioactive materials

NORMS were detected in near-seabed samples at two of the offshore pipeline sites. Radium-226 was recorded at concentrations of 0.023 Bq/L in sample OP4B and 0.018 Bq/L in sample OP6B (Appendix F).

3.3.2 Spoil ground

3.3.2.1 CTD data

Data from the CTD profiles are presented in Figure 3-39 to Figure 3-45. Temperature was either consistent with depth or decreased by up to <0.5 degrees over ~20 m depth range. Salinity was generally consistent with depth or increased slightly (with no evidence of a halocline). Turbidity generally increased with increasing depth, with the most marginal change recorded at site SG1 and the greatest increase recorded at site SG8. Oxygen levels increased by 0.5 to 1 mg/l over a >20 m depth profile at all sites. The pH data from the spoil ground sites was inconsistent, and it was likely that the pH probe had developed a fault during these deployments.

3.3.2.2 Metals

Five of the filtered and unfiltered metals and metalloids were below the LoR concentrations for all sites. These were cadmium (Cd), chromium (Cr), cobalt (Co), nickel (Ni) and mercury (Hg) (Appendix G). Due to an issue with the sample jar, unfiltered metals were not analysed for Triplicate D.

Filtered and unfiltered copper (Cu) concentrations ranged from <0.2 to 0.6 µg/L (Figure 3-46). Only two unfiltered copper samples were below the LoR (Triplicate C and SG7B), while five filtered copper samples were below the LoR (SG12S, Triplicate D, SG13S, SG4S and SG7B). None of the copper samples were above the ANZG (2018) DGV (for slightly to moderately disturbed marine offshore ecosystems, at the 9% species protection level) of 1.3 µg/L (Figure 3-46).

Unfiltered zinc (Zn) concentrations ranged from <1 to 2 µg/L and were below the ANZG (2018) DGV (for slightly to moderately disturbed marine offshore ecosystems, at the 95% species protection level) of 8 µg/L for all sites. Filtered zinc concentrations ranged from 2 to 18 µg/L, four of these samples were at or above the DGV (Figure 3-46). The highest zinc concentration was at SG4B.

The filtered and unfiltered arsenic (As) concentrations were above the LoR and were very similar. Samples ranged from 1.6 to 1.9 µg/L, with all recorded concentrations below the ANZG (2018) DGV (for slightly to moderately disturbed marine offshore ecosystems, at the 95% species protection level) of 4.5 µg/L (Figure 3-46).

Filtered and unfiltered lead (Pb) concentrations ranged from <0.1 to 0.4 µg/L (Figure 3-46). Only three unfiltered lead samples were below the LoR (Triplicate C, SG8S and SG1B), while six filtered lead samples were below the LoR (SG12S, Triplicate C, Triplicate D, SG8S, SG4S, SG13B and SG8B). All lead samples were well below the ANZG (2018) DGV (for slightly to moderately disturbed marine offshore ecosystems, at the 95% species protection level) of 4.4 µg/L.

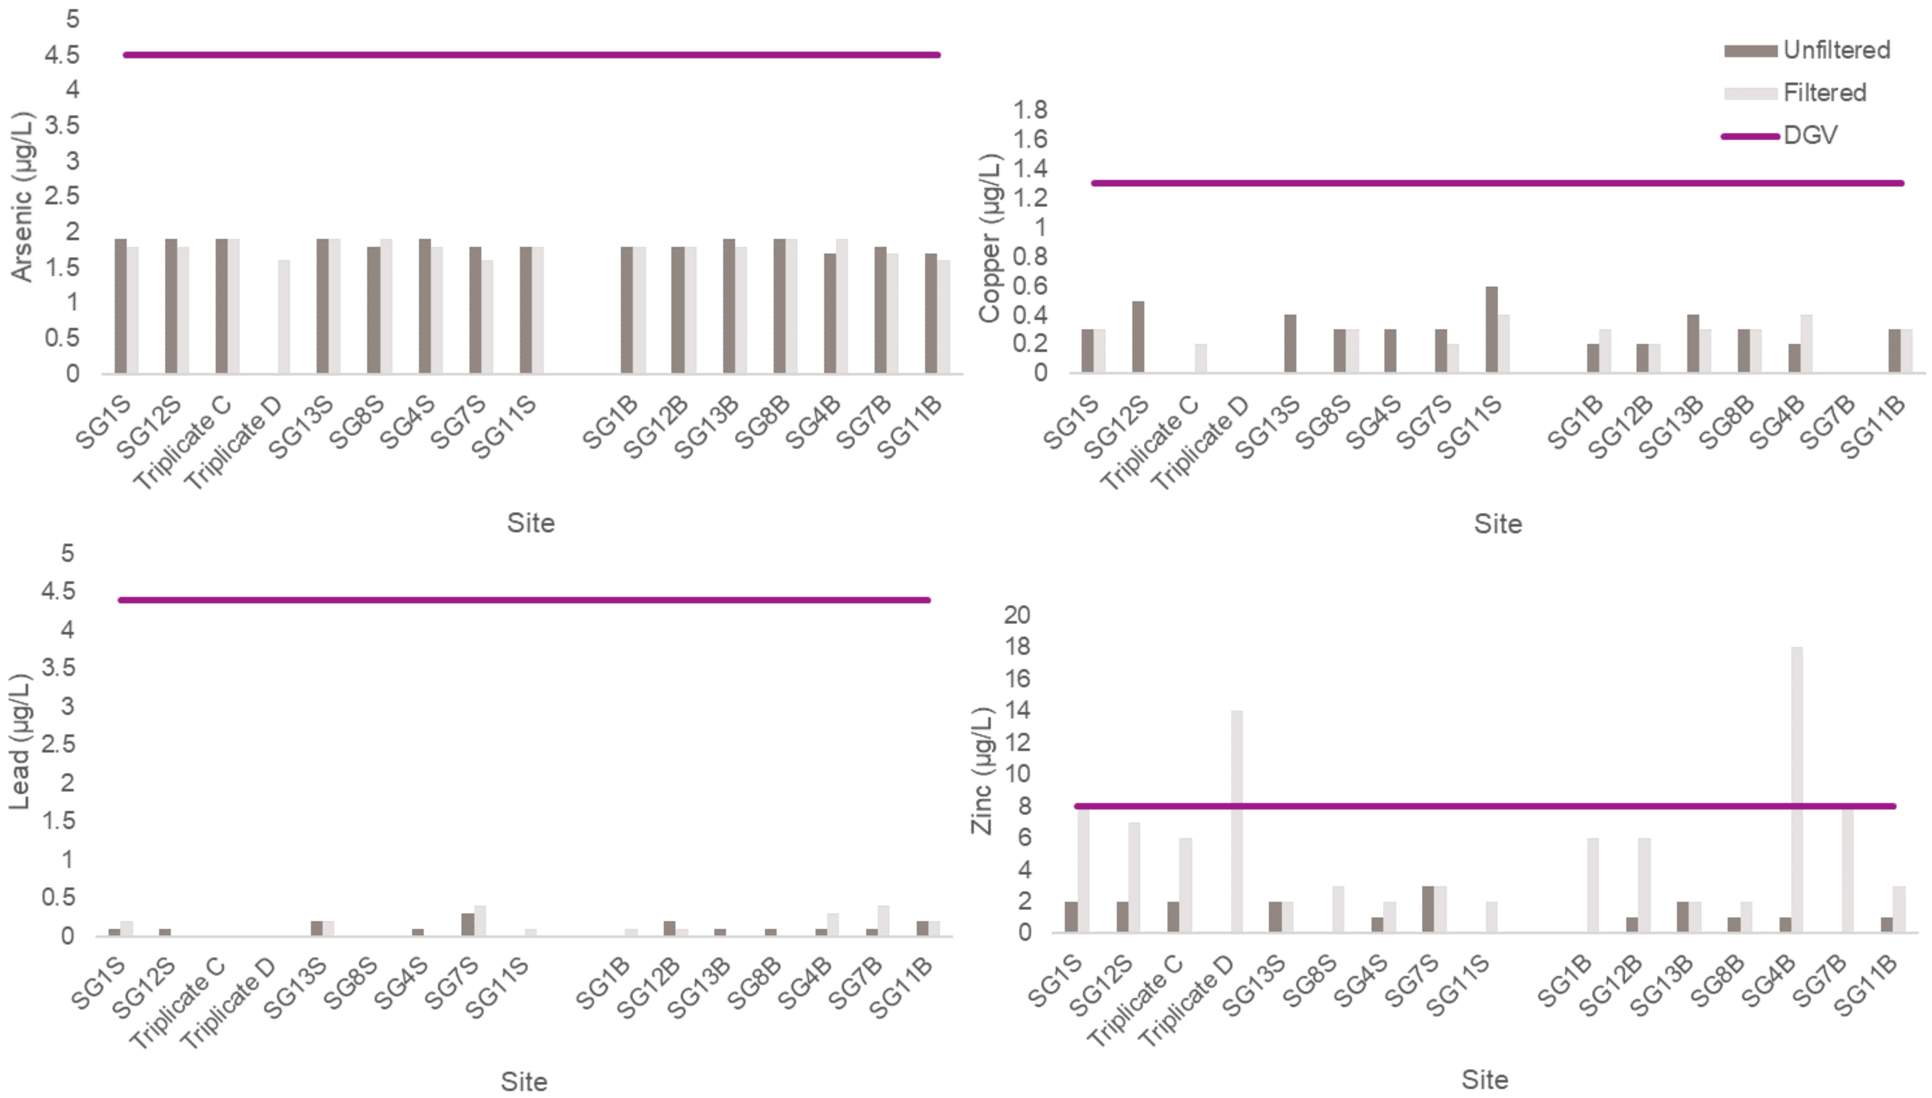

Figure 3-46: Filtered and unfiltered metal concentrations from the spoil ground

3.3.2.3 Nutrients and pigments

3.3.2.3.1 Nitrogen

Nitrite and nitrate were only recorded at concentrations above the LoR at two of the spoil ground sites, with both being bottom samples (Appendix G). These nitrate concentrations were 12 µg.N/L at SG12B and 4 µg.N/L at SG11B. All surface samples were below the LOR. These values are below the ANZG (2018) DGV for physical and chemical stressors in the Anson Beagle bioregion for nitrate in summer 1.717 µmol NO3-N/L (106.46 µg.N/L) in bottom waters.

Ammonia concentrations were below the LoR for all but three samples. Ammonia was only detected in near-seabed water samples (SG12B, SG4B and SG11B). The ammonia concentrations in these samples ranged from 3 µg.N/L to 13 µg.N/L. All samples were below the ANZG (2018) DGV (for slightly to moderately disturbed marine offshore ecosystems, at the 95% species protection level) of 910 µg.N/L.

Total nitrogen concentrations indicated the presence of other organic nitrogen compounds, with no samples (excluding the field and transport blanks) being below the LoR of 50 µg.N/L. There is no ANZG (2018) default guideline value for total nitrogen. There is no ANZG (2018) default guideline value for total nitrogen.

3.3.2.3.2 Phosphorus

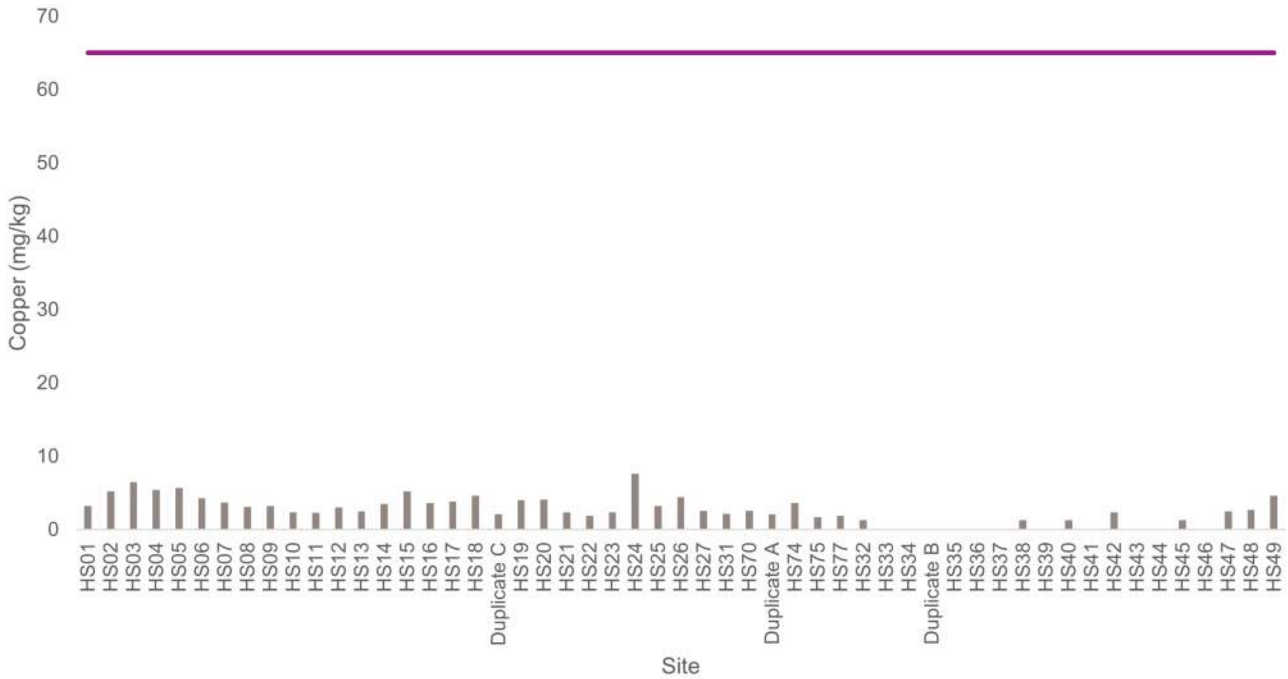
Orthophosphate (filterable reactive phosphorus) concentrations ranged from 4 to 9 µg.P/L (Appendix G). All samples were above the LoR. No samples exceeded the ANZG (2018) DGV for physical and chemical stressors in the Anson Beagle bioregion for phosphate of 0.209 µmol PO4-P/L (19.85 µg.P/L) in surface waters and 0.427 µmol PO4-P/L (40.55 µg.P/L) in bottom waters for summer.

TP concentrations ranged from 11 to 16 µg.P/L. There is no ANZG (2018) default guideline value for TP.

3.3.2.3.3 Pigments

Chlorophyll-a concentrations ranged from 0.2 to 0.5 µg/L at the spoil ground sites (Figure 3-47; Appendix G). All concentrations were below the ANZG (2018) DGV for physical and chemical stressors in the Anson Beagle bioregion value for chlorophyll-a of 2.568 µg/L in summer. Concentrations were variable across surface and bottom samples.

Phaeophytin-a was also sampled as this pigment is a breakdown product of chlorophyll-a and can be used to indicate if phytoplankton are blooming or declining. Phaeophytin-a was not detected above the LoR for any of the spoil ground sites.



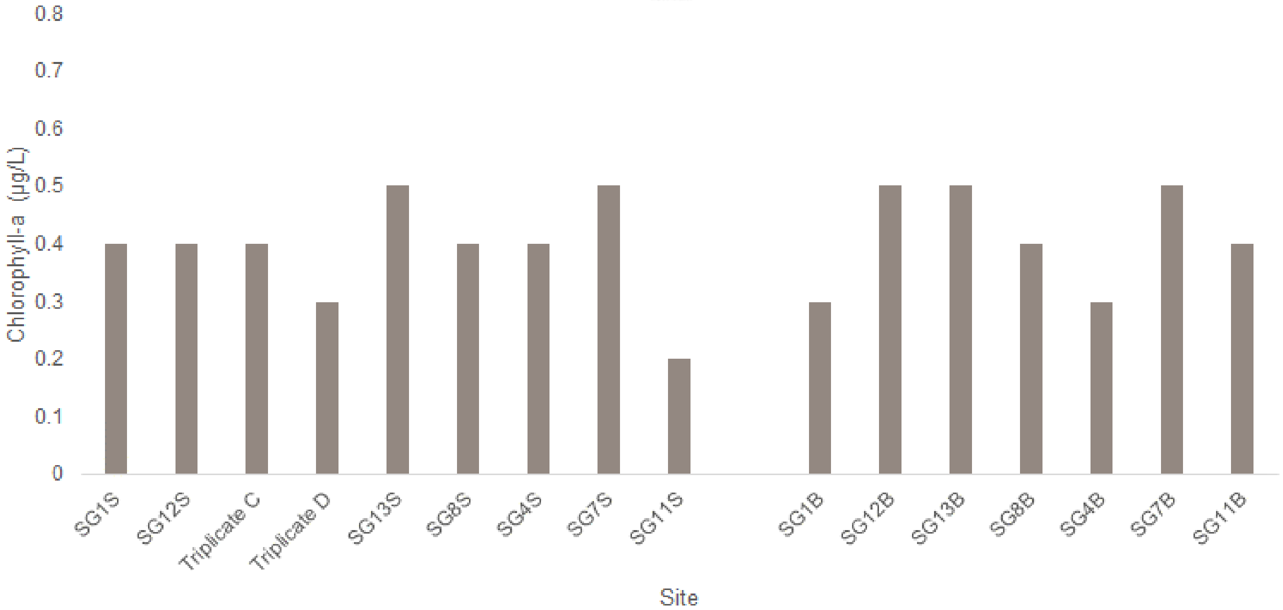


Figure 3-47: Surface and bottom chlorophyll-a concentrations at the spoil ground

3.3.2.3.4 Total suspended solids

Total suspended solid (TSS) concentrations were all above the LoR (0.5 mg/L) and ranged from 1.4 to 6.2 mg/L (Appendix G). There was no clear difference found in the TSS between surface and bottom samples.

3.3.2.4 Hydrocarbons

The spoil ground TRH and BTEXN concentrations were below the LoR for all samples (Appendix H). The offshore pipeline samples were, therefore, not tested for PAHs.

3.3.2.5 Naturally occurring radioactive materials

Naturally occurring radioactive materials (NORMS) were all below limits of detection in spoil ground water samples (Appendix F).

3.4 Quality control

3.4.1 Field quality control samples

Field QC samples were analysed to assess contamination of samples during sampling. The hydrocarbon concentrations for both water and sediment samples showed no difference between the triplicates and the original sample sites. All blank samples were below the limit of reporting for hydrocarbons. Therefore, there was no hydrocarbon contamination of samples during sampling. The equipment blank for sediment sampling indicated potential for contamination of nutrients (phosphorous and nitrogen) from the grab sampler, but analysis of the field samples showed that the contamination management processes had been effective and no notable cross-contamination was likely to have occurred. No other cross-contamination issues were identified.

3.4.2 Laboratory quality control compliance assessment

The laboratory quality control compliance assessments from all water and sediment samples identified the following:

- No method blank value outliers occurred
- Seven sediment sample duplicate, laboratory control and matrix spike outliers were recorded:
  - A total of four analytes (arsenic, chromium, manganese and monobutyltin) from three sediment samples were identified returned relative percentage differences which exceeded LOR-based limits or recovery was greater than the upper control limit.
  - Matrix spike recovery could not be determined for one analyte (TP) as background levels were ≥4 times the spike level.
  - Recovery was less than the lower data quality objective in one analyte test (TP) for one sample.
- Surrogate recovery outliers were identified for organotin surrogate tests for tripropyltin in eight sediment samples, where recovery was greater than the upper data quality objective.
- Holding time compliance – there were extraction/preparation holding time exceedances for seven water sample analytes from equipment blank samples (nutrients and hydrocarbons), though four of these were analysed within analysis holding times. None of the field test samples exceeded holding times.
- Parameter frequency compliance outliers were recorded for two analyte tests (TRH – semivolatile fraction and total metals by ORC-ICPMS) from water samples, where recovery rate was below expected values.

4 DISCUSSION

The surveys described herein provided data characterising benthic habitats and sediment quality (physico-chemical characteristics) in areas along the Barossa DPD pipeline route and proposed spoil disposal area. Water quality and infauna analysis were also undertaken at selected locations along the offshore pipeline and spoil ground. Water depths of sampling sites ranged from 8.5 m in Darwin Harbour to 59.9 m at the westernmost sites.

4.1 Benthic habitats

4.1.1 October 2021 survey

Eight high-level habitat types were identified along the Barossa DPD pipeline route and in the proposed spoil ground area. This comprised six soft substrate habitats and two hard substrate habitats. Soft sediment benthic habitats and communities were well represented across the whole survey area.

The offshore pipeline route was dominated by particulate silt/clay sediments with very sparse to sparse epibiota (1–5% cover), which mostly comprised soft corals and crinoids. Twenty-three video survey sites were characterised by this habitat type. Two other habitat types were also recorded towards the Darwin harbour end of the offshore pipeline route. These were: sand waves (~1 m) with silty sand in troughs and shelly sand at peaks and very sparse biota, and silt/clay with medium density biota (soft corals, algae and bryozoa). Conspicuous epibiota of soft sediment habitats included gorgonians, echinoderms, molluscs, crustaceans (including shrimp and the painted pebble crab, *Leucosia anatum*), with frequent bioturbation (burrows and polychaete tubes).

The benthic habitats in the spoil ground comprised silty/clay sediment with medium density biota (soft corals, algae and Bryozoa, 20–60% cover). Biota commonly associated with this habitat were soft corals (gorgonians, *Junceella* spp. and Alcyoniidae), branching and encrusting sponges, Bryozoa (lace corals), brown algae, bioturbation (invertebrate burrows and polychaete tubes) and occasional motile crinoids.

Darwin Harbour benthic habitats comprised soft sediment habitats and the only two hard substrate habitats were recorded during the surveys. Local fishers in Darwin target areas of the harbour identified as hard substrate. Hard substrates were recorded along the section of the pipeline route offshore from Fannie Bay (HS60 to HS68 and HS54 and HS55). Most of the hard substrate sites were consolidated rocks with a shelly coarse sediment veneer and sparse to medium conspicuous epibiota (mainly soft corals and bryozoans). Low profile reef was also recorded at sites HS61 and HSN2, with medium to high density epibiota. The epibiota associated with this habitat type included hydroids, soft corals (gorgonians, *Junceella* spp.), brown algae, bryozoans (lace corals), ascidians, and encrusting, digitate and globular sponges. The soft substrate habitat adjacent to hard substrate habitats in Darwin Harbour were generally silty, shelly sand with very sparse soft corals to no conspicuous epibiota. As this habitat was recorded both adjacent to and between hard substrate habitats, this soft substrate habitat is potentially a veneer overlying submerged geology. Other recorded soft sediment benthic habitats in Darwin Harbour included:

- Sand waves <1 m with coarse shelly sand and very sparse epibiota (HS78)
- Silt/clay, shelly sand, with very sparse to sparse biota (soft corals and crinoids) (sites HS50, HS52 and HS53, at the southern end of the pipeline, near the shore crossing)
- Silty, shelly sand with sparse epibiota (soft corals) and scattered bombora (site HS51, at the southern end of the pipeline, near the shore crossing).

4.1.2 June 2022 survey

The June 2022 video transect survey was analysed and sorted into the same eight high-level habitat types that were used for the October 2021 (Table 3-1). Similar to the October 2021 study, soft sediment benthic habitats and communities were well represented across the entire survey area.

The June 2022 survey found that the outer offshore pipeline route was dominated by fine sand/silt with sparse epibiota and bioturbation with some sand waves (BACI_6C; <1 m high). Occasional sponges and soft corals were present with below 5% cover. However, a fish aggregation site, outside of the project area, ~2.6 km from the proposed pipeline route, was found to support a rocky reef with medium density epibiota and bioturbation. The proposed sand waves dredge area (Sand waves) was found to contain rippled coarse sand with very little epibiota (<1% abundance), consisting of some sparse soft corals and crinoids.

The habitat just outside Darwin Harbour consisted mainly of course rippled sand, with low overall epibiota but increasing towards the harbour opening and increasing rocky substrate. The habitat sites outside the harbour (Hab1–Hab5) ranged from rippled sand to medium sand with gravel toward the harbour opening. These sites had epibiota less than 1% coverage, consisting mainly of sparse anemone, soft corals and macroalgae (Hab1). INPHCMAN and INPHCMAN_1, closer to the western opening of the harbour, consisted of rocky/bedrock reefs with sediment veneer and medium to high density epibiota, consisting mainly of sponges and soft/hard corals. While epibiota increased towards the coast and opening of the harbour, the heritage sites (147, 031 and 241) did show some variety, as the dominant substrate was rocky/bedrock with sediment veneer and medium densities of epibiota (20–60% coverage), consisting mainly of sponges, soft corals, bryozoan turf with common fish sightings. This region represented a transition between the sand/silt low epibiota density habitats to the rocky high epibiota density habitats.

Epibiota continued to increase further into Darwin Harbour, as the majority of sites had medium to high epibiota density, with many also including reef habitats. The exceptions were the sites near Wickham point (Hab9, Hab10, BACI_1C/P and BACI_2C/P), as these consisted of only bedrock with a thin veneer of sediment unable to support large quantities of epibiota. Only sparse populations of sponges, soft corals and crinoids, though fish were often spotted in boroughs. The central portion of the harbour consisted of rocky/bedrock substrate with large patches of mobile sediment. Moderate density of epibiota was observed, consisting mainly of sponges, soft corals, hydroid/bryozoan turf, macroalgae and small quantities of hard coral (2–5% coverage). This central portion of Darwin Harbour had the greatest density and biodiversity of epibiota observed in the video transects within the project area.

Outside of the project area, INPHCWOD consisted of mainly rippled coarse sand with bioturbation and low-density seagrass. The other three sites (INPHCSSI, INPHCCHI and INPHCNEW) had moderate to high density epibiota with rocky/reef substrates. These sites were characterised by large soft corals and sponges, echinoderms, schools of fish and hard corals. These sites had the highest biodiversity and epibiota density observed in the video transect survey and were located in the shallower protected areas of the harbour, away from the project area.

4.1.3 Video transect surveys compared to AIMS 2021 habitat mapping

The Barossa DPD Darwin Harbour October 2021 and June 2022 benthic habitat data was overlaid on a composite habitat map of Darwin Harbour from AIMS (2021) (Figure 4-1, Figure 4-2 and Figure 4-3). The 2021 AIMS habitat map shows areas of seabed assigned by a predictive model to be suitable for the presence of different biota categories including seagrass, hard coral, macroalgae, filter feeders/octocorals and sponges. The comparison of datasets shows differences in habitat types, particularly with the level of information provided (approximate densities of biota, substrate types not available in AIMS data).

The Barossa DPD surveys recorded filter feeders at sparse densities across almost all soft substrate types whereas large areas of ‘sponges’ habitat with small patches of filter feeders/octocorals were predicted by AIMS only near the harbour entrance, which have been mapped based on emergent bedrock evident in geophysical (bathymetric) survey data (Figure 4-2). Barossa DPD video survey at the harbour entrance, however, identified habitat comprising consolidated rocks with a shell sediment veneer and sparse to medium density biota, mainly characterised by soft corals and bryozoa (though sponges were present). Moving north (in the AIMS predicted ‘sponges’ habitat), the seabed habitats were identified during the Barossa DPD survey as changing to silty, shelly sand, with very sparse to no conspicuous epibiota. This is potentially the area of transition from hard to soft substrates, as the soft sediment habitat continues in a northerly direction along the pipeline route.

Nearer the shoreline crossing, large areas of the AIMS map show ‘bare ground’, whereas the Barossa DPD survey found a mosaic of habitats (Figure 4-3), comprising ‘silty, shelly sand with very sparse to no conspicuous epibiota’, ‘consolidated rocks with a shelly sediment veneer and sparse to medium biota (soft corals, bryozoa)’, and ‘silt/clay and shelly sand with sparse to very sparse epibiota (soft corals and crinoids)’.

Overall, the benthic habitat and communities survey revealed that the Barossa DPD pipeline route is a transitional environment, with soft sediment habitats along the offshore pipeline route and spoil ground, and with areas of both soft and hard substrate habitat within Darwin Harbour. The soft sediment habitats support very sparse to sparse epibiota, and the rocky substrates support low to medium density filter-feeder communities.

Table 4-1: Comparison of habitat classifications of towed video surveys (October 2021 and June 2022) and AIMS habitat mapping (2021)

Site	AIMS habitat classification	Towed video habitat classification
Oct-21		
OP1	Not mapped	Silty, shelly sand, with very sparse biota (soft corals and crinoids).
OP2	Not mapped	Silty, shelly sand, with very sparse biota (soft corals and crinoids).

5	Silty, shelly sand, with very sparse to no biota (soft corals).
6	Hard bottom (rocks) with shelly sediment veneer and sparse to medium biota (soft corals, bryozoa).
7	Low profile reef, with medium to high density biota (soft corals).
8	Silty, shelly sand, with very sparse to no biota (soft corals) with scattered bombora.

Figure 4-3: Benthic habitat types identified along the pipeline route and inner Darwin Harbour overlayed on AIMS 2021 habitat map

4.2 Infauna assemblages

The infauna analysis revealed a total of 744 individuals from ten phyla were recorded from the 29 offshore pipeline samples analysed. Infaunal assemblages were dominated by crustaceans (350 individuals) and annelids (polychaete worms; 313 individuals). Crustaceans were most abundant at more than half of the sites sampled (55.2%), and Annelids most abundant at the other 13 sites (44.8%). The next most numerous phyla were an order of magnitude lower in abundance (Sipuncula, Echinodermata, Mollusca and Chordata). Multivariate analysis identified that there were three main infaunal assemblage types along the offshore pipeline route, interspersed with patchy or transitional (heterogeneous) habitats:

- The furthest offshore soft sediment habitats (OP1–OP10, OP12–OP19, OP22 and OP24) were characterised by a much more diverse community, with 30 taxa comprising the top 90% of taxa characterising the biological assemblage. The crustaceans (mainly amphipods, tanaids and isopods) and polychaetes (mainly deposit-feeding tube worms and free-living taxa) were the dominant taxa, with echinoderms (Ophiuroidea) and sipunculids also represented. This habitat was characterised by coarse sediments with the lowest silt/clay component, which would have provided a more complex substrate and potentially better sediment oxygenation in surficial sediments.
- This next group (sites OP21, OP23 and OP27) around the central and southern section of the offshore pipeline route was dominated by brittlestars (Ophiuroidea) and polychaetes (*Lumbrineris* sp., spionids, *Nephtys* sp. and *Axiothella* sp.). These taxa are generally surface deposit feeders and/or carnivores/ scavengers, with several capable of interface feeding (switching between, e.g. deposit feeding and suspension/filter feeding), which is a trait often associated with harsh or nutrient-poor environments, such as the fine or sandy sediments characterising this habitat. This infaunal assemblage was much less biodiverse than the first grouping, with only five taxa comprising the top 90% of taxa characterising the group. Diversity scores (Shannon-Weiner) were generally lower than recorded for the first group.
- The final group was generally the most shoreward group (OP26, OP28 and OP29), but was also recorded at the offshore end of the pipeline route (OP11). This group was dominated by Anthuridea (elongate isopod crustaceans) and polychaete worms (*Eunice* sp. *Axiothella* sp. and *Nepthys* sp.). The average abundance of these taxa is higher than the previous grouping, which is likely due to a greater range of particle sizes in the substrate. This aspect is indicated by the dominance of Anthuridea, which live in crevices, empty calcareous worm tubes or structurally complex epibiota. Sediments were characterised by a higher per cent gravel component and per cent silt component than the previous group.

A total of 185 individuals from five phyla were recorded from the 13 proposed spoil ground samples analysed. The dataset was dominated by crustaceans (107 individuals) and annelids (polychaete worms; 55 individuals), with the next most numerous phyla being Echinodermata, Sipuncula and Nematoda. Infaunal assemblages at the proposed spoil ground had fewer species and lower abundance, but both were greater than the infaunal assemblages recorded from previous studies in Darwin Harbour (INPEX Browse Ltd, 2010), most likely due to the different environmental conditions within the harbour (e.g. silt input, freshwater input, flushing rates). It is likely that other unmeasured factors, e.g. such as (but not limited to) current speeds/site energy, salinity profiles up the river and sediment chemistry, also contribute, and that there is likely to be seasonal variability in the distribution and composition of benthic faunal assemblages (Chalmers et al. 1976, Tweedley & Valesini 2008, Sheaves 2015, Silva & Barros 2015). No high conservation significant ecological values, habitats, communities of species were identified and the habitats and communities within the Barossa DPD survey area are very well represented in the region.

4.3 Sediment characteristics

Sediment sampling and analysis was conducted in line with the NAGD (CoA, 2009). Seabed sediment PSD data identified a transition in sediment grain sizes along the offshore pipeline route, with the per cent clay and silt contributions increasing from around 3% and 9%, respectively, at the offshore OP1 (slightly silty gravelly sands; near KP0) end of the survey area, to up to around 7% and 39%, respectively, at the OP30, near the Darwin Harbour limits (gravelly muddy sands; at ~KP90). The increase in silt from offshore (~KP0) to Darwin Harbour is likely due to the riverine input of fine material from the Darwin harbour catchment area and mudflats/mangrove areas. The PSD data for the spoil ground indicated some local heterogeneity in sediments but were generally gravelly sands and muddy gravelly sands (3–5% clay, 12–23% silt, 51–73% sand and 9–29% gravel). Darwin Harbour sediments ranged from sandy muds to muddy sandy gravels, with most sediments being muddy gravelly sands. There was also a sediment gradient from the harbour limits

(KP92) to near the shore crossing, with silty and slightly silty slightly gravelly sands at KP92 transitioning to silty sandy gravels from around KP102 to muddy sandy gravels and sandy muddy gravels near the shore crossing at KP120. Gravels in the study area comprise material from both geogenic (i.e. local rock formations) and biogenic (e.g. shell and potentially coral fragments) sources.

Comparison of the sediment composition of the offshore pipeline route, the spoil ground, the sand wave area in Darwin Harbour and the pipeline route south of the sand wave area to the shore crossing identified significant differences between all these areas. Sediments at the offshore sampling sites (offshore pipeline and spoil ground) were generally dominated by sands (average >50%), with pebbles (~27%), silt (11–15%) and clay (3–4%). There was no recorded hard substrate from subsea video survey, so the coarser fragments (pebble) are more likely to be of biogenic origin (e.g. shell fragments). The main difference between the offshore pipeline route and the spoil ground is the increased relative silt content and subsequent reduced sand content. This outcome may well be due to a combination of factor, such as the smaller survey area (relative to the offshore pipeline route) and hence reduced potential heterogeneity), the more eastern location of the spoil ground, and the greater potential for the influence of open ocean environmental conditions on seabed substrates at the western end of the offshore pipeline route (e.g. potentially greater energy and potential increased near-sed bed currents, increasing potential for winnowing of finer particle sizes).

The sediments inside the harbour were generally coarser and more characteristic of mixed sediments rather than the silty coarse sands recorded outside of Darwin Harbour. This is likely to be due to a combination of a range of factors, including the local geology and differences in hydrodynamic conditions of the semi-enclosed Darwin Harbour versus the more open ocean-influenced Beagle Gulf. However, the mobile sediments of the sand wave area were distinct with respect to the very low silt content. This is likely due to the sorting of sediment particle sizes during transport along the seabed and the winnowing (removal through resuspension) of the finer silt particles. It is also likely that the seabed underlying the mobile layer was more similar to nearby seabed substrates in Darwin Harbour.

Analysis of metals and metalloids in sediments along the pipeline route and at the spoil ground indicated arsenic concentrations in 74 samples greater than the relevant NAGD screening levels. Arsenic is considered to have become concentrated in sedimentary rocks through sedimentation processes. The fine-grained clastic sediments have higher arsenic concentrations than the coarse-grained sediments. Comparison of arsenic with iron showed strong positive results with spoil ground and Darwin Harbour surficial sediments. A weak result was identified with the offshore pipeline samples and Darwin Harbour core samples. The results indicate that the highest concentrations of arsenic and iron were recorded in the southerly section of the Darwin Harbour pipeline section, closest to the shore crossing. Geophysical data (both historic and contemporary), historic habitat mapping surveys and subsea video collected during the present study in Darwin Harbour have identified areas of emergent bedrock, often with a relatively thin veneer of sediment. The correlation between arsenic and iron in this area suggests that the underlying bedrock is likely the source of arsenic, which has previously been recorded in Darwin Harbour and is a well-known natural source in north-west Australia (e.g. INPEX Operations Australia Ltd 2014, DEC 2006). Arsenic in Darwin Harbour sediments is considered unlikely to be bioavailable to any significant extent, and therefore unlikely to cause toxic impacts to biota (INPEX Operations Australia Ltd 2014).

Despite a strong positive relationship between arsenic and iron in spoil ground samples, the concentrations of both analytes were much lower than recorded in the Harbour. This suggests that the source of the arsenic and iron is likely to be outside of the spoil ground, and spatial interpretation of arsenic concentrations at spoil ground sampling sites indicates that the source is likely to be to the north-north-west of the spoil ground (as there is an increasing transition in arsenic concentrations in this direction across the sampling array). The source is therefore unlikely to be dredged Darwin Harbour seabed material disposed of at the adjacent INPEX Ichthys spoil ground to the east of the proposed spoil ground location.

A general trend for many of the metals analysed was an increasing concentration towards and within Darwin Harbour, though with much lower concentrations (except manganese) recorded in the proposed sand wave dredging area towards the mouth of the harbour. This trend correlates with the silt content of sediments, which increased towards and within the harbour, except for the mobile sand waves from which the finer components were likely winnowed away by near seabed currents. Metals and metalloids are commonly associated with smaller particle sizes (Martincic et al*.* 1990).

TPH, TRH and BTEXN concentrations were below the laboratory LORs in sediment samples at all offshore pipeline and spoil ground sites. Consequently, no analysis of PAHs was required at these locations. TPH and TRH were detected at 35 of the Darwin Harbour sites at low levels. Normalised TPH and TRH concentrations were well below the Default Guideline Value (DGV) of 280 mg/kg across all sites, with the highest recorded concentration of C10–C36 (sum) being 45 mg/kg at site HS09. All PAH concentrations at these 35 sites were below the LoR.

NORMs were recorded above LoRs for all sediment samples long the offshore pipeline route. Levels of radium-226, radium-228 and thorium-228 were generally below 31, 33 and 37 Bq/kg, respectively, except at sites HS27 and HS31 in Darwin Harbour main channel between KP110 and KP112, where peak levels of 51.7–79.1, 46.8–59.5 and 43–63.8 Bq/kg were recorded, respectively. The combined value for radium-226, radium-228 and thorium-228 ('combined NORMs') were below the NAGD guideline value of 35,000 Bq/kg at all sites, even when considering upper confidence limits.

Pesticide concentration in all 27 of the Darwin Harbour sediment core samples retrieved were below the LoR.

TBT concentrations were below the limit of reporting in all samples from Darwin Harbour. No samples were analysed for TBT outside of the harbour.

There is low potential for acid sulfate soils as although inorganic sulfur is present in the sediments, there is significant ANC kinetically available to neutralise the oxidation products from the inorganic sulfur.

Overall, no contaminants of concern were found in the sediments along the pipeline route or at the potential spoil disposal ground, with elevated levels of arsenic considered to be naturally occurring. Therefore the sediments along the pipeline route are considered to be suitable for unconfined ocean disposal, as per the NAGD and NT EPA (2013) guidelines for dredging.

4.4 Water quality

Measurements of water quality profiles through the water column along the offshore pipeline route and at the proposed spoil ground indicated that water temperature was either consistent with depth or decreased slightly with depth. Salinity was either consistent or varied marginally over depth, except at the two westernmost offshore pipeline route sites, where an increase in salinity was recorded over the 0–10 m depth range. Turbidity at four sites along the offshore pipeline route decreased down to 15–20 m depth, then gradually increased with depth. Elsewhere along the pipeline route, turbidity was either relatively consistent with depth or increased with depth. At the proposed spoil ground turbidity generally increased with depth. Oxygen levels tended to increase with increasing depth in both study areas except at two sites along the offshore pipeline route. Oxygen levels decreased with depth below 20 m and at one and oxygen levels decreased down to ~10 m, then remained fairly consistent at the other site. pH decreased with increased depth at the majority of sites along the offshore pipeline route, increased with depth at two sites and at one site was consistent with depth except at ~15–20 m and ~35–>50 m where there was a relatively large drop from 11.5 to 9.5. The pH data from the spoil ground sites seemed to be inconsistent, and it was likely that the pH probe had developed a fault during these deployments. Overall, the CTD data indicate that there was no evidence of a halocline or thermocline and showed no indications of stratification of the water column.

Filtered and unfiltered cadmium (Cd), chromium (Cr), cobalt (Co), nickel (Ni) and mercury (Hg) were generally below LoRs at both offshore pipeline and spoil ground locations, except for one site, which had filtered nickel and unfiltered chromium concentrations that were above the LoR but well below the relevant guideline value. The filtered and unfiltered arsenic (As) concentrations were very similar in both offshore pipeline and spoil ground samples and were below the relevant ANZG (2018) DGV.

Filtered and unfiltered copper (Cu) concentrations at three sites were above the relevant ANZG (2018) DGV. The copper concentration in one sample OP2S was much higher than in other samples therefore it is likely that this sample is an outlier and sampled a potential contaminant. Filtered and unfiltered lead (Pb) concentrations ranged from <0.1 to 5.4 µg/L in the offshore pipeline samples but were much lower in the spoil ground samples (<0.1 to 0.4 µg/L). One sample had a filtered lead concentration above the relevant ANZG (2018) DGV. Unfiltered zinc (Zn) concentrations were at or above the relevant ANZG (2018) DGV of 8 µg/L in two samples, filtered zinc concentrations were at or above the DGV at six sites at the western end of the offshore pipeline route (between OP1 and OP5) and across the proposed spoil ground area (sites SG4, SG7 and SG12), with no clear trend in exceedances between surface and bottom waters.

The results of the analysis of metals and metalloids identified DGV exceedances in cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), nickel (Ni), mercury (Hg) and zinc (n) in the surface waters of site OP1, though the source was not identified.

Nitrite and nitrate were recorded at concentrations at or above LoRs in bottom water samples only, at concentrations of up to 15 µg.N/L. Ammonia was detected in 14 samples, with 13 of those being bottom (near seabed) samples and were below the relevant ANZG (2018) DGV. The peak concentration of ammonia was 13 µg.N/L at the proposed spoil ground. Total nitrogen concentrations ranged from 80 to 150 µg.N/L; 35 samples were at or exceeded the relevant ANZG (2018) DGV. Nineteen orthophosphate (filterable reactive phosphorus) concentrations samples exceeded the relevant ANZG (2018) and total phosphorous concentrations in 35 samples were at or exceeded the relevant ANZG (2018) DGV. Nutrients (nitrogen, phosphorus and organic carbon) are released in the decay of organic matter, and the increased concentrations of nutrients in near-seabed samples likely correlate with decaying organic matter on the seabed at those locations.

Chlorophyll-a concentrations were used as an indicator of the likely level of phytoplankton biomass across the offshore pipeline area. Chlorophyll-a concentrations ranged from 0.4 to 1.5 µg/L. All concentrations were below the relevant ANZG (2018). Phaeophytin-a is a breakdown product of chlorophyll-a and can be used to indicate if phytoplankton are blooming or declining. Phaeophytin-a was only detected in 10 samples of the offshore pipeline sites, the majority of which were surface samples.

TSS concentrations ranged from 1.7 to 8.6 mg/L. There was no correlation between depth and TSS, and no clear difference found in the TSS between surface and bottom samples. There is no ANZG (2018) default guideline value for TSS.

Hydrocarbon concentrations were below LoRs for all samples at all sites. Radium-226 was detected at above LoRs in near-seabed samples at two of the offshore pipeline sites but none of the spoil ground sites.

Job Name: Pipeline to Shore Marine Sediment Sampling						**Site ID:** KP92.75			
Job Number: 1001175						**Date:** 10/01/2022			
Coordinates (Attempt A): 682 764.090 m E, 8 635 053.557 m N						**Attempt B:**			
Attempt C:						**Attempt D:**			
Water depth LAT (m): 14.24				**Penetration (m):** 1.80 (A)				**Recovery (m):** 1.80 (A)	
Attempt	**Time (Local)**	**Horizon**	**Depth (cm)**	**Grainsize**	**Sorting**	**Colour (Munsell Soil Colour Charts)**	**Texture**	**Presence of shells/organics**	**Properties/comments/ inclusions**
A	0930	1	0-100	M	M	10YR 5/4 (yellowish Brown)	Sand	~20% shell	Some clay/slit mixed in

Log notes:

- 1 m core sampled (upper and lower)
- Shelly sand throughout core
- Small amounts of silt and clay mixed in
- Only 1 attempt required
- Poor recovery at same site for Geotech samples

Job Name: Pipeline to Shore Marine Sediment Sampling		**Site ID:** KP92.85
Job Number: 1001175		**Date:** 10/01/2022
Coordinates (Attempt A): 682 841.553 m E, 8 634 991.945 m N		**Attempt B:** 682 841.086 m E, 8 634 991.847 m N
Attempt C:		**Attempt D:**
Water depth LAT (m): 13.09	**Penetration (m):** 1 (A), 0.5 (B)	**Recovery (m):** 0.77 (A), 0.43 (B)

Attempt	**Time (Local)**	**Horizon**	**Depth (cm)**	**Grainsize**	**Sorting**	**Colour (Munsell Soil Colour Charts)**	**Texture**	**Presence of shells/organics**	**Properties/comments/ inclusions**
A	0948	1	0-77	M	W	10 YR 5/3 Brown	Sand	~20% shell	
B (rep)	1005	1	0-43	M	W	10 YR 5/3 Brown	Sand	~20% shell	

Log notes:

- For attempt A core:
  - 0-0.5 m sampled with all jars full (upper)
  - 0.5-0.77m sampled with all but elutriate jars full (lower)
- For attempt B core:
  - 0-0.43 m core sampled as replicate (upper only)
- Shelly sand throughout (higher shell content at surface ~30%)
- Silt visible in water within liner
- Both cores were temporarily stored upright before processing due to a build-up of samples
- Lower part of sample appeared shellier

Job Name: Pipeline to Shore Marine Sediment Sampling		**Site ID:** KP92.95
Job Number: 1001175		**Date:** 10/01/2022
Coordinates (Attempt A): 682 918.538 m E, 8 634 929.023 m N		**Attempt B:** 682 918.437 m E, 8 634 928.888 m N
Attempt C:		**Attempt D:**
Water depth LAT (m): 15.58	**Penetration (m):** 0.56 (A), 0.6 (B)	**Recovery (m):** 0.56 (A), 0.54 (B)

Attempt	**Time (Local)**	**Horizon**	**Depth (cm)**	**Grainsize**	**Sorting**	**Colour (Munsell Soil Colour Charts)**	**Texture**	**Presence of shells/organics**	**Properties/comments/ inclusions**
A	1021	1	0-15	M	M	10 YR 4/1 Dark grey	Sand	~5% shells	
		2	15-56	VF-M	M	10 YR 4/2 Dark greyish brown	Sandy Clay	~5% shells	
B (rep)	1040	1	0-15	VF-M	M	2.5 Y 4/1 Dark grey	Clayey sand	~5% shells	
		2	15-40	VF-M	M	2.5 Y 4/1 Dark grey	Sandy Clay	~5% shells	
		3	40-54	VF-M	M	2.5 Y 4/1 Dark grey	Clayey sand	~5% shells	

Log notes:

- For attempt A core:
  - 0-0.5 m sampled with all jars full (upper)
- For attempt B core:
  - 0-0.5 m core sampled as replicate (upper only)
  - Clay layer in between two sandy layers
- Sample was stored in liner before processing

Job Name: Pipeline to Shore Marine Sediment Sampling	**Site ID:** KP93.23
Job Number: 1001175	**Date:** 08/01/2022
Coordinates (Attempt A): 683 134.336 m E, 8 634 752.961 m N	**Attempt B:** 683 137.628 m E, 8 634 749.041 m N
Attempt C: 683 134.857 m E, 8 634 752.218 m N	**Attempt D:** 683 133.776 m E, 8 634 750.419 m N

Water depth LAT (m): 12.94	**Penetration (m):** 0 (A), 0.2 (B), 0.1 (C), 0.4 (D)	**Recovery (m):** 0 (A), 0.18 (B), 0.05 (C), 0.4 (D)

Attempt	**Time (Local)**	**Horizon**	**Depth (cm)**	**Grainsize**	**Sorting**	**Colour (Munsell Soil Colour Charts)**	**Texture**	**Presence of shells/organics**	**Properties/comments/ inclusions**
B	0421	1	0-18	M	W	10 YR 5/4 Yellowish brown	Sand	~10% shells	
D	0511	1	0-40	M	M	10 YR 5/4 Yellowish brown	Sand	~20% shells	Patches of clayey sand

Log notes:

- For attempt A core no sediment was collected and attempt 3 minimal sediment was collected
- Sample was collected from attempt B and D after homogenising (upper only)
- Samples were stored in liners before for several hours before processing

Water depth LAT (m): 12.47				**Penetration (m):** 0 (A), 1.57 (B)				**Recovery (m):** 0 (A), 1.57 (B)	
Attempt	**Time (Local)**	**Horizon**	**Depth (cm)**	**Grainsize**	**Sorting**	**Colour (Munsell Soil Colour Charts)**	**Texture**	**Presence of shells/organics**	**Properties/comments/ inclusions**
B	2257	1	0-100	M	W	10 YR 6/4 Light yellowish brown	Sand	~30% shells	

Log notes:

- Attempt A was unsuccessful
- Attempt B was sampled for upper (0-0.5m) and lower (0.5-1m)
- Sandy ridge/crest

Job Name: Pipeline to Shore Marine Sediment Sampling		**Site ID:** KP102.7	
Job Number: 1001175		**Date:** 07/01/2022	
Coordinates (Attempt A): 690 363.030 m E, 8 628 648.399 m N		**Attempt B:**	
Attempt C:		**Attempt D:**	
Water depth LAT (m): 27.09	**Penetration (m):** 2.65 (A)		**Recovery (m):** 1.6 (A)

Attempt	**Time (Local)**	**Horizon**	**Depth (cm)**	**Grainsize**	**Sorting**	**Colour (Munsell Soil Colour Charts)**	**Texture**	**Presence of shells/organics**	**Properties/comments/ inclusions**
A	1704	1	0-25	F	P	5 Y 4/1 Dark grey	Sandy clay	Some shells	Fine-medium gravel
		2	25-100	VF	P	5 Y 5/1 Grey	Clay	Some shells	Fine-medium gravel

Log notes:

- Attempt A core was sampled for upper (0-0.5m) and lower (0.5-1m)
- Less large gravel compared with other gravelly sites
- Alive worm caught in liner

Job Name: Pipeline to Shore Marine Sediment Sampling		**Site ID:** KP103.1
Job Number: 1001175		**Date:** 07/01/2022
Coordinates (Attempt A): 690 613.997 m E, 8 628 335.991 m N		**Attempt B:**

		2	40-59	VF-M	P	5 Y 5/3 Olive	Sandy clay		Medium-coarse gravel Orange mottles (25%) Grey/blue mottles (20%) Red mottles (2%)

Log notes:

- Upper sample collected from homogenised sediment from both attempts A and B
- Sample stored before homogenising and processing
- Orange, blue/grey and red mottles 0.4-0.59m

Job Name: Pipeline to Shore Marine Sediment Sampling	**Site ID:** KP106
Job Number: 1001175	**Date:** 06/01/2022
Coordinates (Attempt A): 692 426.006 m E, 8 626 073.362 m N	**Attempt B:** 692 420.161 m E, 8 626 076.814 m N
Attempt C:	**Attempt D:**

Water depth LAT (m): 21.92	**Penetration (m):** 1 (A), 0.53 (B)	**Recovery (m):** 1 (A), 0.53 (B)

Attempt	**Time (Local)**	**Horizon**	**Depth (cm)**	**Grainsize**	**Sorting**	**Colour (Munsell Soil Colour Charts)**	**Texture**	**Presence of shells/organics**	**Properties/comments/ inclusions**
A	2024	1	0-100	F-M	P	5 Y 5/2 Olive Grey	Sandy clay	Some shells	
B (dupe)	2122	1	0-53	F-M	P	5 Y 5/2 Olive Grey	Sandy clay	Some shells	

Log notes:

- Upper 0.5m of attempt A core homogenised with upper 0.5m of attempt B core and sampled for KP106 upper and duplicate
- Lower 0.5m of attempt A core sampled

Job Name: Pipeline to Shore Marine Sediment Sampling		**Site ID:** KP110.4	
Job Number: 1001175		**Date:** 06/01/2022 (Attempts A & B) & 10/01/2022 (Attempts C & D)	
Coordinates (Attempt A): 695 083.793 m E, 8 622 573.793 m N		**Attempt B:** 695 090.535 m E, 8 622 571.582 m N	
Attempt C: 695 085.691 m E, 8 622 571.271 m N		**Attempt D:** 695 085.769 m E, 8 622 575.183 m N	
Water depth LAT (m): 23.64	**Penetration (m):** 0.2 (A), 0.2 (B), 0.1 (C), 0.28 (D)		**Recovery (m):** 0.2 (A), 0.2 (B), 0.1 (C), 0.28 (D)

Attempt	**Time (Local)**	**Horizon**	**Depth (cm)**	**Grainsize**	**Sorting**	**Colour (Munsell Soil Colour Charts)**	**Texture**	**Presence of shells/organics**	**Properties/comments/ inclusions**
A	1450 (6/1)	1	0-20	VF-F	P	2.5 Y 4/2 Dark greyish brown	Sandy clay	High shell content Green shell mesh at surface	Medium-coarse gravel
C	2229 (10/1)	1	0-10	M	P	2.5 Y 5/2 Greyish brown	Sand	Some shells	High medium-coarse gravel content
D	2253 (10/1)	1	0-19	VF-M	P	5 Y 5/2 Olive grey	Clayey sand	Some shells	High fine-coarse gravel content
		2	19-28	VF-M	P	5 Y 5/2 Olive grey	Sandy clay	Some shells	High fine-coarse gravel content

Log notes:

- Two attempts (A & B) conducted on the 6/1/22
- Attempt A core only enough sediment to fill:
    - 2x 250mL and 2x 150mL glass jars for ALS
    - 1x 150mL glass jars for MAFRL
- Attempt B core only gravel
- Several differing collection techniques trialled to maximise sample retention
- Two attempts (C & D) conducted on the 10/1/22 and homogenised to fill:
    - 3x 250mL jars, 1x 150mL jar and 1 bag for ALS
    - 1x 150mL jar and2 bags for MAFRL
    - Sample containers filled according to remaining requirements for missing containers from previous sample

Job Name: Pipeline to Shore Marine Sediment Sampling		**Site ID:** KP112.4
Job Number: 1001175		**Date:** 06/01/2022 (Attempts A & B) & 10/01/2022 (Attempts C & D)
Coordinates (Attempt A): 696 267.828 m E, 8 620 958.932 m N		**Attempt B:** 696 267.058 m E, 8 620 956.578 m N
Attempt C: 696 265.258 m E, 8 620 960.969 m N		**Attempt D:** 696 264.954 m E, 8 620 963.672 m N
Water depth LAT (m): 19.74	**Penetration (m):** 0.1 (A), 0.25 (B), 0.2 (C), 0 (D)	**Recovery (m):** 0.1 (A), 0.25 (B), 0 (C), 0 (D)

Attempt	**Time (Local)**	**Horizon**	**Depth (cm)**	**Grainsize**	**Sorting**	**Colour (Munsell Soil Colour Charts)**	**Texture**	**Presence of shells/organics**	**Properties/comments/ inclusions**
A	1609	1	0-10	VF	P	5 Y 5/1 Gray	Clay	Shells and corals present	Medium-coarse gravel
B	1644	1	0-25	VF	P	2.5 Y 8/1 White	Clay		Fine-medium gravel 30% mica

Log notes:

- Two attempts (A & B) conducted on the 6/1/22
- Attempt A core was predominantly gravel with some clay
- Attempt B core was a mix of mica, gravel and white clay (very different from first attempt)
- Sampled from attempt B however there was only enough sediment to fill some of the required jars/bags
- Two extra attempts (C & D) were conducted on the 10/1/22
- Attempt C had 0.2m penetration but only recovered gravel
- Attempt D was unsuccessful

Job Name: Pipeline to Shore Marine Sediment Sampling						**Site ID:** KP119.7			
Job Number: 1001175						**Date:** 06/01/2022 (Attempts A & B) & 8/01/2022 (Attempt C)			
Coordinates (Attempt A): 699 601.077 m E, 8 614 551.150 m N						**Attempt B:** 699 601.245 m E, 8 614 551.849 m N			
Attempt C: 699 601.148 m E, 8 614 550.346 m N						**Attempt D:**			
Water depth LAT (m): 19.89				**Penetration (m):** 1.5 (A), 1.5 (B), 1.06 (C)			**Recovery (m):** 0 (A), 0.05 (B), 1 (C)		
Attempt	**Time (Local)**	**Horizon**	**Depth (cm)**	**Grainsize**	**Sorting**	**Colour (Munsell Soil Colour Charts)**	**Texture**	**Presence of shells/organics**	**Properties/comments/ inclusions**
C	1545	1	1-100	VF	P	5 Y 4/1 Dark grey	Clay	Some shells at surface	Fine-medium gravel

Log notes:

- Two attempts (A & B) conducted on the 6/1/22
- Attempt A and B had over a metre penetration but very little recovery and mostly only gravel collected
- Attempt C (conducted on 10/1/22) was sampled for upper and lower as a 1m was collected
- Liner had to be cut open using a grinder as clay was dense and stuck in liner and could not be tipped out
- The side of the sample along where the grinder was used was scrapped off before sampling
- Linear trend from coarser grains to finer from surface to bottom (slight sandiness at top)
- Heavy clay

Job Name: Pipeline to Shore Marine Sediment Sampling						**Site ID:** KP119.8			
Job Number: 1001175						**Date:** 06/01/2022 (Attempts A & B) & 11/01/2022 (Attempts C & D)			
Coordinates (Attempt A): 699 687.918 m E, 8 614 502.655 m N						**Attempt B:** 699 688.574 m E, 8 614 503.248 m N			
Attempt C: 699 688.317 m E, 8 614 500.820 m N						**Attempt D:** 699 686.599 m E, 8 614 500.582 m N			
Water depth LAT (m): 18.99				**Penetration (m):** 1.2 (A), 1 (B), 1 (C), 0.25 (D)				**Recovery (m):** 0 (A), 0.05 (B), 0.1 (C), 0.23 (D)	
Attempt	**Time (Local)**	**Horizon**	**Depth (cm)**	**Grainsize**	**Sorting**	**Colour (Munsell Soil Colour Charts)**	**Texture**	**Presence of shells/organics**	**Properties/comments/ inclusions**
B	0813	1	-	VF	P	2.5 Y 5/3 Light olive brown	Clay	Some shells	Medium-coarse gravel
D	0101	1	0-10	VF-M	P	5 Y 4/2 Olive grey	Sandy clay	Some shells	Medium gravel
		2	10-18	VF-M	P	5 Y 4/1 Dark grey	Sandy clay	Some shells	Fine-medium gravel Sandy layer
		3	18-23	VF-F	P	5 Y 4/1 Dark grey	Sandy clay	Some shells	Fine-medium gravel Clay layer

Log notes:

- Penetration achieved however only gravel recovered on attempt A and B (06/01/2022)
- Sediment smear from attempt B used for colour and texture
- Attempt C and D conducted on the 11/01/2022
- From attempt D core only enough sediment recovered to fill the following:
  - 2x 250mL jars + 1x 150mL jar + 1x bag for ALS
  - 2x bags + 1x 150mL jar for MAFRL

Job Name: Pipeline to Shore Marine Sediment Sampling		**Site ID:** KP120.5

METHOD	METHODOLOGY SUMMARY
ARS-SOP-AS301/AS406	Analysis of radionuclides in liquids by high resolution gamma ray spectrometry after radiochemical preparation . Radiochemical preparation involves total sample evaporation, sample co-precipitation using stable elemental carriers, or a combination thereof. In some cases, preparation may involve merely transferring liquid to a standard geometry container such as a Marinelli beaker.
AS303/406	Analysis of radionuclides in solid samples by high resolution gamma ray spectrometry after preparation to meet standard calibrated geometries. Preparation involves drying, crushing and sieving, and setting in an epoxy resin where necessary.

FOOTNOTES

*	NATA accreditation does not cover the performance of this service.	-	Not analysed.	UOM	Unit of Measure.
**	Indicative data, theoretical holding time exceeded.	NVL	Not validated.	LOR	Limit of Reporting.
***	Indicates that both * and ** apply.	IS	Insufficient sample for analysis.	↑↓	Raised/lowered Limit of Reporting.
		LNR	Sample listed, but not received.		

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received.
Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calculated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the " Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

If reported, measurement uncertainty follow the ± sign after the analytical result and is expressed as the expanded uncertainty calculated using a coverage factor of 2, providing a level of confidence of approximately 95%, unless stated otherwise in the comments section of this report.

Results reported for samples tested under test methods with codes starting with ARS-SOP, radionuclide or gross radioactivity concentrations are expressed in becquerel (Bq) per unit of mass or volume or per wipe as stated on the report. Becquerel is the SI unit for activity and equals one nuclear transformation per second.
Note that in terms of units of radioactivity:

a. 1 Bq is equivalent to 27 pCi
b. 37 MBq is equivalent to 1 mCi

For results reported for samples tested under test methods with codes starting with ARS-SOP, less than (<) values indicate the detection limit for each radionuclide or parameter for the measurement system used. The respective detection limits have been calculated in accordance with ISO 11929.

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: www.sgs.com.au/en-gb/environment-health-and-safety.

METHOD	METHODOLOGY SUMMARY
ARS-SOP-AS301/AS406	Analysis of radionuclides in liquids by high resolution gamma ray spectrometry after radiochemical preparation. Radiochemical preparation involves total sample evaporation, sample co-precipitation using stable elemental carriers, or a combination thereof. In some cases, preparation may involve merely transferring liquid to a standard geometry container such as a Marinelli beaker.
AS303/406	Analysis of radionuclides in solid samples by high resolution gamma ray spectrometry after preparation to meet standard calibrated geometries. Preparation involves drying, crushing and sieving, and setting in an epoxy resin where necessary.

FOOTNOTES

*	NATA accreditation does not cover the performance of this service.	-	Not analysed.	UOM	Unit of Measure.
**	Indicative data, theoretical holding time exceeded.	NVL	Not validated.	LOR	Limit of Reporting.
***	Indicates that both * and ** apply.	IS	Insufficient sample for analysis.	↑↓	Raised/lowered Limit of Reporting.
		LNR	Sample listed, but not received.		

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received.
Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calculated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the " Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

If reported, measurement uncertainty follow the ± sign after the analytical result and is expressed as the expanded uncertainty calculated using a coverage factor of 2, providing a level of confidence of approximately 95%, unless stated otherwise in the comments section of this report.

Results reported for samples tested under test methods with codes starting with ARS-SOP, radionuclide or gross radioactivity concentrations are expressed in becquerel (Bq) per unit of mass or volume or per wipe as stated on the report. Becquerel is the SI unit for activity and equals one nuclear transformation per second.
Note that in terms of units of radioactivity:

a. 1 Bq is equivalent to 27 pCi
b. 37 MBq is equivalent to 1 mCi

For results reported for samples tested under test methods with codes starting with ARS-SOP, less than (<) values indicate the detection limit for each radionuclide or parameter for the measurement system used. The respective detection limits have been calculated in accordance with ISO 11929.

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: www.sgs.com.au/en-gb/environment-health-and-safety.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Morgan Lennox	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
Satishkumar Trivedi	Senior Acid Sulfate Soil Chemist	Brisbane Acid Sulphate Soils, Stafford, QLD
Satishkumar Trivedi	Senior Acid Sulfate Soil Chemist	Brisbane Inorganics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

This report contains preliminary authorised results. The report may contain semi-quantitative results. Any result presented in this preliminary report may be subject to change in the final report.

- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP080-SD: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP131A: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- ASS: EA033 (CRS Suite):Retained Acidity not required because pH KCl greater than or equal to 4.5
- EK061G (Total Kjeldahl Nitrogen as N) / EK067G (Total Phosphorus as P): Sample EB2200737_002 (KP92-95_U_1) Shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- EG005T-Total Metals by ICP-AES: Sample 'KP93-23_U' (EB2200737-001) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- EG005T-Total Metals by ICP-AES: Sample 'KP120-6_U' (EB2200737-014) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- AES 6318477 T/O 6314877
- EG020-SD (Total Metals in Sediments by ICP-MS): Sample KP120-6_U (EB2200737-014) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- EG020-SD (Total Metals in Sediments by ICP-MS): Sample KP92-95_U_1 (EB2200737-002) shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- EP071 (TRH Semivolatiles): Sample 'KP92-95_U_1' shows poor matrix spike recovery due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- ASS: EA033 (CRS Suite): Laboratory determinations of ANC needs to be corroborated by effectiveness of the measured ANC in relation to incubation ANC. Unless corroborated, the results of ANC testing should be discounted when determining Net Acidity for comparison with action criteria, or for the determination of the acidity hazard and required liming amounts.
- ASS: EA033 (CRS Suite): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil', multiply 'reported results' x 'wet bulk density of soil in t/m3'.

ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Morgan Lennox	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
Satishkumar Trivedi	Senior Acid Sulfate Soil Chemist	Brisbane Acid Sulphate Soils, Stafford, QLD
Satishkumar Trivedi	Senior Acid Sulfate Soil Chemist	Brisbane Inorganics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP080-SD: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP131A: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- ASS: EA033 (CRS Suite):Retained Acidity not required because pH KCl greater than or equal to 4.5
- EK061G (Total Kjeldahl Nitrogen as N) / EK067G (Total Phosphorus as P): Sample EB2200737_002 (KP92-95_U_1) Shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- EG005T-Total Metals by ICP-AES: Sample 'KP93-23_U' (EB2200737-001) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- EG005T-Total Metals by ICP-AES: Sample 'KP120-6_U' (EB2200737-014) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- AES 6318477 T/O 6314877
- EG020-SD (Total Metals in Sediments by ICP-MS): Sample KP120-6_U (EB2200737-014) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- EG020-SD (Total Metals in Sediments by ICP-MS): Sample KP92-95_U_1 (EB2200737-002) shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- EP071 (TRH Semivolatiles): Sample 'KP92-95_U_1' shows poor matrix spike recovery due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- ASS: EA033 (CRS Suite): Laboratory determinations of ANC needs to be corroborated by effectiveness of the measured ANC in relation to incubation ANC. Unless corroborated, the results of ANC testing should be discounted when determining Net Acidity for comparison with action criteria, or for the determination of the acidity hazard and required liming amounts.
- ASS: EA033 (CRS Suite): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime ($CaCO_3$) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil', multiply 'reported results' x 'wet bulk density of soil in t/m3'.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Mark Hallas	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Morgan Lennox	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
Satishkumar Trivedi	Senior Acid Sulfate Soil Chemist	Brisbane Acid Sulphate Soils, Stafford, QLD
Satishkumar Trivedi	Senior Acid Sulfate Soil Chemist	Brisbane Inorganics, Stafford, QLD
Thomas Donovan	Senior Organic Chemist - PFAS	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP080-SD: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP131A: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- **OC Pesticides (Ultratrace) & PCB's (Ultratrace) analysis is conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913).**
- **Ultra trace organics analysis is conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913).**
- EK067G (Total Phosphorus as P): Sample EB2200550_001 (KP93.7_U) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- ASS: EA033 (CRS Suite):Retained Acidity not required because pH KCl greater than or equal to 4.5
- EK067G (Total Phosphorus as P) / EK061G (Total Kjeldahl Nitrogen as N): Sample EB2200550_002 (KP93.8_U) shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- EG020-SD (Total Metals Sediments by ICP-MS): Sample 'KP106.0_L' (EB2200550-012) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- ASS: EA033 (CRS Suite): Laboratory determinations of ANC needs to be corroborated by effectiveness of the measured ANC in relation to incubation ANC. Unless corroborated, the results of ANC testing should be discounted when determining Net Acidity for comparison with action criteria, or for the determination of the acidity hazard and required liming amounts.
- ASS: EA033 (CRS Suite): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime ($CaCO_3$) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil', multiply 'reported results' x 'wet bulk density of soil in t/m3'.

No. of samples analysed	: 17		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Morgan Lennox	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
Satishkumar Trivedi	Senior Acid Sulfate Soil Chemist	Brisbane Acid Sulphate Soils, Stafford, QLD
Satishkumar Trivedi	Senior Acid Sulfate Soil Chemist	Brisbane Inorganics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP080-SD: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP131A: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- ASS: EA033 (CRS Suite):Retained Acidity not required because pH KCl greater than or equal to 4.5
- EK061G (Total Kjeldahl Nitrogen as N) / EK067G (Total Phosphorus as P): Sample EB2200737_002 (KP92-95_U_1) Shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- EG005T-Total Metals by ICP-AES: Sample 'KP93-23_U' (EB2200737-001) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- EG005T-Total Metals by ICP-AES: Sample 'KP120-6_U' (EB2200737-014) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- AES 6318477 T/O 6314877
- EG020-SD (Total Metals in Sediments by ICP-MS): Sample KP120-6_U (EB2200737-014) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- EG020-SD (Total Metals in Sediments by ICP-MS): Sample KP92-95_U_1 (EB2200737-002) shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- EP071 (TRH Semivolatiles): Sample 'KP92-95_U_1' shows poor matrix spike recovery due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- ASS: EA033 (CRS Suite): Laboratory determinations of ANC needs to be corroborated by effectiveness of the measured ANC in relation to incubation ANC. Unless corroborated, the results of ANC testing should be discounted when determining Net Acidity for comparison with action criteria, or for the determination of the acidity hazard and required liming amounts.
- ASS: EA033 (CRS Suite): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime ($CaCO_3$) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil', multiply 'reported results' x 'wet bulk density of soil in t/m3'.

Signatory: Jamie Woodward
Date: 19/11/2021

The results only apply to the sample as received and to the sample tested.
Spare test items will be held for two months unless otherwise requested.

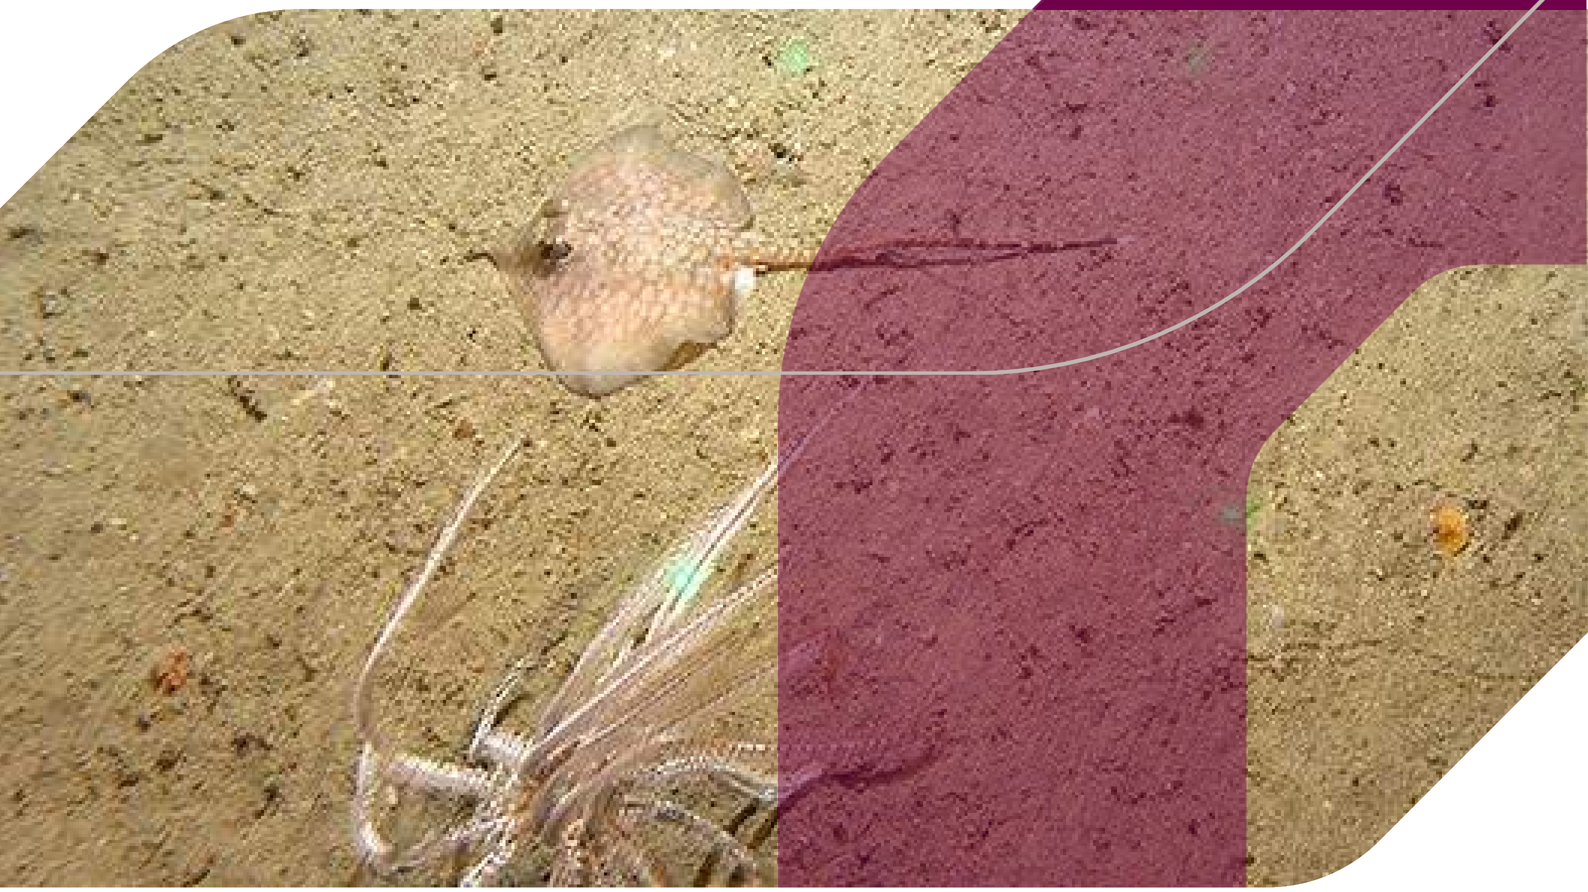
Appendix H
Laboratory sediment and water hydrocarbon, pesticides, tributyl tin and acid sulfate soils data



CERTIFICATE OF ANALYSIS

Work Order	: **ES2137956**	Page	: 1 of 13
Client	: **RPS AAP Consulting Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Natalie Robson	Contact	: Nick Courts
Address	: Level 2, 27-31 Troode St West Perth 6005	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61-2-8784 8555
Project	: RPS Sediment & Water Quality	Date Samples Received	: 21-Oct-2021 06:30
Order number	: ----	Date Analysis Commenced	: 22-Oct-2021
C-O-C number	: ----	Issue Date	: 28-Oct-2021 13:54
Sampler	: Natalie Robson		
Site	: Timor Sea		
Quote number	: EP/145/21		
No. of samples received	: 45		
No. of samples analysed	: 45		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP080-SD: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP080-SD: Surrogate recovery bias low due to sample matrix interferences, confirmed by re-extraction and re-analysis.

No. of samples received	: 45		
No. of samples analysed	: 45		

NATA
Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP080-SD: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.

Client	: **RPS AAP Consulting Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Natalie Robson	Contact	: Nick Courts
Address	: Level 2, 27-31 Troode St West Perth 6005	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61-2-8784 8555
Project	: Sediment Quality	Date Samples Received	: 27-Oct-2021 07:00
Order number	: ----	Date Analysis Commenced	: 28-Oct-2021
C-O-C number	: ----	Issue Date	: 09-Nov-2021 16:51
Sampler	: Natalie Robson		
Site	: ----		
Quote number	: EP/875/21_V3		
No. of samples received	: 54		
No. of samples analysed	: 54		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Ben Felgendrejeris	Senior Acid Sulfate Soil Chemist	Brisbane Acid Sulphate Soils, Stafford, QLD
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Evie Sidarta	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Morgan Lennox	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
Wisam Marassa	Inorganics Coordinator	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP090 Organotins: High LCS recovery for MBT deemed acceptable as all associated analyte results are less than LOR.
- EP090-Organotins: High surrogate recovery for particular samples are deemed acceptable as all associated analyte results are less than LOR.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP080-SD: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP131A: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP131B : LOR is raised due to high amount of moistures is present.
- EG020: Poor precision was obtained for some elements on samples ES2136788 - #001, #011 and #32 due to sample heterogeneity. Results have been confirmed by re-extraction and reanalysis.
- EK067G: Poor spike recovery for Total Phosphorus due to matrix interferences.
- EG094: Results for sample ES2136788-#013 have been confirmed by re-digestion and reanalysis.
- EG020: Poor precision was obtained for Arsenic and Manganese on sample ES2136788-#001. Results have been confirmed by re-extraction and reanalysis.
- EG020: Poor precision was obtained for Chromium on samples ES2136788-#011 and #032. Results have been confirmed by re-extraction and reanalysis.
- ASS: EA037 (Rapid Field and F(ox) screening): pH F(ox) Reaction Rate: 1 - Slight; 2 - Moderate; 3 - Strong; 4 - Extreme
- EA037 ASS Field Screening: NATA accreditation does not cover performance of this service.
- EG093: Samples containing high levels of sulfate may precipitate barium under the acidic conditions of this method and may therefore bias results low.

Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- **Analysis is conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913).**

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- **Analysis is conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913).**

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Morgan Lennox	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
Satishkumar Trivedi	Senior Acid Sulfate Soil Chemist	Brisbane Acid Sulphate Soils, Stafford, QLD
Satishkumar Trivedi	Senior Acid Sulfate Soil Chemist	Brisbane Inorganics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP080-SD: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP131A: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- ASS: EA033 (CRS Suite):Retained Acidity not required because pH KCl greater than or equal to 4.5
- EK061G (Total Kjeldahl Nitrogen as N) / EK067G (Total Phosphorus as P): Sample EB2200737_002 (KP92-95_U_1) Shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- EG005T-Total Metals by ICP-AES: Sample 'KP93-23_U' (EB2200737-001) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- EG005T-Total Metals by ICP-AES: Sample 'KP120-6_U' (EB2200737-014) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- AES 6318477 T/O 6314877
- EG020-SD (Total Metals in Sediments by ICP-MS): Sample KP120-6_U (EB2200737-014) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- EG020-SD (Total Metals in Sediments by ICP-MS): Sample KP92-95_U_1 (EB2200737-002) shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- EP071 (TRH Semivolatiles): Sample 'KP92-95_U_1' shows poor matrix spike recovery due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- ASS: EA033 (CRS Suite): Laboratory determinations of ANC needs to be corroborated by effectiveness of the measured ANC in relation to incubation ANC. Unless corroborated, the results of ANC testing should be discounted when determining Net Acidity for comparison with action criteria, or for the determination of the acidity hazard and required liming amounts.
- ASS: EA033 (CRS Suite): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime ($CaCO_3$) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil', multiply 'reported results' x 'wet bulk density of soil in t/m3'.

NT EPA	Northern Territory Environmental Protection Authority
NW	North western
PMST	Protected Matters Search Tool
PPE	personal protective equipment
PTS	permanent threshold shift
ROV	remotely operated underwater vehicle
SEL	sound exposure level
SER	Supplementary Environmental Report
SHB	split hopper barge
SPL	sound pressure level
SPRAT	Species Profile and Threats Database
TSDMMP	Trenching and Spoil Disposal Management and Monitoring Plan
TSHD	trailer suction hopper dredge
TSSC	Threatened Species Scientific Committee
TTS	temporary threshold shift
TPWC	Territory Parks and Wildlife Conservation
WA	Western Australia

Glossary

Term	Definition
Biologically important area	Areas spatially defined and mapped by the Commonwealth Department of Environment (DoE) where aggregations of individuals of a species are known to display a biologically important behaviour such as breeding, foraging, resting or migration.
Cetacean	A marine mammal of the order Cetacea; a whale, dolphin, or porpoise.

Term	Definition
Consequence	Impact of an event or incident e.g. a loss, injury or concern. May be expressed qualitatively or quantitatively.
Effect	A change to the environment (including socio-economic changes) resulting from the DPD Project that may be positive or negative.
Environment	Consistent with the Envir*onment Protection and Biodiversity Conservation Act 1999*, the definition of environment encompasses physical, biological, heritage, cultural, social, health, safety and economic aspects.
Environmental Performance Standard	A statement of performance required of a management action.
Environmental Performance Objective	Measurable level of performance required for the management of environmental aspects of an activity to ensure that environmental impacts and risks are of an acceptable level.
Impact	A positive or negative effect the DPD Project would have on the environment (including physical, ecological and socio-economic environments.
Listed species	Species of conservation importance listed under the Envir*onment Protection and Biodiversity Conservation Act 1999*, or *Territory Parks and Wildlife Conservation Act 1976*.
Measurement Criteria	A system of measurements that define whether a project is successful.
Performance Criteria	The standards by which success of management actions is evaluated.
Project Area	The Project Area is an area extending 500 m either side of the pipeline, within which the Construction Activity will take place.
Residual risk	Risk remaining after implementation of mitigation measures.
Risk	A combination of the potential consequence of an event occurring and the likelihood of the consequence occurring.
Sensitive receptor	A receptor that could be subject to adverse impacts from the DPD Project.
Significant impact	Under the Envir*onment Protection and Biodiversity Conservation Act 1999*, Significant Impact Guidelines 1.1, a 'significant impact' is an impact which is important, notable, or of consequence, having regard to its context or intensity. Whether or not an action is likely to have a significant impact depends upon the sensitivity, value, and quality of the environment, which is impacted, and upon the intensity, duration, magnitude and geographic extent of the impacts.
Target	Specific and measurable performance requirements to achieve Environmental Performance Objectives.

Measurement units

Measurement unit	Definition
°	degrees
µS	microSiemens
cm	centimetre
dB	decibels
dB(A)	a-weighted sound pressure level in decibels
Hz	hertz
kHz	kilohertz
km	kilometre
km^2	square kilometre
M	metre
m^2	square metre
mg/L	milligrams per litre
Nm	nautical mile (1.856 km)

1 Introduction

1.1 Project overview

Santos NA Darwin Pipeline Pty Ltd (Santos) is the operator of the existing Bayu-Undan to Darwin Gas Export Pipeline (GEP) in the Timor Sea. The Bayu-Undan to Darwin GEP is a dry natural gas export pipeline transporting gas from the Bayu-Undan Field located in Timor-Leste waters to the Darwin liquefied natural gas (DLNG) facility at Wickham Point peninsula near Darwin, Northern Territory (NT), Australia. The Bayu-Undan to Darwin GEP has been operational since 2005. In anticipation of the end of the Bayu-Undan Field's commercial production in 2022 – 2023, the Barossa Field is being developed to supply gas to the DLNG. The supply of backfill gas to the DLNG facility was originally planned to be achieved through the installation of a 262 kilometre (km) Barossa GEP to a tie-in point on the existing Bayu-Undan to Darwin GEP.

In recognition of potential Carbon Capture and Storage opportunities at the Bayu-Undan Field, Santos has approved an alternative solution to transport backfill gas to the DLNG facility through the construction of an additional segment of pipeline to extend the Barossa GEP to the DLNG facility instead of tying into the existing Bayu-Undan to Darwin GEP. Construction of this segment of pipeline is referred to as the Darwin Pipeline Duplication (DPD) Project, as it will be installed parallel to the existing Bayu-Undan to Darwin GEP. The effective 'duplication' of the existing Bayu-Undan to Darwin GEP is considered the optimal route to minimise potential environmental and social impacts.

The pipeline will run from a location where the Barossa GEP approaches the existing Bayu-Undan pipeline and continue through Darwin Harbour into the DLNG facility at Wickham Point (**Figure 1-1**). Santos' DPD Project includes a ~23 km segment in Commonwealth waters and ~100 km segment in NT waters and lands adjacent to the existing Bayu-Undan to Darwin GEP. The DPD Pipeline (NT) will be located for the most part ~100 m from the existing Bayu-Undan to Darwin pipeline, to minimise potential environmental and social impacts. The Project Area for the DPD Project includes a 2 km buffer around the pipeline route in NT waters, the onshore construction area at the DLNG facility and an offshore spoil disposal ground for the trench spoil disposal (**Figure 1-1**).

Pre-lay trenching is required to meet a number of objectives, including providing pipeline protection and stability (in combination with rock installation), reducing pipeline spanning and ensuring compliance with shipping channel clear water requirements. Sections of the pipeline route within the harbour, with a combined length of up to ~12.8 km, will be trenched using various equipment with the remainder of the pipeline laid directly on the seabed. Rock sourced from a local quarry will be used to backfill for anchor protection in some areas where anchor protection or additional stabilisation is required.

Potential underwater noise impacts generated by the construction of the pipeline in NT waters is covered under this Marine Megafauna Noise Management Plan (MMNMP).

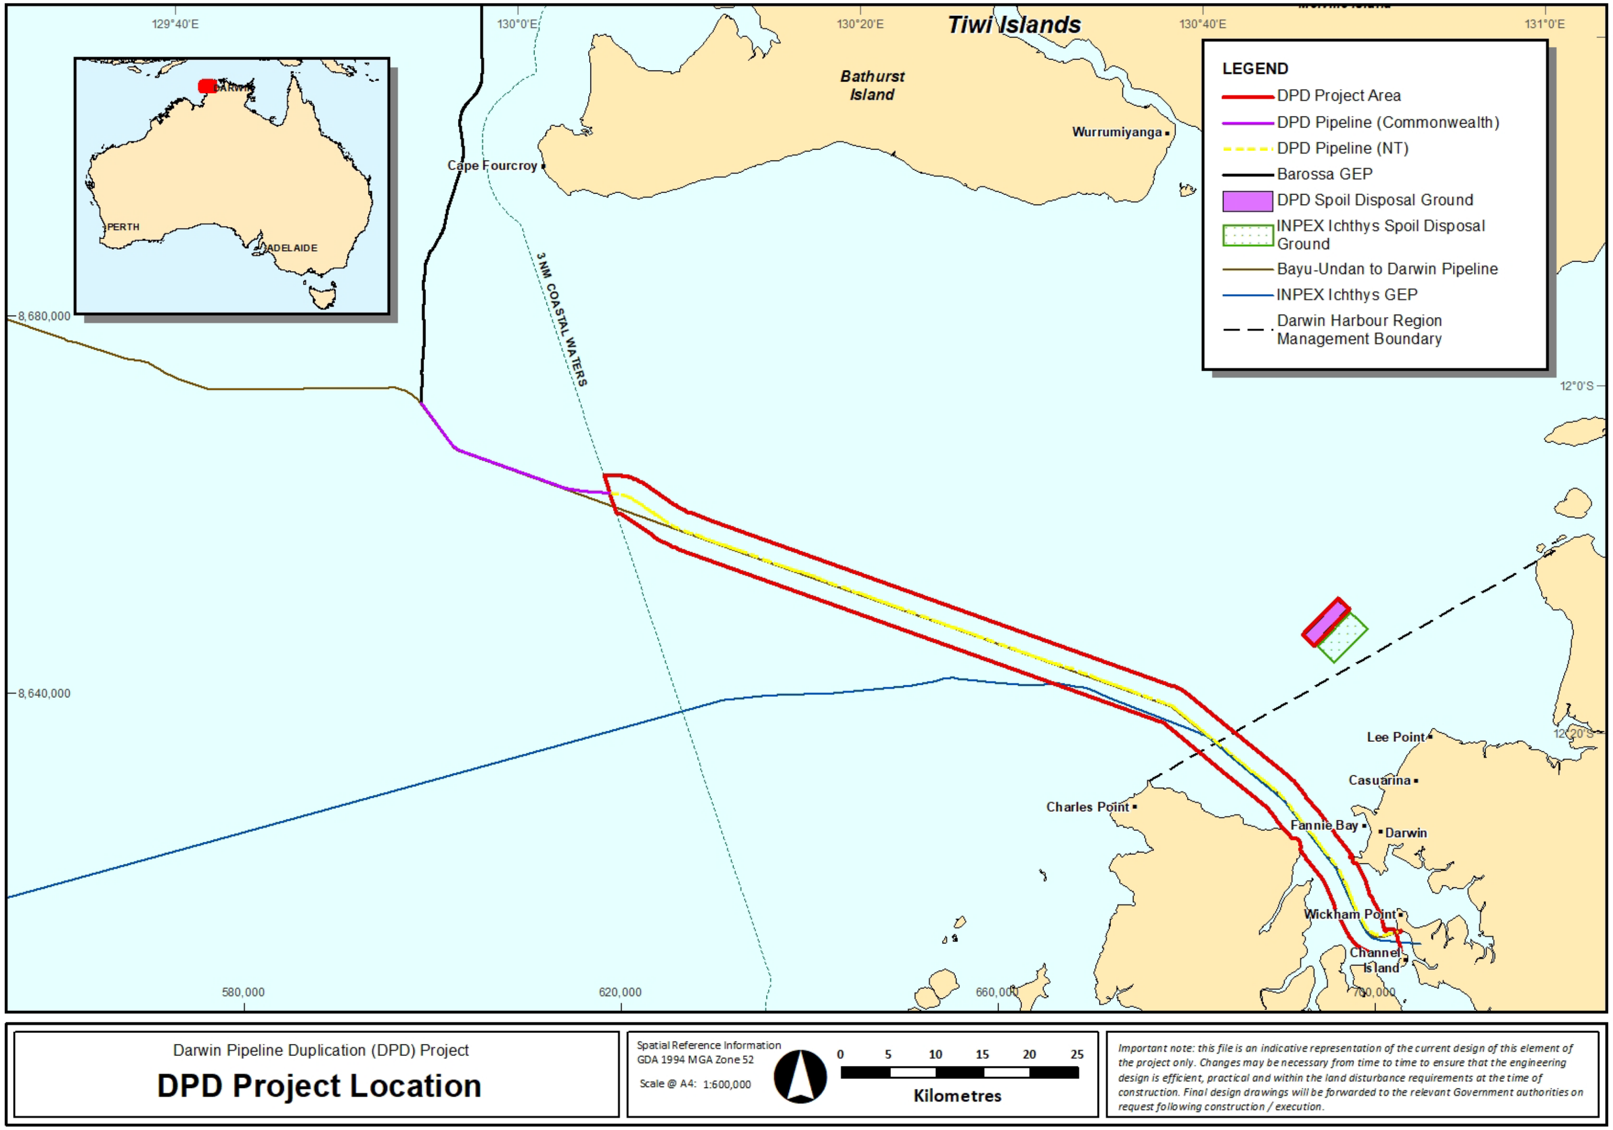

Figure 1-1: DPD Project Location

1.2 Purpose

This MMNMP details the likely impacts associated with underwater noise-generating activities during construction of the DPD pipeline in NT waters (DPD Pipeline (NT)), in particular trenching activities in Darwin Harbour. Assessment of these impacts is based on the results of project-specific underwater noise modelling undertaken during the environmental assessment phase of the DPD Project.

Further, this MMNMP identifies and details measures that will be implemented as required to manage and mitigate potential environmental impacts to marine megafauna due to underwater noise emissions from construction of the DPD Pipeline (NT).

The purpose of this MMNMP is to:

+ Demonstrate that all measures deemed reasonable and practicable will be implemented to manage underwater noise impacts and other potential environmental impacts to marine megafauna arising from the proposed DPD Project construction activities.
+ Prior to finalisation, demonstrate how the requirements of relevant conditions of approvals under the *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) and the NT *Environment Protection Act 2019* (EP Act) will be met.
+ Satisfy the Northern Territory Environmental Protection Authority (NT EPA) requirement for a draft marine megafauna management plan for construction activities that includes:
  - baseline (pre-construction) cumulative noise within the zone of influence of the proposal and relevant parameters to be monitored to detect impacts.
  - noise trigger levels for relevant parameters (and description of their derivation) corresponding to actions that must be taken in the event that monitoring indicates that construction activities are likely to impact protected species.
  - management actions to be applied if noise triggers are exceeded in accordance with the environmental decision-making hierarchy.
  - Santos has interpreted the latter two requirements as the application of management zones, as informed by noise modelling, and monitoring of sensitive fauna (using trained marine fauna observers (MFOs)) within these zones with associated management actions if sensitive fauna are observed.

1.3 Scope

This MMNMP addresses the noise generating activities during the construction of the ~100 km section of the DPD pipeline from the shore pull onshore termination point to the 3 nm Commonwealth/NT waters boundary (**Figure 1-2**).

The noise generating activities considered in the MMNMP, include:

+ Trenching along segments of the pipeline route within Darwin Harbour, with a combined length of up to ~16.5 km:
  - Sediment cutting using a cutter suction dredge (CSD)
  - Suction dredging using a trailer suction hopper dredge (TSHD)
  - Rock breaking (hydraulic tools; Xcentric Ripper or Hydraulic hammer tool) using a backhoe dredge (BHD)

- Excavation dredging using a BHD

+ Mass flow excavation (MFE)
+ Vessels (various, including the use of survey equipment)
+ Helicopters

This MMNMP forms part of a suite of environmental management plans (EMPs) under an overarching Santos Darwin Pipeline Duplication Project Offshore Construction Environmental Management Plan (Offshore CEMP; BAS-210 0024) which covers construction activities from the 3 nm Commonwealth/NT waters boundary to the shore pull onshore termination point. The construction of the remaining section of pipeline between the onshore termination point and the upstream weld of the beach valve will be subject to the DPD Project Onshore Pipeline CEMP (BAS-210 0025; Onshore CEMP) (**Figure 1-2**).

In addition to this MMNMP there are two further EMPs under the Offshore CEMP that address specific activities during construction (**Figure 1-2**). These are the:

+ Trenching and Spoil Disposal Monitoring and Management Plan (TSDMMP) (BAS-210 0023) that addresses all trenching and spoil disposal activities from the 3 nm Commonwealth/NT waters boundary to the shore pull onshore termination point
+ Acid Sulfate Soil and Dewatering Management Plan (ASSDMP) (BAS-210 0049) that addresses all activities associated with acid sulfate soils (ASS) from lowest astronomical tide (LAT) to the upstream weld of the beach valve.

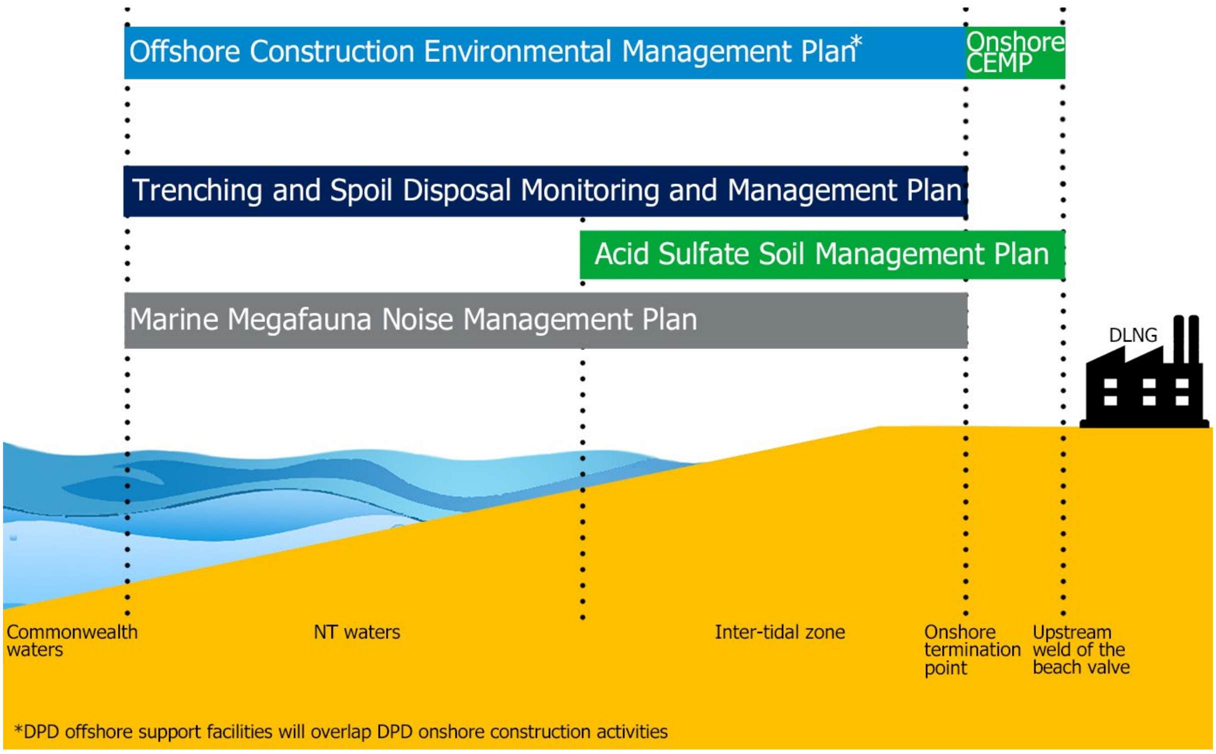

Figure 1-2: Conceptual model of management plan geographical scopes

1.4 Plan structure

This MMNMP has been prepared and structured in accordance with the Northern Territory Environment Protection Authority: Draft Guideline for the Preparation of an Environmental Management Plan (NT EPA, 2015). The guideline requirements and where they have been addressed within the MMNMP are detailed in **Table 1-1**.

1.5 Proponent

1.5.1 Details of the proponent

Santos, as the operator of the Barossa Joint Venture, has applied to the NT Department of Industry Tourism and Trade (DITT) for two pipeline licences for the DPD Pipeline (NT):

+ Coastal and Territorial Waters Licence for the section of the Pipeline under the jurisdiction of the *Petroleum (Submerged Lands) Act 1981* (i.e. between the NT Coastal Waters Limit and the Territorial Sea Baseline)

- Inland Waters Licence for the section of Pipeline under the jurisdiction of the *Energy Pipelines Act 1981* (i.e. between the Territorial Sea Baseline and the upstream weld of the beach valve).

Both licences are applicable to the section of Pipeline within the scope of the MMNMP. The proposed proponent details are provided in **Table 1-2**, with the nominated operator shown in bold.

Table 1-2: Proponent details for Barossa DPD Project's Pipeline licences

Title	Proponent (nominated operator in bold)	ABN	Interest	Titles

Name: Dr Lachlan MacArthur

Title: Environmental Approvals Adviser

Business address: Level 7, 100 St Georges Terrace, Perth, WA 6000

Telephone number: (08) 6218 7100

Email: Barossa.regulatory@santos.com

1.5.3 Notification procedure in the event of changed details

If there is a change in the nominated operator or a change in the contact details for the operator or liaison person, Santos will notify the DITT and provide the updated details.

1.6 Document review, revision and availability

This MMNMP has been prepared for submission with the SER (BAS-210 0020) and other supporting documents to the NT EPA, under the EP Act and to DCCEEW under the EPBC Act, and will be updated to reflect any relevant regulatory conditions associated with the DPD Project approvals.

Santos will review and update the document as required based on regulatory feedback and any regulatory conditions on the DPD Project approval as applicable. The final MMNMP will be made publicly available on an Australian website.

2 Detailed activity description

For the DPD Project, Santos is preparing to develop a second pipeline to connect the Barossa GEP to the DLNG facility. The pipeline will run from where the Barossa GEP approaches the existing Bayu-Undan to Darwin GEP to the existing DLNG facility in Darwin Harbour. The DPD Pipeline (NT) will include a ~23 km segment in Commonwealth waters and ~100 km segment in NT waters and lands. This MMNMP addresses the section within NT waters to the onshore termination point at the shore crossing. For additional description of the activity, refer to Section 2 of the Offshore CEMP (BAS-210 0024).

2.1 Project Area

Santos has defined the Project Area as the DPD Project footprint and an area within which construction activity will take place. The Project Area extends nominally 2 km either side of the DPD pipeline route and additionally includes the spoil disposal ground (**Figure 2-1**).

The Project Area consists of the three key areas, being:

+ Offshore NT waters (i.e. NT waters outside Darwin Harbour). Note that this includes the proposed location for spoil disposal;
+ Darwin Harbour (i.e. waters within the Darwin Harbour Management Area); and
+ Shore crossing within the previously disturbed DLNG facility footprint.

The locations for activities along the DPD Pipeline are described using ‘kilometre points’ (KP), where KP0 is the beginning of the DPD Project pipeline from the “pipeline end termination point” (PLET) in Commonwealth waters. For the purposes of this MMNMP, the scope begins at the 3 nm Commonwealth/NT waters boundary at ~KP23, and terminates at the onshore termination point at KP122.484. The following sections present details of construction activities which have been considered in the MMNMP.

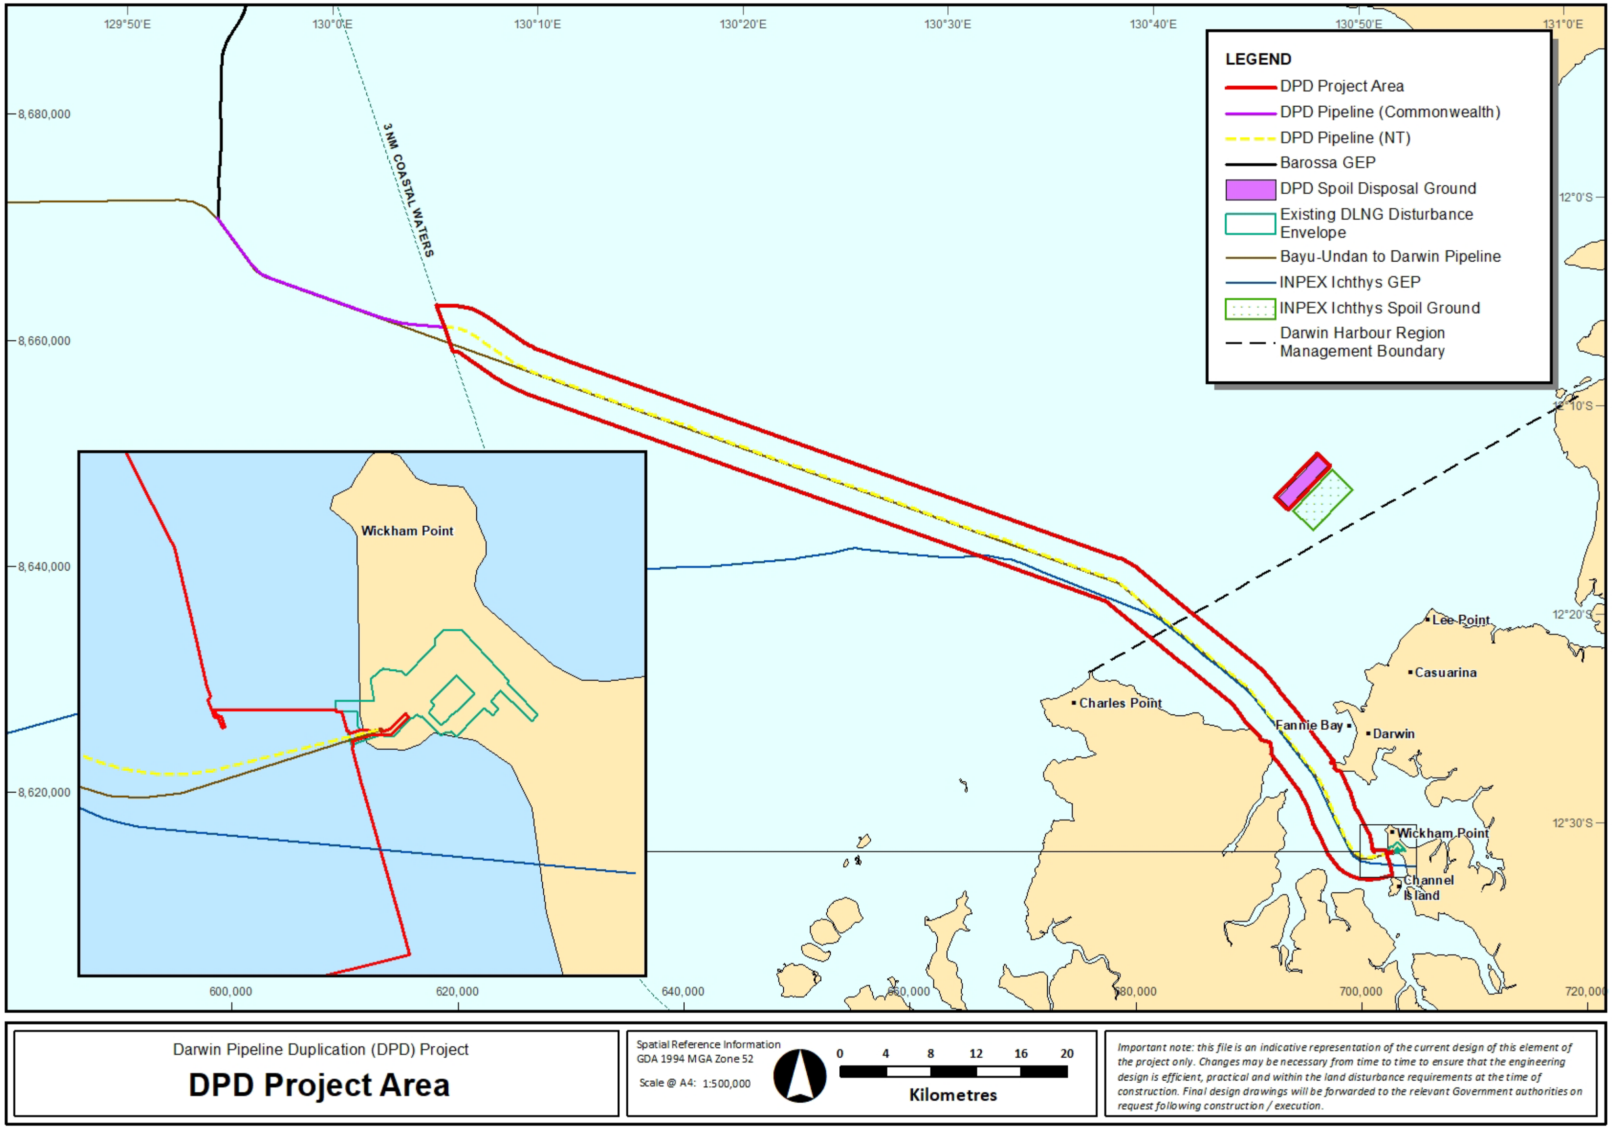

Figure 2-1: DPD Project Area (NT)

2.2 Construction activities

2.2.1 Pre-lay works

In water depths less than approximately 20 m the pipeline will require stabilisation due to exposure to waves, currents and tidal movement, and may need impact protection from third-party activities (i.e., anchors). As such, in some areas the pipeline will be installed and buried in a trench on the seafloor for stabilisation and protection. Some areas of seabed will also require intervention to reduce the potential for pipeline spanning.

2.2.1.1 Pipeline pre-lay trenching and spoil disposal

Trenching and backfill will be required in discrete sections of the pipeline route (with a combined length of up to ~12.8 km) within both nearshore DPD and shore crossing DPD locations. Locations of proposed trenching along the pipeline route are shown in **Figure 2-2**.

Offshore and within Darwin Harbour, the pre-lay trenching will involve the excavation of a trench (approximately 3 m width at its base) within an indicative trunkline corridor of 40 m width. Trailing Suction Hopper Dredge (TSHD), Cutter Suction Dredge (CSD) and a Backhoe Dredge (BHD) have been proposed for the pre-lay trenching works. Material will be excavated and disposed of at the spoil disposal ground, as shown in **Figure 2-1**.

The CSD will be used in conjunction with the TSHD in some areas. The CSD will crush harder seabed material, where required, and leave this in-situ with the TSHD dredging the material and storing spoil within its hopper. The TSHD will deposit spoil at the offshore spoil ground by opening the bottom doors of the hopper.

Closer to shore and at the shore crossing a BHD will be used. Hydraulic rock breaking tools may also be required in conjunction with the BHD for rock breaking. The base case is to use a Xcentric Ripper tool with a hydraulic hammer used as a contingency. The BHD will be supported in shallow waters on spuds and will empty spoil onto split hopper barges (SHBs). These barges will be self-propelled or towed to the spoil disposal ground, where barges 'split' and spoil is released.

At low tide, land-based excavators will also be used to trench at the shore crossing. Excavated spoil will be placed close to low tide allowing any spoil build up to be removed on high tides by the BHD.

A maintenance dredging campaign may be required to ensure the trench is in specification prior to pipe lay. Surveys prior to the pipelay campaign will indicate if maintenance trenching is required based on the level of sediment build-up. It would be expected that only a TSHD and /or BHD would be used for maintenance trenching.

The proposed spoil disposal ground for trenched material is located to the north of Darwin Harbour, within the Beagle Gulf, approximately 12 km north-west of Lee Point. The selected site is adjacent to the spoil disposal ground approved for use by INPEX for the Ichthys Gas Field Development Project (**Figure 2-1**).

Further detail on trenching activities is provided in the TSDMMP (BAS-210 0023).

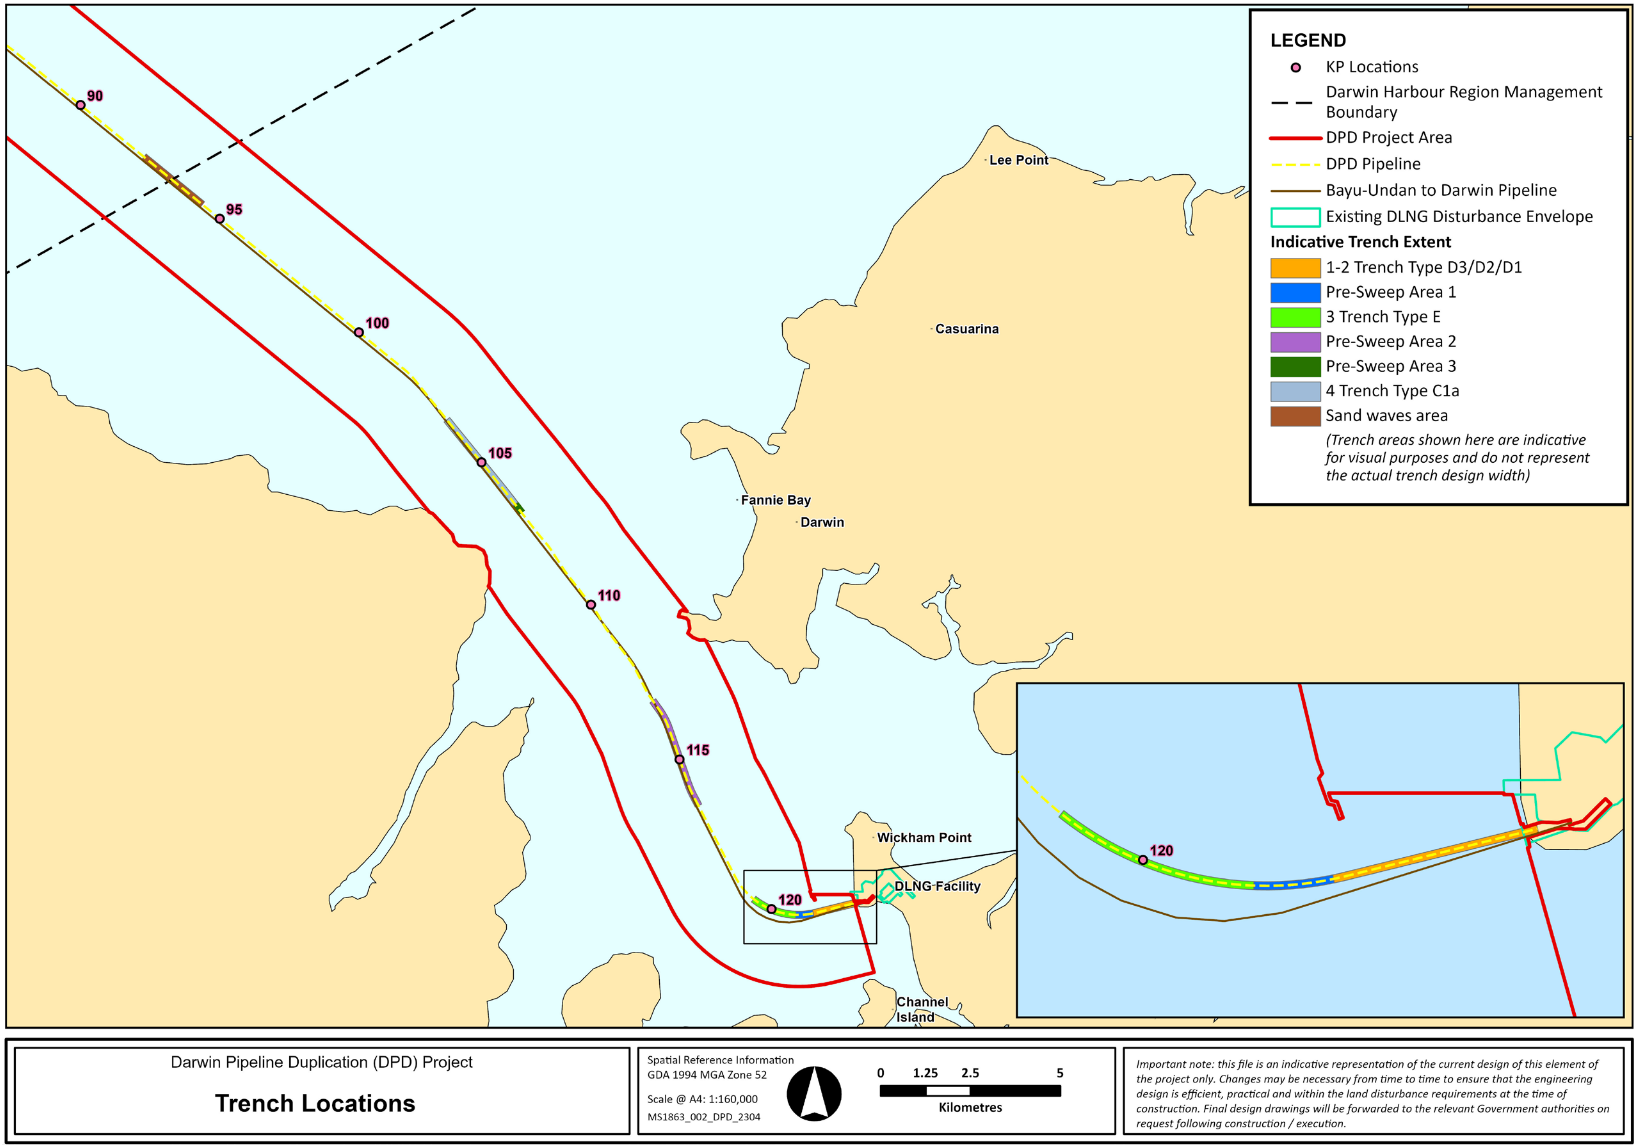

Figure 2-2: Indicative trench locations

2.2.1.2 Rock causeways

To aid in the trenching of the shore crossing, two temporary rock causeways are proposed to be installed either side of the trench in the intertidal zone. These will enable excavators to work further at low tides and provide a stable base for their operation.

2.2.1.3 Span rectification and foundation installation

Where the seabed is uneven a subsea pipeline may be left unsupported across spans between high points in the seabed. Where the spans are beyond acceptable limits and span rectification is required. One area of known sand waves (**Figure 2-2**) will be remediated by the TSHD. For other localised areas the following activities are proposed.

The use of mass flow excavation (MFE) has been identified as a potential method to reduce sediment high points (and therefore pipeline spanning) at 8 locations within two areas along the offshore pipeline route in NT waters. A MFE tool works by accelerating a mass flow of water to blow away sediments within a localised area and can be used to accurately remove sediment high points and reduce pipeline spanning.

MFE is currently the preferred alternative to the installation of numerous concrete mattresses or grout bags to rectify spanning.

The installation of concrete mattresses or grout bags may be used additional to MFE in instances where MFE proves not suitable (e.g., if consolidated sediments are encountered that cannot be removed by MFE) or as an adjunct to MFE if there is residual spanning requiring further rectification. A foundation may be installed for an in-line tee at KP62.8 during pre-lay activities. A construction vessel crane may be used to lift the mattresses or grout bags from the deck of the vessel onto the seabed. Each concrete mattress footprint is ~18 m^2 and may be installed in groups and stacked on top of each other to reach the desired height.

2.2.1.4 Equipment and methods

Trenching and spoil disposal for the DPD Project will be undertaken using the following equipment:

- Backhoe Dredge (BHD): For example "Pinochio/Hippopotous/Ambiorix", or similar (**Section 2.2.1.4.1**).
- BHD hydraulic rock breaking tools (if required): Xcentric Ripper tool (preferred) or hydraulic hammer (contingency) (refer to **Section 2.2.1.4.2**)
- Trailing Suction Hopper Dredge (TSHD): For example "Bonny River/Vox Amalia" or similar (**Section 2.2.1.4.3**)
- Cutter Suction Dredge (CSD): For example "Ambiorix/Athena" or similar (refer to **Section 2.2.1.4.4**)
- Split Hopper Barges (SHBs): For example "Pagadder/Sloeber/Jan Blanken" or similar (**Section 2.2.1.4.5**).
- Excavators (**Section 2.2.1.4.6**)
- Mass flow excavation will be undertaken with N-Sea Twin-prop and Quad-prop excavation tools or similar (**Section 2.2.1.4.7**)

2.2.1.4.1 Backhoe dredger

A BHD is a type of mechanical dredging equipment, consisting of a hydraulic arm and bucket system mounted on a turntable at the front of the pontoon with attached spud legs. Spud legs are driven into the seabed preventing movement due to wind, waves, and currents.

A BHD will be used to trench shallower sections of the DPD pipeline route near the shore crossing. The BHD will be towed to location and will begin operations once positioned and stationary. Trenched material will be lifted by the BHD bucket to an SHB for transport to the spoil disposal ground.

2.2.1.4.2 Hydraulic rock breaking tools

The use of a hydraulic rock breaking tools is required for hard material that the BHD cannot cut through. An Xcentric Ripper tool (preferred) or a hydraulic hammer tool (contingency) is mounted on the BHD in place of the usual bucket. Once the tool has fractured the hard rock the bucket is reattached to the BHD and the broken or fractured strata is dredged by the BHD and loaded into the SHB for transport to and discharge at the spoil disposal ground. This method will only be used when required at specific locations and is a discontinuous process.

2.2.1.4.3 Trailing suction hopper dredger

A TSHD is a type of hydraulic dredger that is a self-propelled sea-going vessel equipped with a hopper that can be loaded or emptied via a dredging installation. Dredging via TSHD is a cyclical process of loading (dredging), transporting, and discharging. TSHDs are the only non-stationary dredger and are not anchored by spud poles.

At the trenching location the TSHD vessel slows to approximately 2 to 3 knots, then one or more suction tubes with dragheads (suction mouths) are lowered to the seabed. Whilst on the seabed swell compensators control the contact between the draghead and the seabed. Pumps then suck the material (a mixture of soil and water) from the seabed into the hopper located within the TSHD.

After the hopper is filled with dredged material, the pumps are stopped, the suction pipes and draghead lifted on deck and the TSHD sails to the spoil disposal ground. At the spoil disposal ground the dredged material is discharged by opening the bottom doors of the hopper.

2.2.1.4.4 Cutter suction dredger

CSDs are stationary hydraulic dredgers that are equipped with a cutter head. The cutter head rotates excavating the seabed which can be sucked up by dredge pumps as a mixture of water and sediment (slurry). CSDs can also be used to break up harder material which is left in-situ for subsequent removal by a TSHD; this will be the mode of operation used for the DPD Project. Whilst operating the dredger moves around the spud pole via the pulling and slacking of two fore sideline wires. The CSD to be used will have barge loading facilities.

The CSDs utilised for this project will have self-propulsion, which will only be used during mobilisation between trench locations. Maximum dredge depth ranges between 31 m (Anthena) and 35 m (Ambiorix).

2.2.1.4.5 Split hopper barge

SHBs are utilised for transporting and discharging of material dredged by the BHD. For this project, it is expected that two SHBs will be used to maximise efficiency and will be either self-propelled, towed or pushed by barges. A third barge may be used to further increase efficiency.

2.2.1.4.6 Excavator

An excavator/s will be utilised to excavate onshore and intertidal material which will be disposed of adjacent to the trench as close to lowest astronomical tide (LAT) as possible. Where this spoil builds up, the BHD will remove the spoil to a SHB for disposal at the offshore spoil ground.

2.2.1.4.7 Mass flow excavation

MFE is expected to take an indicative 7 – 14 days to complete, with an estimated six hours of operation at each site. A MFE tool works by accelerating a mass flow of water to blow away sediments within a localised area and can be used to accurately remove sediment high points and reduce pipeline spanning. MFE is an alternative to the installation of numerous concrete mattresses or grout bags.

2.2.2 Pipeline installation and pre-commissioning

Pipeline installation and pre-commissioning will comprise the following activities:

+ Pipelay activities – The DPD pipeline (NT) will be installed using a continuous assembly pipe-welding installation method. In water deeper than ~20 m the pipeline will be installed using a deep-water dynamic positioning (DP) pipelay vessel. In shallower waters and all waters within the Darwin Harbour, a shallow water pipelay barge will be used and anchoring will be required.
+ In-line tee – The in-line tee (ILT) which can facilitate future pipeline tie-ins to the DPD Project pipeline will be installed in the offshore NT waters at KP62.8 by the deep-water DP pipelay vessel. If required, a foundation for the ILT will be pre-installed during pre-lay works.
+ Pipeline shore pull – Shore pull to bring the DPD Pipeline (NT) onshore, will use a conventional winch operation.
+ Trench backfill – Rock (sourced onshore) will be used where necessary for pipeline stabilisation and protection for sections within Darwin Harbour. Trench backfilling will be required nearshore and at the shore crossing to provide pipeline stability. The rock will likely be installed via a fall pipe vessel (FPV) or side dump vessel (SDV). Self-propelled DP vessels will be used to install rock on to the seabed, possibly with support barges used to transport rock. The volume of rock required is expected to be 200,000 tonnes and no more than 500,000 tonnes. Where possible for the shore crossing, the rock placement will be by shore-based excavators.
+ Post-lay span rectification – To provide pipeline stability, post-lay span rectification may be required to ensure the integrity of the pipeline and avoid failure through fatigue. Where required, spans will be rectified using ROVs to install grout bags that are then filled with grout.

2.2.3 Summary of vessel and support activities

Construction activities will include the operation of vessels, helicopters and ROVs. Vessel and support activities associated with the DPD Project will be undertaken throughout all phases of the DPD Project.

A number of vessel types will be required to complete the proposed activities, including:

+ Marine survey vessels – to support pre-lay and post-lay surveys of the Project pipeline, including verifying trench depth and rock placement, support pipeline and structure placement and monitor spoil ground.
+ Pipelay vessels (to install the pipeline) including: nearshore pipelay barge (shallow water pipelay vessel), dynamically positioned deep water pipelay vessel and pipe supply vessels.

+ Construction support vessels – to support installation of structures (i.e. installation of ILT protection frame, mattresses for scour protection, mechanical protection and stabilisation etc.) and use of MFE tools.
+ Rock installation vessels – including fall pipe vessel, side dump vessels and non-propelled barges
+ Trenching and spoil disposal vessels – including a cutter suction dredge (CSD), trailing suction hopper dredge (TSHD), backhoe dredge (BHD) and split hopper barges (SHB)
+ Survey vessels – to verify trench depth and rock placement and support pipeline and structure placement
+ Supply vessels – to provide general support and supplies to all offshore activities. Supply vessels are expected to operate from local regional ports (i.e. Darwin) to transport fuel, stores, waste and specialist supplies such as rock and pipe
+ Helicopters will be used for transporting passengers and/or urgent freight to/from during offshore installation and commissioning activities.

For trenching and spoil disposal activities, an expected 11 vessels will be required, for deep water and shallow pipelay activities an expected six and seven vessels, respectively, are expected to be involved, for rock installation an expected six vessels will be involved and for pre-commissioning an expected four vessels will be involved.

Supply vessels are expected to operate from local regional ports (i.e. Darwin) to transport fuel, stores, waste and specialist supplies such as rock, pipe etc.

Bunkering (re-fuelling) of the vessels may take place either at sea (i.e. if required for the pipelay vessel) or in port (support and other vessels).

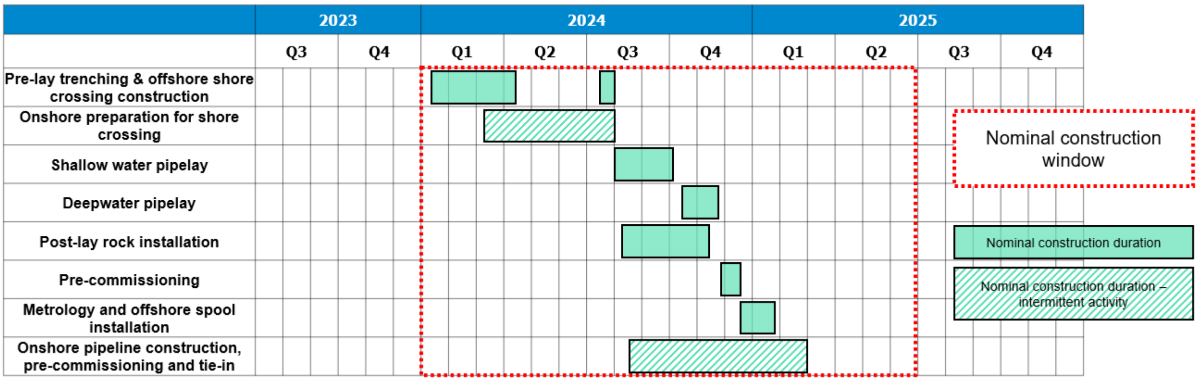
Vessels will vary in length and draft. They may anchor depending on water depth and activity type, with varying anchor requirement and disturbance footprints. Known sensitive areas will be avoided when anchoring.

Throughout the DPD Project, offshore activities will be supported by ROVs. The ROV can be fitted with various tools and camera systems that can be used to capture permanent records of the underwater operations and immediate surrounding environment.

2.3 Indicative construction schedule

Santos is targeting to have all DPD regulatory approvals in place by Q1 2024 to ensure construction activities do not delay Barossa first gas in the first half of 2025. A nominal DPD construction sequence and schedule is shown in **Table 2-1** representing a start of construction activities at the beginning of nominal construction window. The construction activities will span a nominal cumulative period of 15-months in the field. The actual construction sequence and schedule will be subject to the timely receipt of all regulatory approvals and drivers such as vessel availability, operational issues, and weather. Santos' regulatory approvals and stakeholder consultation consider construction activities at any time between Q1 2024 to mid-2025.

Table 2-1: Preliminary pre-lay, construction, installation, and pre-commissioning schedule for DPD



3 Legal and other obligations

The following sections describe the legislative framework governing the impacts from noise emissions during the construction of the DPD Pipeline (NT).

3.1 Barossa DPD Project approvals

This MMNMP has been prepared for submission to the NT EPA with approval documents including the SER (BAS-210 0020) and for submission to the Commonwealth Department of Climate Change, Energy, the Environment and Water (DCCEEW) as part of Preliminary Documentation (EPBC 2022-9372) for assessment under the EPBC Act. This MMNMP will also be submitted to DITT for approval under the *Petroleum (Submerged Lands) Act 1981* and *Energy Pipelines Act 1981*.

3.1.1 Commonwealth Environmental Approval

The DPD Project including the DPD Pipeline section in Commonwealth waters was referred to the DCCEEW under the EPBC Act on 7 October 2022 (EPBC 2022-9372). This MMNMP will be updated to reflect any relevant regulatory conditions associated with this approval. On 6 December the DPD Project was determined to be a Controlled Action requiring further assessment based on Preliminary Documentation. Further information was requested under section 95A(2) of the EPBC Act on 23 December 2022.

It was determined that the Project may have a significant impact on the following controlling provisions under the EPBC Act:

+ Listed threatened species and communities (sections 18 & 18A)
+ Listed migratory species (sections 20 & 20A)
+ Commonwealth marine areas (sections 23 & 24A)

The Preliminary Documentation is currently being prepared for submission to DCCEEW.

This MMNMP will be updated to reflect any relevant regulatory conditions associated with this approval.

3.1.2 Northern Territory Environmental Approvals

The DPD Project was referred to the NT EPA on 14 January 2022 under Section 55 of the *Environmental Protection Act 2019* (EP Act). The NT EPA determined the DPD proposal required assessment by Supplementary Environmental Report (SER) (Tier 2) in accordance with the Environment Protection Regulations 2020 (EP Regulations). The SER is required to address public submissions and include information additional to the referral document in relation to specific aspects of potential significance. This MMNMP will be updated to reflect any relevant regulatory conditions associated with this approval.

3.1.3 Regulatory requirements specific to noise emissions

The NT EPA considers that the DPD Project has the potential to have a significant impact on marine ecosystems. Marine ecosystems may be significantly impacted by disturbance of threatened species, recreationally or commercially significant species or maritime habitats during construction of the DPD Project.

The NT EPA requested the following additional information to support the SER and the Environmental Approval Process:

+ Provide interpreted outcomes of underwater noise modelling, including modelling of cumulative noise resulting from the proposal and existing activities at sensitive receptors.
+ Provide a draft marine megafauna management plan for construction activities that includes:
  - Baseline (pre-construction) cumulative noise within the zone of influence of the proposal and relevant parameters to be monitored to detect impacts
  - Trigger levels for relevant parameters (and description of their derivation) corresponding to actions that must be taken in the event that monitoring indicates that construction activities are likely to impact protected species
  - Management actions to be applied if triggers are exceeded in accordance with the environmental decision-making hierarchy.

This MMNMP has been prepared to address the relevant requests from NT EPA.

3.2 Legislative framework

Environmental legislative requirements governing DPD Project are described in the following sections. All activities will comply with legislative requirements established under relevant Commonwealth and Northern Territory legislation.

3.2.1 Relevant conventions, legislation, standards and guidelines

The following sections describe the conventions, legislation, standards, and guidelines applicable to noise emissions from construction activities and the impacts to marine megafauna.

3.2.1.1 International conventions, agreements, and guidelines

International conventions, agreements, and guidelines relevant to marine megafauna are presented in **Table 3-1**.

Table 3-1: International conventions, agreements, and guidelines relevant to the activity

Name	Description
United Nations Convention on Biological Diversity – 1992	An international treaty to sustain life on earth. Relevant as the activity may interact with MNES (threatened and migratory species) protected under the EPBC Act such as anthropogenic underwater noise.
Convention on the Conservation of Migratory Species of Wild Animals 1979 (Bonn Convention)	The Bonn Convention aims to improve the status of all threatened migratory species through national action and international agreements between range states of particular groups of species. Relevant as the activity may interact with MNES (threatened and migratory species) protected under the EPBC Act. This includes development and implementation of the CMS Family Environmental Impact Assessment Guidelines for Noise-generating Offshore Industries.

3.2.1.2 Commonwealth legislation, standards, and guidelines

Commonwealth legislation, standards, and guidelines relevant to marine megafauna are presented in **Table 3-2.**

Table 3-2: Commonwealth legislation, standards, and guidelines

Name	Description
Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act)	The Act aims to: + Protect MNES; + Provide for Commonwealth environmental assessment and approval processes; + Provide an integrated system for biodiversity conservation and management of protected areas. The Threatened Species Scientific Committee (TSSC) was established under the EPBC Act which plays a critical role in protection and management of native species and ecological communities. The TSSC have published Approved Conservation Advice for important species relevant to this project including humpback whales, sei whales and fin whales.
Environment Protection and Biodiversity Conservation Regulations 2000 (EPBC Regulations)	The regulations are designed to provide a streamlined national environmental assessment and approvals process whilst enhancing the protection and management of the environment.
Marine Bioregional Plan for the North Marine Region (DSEWPAC, 2012)	The document describes the marine environment and conservation values (protected species, protected places and key ecological features) of the North Marine Region. It sets broad objectives for its biodiversity, identifies regional priorities, and outlines strategies and actions to achieve these.
National Guidance on the Management of Whale and Dolphin Incidents in Australian Waters (DSEWPAC, 2013)	The document outlines best practice guiding principles for the management of incidents where whales and dolphins are in distress (e.g. entangled or stranded). The Guidelines may be relevant in the event that a whale or dolphin is impacted by noise emissions from construction activities during the DPD Project that may result in animal distress and stranding.
Recovery Plan for Marine Turtles in Australia 2017-2027 (DoEE, 2017)	The document describes a long-term recovery plan for marine turtles in Australia. The main objective it to minimise anthropogenic threats to allows for the conservation status of marine turtles to improve so that they can be removed from the EPBC Act threatened species list.

3.2.1.3 Northern Territory legislation, standards, and guidelines

NT legislation, standards, and guidelines relevant to marine megafauna are presented in **Table 3-3**.

Table 3-3: Northern Territory legislation, standards, plans, and guidelines

Name	Description
Darwin Port Environmental Management Plan (EMP) (Darwin Port, 2020)	The EMP provides environmental standards which are to be adhered to within Darwin Port. It provides environmental information, targets, and management strategies to prevent adverse impacts to the environment (Darwin Port, 2020).
Darwin Harbour Strategy 2020 – 2025 (DHAC, 2020)	The Darwin Harbour Advisory Committee (DHAC) developed the Darwin Harbour Strategy 2020 – 2025 to act as a contemporary strategy for the sustainable management of the Darwin Harbour region. The strategy outlines goals, objectives and outcomes that will help guide sustainable management and planning in the region. The management strategy goals are: + Foster partnerships: To protect and enhance Darwin Harbour through integrated management and in a partnership between government, industry, and the community. + Protect and preserve: To protect and enhance the natural environment of Darwin Harbour. + Celebrate connection: To protect and enhance the cultural values and heritage of Darwin Harbour. + Maintain our unique lifestyle: To protect and enhance social, recreational and lifestyle use and enjoyment of Darwin Harbour in an ecologically sustainable manner.
Environmental Protection Act 2019	The objects of this Act are: (a) to protect the environment of the Territory; (b) to promote ecologically sustainable development so that the wellbeing of the people of the Territory is maintained or improved without adverse impact on the environment of the Territory; (c) to recognise the role of environmental impact assessment and environmental approval in promoting the protection and management of the environment of the Territory; (d) to provide for broad community involvement during the process of environmental impact assessment and environmental approval; and (e) to recognise the role that Aboriginal people have as stewards of their country as conferred under their traditions and recognised in law, and the importance of participation by Aboriginal people and communities in environmental decision-making processes.
Environmental Protection Regulations 2020	The regulations provide guidance and a legislative framework for environmental impact assessments and approval processes that involve the NT EPA.
Fisheries Act 1988	The Act makes it illegal to pollute waters where the effect of the substance is that fish or aquatic life are injured, detrimentally

Name	Description
	affected or the habitats, food or spawning grounds are detrimentally affected. Consideration of this Act is required in the assessment of potential impacts and mitigation measures for the construction of the pipeline.
Guidelines for Reporting of an Environmental Management Plan (NT EPA 2015)	The document provides project proponents with advice on when an EMP may be required and what is required in preparing an EMP for assessment by the NT EPA.
Guideline for Reporting on Environmental Monitoring (NT EPA 2016)	This guideline outlines the NT EPA's requirements for environmental monitoring reports – to establish a minimum standard and consistent approach. The guideline outlines how to report the information collected through monitoring to the NT EPA.
Northern Territory *Environment Protection Authority Act 2012*	This act aims to a) promote ecology sustainable development; b) to protect the environment, having regard to the need to enable ecologically sustainable development; (c) to promote effective waste management and waste minimisation strategies; and (d) to enhance community and business confidence in the environmental protection regime of the Territory.
Territory Parks and Wildlife Conservation Act 1976 (TPWC Act) and Regulations 2001	The Act forms a framework for the establishment and management of parks and reserves and declaration of protected wildlife. This Act has been considered with regard to the potential interactions with protected wildlife.

4 Environmental management framework

4.1 Santos management system

Santos's Management System (known as the SMS) exists to support its moral, professional, and legal obligations to undertake work in a manner that does not cause harm to people or the environment. The framework of policies, standards, processes, procedures, tools, and control measures that, when used together by a properly resourced and competent organisation, result in:

- A common HSE approach is followed across the organisation.
- HSE is proactively managed and maintained.
- The mandatory requirements of HSE management are implemented and are auditable.
- HSE management performance is measured, and corrective actions are taken.
- Opportunities for improvement are recognised and implemented.
- Workforce commitments are understood and demonstrated.
- The Implementation Strategy (**Section 9**) and Stakeholder Consultation (**Section 10**) align with the Management System structure and are designed to require that:
- environmental impacts and risks continue to be identified for the duration of the activity and reduced to ALARP
- controls are effective in reducing environmental impacts and risks to ALARP and acceptable levels
- environmental performance outcomes and standards set out in this MMNMP are met
- consultation with relevant and interested persons is maintained throughout the activity as appropriate.

4.2 Santos' Environment, Health and Safety Policy

Santos' Environment, Health and Safety Policy (**Appendix 1**) clearly sets out its strategic environmental objectives and the commitment of the management team to continuous environmental performance improvement. This EMP has been prepared in accordance with the fundamentals of this policy. By accepting employment with Santos, each employee and contractor is made aware during the recruitment process that he or she is responsible for the application of this policy.

4.3 DPD Project environmental management plans

There are a suite of environmental management plans covering DPD Project activities. The Offshore CEMP (BAS-210 0024) is an overarching management plan covering all activities from the 3 nm Commonwealth/NT waters boundary to the onshore termination point. The Onshore CEMP (BAS-210 0025) covers all activities to be completed from the onshore termination point to the upstream weld of the beach valve, except for support facilities for DPD Project offshore pipeline. The TSDMMP (BAS-210 0023), ASSDMP (BAS-210 0049) and MMNMP (BAS-210 0045) sit under these CEMPs and address specific activities. The activities for these management plans are outlined in **Section 1.3** and **Figure 1-2**.

5 Existing environment

This section describes the key physical and biological characteristics of Darwin Harbour and the offshore areas within and around the Project Area, including the DPD spoil disposal ground, as relevant to this MMNMP. Further detail on the physical, biological, cultural and socio-economic environment of the Project Area is provided in the Offshore CEMP (BAS-210 0024) and the DPD Project SER (BAS-210 0020).

5.1 Physical environment

5.1.1 Coastal morphology

Darwin Harbour is a large, drowned river system approximately 500 km^2 in extent. It is comprised of three arms (East Arm, West Arm, and Middle Arm) which along with the smaller Woods Inlet converge into a single unit before opening to the ocean and into Beagle Gulf in the north.

Freshwater inflow from the Elizabeth River into the East Arm and the Blackmore and Darwin rivers into the Middle Arm generally occurs between January and April creating more estuarine conditions.

Port Darwin's main channel is approximately 1,525 m wide and 15 – 25 m deep, with a maximum recorded depth of 36 m. The channel is generally deeper on the eastern side of the Harbour, while the western side is broader and shallower areas with intertidal flats and shoal being more extensive.

The channel extends into the East Arm with depths of more than 10 m LAT, the bathymetry of this area has been modified by dredging associated with the development of East Arm Wharf. A slightly deeper channel can be found in the Middle Arm extending up to the western side of Channel Island.

5.1.2 Oceanography

Darwin Harbour has a macrotidal (more than four metres) regime with tide range reaching 8 m which is considerable by world standards. Tides are generally semidiurnal (two highs and two lows each day) with some inequality between successive tides in a single day. Neap tides result in a two-day period where tidal conditions are nearly diurnal (one high and on low each day). There is a great degree of variation in daily tidal range with the presence of spring-neap tide cycle approximately every 15 days. The spring phase of the cycle has an average tidal range of 6 m, while the neap phase average tidal range is 3 m. Large tidal movements and to a lesser extent wind, drives rapid and regular exchange of large volumes of water between Darwin Harbour and Beagle Gulf.

Darwin Harbour is considered sheltered with tsunamis and swell waves unlikely to occur due to the harbour's orientation, shallow bathymetry and protection afforded by the Tiwi Islands. Most waves are generated within Darwin Harbour or Beagle Gulf and are well below 1 m with periods of 2 – 5 seconds, under non-cyclone conditions. Tropical cyclones can cause extreme wave conditions producing significant wave height of 4.5 m and approximate periods of 7.5 seconds at the entrance to Darwin Harbour. Inside the harbour waves heights are reduced by the bathymetry to approximately 0.7 m (GHDM, 1997).

5.1.3 Underwater noise

5.1.3.1 Darwin Harbour

Underwater noise within Darwin Harbour is influenced by the existing shipping traffic, biological sources, and weather. Natural prominent sources of noise include thunderstorms, lightning strikes, and heavy wet-season rains, which all generate noise at considerable intensities, although these natural sources of noise all occur seasonally. Vessel traffic in Darwin Harbour is a year-round source of noise with the Port of Darwin recording 1,510 vessels in the 2021 – 2022 financial year (Darwin Port, 2022). Large commercial vessels, such as cargo ships, LNG tankers, cruise ships and offshore oil and gas vessels enter, exit and move around the harbour on a daily basis. Vessel movements are concentrated along designated shipping channels and around berthing and anchorage areas. The proposed DPD pipeline route and associated trenching areas are adjacent to these shipping channels.

Typical underwater noise emissions for the types of vessels using Darwin Harbour are provided in **Table *5-1*** along with typical source levels from the types of dredging vessels planned to be used for the DPD Project. Trenching vessels (BHD, CSD, TSHD) are expected to produce noise intensities and noise frequencies similar to large commercial vessels that use Darwin Harbour (**Table 5-1**).

Table 5-1: Indicative noise levels from typical Darwin Harbour vessels and DPD Project trenching vessels

Vessel Type	Source Level (dB)	Frequency	Reference
Tanker and Bulk Carriers	180-186	Low (10-30 kHz)	INPEX Browse, 2010
Offshore vessels (e.g. rig tender vessels)	177	Broadband	INPEX Browse, 2010
Powerboats with 80hp outboards (small recreational boats)	156-175	Broadband up to several kHz	INPEX Browse, 2010
Cutter Suction Dredge (CSD)	172-185	30Hz>-20kHz	Thomsen *et al.*, 2009
Trailing Suction Hopper Dredge (TSHD)	184-188	30Hz>-20kHz	de Jong *et al.*, 2010 Robinson *et al.*, 2011 Reine *et al.*, 2012
Backhoe Dredge (BHD)	175	30Hz>-20kHz	Reine *et al.*, 2012

Underwater noise measurements have been taken in Darwin Harbour by Salgado-Kent *et al.* (2015) during a period where dredging and piling activities were being conducted in East Arm for the INPEX Ichthys Project. Dredging noise measurements were taken in the vicinity of a Cutter Suction Dredge (CSD) cutting an area of hard rock known as Walker Shoal (Salgado-Kent *et al.*, 2015). These measurements revealed noise levels close to approximately 145 dB re 1 µPa at distances between 630 m and 680 m from the source, which were greater than the levels predicted by underwater noise modelling.

Given seabed hardness is expected to influence the level of noise emitted from a CSD while dredging, Santos commissioned an analysis of seabed hardness to be undertaken to determine if noise measurements from Walker Shoal would be applicable for the DPD Project. Fugro (2022) undertook a comparative analysis of Walker Shoal geology and seabed refractivity against the geology and seabed refractivity of a representative CSD trenching area between KP104 and KP105 along the DPD route. This assessment compared available refractivity and bore hole data at these locations and concluded that seabed materials at the representative DPD trenching location were significantly weaker than those encountered at Walker Shoal (Fugro, 2022). Interpreted compressional wave acoustic velocities (Vp) ranged between 1,700 m/s to 3,000 m/s for the DPD Project trenching location while for Walker

Shoal they ranged between 2,500 m/s and 4,000 m/s. Due the hardness of the rock at Walker Shoal and the fact that a specialised cutting tool was required to be used on the CSD for dredging in this area (INPEX Browse, 2011) it is unlikely that CSD noise measurements collected by Salgado-Kent *et al.* (2015) would be representative for DPD Project CSD trenching.

Salgado-Kent *et al.* (2015) found that in the absence of Ichthys project pile driving or dredging in East Arm, the most intense noises dominating the environment were from a range of vessel, and to a lesser extent machinery, operating in the area. Noise emissions from vessels were found to be broadband, with most energy ranging from tens of Hz to several kHz and often reaching 130 to 140 dB re 1 Pa. The study found intense broadband anthropogenic noise from vessels and machinery also occurred typically between 5 to 20 times per day throughout the recording period in the frequency band of approximately 10 Hz to 2 kHz with noise periods lasting from approximately 1 hour to 5 hours and with intensity levels reaching close to 160 dB re 1 µPa during some periods (Salgado Kent *et al.* 2015). Underwater noise measurements taken by SVT (2009) and provided within the Ichthys EIS (INPEX Browse 2010) also show relatively high measured background noise levels within East Arm of 150-170 dB re 1 µPa2/Hz.

Salgado-Kent *et al.* (2015) found that in comparison to East Arm, the ambient underwater noise levels in Middle Arm were on average lower, likely due to lesser vessel movements. It is also expected that, all other things being equal, received noise levels from vessel traffic will be lower in shallower areas of Darwin Harbour due to reduced sound propagation in shallow waters. This was found during surveys by SVT (2009) where measured ambient noise levels in the shallower Elizabeth River were lower than those for the broader East Arm.

When anthropogenic noise was not present, biological sounds such as fish and snapping shrimp were observed. While the program was aimed at detecting dolphins, they had a minor contribution to the soundscape and were detected infrequently. This suggests dolphins were either silent whilst travelling through the detection zone, spent limited time in the zone, or both (Salgado-Kent *et al.* 2015).

5.1.3.2 Offshore NT waters

There are no available ambient underwater noise monitoring data for the Project Area within offshore NT waters. It is expected that in the offshore NT waters ambient underwater noise would be minor, typically consisting of vessel noise from commercial fishers and shipping vessels.

5.2 Marine megafauna

The Darwin region supports marine megafauna including marine mammals, reptiles, sharks and birds. The EPBC Act Protected Matters Search Tool (PMST) has been used as a screening tool to determine EPBC Act listed marine megafauna that may occur within the DPD Project Area (with a 5 km buffer). Following the PMST screening, an assessment of likelihood of the species occurring within the DPD Project Area was determined based on documented records and the species habitat requirements with respect to habitat features within the Project Area.

The criteria applied to define the likelihood of occurrence for marine megafauna was:

+ **Unlikely**: the species has not been recorded within Darwin Harbour or surrounding waters; and/or its current known distribution does not encompass Darwin Harbour, and surrounding water; and/or suitable habitat is generally lacking from the Project Area.

- **Potential**: the species has not been recorded within Darwin Harbour or surrounding waters although species' distribution incorporates Darwin Harbour and surrounding waters; and potentially suitable habitat occurs in the Project Area.
- **Likely**: the species has been recorded within Darwin Harbour or surrounding waters in the past 10 years; and suitable habitat is present within the Project Area.
- **Known to occur**: the species has been recorded (directly by commissioned surveys or from database records) within the Project Area in the past 10 years.

The results of PMST searches and subsequent assessments of likelihood of occurrence within the Project Area have been presented in the DPD Project NT EPA referral, EPBC Act referral and DPD Project SER (BAA-201 0003; Santos, 2021a; BAA-201 0004; Santos, 2022; BAS-210 0020).

Those species known to occur or likely to occur within the Project Area relevant to this MMNMP are described in the following sections. The search identified species of diving birds as occurring or potentially occurring in the area but have not been discussed further due to low underwater noise impact.

5.2.1 Marine mammals

Five species of marine mammals are known to occur in the Project Area, including four listed as migratory under the Commonwealth EPBC Act (**Table 5-2**). None of these species are currently listed under the *Territory Parks and Wildlife Conservation Act.* Through further assessment as described above, the species determined likely to occur in the Project Area are described in the following sections.

Table 5-2: Marine mammal species identified as known or likely to occur in the Project Area

Species	EPBC Act (Cwth)	*Territory Parks and Wildlife Conservation Act 1976*	Likelihood of occurrence in Project Area	Biological Important Area (BIA) in Project Area
False killer whale[1] (*Pseudorca crassidens*)	N/A	-	Known to occur – This species has been recorded within the Darwin Harbour. Demographically independent population(s), year-round inhabits of coastal areas in Northern Australia	None
Australian humpback dolphin (*Sousa sahulensis*)	Migratory	-	Known to occur – Suitable habitat for the species is present. This species has been recorded within the Darwin Harbour.	Yes – The Project Area intersects the Indo-Pacific humpback dolphin BIA for breeding.
Australian snubfin dolphin (*Orcaella heinsohni)*	Migratory	-	Known to occur – Suitable habitat for the species is present. Individuals of the species have previously been recorded in the Darwin Harbour and near Catalina Island, located to the east of the Project Area.	Yes – The Project Area intersects the Australian snubfin dolphin BIA for breeding.
Indo-pacific bottlenose dolphin (Arafura/ Timor Sea populations) (*Tursiops aduncus*)	Migratory	-	Known to occur – Suitable habitat for the species is present. This species has been recorded within the Darwin Harbour.	Yes – The Project Area intersects the Indo-pacific bottlenose dolphin BIA for breeding.
Dugong (*Dugong dugon*)	Migratory	-	Known to occur – Individuals of this species are known to occur within the Darwin Harbour.	None

Notes:

1. The false killer whale was not identified in the PMST search, however the species has been recorded in Darwin Harbour and is therefore included in the below impact assessment.

5.2.1.1 False killer whale

False killer whales (*Pseudorca crassidens*) were not identified in the PMST search, however, they have been recorded in the Darwin Harbour and Beagle Gulf, therefore the species are briefly described here. False killer whales are found in all tropical and warm temperate oceans. They are typically pelagic but are also known to approach close to shore around oceanic islands. However, a recent study of 14 satellite tagged individuals has shown that the false killer whale population(s) in northern Australia are thought to be a demographically independent population and inhabit these shallow coastal waters year-round (Palmer *et al.*, 2022). Currently, there are no estimates of global populations available, but they appear to be uncommon throughout their range.

In the NT, eight sightings of false killer whale groups within the semi-closed harbours of Port Essington and Darwin have been recorded since 2007 as part of monthly surveys undertaken by the Coastal Dolphin Project (Palmer *et al.*, 2009). The most recent sightings within these NT harbours have been recorded during the wet season of 2018 (December – April) (ALA, 2018). The behavioural observations associated with these sightings suggest the false killer whales were foraging (i.e., chasing schools of fish). Therefore, the species is considered as known to occur in the area.

5.2.1.2 Inshore dolphin species

Three inshore dolphin species were identified in the PMST search: Indo-pacific bottlenose dolphin, Australian humpback dolphin and Australian snubfin dolphin.

These species were monitored in the Darwin Harbour region (comprising Bynoe Harbour, Darwin Harbour and Shoal Bay) between 2011 and 2019 by the Coastal Dolphin Monitoring Program (Griffiths *et al*., 2020). The monitoring program found that populations of coastal dolphin species occurred at low densities in the Darwin Harbour region, though were similar to average densities found across NT coastal waters, and individuals or pods exhibited fluctuating movement across sites. Griffiths *et al.*, (2020) noted that population sizes fluctuated over the monitoring period, however showed a general decline over time. The authors were unable to explain the reasons for year-to-year variation in abundance and declines, citing potential factors as population dynamics, environmental factors or anthropogenic factors (Griffiths *et al.*, 2020).

5.2.1.2.1 Australian humpback dolphin

Humpback dolphins (*Sousa sahulensis*) are found in tropical/subtropical waters of the Sahul Shelf from northern Australia to the southern waters of the island of New Guinea (Jefferson & Rosenbaum, 2014). In Australia, humpback dolphins are thought to be widely distributed along the northern Australian coastline from approximately the Queensland-NSW border to western Shark Bay, WA (Parra & Cagnazzi, 2016). Humpback dolphins are more likely to be found in relatively shallow and protected coastal habitats such as inlets, estuaries, major tidal rivers, shallow bays, inshore reefs and coastal archipelagos, rather than in open stretches of coastline (Parra & Cagnazzi, 2016). BIAs for the Australian humpback dolphin occur along the Kimberley coast in WA, in NT waters and down the Queensland coast from Cape York to Brisbane (DSEWPaC, 2012).

The species is widely distributed across the NT with populations considered in a heathy state as per the findings of a conservation assessment by the NT Department of Natural and Environmental Resources (DENR) conducted in 2017 based on 2014/2015 surveys (Palmer *et al.*, 2017). The Australian humpback dolphin was identified as having an area of occupancy (AOO) of 16,900 km^2 as well as a calculated extent of occurrence of 88% of NT coastal waters (Palmer *et al.*, 2017). Highest densities of sightings were from Groote Eylandt (500), English Company Islands, Kakadu National Park, Melville Island (Aspley Straight) (Palmer *et al*., 2017) which are located on northern and eastern coasts of NT, over ~150 km from the Project Area.

BIAs (foraging, feeding and breeding) have been designated for the Australian humpback dolphin in Darwin Harbour; Port Essington, Cobourg Peninsula; East Alligator River region and South Alligator River region (DSEWPaC, 2012). The Project Area overlaps the Darwin Harbour breeding BIA for Australian humpback dolphins (**Figure 5-1**). In the Darwin Harbour BIA, calving occurs in the months of October to April (Palmer, 2010). The proportion of dolphin calves sighted has varied considerably over the years with calving rates increasing from 3% in 2017 to 4% in 2018 for the Australian humpback dolphin, where over the previous years the rate has generally been low (Flora and Fauna Division, 2019).

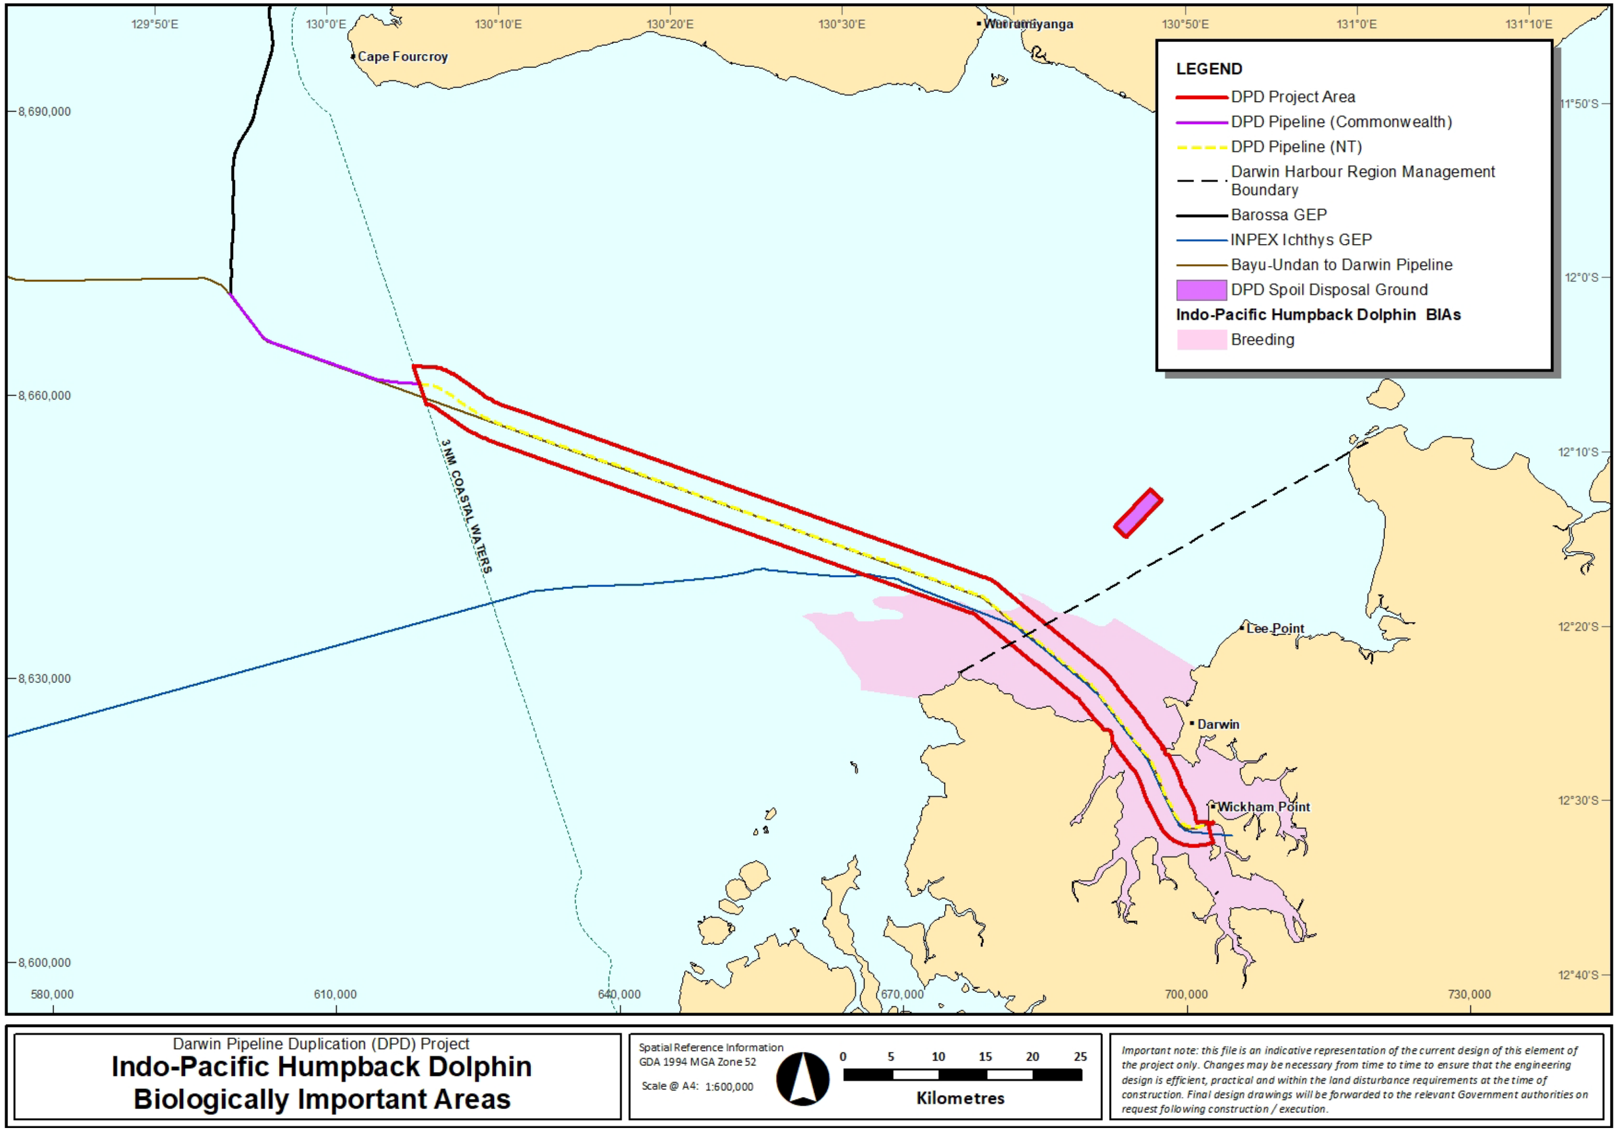


Figure 5-1: Biologically important areas for the Indo-Pacific humpback dolphin

5.2.1.2.2 Australian snubfin dolphin

The Australian snubfin dolphin (*Orcaella heinsohni*, hereafter, snubfin dolphin) was described as a separate species in 2005 and is endemic to the tropical waters of northern Australia and southern New Guinea (Beasley *et al.* 2005). Snubfin dolphins are typically found in shallow coastal waters (<20 m) and usually in proximity (<15 km) to freshwater inputs (Parra *et al.*, 2002, 2006a; Parra, 2006; Bouchet *et al.*, 2021). Previous research suggests they are intermittently distributed across their range as small local populations of 50 – 200 individuals (Parra *et al.*, 2006b; Palmer *et al.*, 2014b; Brown *et al.*, 2016; Brooks *et al.*, 2017; Bouchet *et al.*, 2021) that exhibit site fidelity (Parra, 2006; Brown *et al.*, 2016; D'Cruz *et al.*, 2022) and limited gene flow between populations (Brown *et al.*, 2014b, 2017). BIAs for Australian snubfin dolphins (breeding, foraging and resting) have been designated along the Kimberley coastline in WA and in NT waters.

The Australian snubfin dolphin is widely distributed across NT coastal waters, with populations considered in a heathy state, as per the findings of a conservation assessment by the NT DENR (Palmer *et al*., 2017). From aerial surveys undertaken in 2014 and 2015, the snubfin dolphin was identified as having an AOO of 24,900 km^2 and was calculated to occupy 89% of NT coastal waters (Palmer *et al.*, 2017). Highest densities of sightings were from Pellew Islands, Groote Eylandt, English Company Islands / Arnhem Bay and Fog Bay (Palmer *et al.*, 2017), with these sites primarily on the east coast of the NT.

The Project Area overlaps the Darwin Harbour breeding BIA for Australian snubfin dolphins (**Figure 5-2**). Limited data on breeding time are available for the Australian snubfin dolphin, however, the closely related irrawaddy dolphin is thought to mate from March to June (Ross, 2006) with calves born in August or September.

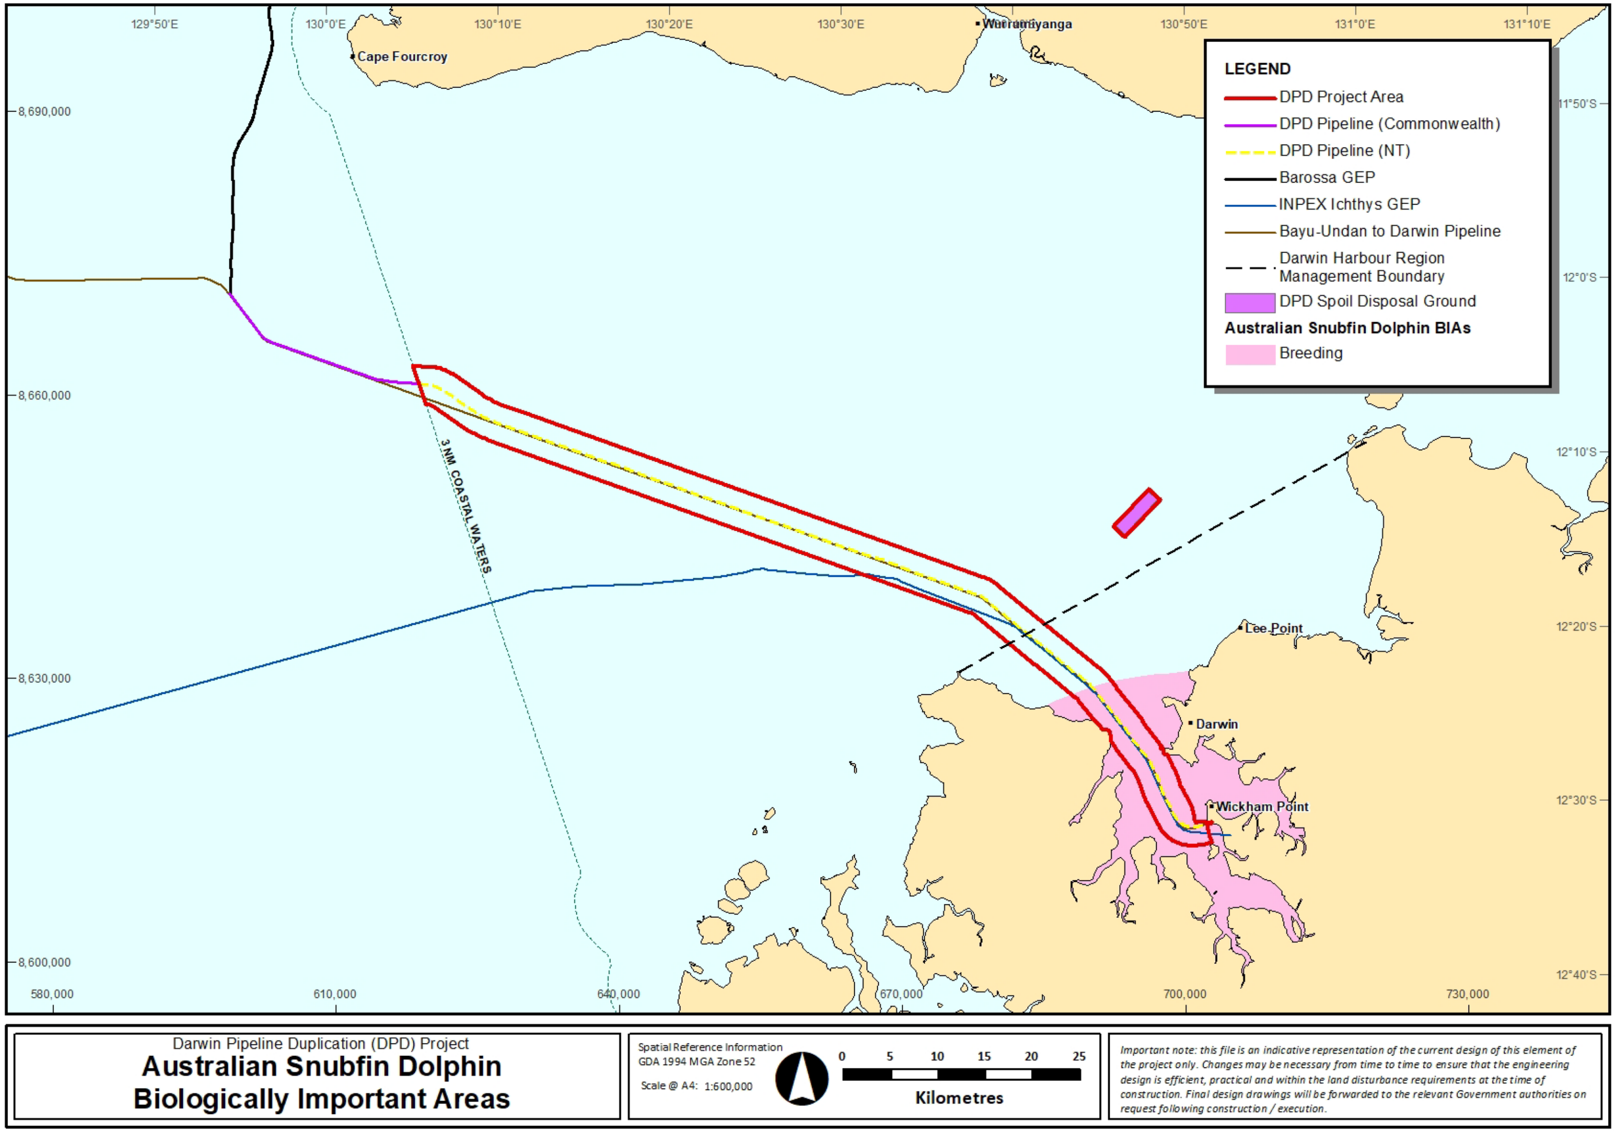

Figure 5-2: Biologically important areas for the Australian snubfin dolphin

5.2.1.2.3 Indo-Pacific bottlenose dolphin

Indo-pacific bottlenose dolphins (*Tursiops aduncas*) are found in tropical and sub-tropical coastal and shallow offshore waters of the Indian Ocean, Indo-Pacific Region and the western Pacific Ocean (Möller & Beheregaray 2001; Rice 1998; Ross & Cockcroft 1990; Wang *et al.*, 1999). The species has been recorded in waters of all Australian states/territories, and can be found in estuarine and coastal waters of eastern, western and northern Australia (Hale *et al.*, 2000; Möller & Beheregaray 2001; Ross & Cockcroft 1990). BIAs for the species have been designated along the Kimberley Coast in WA, in NT waters and down the entire east coast of Australia from Cape York to past the New South Wales (NSW) – Victorian border.

The species is widely distributed across the NT with populations considered in a heathy state as per the findings of a conservation assessment by the NT Department of Natural and Environmental Resources (DENR) based on 2014/2015 surveys (Palmer *et al*., 2017). The species was identified as having an area of occupancy (AOO) of 17,600 km^2 and occurred within 84% of NT coastal waters (Palmer *et al.*, 2017). Highest densities were recorded from Limmen Bight, Nhulunbuy, Caledon Bay, Maningrida, Fog Bay, Anson Bay and Cape Ford (Palmer *et al.*, 2017), which are distributed across west, north and east coasts of NT.

The Project Area overlaps with a breeding BIA in Darwin Harbour (**Figure 5-3).** Calving in the Darwin Harbour BIA occurs in the months of October to April (Palmer, 2010). The proportion of dolphin calves sighted has varied considerably over the years with calving rates decreasing from 12% in 2011 to 0% in 2017 and increasing to 4% in 2018 (Flora and Fauna Division, 2019).

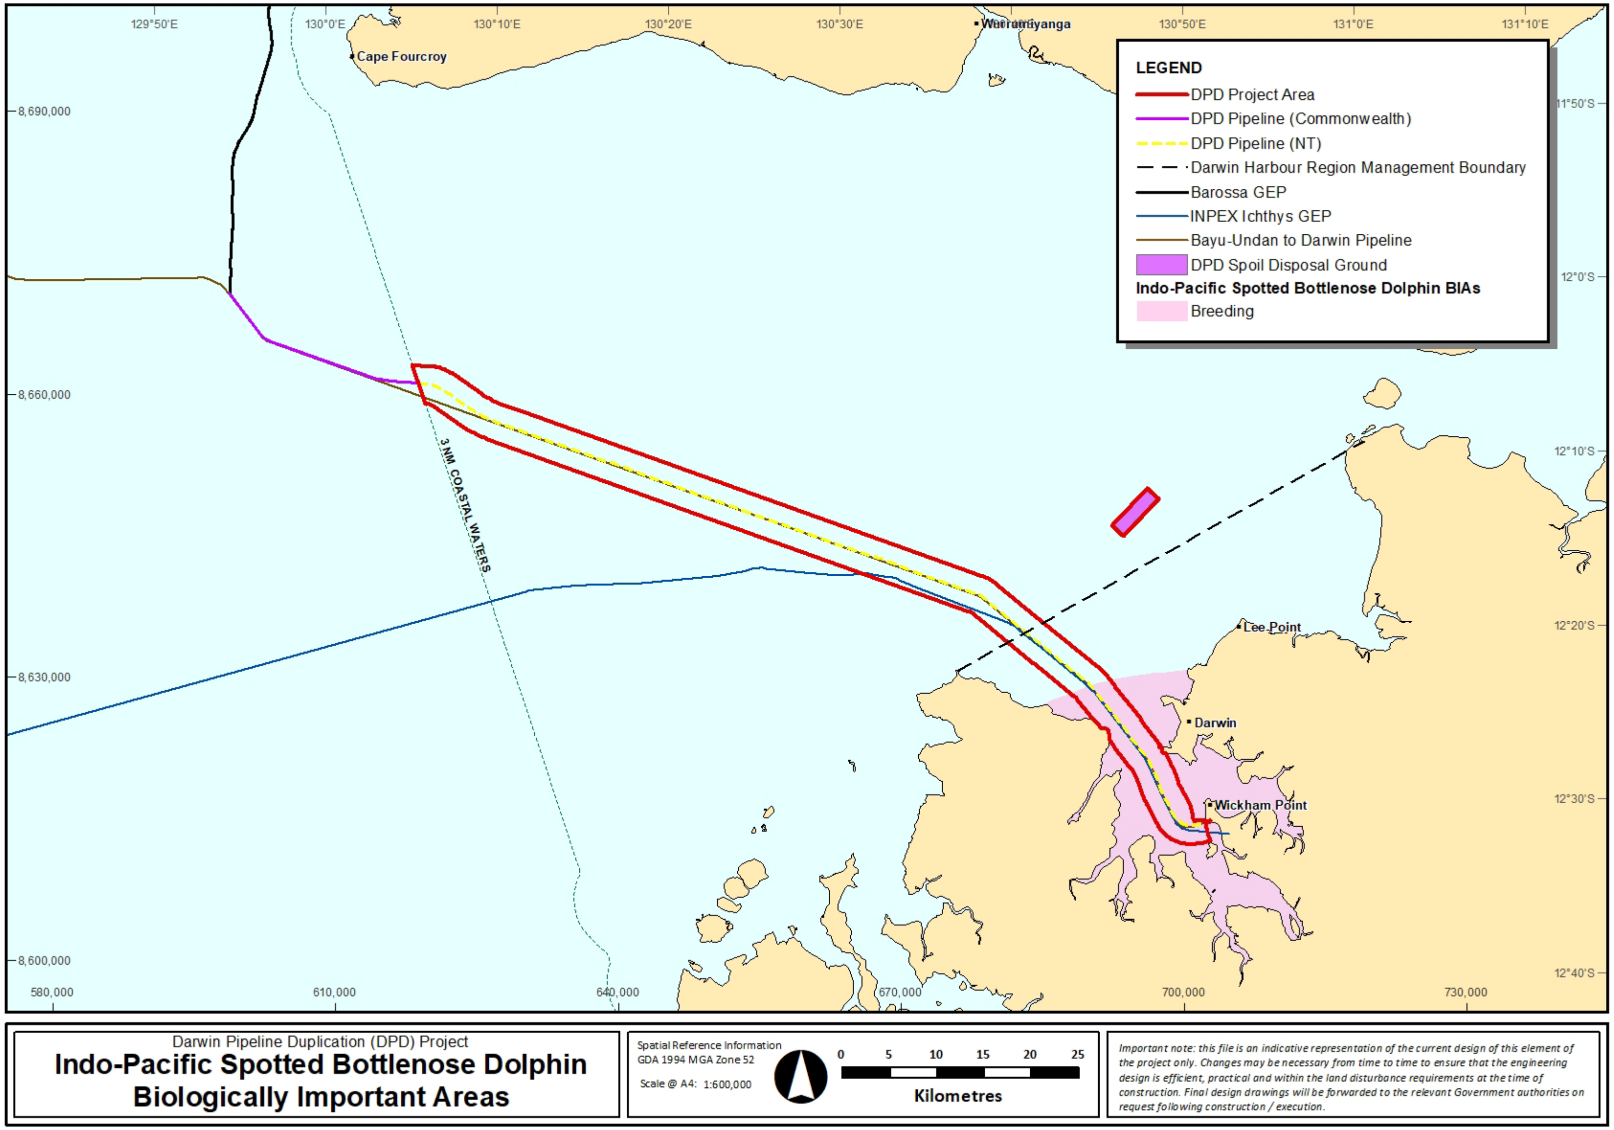

Figure 5-3: Biologically important areas for the Indo-Pacific bottlenose dolphin

5.2.1.2.4 Dugong

The Dugong (*Dugong dugong)* has a very large and fragmented Indo-West Pacific range that extends between about 26 – 27° north and south of the equator (Nishiwaki & Marsh, 1985), encompassing some 860,000 km² of shallow marine habitat across 128,000 km of coastline (Marsh *et al.*, 2011). In Australia, dugongs are known to occur in coastal and island waters from Shark Bay in WA, across the northern coastline to Moreton Bay in Queensland (Marsh *et al.*, 2002; 2011). The winter range includes about 24,000 km of Australia's coast, which represents about 19% of the global extent of occurrence along coastline habitats (Marsh *et al.*, 2011).

The NT supports a moderate population compared with the Torres Strait, which is the largest global population (Groom *et al.*, 2017). Specific areas supporting dugongs in the NT include: the northern coast from Daly River to Millingimbi, including Melville Island and Vernon Islands and the Darwin region; and the Gulf of Carpentaria, including the Sir Edward Pellew Group of Islands, the mouth of the Limmen Bight River, and the waters between Blue Mud Bay and Groote Eylandt (Marsh *et al.*, 2008; Grech *et al.*, 2011). The distribution and abundance of dugongs is generally associated with extensive seagrass and algal habitats, and they are usually found in coastal areas such as shallow protected bays, mangrove areas and leeward of large inshore islands where seagrass grows (O2 Marine, 2019). Aerial surveys conducted by Groom *et al.* (2017) in 2015 found that the Sir Edward Pellew Island Group and Limmen Bight on the east coast of the NT have the highest population estimates for dugongs in NT consistent with earlier survey results from 2007 and 2014.

Dugong monitoring was undertaken as part of the Ichthys Nearshore Environmental Monitoring Program from 2012 to 2014 across three areas (blocks), representing Bynoe Harbour, Darwin Harbour/Hope Inlet and Vernon islands and surrounds. Population estimates ranged from approximately 120 to 300 individuals (calculated from post-dredging phase monitoring) with a clear preference for shallow waters (0 – 10 m) and with far fewer sightings in the inner Darwin Harbour (demarcated as a line from Mandorah to East Point) than in the outer Darwin Harbour (Cardno, 2015a). Highest dugong abundances from these surveys were recorded in seagrass meadows at Casuarina Beach and Lee Point in the outer Darwin Harbour and outside of the Project Area. Within the inner harbour, dugongs were observed in highest abundance (n = 19) at Weed Reef (Cardno, 2015a).

Cardno (2015a) found that sightings and densities of dugongs increased from May to October, when overall sightings were greatest. This is consistent with seasonal increase in seagrass extent and density (Cardno, 2015b). There are no BIAs for dugongs in the Marine Bioregional Plan for the North Marine Region (DSEWPaC, 2012), however the species is known to regularly occur in Darwin Harbour.

5.2.2 Marine reptiles

There are six species of marine turtle known to occur in NT waters that are either known to occur or have the potential to occur within the Project Area (**Table *5-3***). Of these only the green, hawksbill, flatback and olive ridley turtle are known to inhabit Darwin Harbour (BAA-201 0003; Santos, 2021a; BAA-201 0004; Santos, 2022). Through further assessment as described above, the species determined likely to occur in the Project Area are described in the following sections.

Marine turtle aerial surveys undertaken for the INPEX nearshore environmental monitoring program (NEMP) estimated a population size of between 500 and 1,000 for the Darwin region (Buckee *et al.*, 2014). Turtles were primarily observed in shallow waters (<10 m), with the highest densities recorded between East Point and Lee Point, and near Gunn Point (Cardno, 2015a). Turtles were also sighted throughout Darwin Harbour, although at lower densities. It is likely that the majority of turtles observed in the harbour during these surveys were green turtles, as they accounted for 74% of sightings during fine scale land-based observations (INPEX Browse Ltd, 2018).

In addition to marine turtles, the salt water crocodile is known to occur in the Project Area.

Table 5-3: Threatened and migratory marine reptile species identified as habitat critical and as likely to occur in the Project Area.

Species	EPBC Act (Cwth)	*Territory Parks and Wildlife Conservation Act 1976*	Likelihood of occurrence in Project Area	BIA and habitat critical in Project Area
Loggerhead turtle (*Caretta caretta*)	Endangered Migratory	Vulnerable	Potential – Possibly infrequent users of Darwin Harbour but more likely to occur in surrounding oceanic areas.	None
Green turtle (*Chelonia mydas*)	Vulnerable Migratory	-	Known to occur – Suitable habitat for the species is present. This species is known to occur within the Darwin Harbour.	None
Hawksbill turtle (*Eretmochelys imbricata*)	Vulnerable Migratory	Vulnerable	Known to occur – Suitable habitat for the species is present. This species is known to occur within the Darwin Harbour.	None
Flatback turtle (*Natator depressus*)	Vulnerable Migratory	-	Known to occur – Suitable habitat for the species is present. This species is known to occur within the Darwin Harbour.	Yes – The Project Area intersects the flatback turtle habitat critical and BIA critical for survival (inter-nesting).
Leatherback turtle (*Dermochelys coriacea*)	Endangered Migratory	Critically endangered	Potential – Preferred habitat for this species is open ocean. Likely to occur in the oceanic waters outside Darwin Harbour.	None
Olive ridley turtle (*Lepidochelys olivacea*)	Endangered Migratory	Vulnerable	Known to occur – Suitable habitat for the species is present. This species is known to occur within the Darwin Harbour.	None – Habitat critical and BIA critical for the survival of the olive ridley turtle (inter-nesting) is present

Species	EPBC Act (Cwth)	*Territory Parks and Wildlife Conservation Act 1976*	Likelihood of occurrence in Project Area	BIA and habitat critical in Project Area
				to the north and south of the Project Area.
Salt-water Crocodile (*Crocodylus porosus*)	Migratory	-	Likely – The species has been recorded within Darwin Harbour or surrounding waters in the past 10 years; and suitable habitat is present.	None – no important habitat for the species located within the Project Area.

5.2.2.1 Loggerhead turtle

The loggerhead turtle (*Caretta caretta*) has a worldwide distribution, living and breeding in subtropical to tropical locations (Limpus, 2009). Loggerhead turtles are known to forage in subtidal and intertidal coral and rocky reefs and seagrass meadows in inshore waters, as well as in deeper soft-bottomed habitats. Females can migrate up to 2,600 km from feeding areas to traditional nesting beaches.

In Australia, they occur in coral reefs, seagrass beds and muddy bays and estuaries in tropical and warm temperate waters off the coast of Queensland, NT, WA and NSW. The current area of occurrence is estimated to be ~1.5 million km^2.

Breeding aggregations in Australia occur on both the east coast (Queensland and NSW) and the west. Based on the percentage of nesting females per year, approximately 2 – 4% of the total global population of loggerhead turtles occur in Australia, with the majority occurring in eastern and western Australia. There are no known nesting areas in NT. The annual nesting population in WA is thought to be 3,000 females annually (Baldwin *et al*., 2003), and this is considered to support the third-largest population in the world (Limpus, 2009). Loggerhead turtles have one genetic breeding stock within WA (Commonwealth of Australia, 2017).

Loggerhead turtles are known to forage in the Oceanic Shoals Marine Park, the Arafura Sea and the Gulf of Carpentaria; however, they have not been observed breeding in the region (DEWHA, 2008a). Loggerhead turtles are expected to be infrequent users of the Darwin Harbour (Whiting, 2003). The loggerhead turtle is more likely to occur in oceanic areas outside the Darwin Harbour. Benthic surveys undertaken in October/November 2021 and June 2022 found epibiota density did increase towards the shallow inner Darwin Harbour area outside the Project Area (RPS, 2022). However, there is unlikely to be suitable habitat for loggerhead turtles throughout the Project Area due to the large areas of bare silty sand with sparse epibiota. There are no BIAs for loggerheads in the Project Area and there is no evidence to suggest the species will use beaches within the Darwin Harbour for nesting.

5.2.2.2 Green turtle

Green turtles are found in tropical and subtropical waters throughout the world. The global population of green turtles is estimated to be very large (~2 million). Green turtles spend their first five to ten years drifting on ocean currents (pelagic phase). They then settle in shallow benthic foraging habitats such as tropical tidal and sub-tidal coral and rocky reef habitat or inshore seagrass beds. The shallow foraging habitat of adults contains seagrass beds or algae mats on which green turtles mainly feed. Green turtles can migrate more than 2,600 km between their feeding and nesting grounds.

Green turtles nest, forage and migrate across tropical northern Australia. The total Australian population of green turtles is estimated to be more than 70 000 individuals, distributed across seven regional populations that nest in different areas; the southern Great Barrier Reef, the northern Great Barrier Reef, the Coral Sea, the Gulf of Carpentaria, Western Australia's north-west shelf, the Ashmore and Cartier Reefs and Scott Reef. The Gulf of Carpentaria has two main nesting areas, the Wellesley Island Group, with major rookeries at Bountiful, Pisonia and Rocky Islands, and the Eastern Arnhem Land, Groote Eylandt and Sir Edward Pellew Islands area. Nesting occurs year-round, with a mid-year peak in nesting activity.

The key nesting and inter-nesting areas (where females live between laying successive clutches in the same season) are Coburg Peninsula (~125 km from the Project Area), between Nhulunbuy and northern Blue Mud Bay (East Arnhem Land), Groote Island, offshore islands including Crocker Island, Goulburn Island, Sir Edward Pellew Islands, Bathurst and Melville Islands, Wessel and English Islands, and Rocky Island.

There are no defined or evidence of nesting or inter-nesting areas within the Project Area, however, within Darwin Harbour, it is not known if the green turtle use Casuarina Beach, Cox Peninsula Beaches and Mandorah Beach for nesting (~10 km from the Project Area) due to low survey effort, low reporting effort and low levels of turtle nesting effort in the area. Incidental sightings from other surveys indicate green turtle are present within Darwin Harbour (Pendoley, 2022; Whiting, 2001). The Project Area contains rocky reef and algae habitat (e.g. weed reef), therefore it is likely that green turtles feed in the Project Area.

5.2.2.3 Hawksbill turtle

Hawksbill turtles (*Eretmochelys imbricata*) have a global distribution throughout tropical and subtropical marine waters. The total population of hawksbill turtles in Australia is unknown. Hawksbill turtles are largely concentrated on the North West Shelf (Dampier Archipelago) of WA (Limpus, 2009), however a second major population of hawksbill turtles, which is genetically isolated from the North West Shelf population is located along the NT coast and north-eastern Queensland (Northern Territory Government, n.d).

In the NT nesting is reported to occur from July to December (Chatto, 1997; 1998). Adults tend to forage in tropical tidal and subtidal coral and rocky reef habitat where they feed on an omnivorous diet of sponges, algae, jelly fish and cephalopods (DSWEPaC, 2012a).

Incidental sightings suggest hawksbill turtles utilise Darwin Harbour regularly but occur in lower abundances compared to the green turtle (Whiting, 2001; 2003). In the Darwin Harbour, immature and adult sized hawksbill turtles were found to use the rocky reef habitat at Channel Island, and may also utilise other habitats (Whiting, 2001). Soft coral and sandy habitats are widely present throughout the Project Area within Darwin Harbour, providing suitable foraging habitat for the hawksbill turtle.

5.2.2.4 Flatback turtle

The flatback turtle (*Natator depressus*) is found only in the tropical waters of northern Australia, Papua New Guinea and Irian Jaya and is one of only two species of sea turtle without a global distribution.

There are no estimates of population size for the species and it is currently listed as 'data deficient' by the IUCN. Flatback turtles feed in the northern coastal regions of Australia, extending as far south as the Tropic of Capricorn. Their feeding grounds also extend to the Indonesian archipelago and the Papua New Guinea coast. Post-hatchling flatback turtles do not have an oceanic dispersal phase, this species remains within the relatively shallow Australian continental shelf waters (Salmon *et al.*, 2009).

Flatback turtles are the most widely spread nesting marine turtle species in the NT, nesting on a wide variety of beach types around the entire coastline. Flatback turtles have a preference for shallow, soft-bottomed seabed habitats away from reefs; consistent with the habitat in the Project Area. A study conducted on Field Island in the Van Diemen Gulf (~100 km from the Project Area) recorded a total of 257 individuals nesting on the island from 2002 to 2013 (Groom *et al.* 2017). The study estimated the abundance of nesting flatback turtles at Field Island and found it varied over time and ranged from 97 to 183. Peak internesting for flatback turtles in the NT occurs between June-September (DoEE, 2017a).

As shown on **Figure 5-4**, the Project Area intersects 'Habitat Critical to the survival of the flatback turtle species'. This habitat was mapped by consensus of a panel of experts in marine turtle biology and according to the EPBC Act Significant Impact Guidelines 1.1 – Matters of National Environmental Significance, is defined as areas necessary:

+ For activities such as breeding or dispersal.
+ For the long-term maintenance of the species.
+ To maintain genetic diversity and long-term evolutionary development.
+ For the reintroduction of populations or recovery of the species.

Habitat Critical to the survival of flatback turtles includes at least 70% of nesting habitat for the stock (i.e. these marine areas are extensive). The Project Area also overlaps a flatback turtle BIA (inter-nesting), which further supports the species assessment as known to occur in the Project Area.

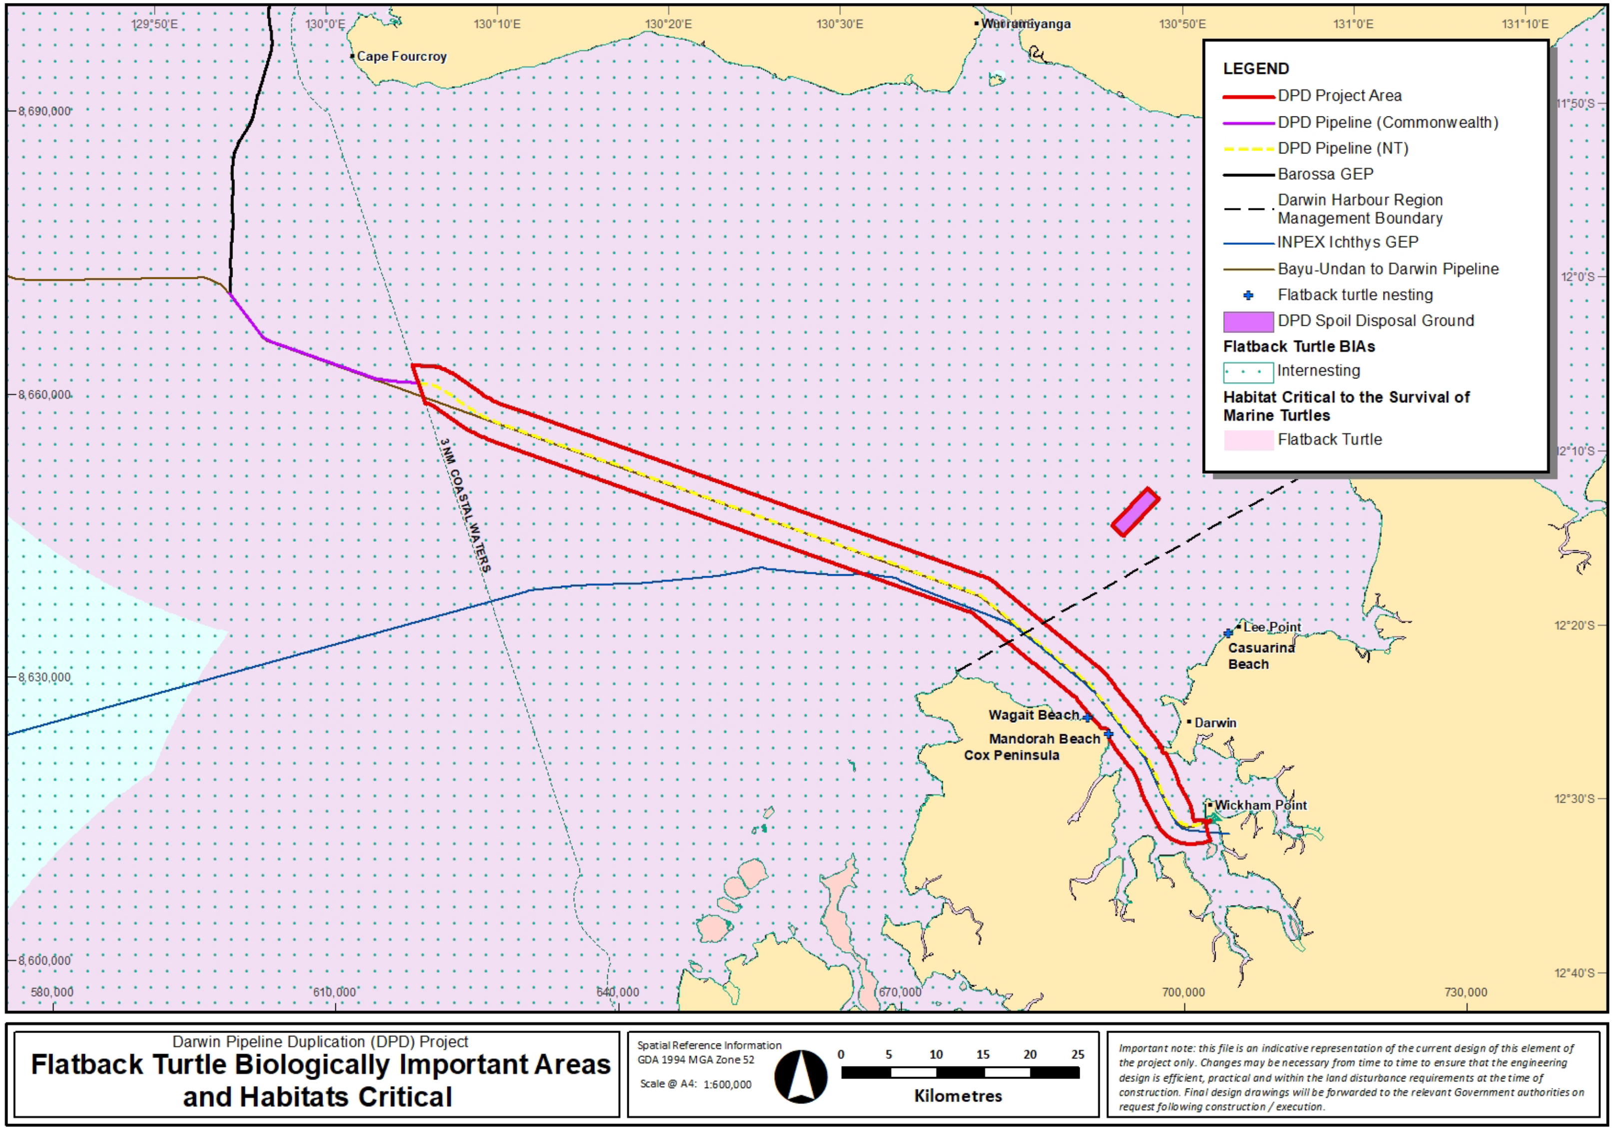

Figure 5-4: Flatback turtle biologically important areas and habitats critical to survival

5.2.2.5 Leatherback turtle

The leatherback turtle *(Dermochelys coriacea*) has the widest distribution of any marine turtle and can be found from tropical to temperate waters throughout the world. The leatherback turtle is a pelagic feeder, found in tropical, subtropical and temperate waters throughout the world. Although this species has an unusually wide latitudinal range as adults can withstand cold (10 °C) water. Leatherback turtles are presumed to migrate to Australian waters from nesting populations in Indonesia, Papua New Guinea and the Solomon Islands.

The species has been recorded feeding in the coastal waters of all Australian States (Hamann *et al.*, 2006). The species is most commonly reported from coastal waters in central eastern Australia (from the Sunshine Coast in southern Queensland to central NSW); south-east Australia (from Tasmania, Victoria and eastern South Australia) and in south-western WA. It is regularly seen in southern Australian waters. The current area of occurrence in Australia is estimated to be ~6 million km². No estimates of the numbers of leatherback turtles that forage in Australian waters are available.

There are no known major leatherback turtle nesting sites in Australia, although scattered isolated nesting (one to three nests per year) occurs in southern Queensland and the NT (Limpus & McLachlin, 1994). Nesting sites have been found at Cobourg Peninsula, Manangrida and Croker Island (200 – 250 km from the Project Area) in the NT. Only very small numbers of nests are laid per year in the NT and thus would only be a minor contributor to the global population. The species is unlikely to use beaches within the Darwin Harbour for nesting (Whiting, 2001).

The leatherback turtle is considered to be an oceanic species, which is unlikely to occur within the Darwin Harbour (Whiting, 2001).

5.2.2.6 Olive ridley turtle

The olive ridley turtle has a worldwide tropical and subtropical distribution, including northern Australia. The current area of occurrence is estimated to be in excess of 10 million km². Olive ridley turtles typically occur in shallow soft-bottomed habitats of protected waters. In Australia, they occur along the coast from southern Queensland and the Great Barrier Reef, northwards to Torres Strait, and across to the Joseph Bonaparte Gulf in WA.

A substantial part of the immature and adult population forage over shallow benthic habitats, though large juvenile and adult olive ridley turtles have been recorded in both benthic and pelagic foraging habitats. Foraging habitat can range from depths of several metres to over 100 m. A 'Habitat Critical to the survival of the olive ridley turtle species' occurs around the south-western side of Bathurst Island, extending 20 km seaward and approximately 5 – 10 km north of the Project Area (**Figure 5-5**).

An olive ridley turtle BIA inter-nesting area is located south-east of Darwin Harbour, approximately 10 km from the Project Area (**Figure 5-5**). This BIA is near the turtle nesting sites of Bare Sand Island, Quail Island and Indian Island, located near the mouth of Bynoe Harbour (~50 km from Darwin), however these sites are not considered significant on a regional scale with infrequent nesting recorded (Chatto and Baker, 2008). Within the Darwin Harbour, Casuarina Beach, Cox Peninsula Beaches and Mandorah Beach are infrequently used for nesting. In Northern Australia nesting occurs all year round, although most nesting occurs during the dry season from April to August. Hatchlings emerge from the nests about two months after laying (DoEE, 2017a).

There are no nesting beaches or defined inter-nesting area within the Project Area. However, Habitat Critical to the survival of olive ridley turtles and a BIA (inter-nesting) occur outside to the north and south of the Project Area respectively. Therefore, olive ridley turtles are likely to occur in waters outside Darwin Harbour and may transit through the Project Area.

Santos

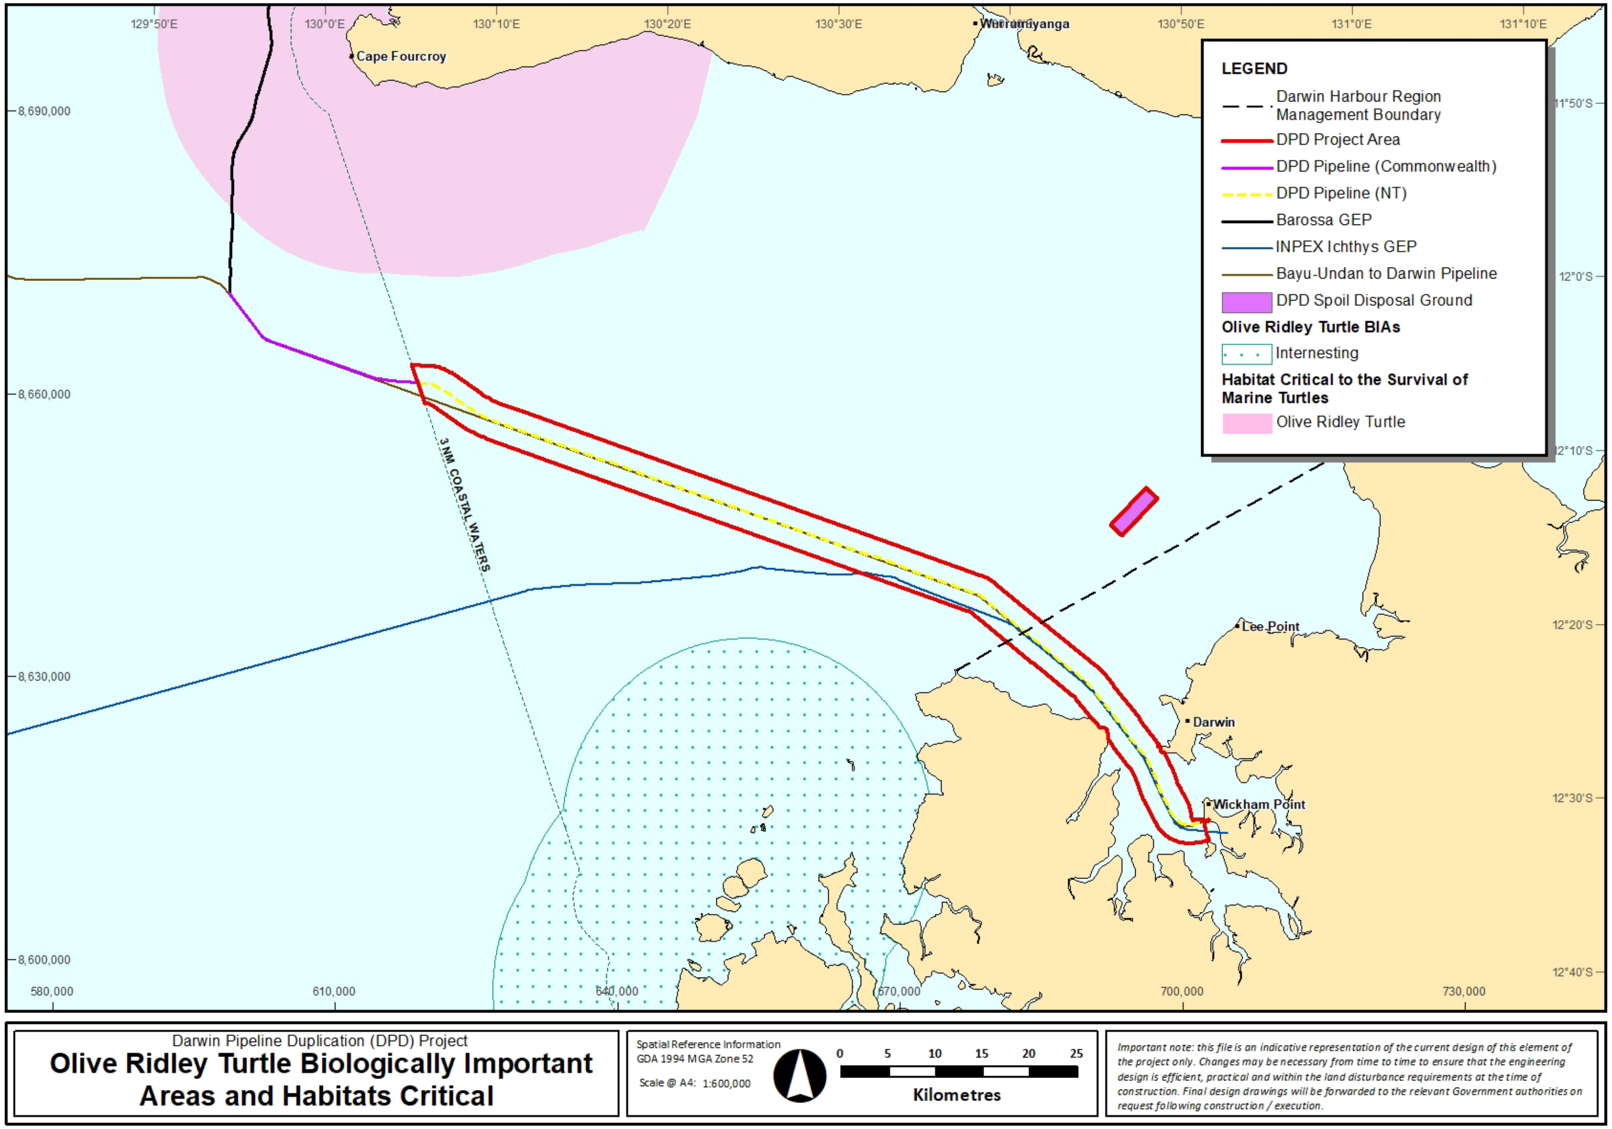

Figure 5-5: Olive ridley turtle biologically important areas and habitats critical to survival

5.2.2.7 Saltwater crocodile

The saltwater crocodile (*Crocodylus porosus*) is primarily found in inland waterways, tidal creeks, coastal floodplains and channels, billabongs and swamps across northern Australia (DoEE, 2019). The species' recognised distribution extends from Rockhampton in Queensland to King Sound in WA (DoEE, 2019). There are no identified BIAs or EPBC-listed critical habitat within the NMR for saltwater crocodiles. In the NT, saltwater crocodiles can be found in almost any type of water body, including fresh or saline, within their range (Saalfeld *et al.*, 2016). In the NT, most breeding sites are found on riverbanks or floating rafts of vegetation.

Within the NMR, the saltwater crocodile's distribution is thought to have expanded since its protection in the early 1970s, with individuals occurring up to 150 km inland, further than any historical records or knowledge (DEWHA, 2008b). Although the species is considered recovered and no longer threatened, it is recognised that strict regulation is required to avoid the population becoming depleted again (DoEE, 2019). Saltwater crocodiles breed during the wet season between October and May. Preferred nesting habitat of the saltwater crocodile includes elevated, isolated freshwater swamps that do not experience the influence of tidal movements (Saalfeld *et al.* 2016). Nesting occurs in freshwater swamps that have little tidal movement between December and March, with a peak period between January and February (DEWHA, 2008b).

The saltwater crocodile is common throughout the Darwin region and could occur in the Project Area. In 2019/2020 a total of 249 'problem crocodiles' were removed from NT waters with nearly all of these being caught within Darwin Harbour area (DEPWS, 2021).

The saltwater crocodile is commonly recorded in the Darwin Harbour, with sightings of individuals on boat ramps near the Project Area.

5.3 Sharks, rays and sawfishes

The EPBC Act PMST (BAA-201 0003; Santos, 2021a; BAA-201 0004; Santos, 2022) identified 13 species of sharks, rays and sawfishes listed as threatened and/or migratory under the EPBC Act. Through further likelihood assessment all are considered unlikely to occur within the Project Area BAA-201 0003; Santos, 2021a; BAA-201 0004; Santos, 2022).

6 Noise assessment

6.1 Underwater noise sources

There will be a period of increased noise emissions during construction activities due to the operation of vessels, survey and positioning equipment, trenching equipment and helicopters. Underwater noise emissions will be temporary and will take place for a relatively short period of time in any one location.

Research has found that the noise levels at which physiological or behavioural impacts to marine fauna occur is dependent on whether the noise being generated is classed as impulsive or non-impulsive:

+ **Impulsive** – sounds produced are typically transient, brief (less than one second), broadband and consist of high peak pressure with rapid rise time and rapid decay (NOAA, 2019). This noise source is associated with activities such as pile driving, seismic activities and underwater blasting and results in some of the most powerful sounds produced underwater (Yelverton et al., 1973; Young, 1991).
+ **Non-impulsive** – sounds produced can be broadband, narrowband or tonal, brief or prolonged, continuous or intermittent and typically do not have the high peak sound pressure with rapid rise / decay times that impulsive sounds do (NOAA, 2019). This type of noise source is associated with activities such as dredging, vessel noise, drilling and some construction activities.

The following sections describe the potential noise generating activities and noise sources during the DPD Project. The noise sources that were modelled were determined based on the activities with the highest risk of causing underwater noise impacts and the best possible match to the activities and equipment provided at the time of assessment.

6.1.1 Vessels

Noise associated with vessel activity that could impact marine megafauna includes noise generated by vessel thrusters, engines and propellers, as well as noise emitted onboard which is converted to underwater noise through the hull (i.e., from heavy machinery) (Abrahamsen, 2012). These are considered non-impulsive noise sources. The main source of vessel noise will be from propellers or dynamic positioning (DP) thrusters. Noise will also be generated during vessel transit within the Project Area. Noise from DP systems is predominately generated from water rushing through the thruster tunnel on vessels and typically ranges between 200 Hz and 1.2 kHz in frequency. Surveys measuring underwater noise from DP vessels holding station reported maximum source levels of approximately 182 dB re 1 µPa at 1 m (McCauley, 1998). Levels emitted from vessels during activities are expected to be no higher than these reported levels.

Of the vessels used for DPD Project activities, vessels undertaking trenching activities are considered to have the highest potential noise emissions and have been modelled.

6.1.2 Trenching vessels

Depending upon the trenching area, trenching will be completed using different trenching vessels, including a BHD, a TSHD and a CSD. These are considered non-impulsive noise sources. Previous studies of underwater noise have recorded that source levels for general marine dredging operations range from 160 – 180 dB (re 1 µPa at 1 m) for 1/3 octave bands, with peak intensities between 50 and 500 Hz (Greene & Moore, 1995; Thomsen *et al.*, 2009; CEDA, 2011; WODA, 2013). Received sound levels from some large trailer suction hopper dredges operating in rocky areas have been recorded greater than

150 dB (re 1 µPa at 1 km), while large CSDs can emit strong tones from the water pumps that are audible to 20 – 30 km ranges (Richardson *et al.*, 1995; Dames & Moore, 1996; Robinson *et al.*, 2011). Operating dredges will emit sound at their maximum source levels, which are in the 180 to 190 dB (re 1 µPa at 1 m) range (Richardson *et al.*, 1995; Simmonds, Dolman & Weilgart, 2004; Thomsen *et al.*, 2009; CEDA, 2011; WODA, 2013).

6.1.3 Rock breaking tools (Xcentric Ripper and hydraulic hammer)

An Xcentric Ripper (preferred) or a hydraulic hammer are BHD tools that may be required to break up rocky material during the trenching activities. For the purposes of modelling, the Xcentric Ripper is considered a non-impulsive noise source and the hydraulic hammer an impulsive noise source Connell *et al.* (2003).

Underwater measurements of an Xcentric Ripper XR-60 have been used to inform an appropriate source level for the purposes of underwater noise modelling. Connell et al. (2023) used underwater noise measurements taken by Lawrence (2016) to calculate a source level of 184.8 dB re 1 μPa^2 s m^2.

In order to determine an appropriate source level for modelling the effects of a hydraulic hammer (Epiroc HB 10000), Connell *et al.* (2023) used a source-level spectra corresponding to Down-The-Hole (DTH) hydro-hammering as a proxy. DTH hydro-hammering is a percussive rotating drilling technique appropriate for hard rock formations. The proxy DTH levels used correspond to a Numa Patriot 180 hammer as detailed in Denes *et al.* (2016). The source level used to represent hydraulic hammering was determined to be 192 dB 1 μPa^2s m^2.

6.1.4 Survey equipment

Commercial survey vessels (multibeam echosounder (MBES), side scan sonar (SSS), long baseline acoustic positioning system (LBL) / ultra-short baseline system (USBL)) use a variety of sonar (e.g., depth sounders) that emit underwater noise (150 – 235 dB) but tend to use a higher frequency (>70 kHz). They are generally pointed directly towards the bottom in a narrow beam limiting horizontal noise propagation and are considered impulsive noise sources. Side scanning sonars (e.g., seafloor mapping) are the exception as noise is propagated horizontally (Weilgart, 2007). Most SSS and MBES operate in the frequency range of 100 kHz to 500 kHz (MacGillivary *et al*., 2014; Ruppel *et al*., 2022).

6.1.5 Noise generated by helicopters

Helicopters will also generate noise, with the main source of noise being the engines and the rotor blades. Sound traveling from a helicopter to a receiver underwater is affected by both in-air and underwater propagation processes, and processes occurring at the air seawater surface interface (e.g., wind and waves). The level of noise received underwater depends on source altitude and lateral distance, receiver depth, water depth, and other variables.

Helicopter engine noise is emitted at various frequencies however, the dominant tones are generally of a low frequency (LQ) below 500 Hz (Richardson *et al.*, 1995) and is considered an impulsive noise source. Sound pressure in the water directly below a helicopter is greatest at the surface and diminishes with increasing receiver depth. Noise also reduces with increasing helicopter altitude, but the duration of audibility often increases with increasing altitude, with sound penetrating water at angles <13°.

It is expected the duration of helicopter operations within close proximity to the marine environment is limited and intermittent. Further, helicopter operations are expected to result in received underwater noise levels lower than those associated with vessel operations.

6.2 Underwater noise thresholds

Available threshold criteria associated with behavioural and physiological impacts for sensitive marine fauna have been derived from a number of sources (NMFS, 2018; NMFS, 2014; Popper *et al.*, 2014; Southall *et al.*, 2019). These thresholds have been used to assess modelling results and determine potential impacts to marine fauna from permanent threshold shift (PTS) and temporary threshold shift (TTS) as well as to determine potential behavioural effects.

6.2.1 Noise thresholds for marine mammals

The potential impacts of anthropogenic noise on marine mammals, specifically cetaceans, have been the subject of considerable research. Current data and predictions show that marine mammal species differ in their hearing capabilities, in absolute hearing sensitivity, as well as frequency band of hearing (Richardson *et al.*, 1995; Wartzok and Ketten, 1999; Southall *et al.*, 2007). To better reflect the auditory similarities between phylogenetically closely related species, but also significant differences between species groups among the marine mammals, Southall *et al.* (2007) assigned the extant marine mammal species to functional hearing groups based on their hearing capabilities and sound production. More recently, U.S. Navy technical reports by Finneran (2015, 2016) proposed new auditory weighting functions and the U.S. NMFS (2014, 2018) undertook a comprehensive review of PTS and TTS dual metric criteria for marine mammals and revised the threshold criteria for each frequency-weighted functional hearing category of cetacean. The only marine mammals likely to occur in the waters of Darwin harbour are dolphins (high frequency functional hearing category) and dugong and the noise effect threshold for these receptors are in **Table 6-1**.

6.2.2 Noise thresholds for marine reptiles

Marine turtles are considered to be less sensitive to noise than marine mammals as they do not have an external hearing organ but can detect sound through bone-conducted vibration in the skull with their shell providing a receiving surface (Lenhardt *et al.*, 1985). Morphological studies of green and loggerhead turtles (Ridgway *et al.*, 1969; Wever, 1978; Lenhardt *et al.*, 1985) found that the turtle ear is similar to other reptile ears but has adaptations for underwater listening.

Most studies researching the effect of seismic noise on sea turtles focused on behavioural responses, as physiological impacts are more difficult to observe in living animals. Turtles avoid low-frequency sounds (Lenhardt, 1994) and sounds from seismic surveys (O'Hara and Wilcox, 1990), but these reports did not note received sound levels. In another study, caged green and loggerhead turtles increased their swimming activity in response to an approaching airgun when the received SPL was above 166 dB (re 1 µPa) (McCauley *et al.*, 2000).

There are no known studies that have investigated the effects of noise on crocodiles so the thresholds for turtles have been applied to crocodiles and these are presented in **Table *6-1***.

Table 6-1: Noise impact thresholds for the marine fauna groups in Darwin Harbour

Marine fauna type	Marine hearing group	Hearing bandwidth	Noise type	SEL24hour (Weighted) dB (re 1µ Pa2.s)		SPL Possible Behavioural Disturbance dB (re 1µ Pa)
				TTS	PTS	
Dolphins			Non-Impulsive[1]	178	198	120

Marine fauna type	Marine hearing group	Hearing bandwidth	Noise type	SEL24hour (Weighted) dB (re 1µ Pa2.s)		SPL Possible Behavioural Disturbance dB (re 1µ Pa)
				TTS	PTS	
	High Frequency (HF)	150 Hz to 160 kHz	Impulsive[1]	170	185	160
Sirenians (Dugong)	SI	100 Hz to 50 kHz	Non-Impulsive[1]	186	206	120
			Impulsive[1]	175	190	160
Turtles and crocodiles	N/A	100 Hz to 2 kHz	Non-Impulsive[1]	200	220	Relative risk[2]
			Impulsive[1]	189	204	166

Note:

1. Thresholds are derived from Southall et al. (2019); NMFS (2018); NOAA (2019); Finneran et al. (2017); McCauley et al. 2000 and Popper et al. (2014).
2. Relative risk levels of Low, Moderate and High have been developed by Popper *et al*. (2014) for behavioural effect on turtles exposed to non-impulsive noise. Risk rankings from Popper *et al*. (2014) for 'Shipping and Other Continuous Noise' have been applied to non-impulsive noise for behavioural response. Risk rankings are provided in context of distance of Near (N) (10s of metres), Intermediate (I) (100s of metres) and Far (F) (1,000s of metres)

6.3 Underwater noise modelling

6.3.1 Overview

Of the activities and noise sources detailed in **Section 6.1**, and in discussion with underwater noise modeller, trenching activities using a combination of TSHD, CSD and BHD (including rock breaking using hydraulic tools) were considered the most significant sources of Project underwater noise. These activities have been modelled to quantify noise emissions and marine fauna exposures to inform impact assessment and marine fauna noise management measures included herein. An overview of the modelling approach is presented below with the full technical reports presented as attachments to the SER.

Underwater noise modelling initially conducted for the Project (Talis Consultants, 2023) included for dredging vessel noise emissions (TSHD, CSD and BHD), vibratory hammer (sheet piling) noise emissions and hydraulic hammer (BHD rock breaking) noise emissions. Since completion of that modelling, further definition of the Project scope was developed by Project contractors, including removal of the need to construct a cofferdam (and associated sheet piling) and further detail made available on the type and specification of rock breaking tools. For rock breaking from the BHD, the quieter Xcentric Ripper tool is considered the base case, and likely the most effective option, with a hydraulic hammer proposed as a contingency only.

To better represent underwater noise emissions and fauna exposure from the use of BHD rock breaking tools, additional underwater modelling was undertaken for an Xcentric Ripper (Xcentric Ripper XR-60) and a hydraulic hammer (Epiroc HB 10000) (Connell *et al.*, 2023). The results presented below for an Xcentric Ripper and a hydraulic hammer have been taken from that modelling. Since sheet piling is no longer required for the Project, the vibratory hammer modelling results included in Talis Consultants (2023) have not been presented below.

6.3.2 Modelling scenarios

DPD Project underwater noise modelling scenarios were discussed initially at a workshop with the Project team, environmental advisers and a noise modelling consultant. Noise activity scenarios were identified for modelling on the basis of those with the greatest potential for environmental impact (i.e., greatest noise generating activities in proximity to species of concern).

The following Project underwater noise sources/scenarios have been modelled:

+ **Trenching**: trenching will be undertaken using a combination of a TSHD, a CSD and a BHD. The following indicative 24-hour cycle times for each type of trenching vessel were modelled:
    - **TSHD** – The TSHD will alternate between trenching activities and spoil disposal at the offshore spoil ground. Cycle times are dependent on distance from spoil ground but nominally have been modelled as 3 hours trenching noise (non-impulsive noise, continuous noise) and 2 hours transit to spoil ground and back (i.e. 'no noise' period) repeated over period of 24 hours. The average time for transit is 102mins with the longest transit time at ~140 minutes (pre-sweep area 1) and the shortest at ~64 minutes (sand waves area)
    - **CSD** – 10 hours cutting (non-impulsive, continuous noise), 2 hours downtime over 12 hours (2x 12-hour cycles per 24h).
    - **CSD + TSHD** – The cycles for TSHD and CSD were applied at the same trenching location to conservatively assess cumulative effects of these vessels if they were operating in the same location.
    - **BHD** (in an area requiring rock breaking) - 4 hours of rock breaking modelled using an Xcentric Ripper (non-impulsive, continuous noise) and a hydraulic hammer (impulsive noise), 4 hours no noise (switching between rock breaking tool and excavating tool) and 4 hours digging (non-impulsive, continuous noise) over a 12-hour period and repeated (2x 12-hour cycles per 24h) i.e., cumulative total of 8 hours each of rock breaking, digging and no noise.
    - **BHD** (hydraulic hammer sensitivity analysis) **-** In addition to modelling a Xcentric Ripper and a hydraulic hammer noise for 8 hours per 24 hours, a sensitivity analysis on the effect of reducing operation time for the hydraulic hammer was undertaken, since the modelled PTS/TTS ranges for this tool were relatively large. The sensitivity analysis modelled reduced operation times of 6, 4 and 2 hours per 24 hours for the hydraulic hammer.

Trenching scenarios have been modelled at three representative locations (**Figure 6-1**):

+ Location 1 - BHD excavating and rock breaking (Xcentric Ripper or hydraulic hammer) in an area of hard rock;
+ Location 2 - TSHD operating at a middle harbour trenching zone. This area was also relatively close to Weed Reef compared to other trenching zones. Weed Reef is a known hard reef area supporting greater diversity of biota (including hard corals) and may support higher marine fauna abundance.
+ Location 3 - TSHD (alone) and TSHD/ CSD (operating together) operating in an outer harbour trenching zone. This zone was relatively close to Cox Peninsula shallow water and shorelines which support a higher diversity of biota and may support higher marine fauna abundance.

The sound source locations and levels used for each modelling scenario are shown in **Figure 6-1**, **Table 6-3** and **Table 6-4** respectively.

Table 6-2: Noise Modelling Locations and Scenarios

Location	Scenario	Easting (GDA94, MGA Zone 52) (m)	Northing (GDA94, MGA Zone 52) (m)	Recurring Cycle Time over 24 Hours
1	BHD (Excavating)	701 366	8 614 382	Two x 4 hours of digging over 24 hours.
	BHD (Rock breaking)			Two x 4 hours rock breaking over 24 hours.
2	TSHD	696 636	8 620 225	3 hours trenching and 2 hours transit/ spoil dump.
3	TSHD	692 710	8 625 712	3 hours Trenching and 2 hours transit/ spoil dump
	Concurrent operations – TSHD and CSD			TSHD (3 hours trenching and 2 hours transit/ spoil dump). CSD (10 hours of cutting and 2 hours downtime).

Table 6-3: Modelled noise source levels

Source type	Source Level
TSHD	184 dB re 1µPa @1m (based on Reine et al., 2012)
CSD	182 dB re 1µPa @1m (based on Thomsen et al., 2009)
BHD (excavating)	175 dB re 1µPa @1m (based on Reine et al., 2012)
BHD (Xcentric ripper)	184.8 dB re 1 $\mu Pa^2 \cdot s$ m^2 (based on Lawrence, 2016)
BHD (hydraulic hammer)	192.4 dB re 1 $\mu Pa^2 \cdot s$ m^2 (based on Denes et al., 2016)

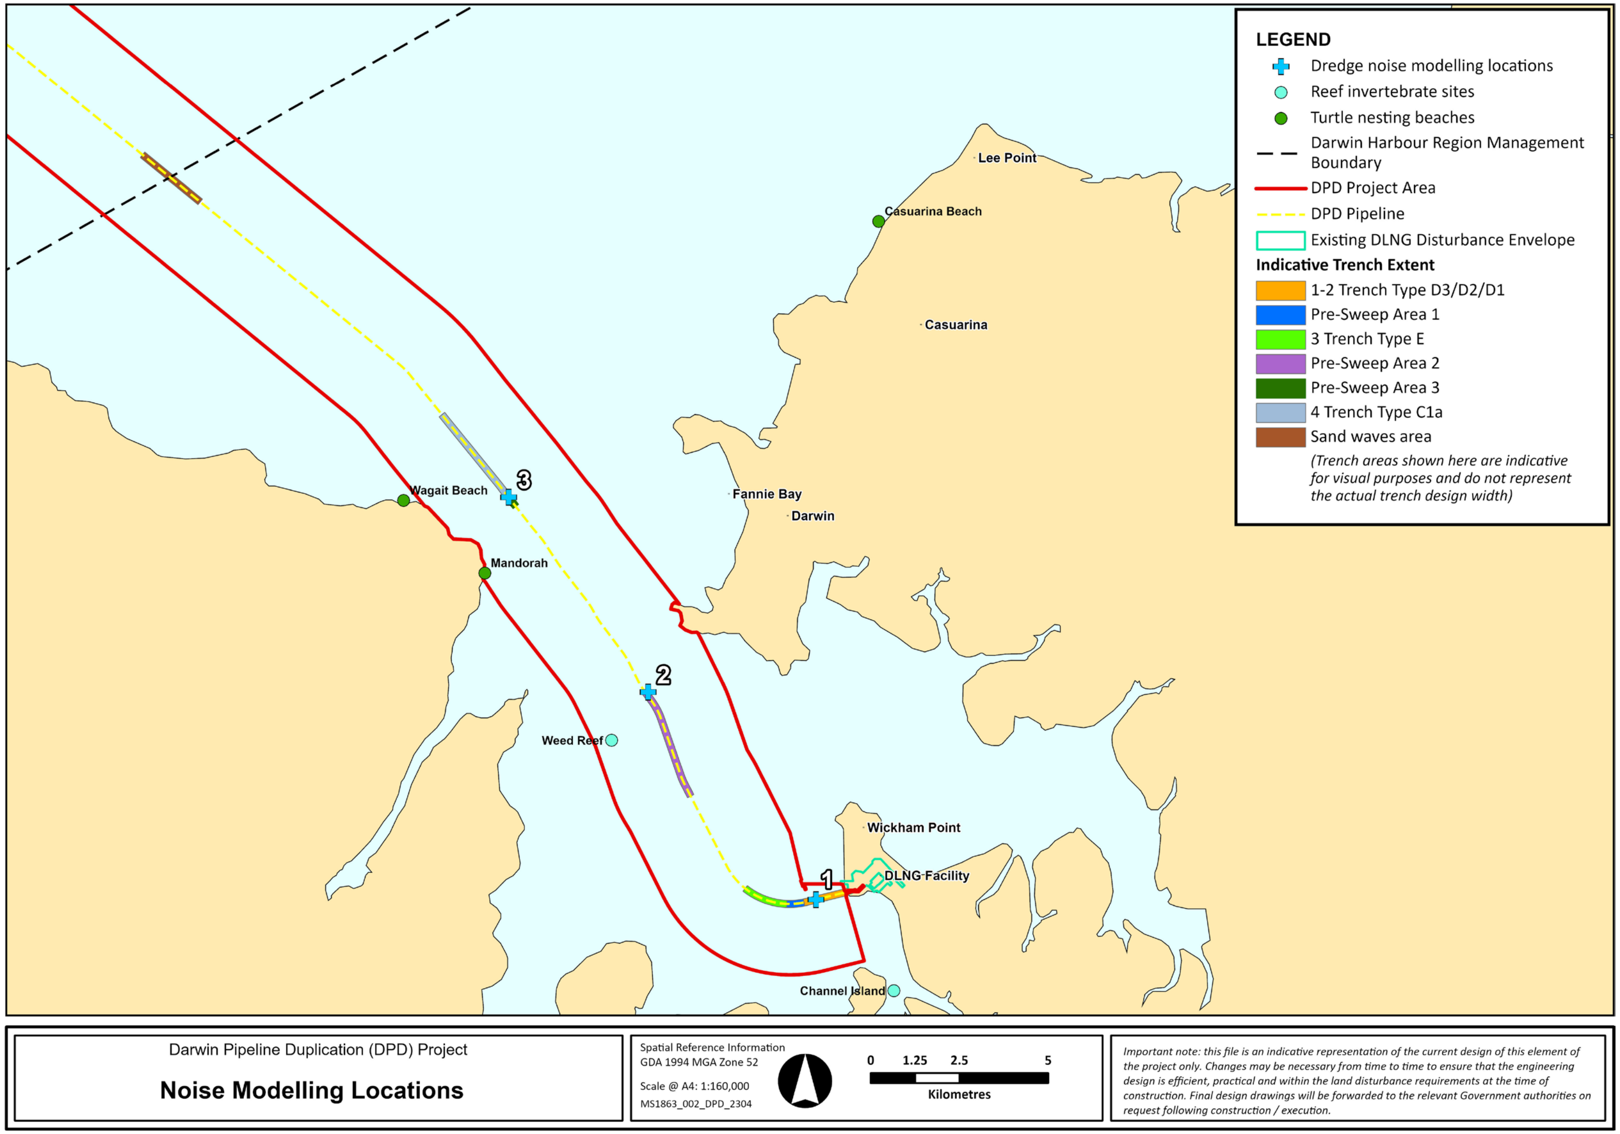

Figure 6-1: Noise modelling locations

Modelling of 24-hour sound exposure level ($SEL_{24\ hour}$) was conducted for each scenario to provide a conservative determination of PTS and TTS ranges from the cumulative effect of noise to marine fauna of interest over a 24-hour period. This modelling method is considered industry leading practice and is a conservative way of estimating potential effect ranges, as $SEL_{24\ hour}$ assumes the receptor (i.e., fauna) is stationary within the noise field of the noise source. In reality, the marine fauna of interest are highly mobile species which move naturally throughout the harbour and are capable of moving away from a noise source.

$SEL_{24\ hour}$ modelling presented here is based on a mean sea level (MSL) over a 24-hour period to represent average water level throughout the daily tidal cycle. This was considered the most appropriate approach for $SEL_{24\ hour}$ modelling (in comparison to presenting LAT or HAT results) since tide state varies significantly between low and high tide over a 24-hour period in Darwin Harbour (up to an 8 m range) and low and high tides are not representative of water level over a duration of 24 hours (rather they represent extreme water levels present for short periods of time).

Modelling of sound pressure level (SPL) which represents an instantaneous level of noise (in contrast to SEL) has been used for determining behavioural impact ranges to fauna. For SPL modelling, modelled results at high and low tide (as well as MSL) are considered appropriate given SPL is an instantaneous level. Highest astronomical tide (HAT) and Lowest astronomical tide (LAT) were conservatively used as water levels to represent high and low tide states, respectively, although these extremes are rarely reached. Between LAT of 0.0 m and a HAT of 8.0 m, low and high tides are on average (mean level) 2.2 m and 5.9 m, respectively as shown in **Table 6-5** (Williams *et al.*, 2006).

Table 6-4: Tide heights within Darwin Harbour (Williams *et al.*, 2006)

Tide type	Height
Highest Astronomical Tide (HAT)	8.0 m
Mean High Water Springs	6.9 m
Mean High Water	5.9 m
Mean High Water Neaps	4.9 m
Mean Sea Level (MSL)	4.0 m
Mean Low Water Neaps	3.1 m
Mean Low Water	2.2 m
Mean Low water Springs	1.2 m
Lowest Astronomical Tide (LAT)	0.0 m

Further description of the modelling inputs, including bathymetry, seabed types and sound profiles and further description of the noise sources used is presented in Talis Consultants (2023) and Connell *et al.* (2023) (attached to the DPD Project SER).

6.3.3 Results

To evaluate the potential for impact to different marine fauna, the estimated distances from the sound source at which the behavioural and physiological thresholds (as listed in **Table 6-1**) were predicted to be exceeded are presented below for each location and activity.

Table 6-6 presents the threshold ranges at mean sea level (MSL) between the noise source and the modelled PTS, TTS and behavioural response thresholds for each fauna group for each of the modelled scenarios. Equivalent figures plotting the threshold contours for TSHD, CSD and BHD trenching (non-impulsive noise) are provided in Talis Consultants (2023) with worst-case ranges illustrated in **Figure 6-2** to **Figure 6-4**. Equivalent threshold contour figures for Xcentric Ripper and hydraulic hammer are provided in Connell *et al.* (2023).

For all scenarios and fauna groups, PTS $SEL_{24\ hour}$ threshold ranges were below 50 m with the exception of the BHD impulsive noise (hydraulic hammering) scenario where PTS threshold ranges were 130, 160 and 100 m for dolphins, dugongs and turtles, respectively (**Table 6-6**). Given the mobility of these species, and the threshold ranges for behavioural response being greater than the PTS range for all species, it is unlikely that these species would remain within the predicted PTS ranges for a period of 24 hours. Permanent threshold shift (PTS) injury is therefore considered unlikely for dolphins, dugongs and turtles from Project trenching activities.

TTS $SEL_{24\ hour}$ threshold ranges at mean sea level varied across scenarios and fauna groups (**Table 6-6**). For continuous noise source scenarios of TSHD, CSD and BHD trenching and BHD rock breaking using an Xcentric Ripper, TTS threshold ranges varied between 40 m and 350 m and were highest for dolphins (100 – 350 m), followed by dugongs (70 – 210 m) and then marine turtles (40 - 160m) (**Table 6-6**).

For the BHD hydraulic hammering scenario, TTS threshold ranges were significantly larger than those predicted for the other modelled scenarios; threshold ranges for dolphins, dugongs and turtles were predicted to be 1,830 m, 2,500 m and 950 m, respectively (**Table 6-6**). Given the relatively large size of these ranges and the fact that behavioural response thresholds were predicted to be within these ranges, it is possible that dolphins, dugongs and turtles could remain within the threshold TTS ranges for a period of 24 hours and receive TTS impact, if management measures were not in place to prevent this from occurring.

Given the above, further investigation was undertaken by Connell *et al.* (2023) to determine the effect of reducing BHD hydraulic hammering time on the size of PTS and TTS threshold ranges. A summary of this analysis at MSL is presented in **Table 6-7**. PTS and TTS threshold ranges decreased as hammering time decreased. For dolphins, PTS/TTS ranges dropped from 130 m/1,830 m for 8 hours hammering time (per 24 hours) to 30 m/670 m for 2 hours hammering time. For dugongs PTS/TTS ranges dropped from 160 m/2,500 m for 8 hours hammering time to 50 m/840 m for 2 hours hammering time while for turtles, PTS/TTS ranges dropped from 100 m/950 m for 8 hours hammering time (per 24 hours) to 30 m/380 m for 2 hours hammering time. While reducing operation time had a significant effect on reducing PTS/TTS ranges for the hydraulic hammer, the ranges modelled for 2 hours of operation time per 24 hours were still significantly larger that for the Xcentric Ripper tool operated for 8 hours per 24 hours (**Table 6-6, Table 6-7**).

For behavioural response thresholds, ranges for marine mammals (dolphins and dugongs) varied from 100s of metres to 10s of kilometres for scenarios modelled at MSL with the highest range being for the Xcentric Ripper tool (14 km for both dolphins and dugongs) (**Table 6-6**). A quantitative threshold for marine turtles was only considered applicable for impulsive noise (i.e. BHD hydraulic hammer scenario). The range for this threshold at MSL was predicted to be 270 m (**Table 6-6**). For non-impulsive noise from TSHD, CSD and BHD trenching and use of Xcentric Ripper, the relative risk levels for marine turtle behavioural effect are taken from Popper *et al.* (2014) which are high risk in the near field (scale of 10s of metres), moderate risk at intermediate ranges (scale of 100s of metres) and low risk in the far field (scale of 1000s of metres). Behavioural effect in Popper *et al.* (2014) is defined as a substantial change in behaviour for the animals exposed to the sound.

In addition to ranges at MSL, quantitative behavioural threshold ranges were also modelled across LAT and HAT (**Table 6-8**). The effect of water level on range size was not consistent between modelling studies (Talis Consultants, 2023; Connell *et al.*, 2023). The greatest marine mammal (dolphin and dugong) behavioural response ranges for each scenario were: 909 m at HAT for BHD digging; 14,700 m at LAT for BHD Xcentric ripper use; 270 m at LAT for BHD hydraulic hammering; 20,000 m at HAT for the TSHD at Location 2; 17,878 m at HAT for the TSHD at Location 3 and 20,000 m at HAT for the TSHD and CSD operating at the same location (Location 3) (**Table 6-8**). A quantitative behavioural threshold for marine turtles was only considered applicable for impulsive noise. The largest behavioural response threshold range for marine turtles for BHD hydraulic hammering was 90 m at LAT (**Table 6-8**).

6.3.4 Marine megafauna impact discussion

The potential for physiological impacts to EPBC Act listed marine megafauna (dolphins, dugong and turtles), in the form of PTS and TTS was determined through modelling for the highest underwater noise generating activities associated with the DPD Project, i.e. the operation of trenching vessels, including the use of rock breaking tools. PTS $SEL_{24\ hour}$ threshold ranges of <50 m to 160 m were determined, with range sizes varying across species and modelled scenarios. PTS impact within these ranges requires marine fauna to be within the range for 24 hours. Given the likely behavioural response to avoid the area prior to entering into a PTS zone, and the known mobility of these species, it is unlikely that these species would remain within these ranges for long enough for PTS injury to occur. Nevertheless, the monitoring of observation and exclusion zones around trenching vessels, and appropriate adaptive management measures to cease trenching if fauna enter exclusion zones will be adopted for the Project to prevent this occurrence (**Section 8.4**).

For the continuous (non-impulsive) noise sources of TSHD, CSD and BHD trenching, and the use of an Xcentric Ripper tool for rock breaking, modelled TTS $SEL_{24\ hour}$ threshold ranges varied between 40 m and 350 m, and were highest for dolphins (100 – 350 m), followed by dugongs (70 – 210 m) and marine turtles (40 – 160m). As with the PTS thresholds ranges, it is unlikely that these EPBC Act listed marine fauna would remain within these ranges long enough (i.e. for 24 hours or greater) for TTS impacts to occur, and there are no known aggregation areas for these fauna within this range of trenching areas. However, the application of observation and exclusion zones, monitored from trenching vessels, together with the use of soft start operations, where practical, will be adopted to avoid TTS impacts (**Section 8.4**).

Modelling undertaken for hydraulic hammer use predicted that PTS and TTS threshold ranges would be significantly larger than for other trenching sound sources, that is, trenching using a TSHD, CSD or BHD and the use of an Xcentric Ripper rock breaking tool. In particular, the scale of hydraulic hammering TTS ranges (in the order of kms) suggests that TTS impacts would be possible to marine fauna remaining within these ranges for 24 hours or more, particularly given a behavioural response to this impulsive noise source noise may not occur until marine fauna are well within the TTS range. While an Xcentric Ripper tool is considered the base case for rock breaking from the BHD, a hydraulic hammer may be used as a contingency, therefore additional management controls were considered necessary (over and above those proposed for other trenching activities) and have been included in **Section 8.4**. This includes monitoring of significantly larger observation and exclusion zones and restricting hydraulic hammering to daylight hours only.

Based on the modelled behavioural effect ranges, in particular the continuous noise behavioural effect ranges, there is the potential for species of interest (dolphins, dugongs and turtles) to be affected by noise from dredging vessels on a scale of 100s to 1000s of metres. These ranges are expected to be similar to those associated with noise emissions from large non-Project commercial vessels that use

Santos

Darwin Harbour on a daily basis, as they have similar noise source levels and frequency bands and operate in the same areas (refer **Section 5.1.3**). Given the existing noise environment, it is expected that marine fauna will have developed some level of acclimatisation to vessel noise over a range similar to that modelled for the Project trenching vessels. It is also likely that some masking of Project vessel noise above the marine mammal behavioural threshold of 120 dB re 1µ Pa would occur from other commercial vessels that transit Darwin Harbour. In support of this, ambient noise measurements taken by noise loggers in East Arm by Salgado-Kent *et al.* (2015) recorded that noise from transiting commercial vessels was frequently in the range of 130 – 140 dB re 1 µPa. Masking of Project vessel noise by other anthropogenic noise sources would be expected to diminish the range of behavioural effect ranges around Project vessels in areas and times where other vessels are active. While there may be a more prolonged exposure of marine fauna to noise above behavioural threshold levels from slow moving trenching vessels working in an activity area (i.e. a trenching zone) when compared to transiting commercial vessels, trenching activity is expected to be completed relatively quickly, within a period of 2 to 3 months and therefore any behavioural effects are considered temporary.

Within and around Darwin Harbour there are known periods for biologically important behaviours for turtles and dolphins. There are known flatback turtle nesting sites on Cox Peninsula and Casuarina Beach and a known period of increased nesting activity from May to October. However, the densities of nesting turtles in these areas are very low and not significant on a regional scale (Chatto and Baker, 2008) and furthermore, these sites are on a scale of 1000s of meters away from the pipeline route and trenching areas (as they are from existing vessel traffic using navigation channels) therefore the relative risk of behavioural effects to turtles at this scale from vessel noise is considered low (Popper *et al.*, 2014).

For dolphins, there is evidence that there is a peak in calving within Darwin Harbour between October and April (Palmer, 2010). Important areas have not been defined however, given the high mobility of dolphin species within Darwin Harbour and the use of adjoining coastal areas (Griffiths *et al.*, 2019), it is unlikely that behavioural disturbance around DPD Project activities, relative to the total area of Darwin Harbour and surrounding coastal waters, would have a significant impact on dolphin calving behaviour.

Foraging activities by marine megafauna within and around Darwin Harbour are considered to occur year-round. While there is the potential for Project underwater noise to reach areas that can be used as foraging habitat (e.g. shallow areas that could support algae and seagrass), at a level above a behavioural response threshold, the Project activities will not restrict access to foraging habitats that wouldn't be available elsewhere within and around the harbour given the size of behavioural effect ranges relative to the size of Darwin Harbour and distribution of habitat.

On the basis that physiological impacts (PTS and TTS) to EPBC Act listed marine fauna from Project underwater noise emissions (in particular vessels undertaking trenching activities) will be avoided through the application of industry standard management controls and behavioural response to underwater trenching noise will be temporary and on the same scale as from existing commercial vessel using Darwin Harbour, impacts to marine fauna from underwater noise emissions are considered to be minor.

Table 6-5: PTS, TTS and Behavioural response threshold ranges for each fauna group for each modelled scenario/location at mean sea level

Hearing Group	SEL 24 hour (Weighted) Threshold [dB re 1µ Pa².s]		Distance [m]		SPL Behavioural Response [dB re 1µ Pa]	Distance [m]

7 Impact assessment

This MMNMP has employed a systematic impact assessment process to inform the management of underwater noise during construction activities for the DPD Project. As described below, the approach is consistent with the NT EPA Draft Guideline for the Preparation of an Environmental Management Plan (NT EPA, 2015).

7.1 Conceptual site model

A conceptual site model, as required by the NT EPA, is a written or illustrated representation of the nature, fate and transport of discharges, wastes or contaminants that allows assessment of potential and/or actual exposure of the environment to contaminants (NT EPA, 2015). The conceptual site model for this MMNMP is embedded within the impact assessment, which, details receptors and impact pathways for noise emissions from construction activities, see **Section 7.3.**

7.2 Impact assessment methods

The MMNMP environmental impact assessment followed the Santos' Risk Matrix Procedure (SMS-LRG-OS01-TP02) with modified consequence descriptors to reflect the NT EPA key environmental factors and consequence descriptors (**Table 7-1**). Identification of management actions followed the Santos' Environment Hazard Controls Procedure (SMS-EXA-OS01-PD02). An environmental aspect, for the purpose of this environmental management plan, is defined as characteristics of the construction activities that could potentially affect the environment.

7.2.1 Identification of environmental hazard

Environmental hazards related to noise for this MMNMP were identified using Santos' DPD Project NT EPA Referral (Santos, 2021), DPD Project Basis of Approval (BAS-210 0005; Santos, 2022) and discussion by DPD Project team and environmental specialists. Key DPD Project construction activities and associated hazards and results from the noise modelling study Talis Consultants (2023) noise modelling study were presented during ENVID workshops to inform the impact assessment process. Note the Connell *et al.* (2023) noise modelling study was completed after the ENVID workshops.

7.2.2 Standard controls

The standard controls identified in **Section 8** were drawn from:

+ Santos' DPD Project NT EPA Referral (BAA-201 0002; Santos, 2021)
+ Santos' environmental plans and procedures for similar activities
+ Regulator approved management plans developed by other proponents.

Additional controls were provided by ENVID workshop attendees based on their relevant experience.

7.2.3 Impact assessment

All hazards identified were assigned a consequence level following the six levels and criteria outlined in Santos' Risk Matrix Procedure (SMS-LRG-OS01-TP02). The consequence criteria were then modified to incorporate the NT EPA Key Environmental Factors. The modified consequence descriptors shown in **Table 7-1.**

Santos

Table 7-1: Consequence descriptors

Consequence Level		**I**	**II**	**III**	**IV**	**V**	**VI**
Acceptability		**Acceptable**	**Acceptable**	**Unacceptable**	**Unacceptable**	**Unacceptable**	**Unacceptable**
Consequence Level Description		**Negligible** No impact of negligible impact	**Minor** Detectable but insignificant change to local population, industry or ecosystem factors Localised effect	**Moderate** Significant impact to local population industry or ecosystem factors	**Major** Major long-term effect on local population industry or ecosystem factors	**Severe** Complete loss of local population industry or ecosystem factors AND/OR extensive regional impacts with slow recovery	**Critical** Irreversible impacts to regional population industry or ecosystem factors
Environmental Receptors	**Marine Ecosystems** Fauna, habitat, conservation significant areas and ecological function, processes and integrity	Short term behavioural impacts only to small proportion of local population and not during critical lifecycle activity. No decrease in local population size / area of occupancy of species / loss or disruption of habitat critical / disruption to the breeding cycle/ vales of a protected area. No introduction of disease and no reduction in habitat area/function.	Detectable but insignificant decrease in local population size and threat to local population viability. Insignificant disruption to the breeding cycle of local population / area of occupancy of species / loss of habitat critical to survival of a species/ values of a protected area. Detectable but insignificant loss of area/function of habitat with rapid recovery within 2 years.	Moderate. Significant decrease in local population size but no threat to overall population viability. Significant behavioural disruption or disruption to the breeding cycle of local population / Significant reduction in area of occupancy of species / loss of habitat critical to survival of a species. Modify, destroy, remove or decrease availability of quality habitat to the extent that a long-term decline in local population or function of habitat is likely with recovery over medium term (2-10 years) Introduction of disease likely to cause significant population decline	Long term decrease in local population size and threat to local population viability. Major disruption to the breeding cycle of local population / area of occupancy of species / loss of habitat critical to survival of a species/ values of a protected area Fragmentation of existing population / Loss or change of habitat to the extent that a long-term decline in local population and function of habitat is likely with slow recovery over decades Introduction of disease likely to cause long term population decline	Complete loss of local population, habitat critical to survival of local population or protected area/conservation significant area Widespread (regional) decline in population size or habitat critical to regional population Extensive destruction of local habitat with no recovery or long term (decades) or widespread loss of area or function of primary producers on a regional scale	Complete loss of regional population Complete loss of habitat critical to survival of regional population
	Marine Environmental Quality Water quality, sediment quality, ecosystem health and parameters that support fishing, aquaculture, recreation, aesthetics and cultural/spiritual values	Negligible. No or negligible reduction in physical environment nor decrease in ecosystem function/health. No or negligible loss of value to socio-economic activities	Detectable but localised, short term and insignificant impact to physical environment or ecosystem function/health or value to socio-economic activities. Rapid recovery evident within ~ 2 years.	Significant wide-scale medium term impact to physical environment, decrease in ecosystem function/health or value to socio-economic activities. Recovery over medium term (2-10 years).	Wide-scale, long term impact to physical environment, long term decrease in ecosystem function/health or value to socio-economic activities. Slow recovery over decades.	Extensive impact to/destruction of physical environment with no recovery or shutdown of socio-economic activities Long term (decades) and widespread loss of ecosystem function/health on a regional scale that damages value to socio-economic activities.	Complete destruction of regional physical environment / habitat with no recovery Complete loss of area or function of primary producers on a regional scale

Consequence Level		I	II	III	IV	V	VI
	Coastal Processes Geophysical processes, primary productivity/ nutrient cycling, conservation significant areas/coastal landforms and cultural, aesthetic or recreation values	Short term changes to local geophysical/hydrological processes, widespread loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale	Detectable but insignificant loss or change to local geophysical/hydrological processes, area or function of primary producers/nutrient cycling or conservation significant areas with rapid recovery within 2 years.	Moderate. Significant modification, destruction, removal or change of local geophysical/hydrological processes, wide-scale loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale with recovery over medium term (2-10 years).	Long term loss or change of local geophysical/hydrological processes, widespread loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale with slow recovery over decades	Extensive destruction of local geophysical/hydrological processes, widespread loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale with no recovery or long term (decades)	Complete loss or change of geophysical/hydrological processes. Complete loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale.
	Community and Economy Includes: fisheries (commercial and recreational); tourism; oil and gas; defence; commercial shipping	No or negligible loss of value of the local industry. No or negligible reduction in key natural features or populations supporting the activity.	Detectable but insignificant short-term loss of value of the local industry. Detectable but insignificant reduction in key natural features or population supporting the local activity.	Significant loss of value of the local industry. Significant medium-term reduction of key natural features or populations supporting the local activity.	Major long-term loss of value of the local industry and threat to viability. Major reduction of key natural features or populations supporting the local activity.	Shutdown of local industry or widespread major damage to regional industry. Permanent loss of key natural features or populations supporting the local industry.	Permanent shutdown of local or regional industry Permanent loss of key natural features or populations supporting the local or regional industry
	Culture and heritage Includes: Indigenous heritage and maritime heritage (i.e. shipwrecks)	No or negligible impact on the area's cultural or heritage values. No or negligible alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Detectable but insignificant impact on one or more of the area's cultural or heritage values. Detectable but insignificant alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Significant impact on one or more of the area's cultural or heritage values. Significant alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Major long-term effect on one or more of the area's cultural or heritage values. Major alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Complete loss of one or more of the area's cultural or heritage values.	Permanent loss of one or more of the area's cultural or heritage values with no recovery.

The consequence is defined as the resulting impact from an event occurring. Consequence level for this assessment was based on the credible worst-case scenario and assumed no management actions were in place. Categories of environmental consequence and severity level are outlined in **Table 7-2**. These consequence levels are not presented in this MMNMP but are contained in the ENVID documentation. Table 7-3 presents the residual consequence ranking which is the outcome after standard and additional (as low as reasonably practicable; ALARP) management actions are applied.

Consistent with the Santos' Risk Matrix Procedure (SMS-LRG-OS01-TP02), given the generation of noise is a planned event a residual risk ranking was not assigned. A comprehensive impact assessment for the planned event, and subsequent management actions proposed by Santos to reduce the impacts to ALARP are detailed in the following subsections. Within the ENVID developed by Santos some environmental aspects had multiple residual consequence ratings, in these cases the residual consequence of greater severity was chosen for this summary.

Table 7-2: Summary environmental consequence descriptors

Consequence Level	Consequence Level Description
I	**Negligible** – No impact or negligible impact
II	**Minor** – Detectable but insignificant change to local population, industry or ecosystem factors
III	**Moderate** – Significant impact to local population, industry or ecosystem factors
IV	**Major** – Major long-term effect on local population, industry or ecosystem factors
V	**Severe** – Complete loss of local population, industry or ecosystem factors AND/OR extensive regional impacts with slow recovery
VI	**Critical** – Irreversible impact to regional population, industry or ecosystem factors

7.3 Impact assessment summary

The outcomes of the planned event impact assessment are presented in **Table 7-3**, and where relevant includes reference to the relevant management strategy within this MMNMP proposed to manage individual environmental aspects.

Table 7-3: Summary of underwater noise impact assessment outcome

Aspect	Activity	Description of hazard	Spatial scale	Temporal scale	Potential impacts	Sensitive receptors	Residual consequence (planned impact)	Management strategy
Planned impacts								
Noise Emissions	Pre-lay works including: + Cutter suction dredge (CSD) + Trailer suction hopper dredge (TSHD) + Backhoe dredge (BHD) for excavating with potential used of hydraulic tools (Xcentric Ripper, hydraulic hammer) for fracturing rock + Mass flow excavation (MFE) + Construction of two temporary causeways either side of the trench at the shore crossing Pipelay by nearshore pipelay barge in shallower waters including Darwin Harbour. Pipelay by dynamic positioning (DP) vessel in deeper waters outside of Darwin Harbour. Operation of onshore plant and equipment within Project Area at DLNG facility Support operations including: + General vessel operations during all DPD Project activities + Vessel and subsea positioning equipment	Vessel noise is considered non-impulsive (continuous) and broadband and includes vessel thrusters, engines and propellers, as well as noise emitted onboard which is converted to underwater noise through the hull. The main source of vessel noise will be from propellers or dynamic positioning (DP) thrusters (deeper water pipelay only). Project vessels (excluding trenching vessels) may emit noise up to ~180 dB re 1 µPa at 1 m. Trenching will be completed using different trenching vessels, including a BHD, a TSHD and a CSD. Noise includes operation of vessel engines for propulsion (as applicable), onboard equipment, pumps and interaction of trenching equipment with the seabed. The following source levels are considered representative of trenching vessel non-impulsive noise: + TSHD: 184 dB re 1µPa @1m + CSD: 182 dB re 1µPa @1m + BHD: 175 dB re 1µPa @1m BHD rock breaking tools will be either non-impulsive from Xcentric Ripper tool or impulsive from hydraulic hammer (contingency only). Representative source levels are:	For TSHD, CSD and BHD trenching and Xcentric Ripper tool use, permanent threshold shift (PTS) SEL24 hour ranges for dolphins, dugongs and turtles modelled at <50 m. Equivalent threshold range for hydraulic hammer modelled at 100- 160 m. For TSHD, CSD and BHD trenching and Xcentric Ripper tool use, temporary threshold shift (TTS) SEL24 hour ranges for dolphins, dugongs and turtles modelled at 40-350 m. Equivalent threshold range for hydraulic hammer modelled at 950- 2,500 m. The PTS and TTS ranges were shown to decrease with reduced hammering time (per 24 hours) for the hydraulic hammer. For behavioural response thresholds, ranges for marine mammals (dolphins and dugongs) varied from 100s of metres to 10s of kilometres for scenarios modelled at MSL. Spatial scales for other activities are as follows: + Localised: A support vessel using main engines and bow thrusters to maintain position will become inaudible above background noise within thousands of metres.	Vessel noise for the duration of the construction activity (12-15 months), with intermittent survey equipment and helicopter noise. Trenching vessel noise expected over indicative period of 2-3 months. Noise will be infrequent during operations given scale of planned vessel pipeline inspection surveys indicatively every 1-3 years.	Project activities including trenching, pipelay, additional vessel operations and will add to the existing underwater noise profile inside and outside Darwin Harbour during construction. The use of sound in the underwater environment is important for marine animals, particularly cetaceans, to navigate, communicate and forage effectively, along with reptiles, sharks/rays and other fish, for a range of functions such as social interaction, foraging and orientation. Underwater noise could result in: + Acoustic masking: – Disruption to underwater acoustic cues – Masking of vocalisations and signals from predators and prey + Behavioural response: – Modification of fauna behaviour (avoidance, attraction and disruption of normal behaviour) – Disturbance, leading to behavioural changes or displacement from areas – Indirectly by inducing behavioural and physiological changes in predator or prey species. + Physiological impacts: – Increased stress levels – Physical injury to fauna from exposure to excessive noise	+ **Marine ecosystem** (marine mammals particularly cetaceans, marine reptiles, sharks, rays, pelagic and demersal fish) + **Marine environmental quality** (impact to parameters that support fishing, aquaculture, recreation, aesthetics and cultural/ spiritual values) +	II - Minor	**Section 8**

Aspect	Activity	Description of hazard	Spatial scale	Temporal scale	Potential impacts	Sensitive receptors	Residual consequence (planned impact)	Management strategy
	e.g. MBES, SSS, LBL) / USBL) + Helicopter operations	+ Xcentric Ripper: 184.8 dB re 1 µPa2 s m^2 + Hydraulic hammer: 192 dB 1 µPa2s m^2	+ Localised: A conservative estimate is that survey equipment (MBES/SSS) will be inaudible within thousands of metres, depending on the activity characteristics. + Localised: Helicopter noise will be highly localised and most of the noise will not transfer into the water.		(barotrauma, hearing loss including TTS and PTS Onshore construction activities are not expected to have an impact as they will not occur in water.			

7.4 Assessment of potential for cumulative impacts

The underwater noise emission from Project vessels and activities will add to the ambient noise environment within the Project Area which includes Darwin harbour and major shipping routes. The frequency and noise levels of DPD Project vessels are expected to be similar to that from existing shipping traffic. This is discussed in **Section 6.3.4.**

In terms of potential cumulative noise impacts between the DPD Project and other proposed projects within Darwin Harbour this is detailed within the DPD Project SER (BAS-210 0020), including an assessment of potential for overlap in time and space between projects.

Given the high level of uncertainty on the degree of overlap between specific noise generating activities of other projects with the DPD Project and the inherent difficulties in modelling multiple dynamic sound sources, underwater noise modelling has not attempted to integrate other project noise sources. However, modelling conducted for the DPD Project has conservatively assessed impacts from the operation of two DPD Project trenching vessels (TSHD and CSD) at the same location at the same time and results from this have informed the impact assessment.

Santos has and will continue to engage all relevant proponents and authorities, to minimise the potential for cumulative impacts. The consultation strategy is further detailed in SER (BAS-210 0020).

8 Environmental management strategy

This section outlines the environmental management strategy (EMS) that will be implemented for management of noise impacts associated with the DPD Project construction works, therefore minimising and/or mitigating the risks to sensitive receptors and protected marine megafauna.

The EMS outlines the commitments and objectives that are relevant and states specific measurable targets to achieve proposed objectives. Subsequently, these targets potentially trigger the use of certain management actions. Performance indicators and monitoring activities are used to quantify success in meeting requirements and identify the need for corrective actions. This ensures the continuous improvement of the effectiveness of the DPD Project's EMS. The EMS defines the reporting requirements, terms, and responsibilities.

The EMS is structured to align with the template presented in **Table 8-1**.

Table 8-1: Environmental management strategy template

Item	Content
Environmental Performance Objectives (EPO)	Environmental management goal(s) tailored to each aspect per NT EPA requirements.
Target	Aspect specific measurable performance necessary to successfully achieve objective. Part 1 of NT EPA required performance criteria.
Performance Indicator	Quantitative or qualitative measures representing the performance related to Target(s). Part 2 of NT EPA required performance criteria.
Management actions	Tasks to be undertaken to meet objective/s. For example, install turtle deflection chains on TSHD drag head, comply with Darwin Port vessel speed restrictions etc.

8.1 NT EPA hierarchy

In the development of the EMS outlined within this MMNMP Santos applied the Environmental Decision-Making Hierarchy outlined within the EP Act. This hierarchy being:

+ To ensure that actions are designed to avoid adverse impacts on the environment
+ To identify management options to mitigate adverse impacts on the environment to the greatest extent practicable
+ And if appropriate, provide for environmental offsets in accordance with the EP Act for residual adverse impacts on the environment that cannot be avoided or mitigated[1]

[1] No offsets were deemed necessary for this project.

8.2 Environmental performance objectives and performance criteria

To ensure environmental impacts will be of an acceptable level, an environmental performance objective (EPO) has been defined for noise impacts.

The EPO relevant to noise emissions, including performance criteria, are described in **Table 8-2**.

Table 8-2: Noise emissions EPOs and associated performance criteria

EPO	Performance criteria	
	Target/s	Performance Indicator/s
Avoid hearing injury impacts to protected marine species from underwater noise generated by DPD Project trenching and spoil disposal activities	Zero incidents of injury or mortality to EPBC Act listed marine fauna from noise generated during DPD construction activities	+ Incident reports of injured or dead EPBC Act listed fauna + MFO records of EPBC Act listed fauna within vessel observation/exclusion zones
	Zero incidents of trenching or rock breaking while EPBC Act listed marine fauna observed in exclusion zone	+ MFO records of EPBC Act listed fauna within vessel exclusion zone

This EPO aligns with the following NT EPA Factor objectives:

- Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
- Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions for this planned impact are shown in **Section 8.4.6**.

8.3 Adaptive management mechanism

The proposed adaptive management actions are detailed in **Section 8.4.2**. Further adaptive management actions may be added based on approval conditions following assessment by NT EPA and DCCEEW.

Additionally, adaptive management can be triggered through Santos' incident response and assurance processes, with corrective actions and management adapted as required to address any incidents and non-conformances identified (detailed in Section 8.3 of the Offshore CEMP (BAS-210 0024)).

8.4 Noise impact management actions

Management actions will be implemented to meet the environmental objectives outlined above.

8.4.1 Vessel and Helicopter Approach Distances

Vessel and helicopter contractor procedures will comply with Part 8 of the Environment Protection and Biodiversity Conservation (EPBC) Regulations 2000, which includes controls for minimising interaction with marine megafauna. Whilst these measures are usually aimed at reducing the risk of collision, maintaining the correct approach distances will also help reduce the risk of disturbance and injury from noise emissions from vessels and helicopters.

The approach distances outlined in the EPBC Regulations include the ‘no approach zone’ which excludes vessels within 100 m to the side of and 300 m in front and to the rear of an adult whale and within 50 m to the side of and 150 m in front and to the rear of an adult dolphin. The EPBC Regulations also include a ‘caution zone’ in which vessel speed must be no more than six knots (~11 km/hr), no more than three vessels are allowed, and vessels cannot enter if animals are injured, stranded, entangled, distressed or where a calf is present. The ‘caution zone’ is between 300 and 100 m for an adult whale and 150 and 50 m for an adult dolphin.

8.4.2 Marine Megafauna Observation and Adaptive Management Protocol

Observation and exclusion zones can reduce the risk of physical and behavioural impacts to marine megafauna as construction activities can be paused until marine megafauna have moved outside of the exclusion zone and are no longer at risk of injury or disturbance.

8.4.2.1 Routine construction operations

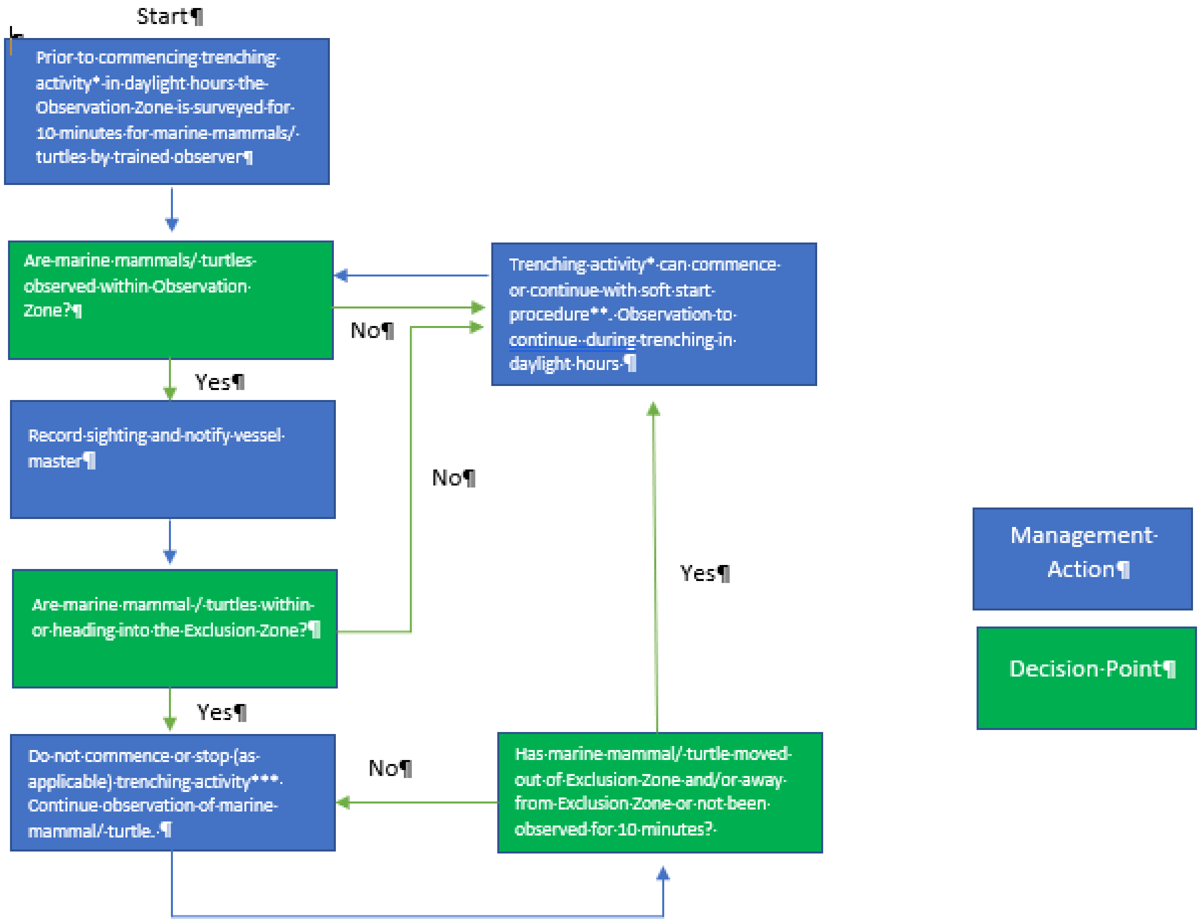
An Observation Zone of 150 m and an Exclusion Zone of 50 m has been proposed around vessels/plant engaged in routine construction activities including the use of an Xcentric Ripper rock breaking tool on the BHD where required. These zones align with Dolphin Caution Zones outlined in Part 8 of the EPBC Regulations. The 150 m observation zone also provides an appropriate range for observing marine mammals and turtles that could potentially receive temporary hearing injury over a 24-hour period. While the site-specific modelling results (**Section 6.3.3**) indicate TTS ranges could extend to 350 m for dolphins at MSL (based on concurrent operation of a TSHD and CSD in the same area), these are considered very conservative values given the known mobility and transient nature of dolphins within Darwin Harbour (Griffiths *et al.*, 2019) and the very low likelihood of dolphins remaining within this range for 24 hours. Therefore, a 150 m zone was considered sufficient on this basis and a more practical range for the observation of marine fauna by trained observers. For turtles, the proposed 150 m observation zone aligns with the TTS ranges at MSL.

The 50 m Exclusion Zone aligns with PTS ranges for marine mammals and turtles (and with dolphin No Approach Zones under Part 8 of the EPBC Regulations), although it is very unlikely these species would remain in close proximity to a trenching vessel over a full 24-hour period. Rather, the Exclusion Zone is considered to provide value in protecting marine fauna, in particular turtles, from direct interaction and injury from trenching equipment (refer to the Offshore CEMP and TSDMMP (BAS-210 0024; BAS-210 0023) for further information regarding this risk).

During daylight hours, prior to the commencement of any noise-intensive activity the Observation Zone will be monitored by a crew member trained in marine fauna observation. The Observation Zone will be monitored for a minimum of 10 minutes prior to a noise-intensive activity to ensure no key marine megafauna species (e.g., dolphins, dugongs or turtles) are present. If any such species are present within the zone, they will be recorded. If the marine megafauna is observed within or heading into the Exclusion Zone, noise-intensive activities will not commence until the animal is observed to leave and move away from the exclusion zone, or until 10 minutes of observations have passed since the last sighting and no further key marine megafauna have been sighted. Should noise-intensive activity be already underway when a key marine megafauna is observed within or heading into the Exclusion Zone, the activity will be stopped (as applicable) and observation of the marine megafauna will continue until animal is observed to leave or move away from the Exclusion Zone, or until 10 minutes of observations have passed since the last sighting.

All marine fauna interactions and observations during daylight hours will be appropriately recorded and reported to DEPWS/NT EPA and DCCEEW.

The proposed marine megafauna observation and adaptive management protocol for routine operations (including use of Xcentric Ripper tool) is summarised in **Figure 8-1**.



KEY

*Trenching activity means: BHD excavating or rock breaking, activation of CSD cutter head, activation of TSHD suction pump

**Where practicable dependent on machine capability

***Not commencing or stopping trenching means the following:

- For BHD trenching—not commencing or stopping excavating or rock breaking activities
- For CSD trenching—not starting or stopping the cutter head
- For TSHD trenching—not starting or stopping the TSH suction pump

Observation Zone = 150m zone around vessel

Figure 8-1: Marine megafauna observation and adaptive management protocol for routine construction operations including the use of Xcentric Ripper tool.

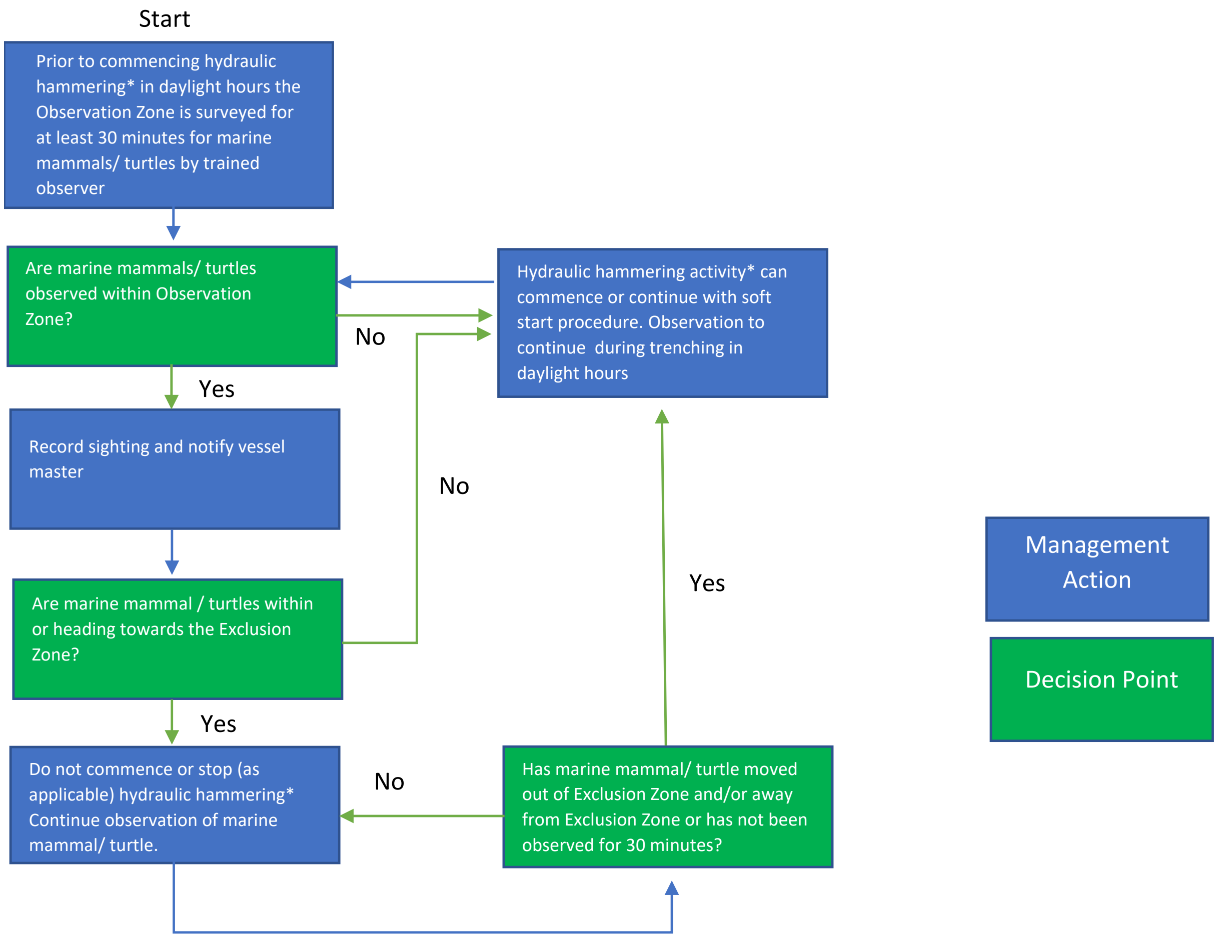
8.4.2.2 Hydraulic hammer operations

The underwater noise modelling for the hydraulic hammer has shown that hearing injury (PTS or TTS) could occur to marine turtles, dolphins and dugongs at ranges significantly greater (up to ~10x) those modelled for dredging vessel noise as well as over 10x the range determined for the Xcentric Ripper tool. The modelling indicates that hydraulic hammering could result in PTS for dolphins and dugongs if they remained (for 24 hours) within 130 and 160 m, respectively, of the rock breaking activity and result in TTS if they remained (for 24 hours) within 1.83 km and 2.5 km, respectively, of the activity. For marine turtles, the equivalent ranges were modelled as 100 m for PTS and 950 m for TTS. Given behavioural effect ranges for marine fauna applicable to hydraulic hammering are within the TTS ranges, natural avoidance of the noise source is not considered a mitigation for preventing TTS.

On the basis of the modelling results, the management actions for routine construction for preventing hearing injury to marine mammals or marine turtles are not considered adequate for rock breaking using a hydraulic hammer. They are, however, considered applicable and effective for preventing hearing injury to marine fauna during rock breaking using an Xcentric Ripper.

In the event that a hydraulic hammer is required for rock breaking (expected to occur only as a contingency), the following additional management actions will apply.

- Hydraulic hammering for no greater than 8 hrs over a 24 hr period.
- No hydraulic hammering at night
- A separate vessel with MFO onboard will be required to patrol the Observation Zone (Figure 8-2) prior to and during hydraulic hammering
- Increased Observation and Exclusion Zones for hydraulic hammering based on noise modelling results will be applied through a revised marine megafauna observation and adaptive management protocol for contingency hydraulic hammering as presented in **Figure 8-2**.



KEY

*Hydraulic hammering means use of an impulsive hydraulic hammer for rock breaking. It does not apply to the use of an Xcentric ripper.

Observation and Exclusion Zones for hydraulic hammering applied as follows:

- If up to 8 hours of rock breaking is required an Observation Zone of 2.5km (marine mammals) and 1km (turtle) will apply and an Exclusion Zone of 150m for marine mammals and turtles will apply
- If up to 6 hours of rock breaking is required an Observation Zone of 2 km (marine mammals) and 750 m (turtle) will apply and an Exclusion Zone of 100m for marine mammals and turtles will apply
- If up to 4 hours of rock breaking is required an Observation Zone of 1.5 km (marine mammals) and 750 m (turtle) will apply and an Exclusion Zone of 100 m for marine mammals and turtles will apply
- If up to 2 hours of rock breaking is required an Observation Zone of 1km (marine mammals) and 500 m (turtle) will apply and an Exclusion Zone of 50 m for marine mammals and turtles will apply

Figure 8-2: Marine megafauna observation and adaptive management protocol for contingency hydraulic hammering.

8.4.3 Marine fauna observer

Crew trained in marine fauna observation will ensure marine megafauna can be reliably identified to different species during observation periods. This will improve the ability to spot and identify marine megafauna at risk from injury or disturbance due to noise emissions from construction activities. At least one marine fauna observer (MFO) will be on duty per pipelay, trenching and rock installation vessel/barge during daylight hours. The MFO will sight and record marine megafauna interactions prior to, and during, trenching and rock breaking operations.

MFOs will also reduce the risk of direct interaction and injury from vessels and trenching activities (refer to the Offshore CEMP and TSDMMP (BAS-210 0024; BAS-210 0023) for further information regarding this risk).

Given the increased size of Observation Zone required for rock breaking with a hydraulic hammer, a separate vessel with MFO onboard will be required to patrol the Observation Zone prior to and during hydraulic hammering.

8.4.4 Soft start procedures

Where practicable, soft start procedures will be implemented which may reduce the impact to marine megafauna by allowing them to move away from the area of trenching or rock breaking activity prior to noise generation reaching maximum levels. Soft start procedures generally involve a slow ramp up of the activity so that energy and noise levels increase gradually before reaching maximum operating levels. This gradual ramp up will provide greater opportunities for animals to avoid exposure to the maximum noise levels by moving away from the activity during this gradual ramp up. The following controls will be applied:

+ Soft start (ramp-up) for rock breaking (Xcentric Ripper or hydraulic hammer) by BHD, where practicable
+ Soft start (ramp-up) for trenching equipment, where practicable, will apply to the CSD and TSHD

Soft start procedures will also reduce the risk of direct interaction and injury from vessels and trenching activities (refer to the Barossa CEMP and TSDMMP (BAS-210 0024; BAS-210 0023) for further information regarding this risk).

8.4.5 Reporting injured marine wildlife

Any injured marine megafauna must be reported to the NT EPA/DEPWS within 24 hours and reported to DCCEEW for EPBC Act listed species. If a marine mammal vessel strike incident has occurred it will be recorded in the National Marine Mammal Ship Strike database (AMMC, 2022).

8.4.6 Summary of management actions

A summary of management actions adopted for noise generating construction activities to reduce the risk of injury and disturbance to marine megafauna in the DPD Project Area is outlined in **Table 8-3** for routine construction operations, including the use of an Xcentric Ripper tool for rock breaking. As a contingency, a hydraulic hammer may be used if rock breaking cannot be completed successfully using an Xcentric Ripper. Additional contingency management actions for the use of a hydraulic hammer are outlined in **Table 8-4**. Environmental Performance Standards for these management actions will be developed in conjunction with Project contractors prior to finalisation of this MMNMP.

Table 8-3: Summary of management actions for noise emissions during routine construction including the use of an Xcentric Ripper tool

MA reference	Management actions
Standard management actions	
Avoidance	
DPD-MA46	Observation and exclusion zones for marine fauna developed based on noise modelling results and standard protocols
Mitigation	
DPD-MA49	Vessel inductions for all crew to address marine fauna risks and the required management controls
DPD-MA50	Vessel and helicopter to complete Part 8 of the Environment Protection and Biodiversity Conservation Regulations 2000, which includes controls for minimising interaction with marine fauna
DPD-MA51	Personnel trained in MFO to be present on pipelay, dredge and rock installation vessels/barges during daylight hours, including one crew member with MFO training on the bridge at all times
DPD-MA52	All marine fauna interactions and observations to be appropriately recorded and reported to DEPWS/NT EPA and DCCEEW as required
DPD-MA55	Maintenance of vessel, vehicle and equipment combustions engines and vessel incinerators as per planned maintenance system
Additional (ALARP) management actions	
Avoidance	
DPD-MA56	Observation and shut-down zones for marine fauna have been developed based on noise modelling results for trenching and standard protocols and include: + Observation (150 m) and exclusion (50 m) zones for marine mammals and turtles. + Observation zone monitored for 10 minutes prior to commencing trenching during daylight only. A Marine Megafauna Observation and Adaptive Management Protocol for routine construction operations, including the use of Xcentric Ripper tool, is to be followed as per **Figure 8-1**
Mitigation	

MA reference	Management actions
DPD MA62	+ Soft start (ramp-up) of hydraulic tools (rock breaking) by BHD, where practicable + Soft start (ramp-up) of trenching equipment, where practicable, will apply to the CSD and TSHD
Additional (ALARP) management actions not adopted	
1	Schedule trenching activities outside of peak flatback turtle nesting period (May to October) or outside of peak Darwin Harbour dolphin calving period (October to April). Reason for rejection: + It would not be possible to avoid both peak periods. + The potential benefit of avoiding locations of higher marine megafauna sensitivity at certain times of the year, such as nesting periods for turtles and dolphin calving periods, is considered disproportionately low compared to the implications to Project scheduling and costs – While there are known flatback turtle nesting sites (Cox Peninsula and Casuarina Beach), and a known period of increased nesting activity (May to October), the densities of nesting turtles in these areas are very low and not significant on a regional scale (Chatto and Baker, 2008). Furthermore, these sites are on a scale of 1000s of meters away from the pipeline route and trenching areas (as they are from existing vessel traffic using navigation channels) and the relative risk of behavioural effects to turtles at this scale from vessel noise is considered low (Popper et al., 2014). For dolphins, there is evidence that there is a peak in calving within Darwin Harbour between October and April (Palmer, 2010). Important areas have not been defined however and given the high mobility of dolphin species within Darwin Harbour and the use of adjoining coastal areas (Griffiths et al., 2019) it is unlikely that behavioural disturbance around DPD Project activities, relative to the total area of Darwin Harbour and surrounding coastal waters, would have a significant impact on calving behaviour.

MA reference	Management actions
2	The observation period for marine megafauna prior to commencing dredging and pile driving is 20 minutes and the MFO is solely dedicated to the task of sighting and recording marine megafauna interactions prior to, and during, dredging and pile driving operations. Reason for rejection: + A 20-minute observation period was considered excessive for the size of the Observation Zone (150 m) and a 10-minute observation period was considered sufficient to monitor this zone for marine fauna. An additional 10 minutes would prolong dredging operations without any appreciable benefit. + A MFO for the pre-start up observation period was considered warranted however a MFO solely to the task of sighting and recording marine megafauna for the entirety of dredging operations was not considered warranted given that the dredging vessel to have multiple crew with marine fauna observation training onboard during daylight hours and the vessel bridge to be constantly manned with at least one crew with MFO training on the bridge at all times.
3	No use of DP vessels. Reason for rejection: + Not using DP vessels will cause additional seabed and benthic habitat impacts through the need to use anchoring to hold position during pipelay. The use of DP also decreases pipelay duration and reduces impact to other users through shorter timeframe.
4	Cease noise generating activities (e.g. DP) when near marine fauna. Reason for rejection: + Ceasing DP activities when near sensitive fauna may reduce the potential for impacts, however, the potential for impacts beyond behavioural disturbance are very low. Engine/DP thruster noise cannot reliably be ceased due to the safety critical role of vessel propulsion. It is also not practical to cease pipelay or other critical construction activities in a short timeframe as safely abandoning such operations can often take a number of hours (namely laying down the pipeline or disconnecting from a structure), during which time the impacted fauna will have left the area. Therefore, this control is not deemed feasible.
5	Soft start/power-up procedures for use of sonar equipment and use of fauna observation and shutdown zones. Reason for rejection: + The systems being used are at a low power or are an intermittent type such that the reduced cumulative exposure would reduce TTS or PTS impacts for marine fauna and behavioural impacts were not considered credible

MA reference	Management actions
6	No use of helicopters. Reason for rejection: + Use of helicopters required (e.g. vessel/crew transfers) and restriction will result in an overall longer duration construction activity and therefore noise impacts
7	Avoidance of night work for routine construction and Xcentric Hammer use. Reason for rejection: + Avoidance will result in an overall longer duration construction activity and therefore noise impacts and also increase the safety risk profile. The cost of implementing this far exceeds the benefit gained

Santos

Table 8-4: Summary of additional environmental management actions for contingency rock breaking using hydraulic hammer

MA reference	Management actions
Contingency management actions	
1	Increased Observation and Exclusion Zones for hydraulic hammering based on noise modelling results will be applied as follows: + If up to 8 hours of rock breaking is required, an increased Observation Zone of 2.5km (marine mammals) and 1km (turtle) will apply and an increased Exclusion Zone of 150m for marine mammals and turtles will apply + If up to 6 hours of rock breaking is required, an increased Observation Zone of 2 km (marine mammals) and 750 m (turtle) will apply and an increased Exclusion Zone of 100m for marine mammals and turtles will apply + If up to 4 hours of rock breaking is required, an increased Observation Zone of 1.5 km (marine mammals) and 750 m (turtle) will apply and an increased Exclusion Zone of 100 m for marine mammals and turtles will apply + If up to 2 hours of rock breaking is required, an increased Observation Zone of 1 km (marine mammals) and 500 m (turtle) will apply and an increased Exclusion Zone of 50 m for marine mammals and turtles will apply
2	Contingency hydraulic hammering protocols for managing noise impacts will be followed as per **Figure 8-2**
3	Hydraulic hammering for no greater than 8 hrs over a 24 hr period.
4	No hydraulic hammering at night
5	A separate vessel with MFO onboard will be required to patrol the Observation Zone prior to and during hydraulic hammering

8.4.7 Demonstration of ALARP

Use of vessels and subsea equipment will be required to complete construction activities, therefore underwater noise emissions are unavoidable if the planned activity is to proceed. Trenching and rock breaking activities will follow industry standard measures to prevent physiological impact to marine megafauna from noise, including implementation of Observation and Exclusion Zones and associated adaptive management measures, use of marine fauna observers to monitor zones and use of soft-starts where practicable. These zones have been informed by underwater noise modelling and appropriate thresholds to ensure the scale of these zones are sufficient to meet environmental objectives. In addition to the implementation of monitored zones, marine megafauna are expected to display avoidance behaviour of sound source at close ranges, thereby reducing the potential for physiological impact. For contingency hydraulic hammering, while not expected to be required, the zones have been increased significantly and additional measures put in place to ensure physiological impacts do not occur to marine megafauna.

While there is the potential for behavioural response on larger scales of 100s of metres to 1000s of metres from continuous noise from trenching activities, depending upon fauna type, the activities are not expected to produce emissions significantly louder than other marine vessels that frequent or transit through the vicinity of the Project Area (e.g. cargo ships, LNG tankers, cruise ships and offshore oil and gas vessels). Given construction activity is temporary and trenching is expected to last for ~2-3 months, the addition of Project noise sources to the existing ambient noise environment is not expected to result in any significant additional behavioural effects within Darwin Harbour. The activity is unlikely to affect the health of and/or displace marine megafauna, as biologically important behaviours can continue given the widespread availability of suitable habitat within Darwin Harbour relative to the size of behavioural effect ranges.

Santos has considered the actions prescribed in various recovery plans and conservation advice, such as the Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017), when developing the controls relevant to potential construction activities to minimise noise impacts on marine fauna. Management controls are in place to reduce operating noise, including vessel operational protocols, and to adhere to the fauna interaction management stated in EPBC Regulations (Part 8). As such, noise emitted during the activities is not expected to significantly impact on marine fauna within the Project Area.

The potential benefit of avoiding locations of higher marine megafauna sensitivity at certain times of the year, such as nesting periods for turtles and dolphin calving periods, is considered disproportionately low compared to the implications to Project scheduling and costs. There are also mutually exclusive sensitivity periods for dolphins and turtles. While there are known flatback turtle nesting sites (Cox Peninsula and Casuarina Beach), and a known period of increased nesting activity (May to October), the densities of nesting turtles in these areas are very low and not significant on a regional scale (Chatto and Baker, 2008). Furthermore, these sites are on a scale of 1000s of meters away from the pipeline route and trenching areas (as they are from existing vessel traffic using navigation channels) and the relative risk of behavioural effects to turtles at this scale from vessel noise is considered low (Popper et al., 2014).

For dolphins, there is evidence that there is a peak in calving within Darwin Harbour between October and April (Palmer, 2010). Important areas have not been defined however and given the high mobility of dolphin species within Darwin Harbour and the use of adjoining coastal areas (Griffiths et al., 2019) it is unlikely that behavioural disturbance around DPD Project activities, relative to the total area of Darwin Harbour and surrounding coastal waters, would have a significant impact on calving behaviour.

Other additional management actions were considered but rejected due to lack of feasibility, the associated cost or because the effort was disproportionate to any benefit (**Table 8-3**). Therefore, the risks to marine fauna from noise associated with the DPD Project activities are considered to be ALARP.

The potential consequence of noise emissions on receptors is assessed as II - Minor following the implementation of standard and additional (ALARP) management actions and will not have a significant impact on any habitat identified as critical to the survival of marine megafauna. With the management actions in place, no significant impacts are expected. Therefore, the impacts of noise emissions to the receiving environment are ALARP and considered environmentally acceptable.

9 Environmental management implementation strategy

Section 8 of the Offshore CEMP (BAS-210 0024) outlines the processes and procedures that will be implemented more broadly to all aspects of the DPD Project to ensure the environmental requirements within this MMNMP will be met, including:

+ Specific systems, practices and procedures that ensure both environmental impacts and risks are reduced to ALARP and EPOs, performance criteria and management actions are being met;
+ A clear chain of command, outlining roles and responsibilities of personnel involved in the implementation, management and review of the MMNMP;
+ Measures to ensure that employees and/or contractors working in relation to this activity are aware of their responsibilities regarding the environment and have the appropriate skill and training;
+ Auditing, review and revision processes;
+ Incident recording and reporting in line with Santos and regulatory requirements;
+ Maintenance of quantitative records of discharges and emissions; and
+ Details of emergency response and oil spill arrangements.

This implementation strategy is consistent with the Barossa Health, Safety & Environment Management Plan for Execute (BAA-200 0003).

Stakeholder engagement is assessed separately for the requirements of the activity. Ongoing stakeholder management strategies are discussed in **Section 10.**

10 Stakeholder engagement and communications

The stakeholder engagement approach used for the Project is in accordance with Santos's corporate approach to stakeholder engagement and industry leading standards and practice. The approach recognises and is aligned with the NT EPA's Guidance for Proponents – Stakeholder Engagement (NT EPA 2021a), the NT EPA's guidance for Preparing a Supplementary Environmental Report (NT EPA 2021b) and the International Association for Public Participation's (IAP2) Quality Assurance Standard for Community and Stakeholder Engagement (IAP2 2015).

Due to the iterative nature of the stakeholder process all relevant details have been contained in one document, the SER (BAS-210 0020), to contain updates to one location. The SER provides an outline of the objectives, process and key stakeholders consulted for the DPD Project. Additionally, the Stakeholder Engagement Plan (SEP) is attached to the SER. It details all consultation undertaken to date and information on future engagement activities.

In preparing the SER, and project management plans, Santos has considered and assessed each submission individually, and taken into consideration the issues raised when engaging with stakeholders to assess potential impacts and proposed management measures.

The SER provides a summary of the issues raised relevant to the Project and Santos' assessment and response to these issues. A full register, with all submissions and responses, is provided as an attachment to the SER.

Appendix 1: Santos Environment, Health and Safety Policies

Environment, Health & Safety

Santos

Policy

Our Commitment

Santos is committed to being the safest gas company wherever we have a presence and preventing harm to people and the environment

Our Actions

We will:

1. Integrate environment, health and safety management requirements into the way we work
2. Comply with all relevant environmental, health and safety laws and continuously improve our management systems
3. Include environmental, health and safety considerations in business planning, decision making and asset management processes
4. Identify, control and monitor risks that have the potential for harm to people and the environment, so far as is reasonably practicable
5. Report, investigate and learn from our incidents
6. Consult and communicate with, and promote the participation of all workers to maintain a strong environment, health and safety culture
7. Empower our people, regardless of position, to "Stop the Job" when they feel it necessary to prevent harm to themselves, others or the environment
8. Work proactively and collaboratively with our stakeholders and the communities in which we operate
9. Set, measure, review and monitor objectives and targets to demonstrate proactive processes are in place to reduce the risk of harm to people and the environment
10. Report publicly on our environmental, health and safety performance

Governance

The Environment Health Safety and Sustainability Committee is responsible for reviewing the effectiveness of this policy.

This policy will be reviewed at appropriate intervals and revised when necessary to keep it current.

Kevin Gallagher

Summary of Auditory Weighting and Exposure Function Parameters

1 Introduction

This report summarises the outcomes of an underwater noise modelling study undertaken for Santos' proposed Darwin Pipeline Duplication Project (the Project).

1.1 Aim

The aim of this study is to model predicted underwater noise levels from construction activities (i.e. sheet piling and dredging) associated with the Project.

1.2 Scope

The report includes a summary of the methods and results of underwater noise modelling undertaken for the Project. It focuses on sheet piling and dredging as these are the most significant sources of underwater noise identified for the Project.

1.3 Applicable Documents

The following project document was used in support of the underwater noise study:

- EEN20291.007 – Santos Barossa PTS Underwater Noise Technical Note_0_220404.

References used for the underwater noise study are given in Appendix A and abbreviations and acronyms are given in Appendix B.

2 Project Background and Noise Sources

2.1 Overview

The Darwin Pipeline Duplication (DPD) Project is associated with the Barossa gas field development in northern Australia. The DPD Project involves the construction of a new pipeline running parallel to and approximately 50-100m from the existing Bayu-Undan to Darwin pipeline through Darwin Harbour and to the Darwin LNG facility (beach valve location). Some sections of the pipeline route through Darwin Harbour will be trenched using dredging vessels prior to pipelay (as shown in Figure 2-1). The pipeline will come ashore through a trenched shore crossing at the DLNG facility which may require the installation of a cofferdam.

2.2 Construction Overview

The following construction activities will be undertaken for the Project:

- Sheet piling may occur in the supratidal zone at the shore crossing site.
- Trenching activities using a dredger will occur in some sections along the pipeline route through the harbour.
- Rock breaking (hydraulic hammering) in areas of surficial rock.
- Laying of pipe on the seabed and within trenched area.

The most significant underwater noise sources are as follows:

- **Sheet Piling:** Steel sheets may be piled to create a cofferdam wall on the mudflats using a vibratory hammer. Sheet piling is not planned to take place at high tide or at night-time. As a result, the cumulative impacts from sheet piling have been determined using the hammer energy source level multiplied by the frequency over a maximum duration of eight hours (thus by adding it cumulatively over 480 minutes) over a 24-hour period.
- **Dredge Vessel:** Trenching will be undertaken in trenching zones by utilising a Trailing Suction Hopper Dredge (TSHD), a Cutter Suction Dredge (CSD) and a Backhoe Dredge (BHD) depending on the area. The following indicative 24-hour cycle times have been used to inform modelling:
  - **TSHD**: Cycle times are dependent on distance from spoil ground. On average it is expected that 3 hours will be spent dredging, 2 hours will be spent in transit/spoil dump repeated over period of 24 hours.
  - **CSD**: The CSD will have two cycles over a 24-hour period, with each cycle consisting of 10 hours of cutting and 2 hours of downtime.
  - **BHD – Hydraulic Hammering and Digging:** Rock breaking (hydraulic hammering) using a BHD. Indicative 24-hour cycle consisting of two cycles of 4 hours hammering, 4 hours of downtime followed by 4 hours of digging have been used to inform modelling.

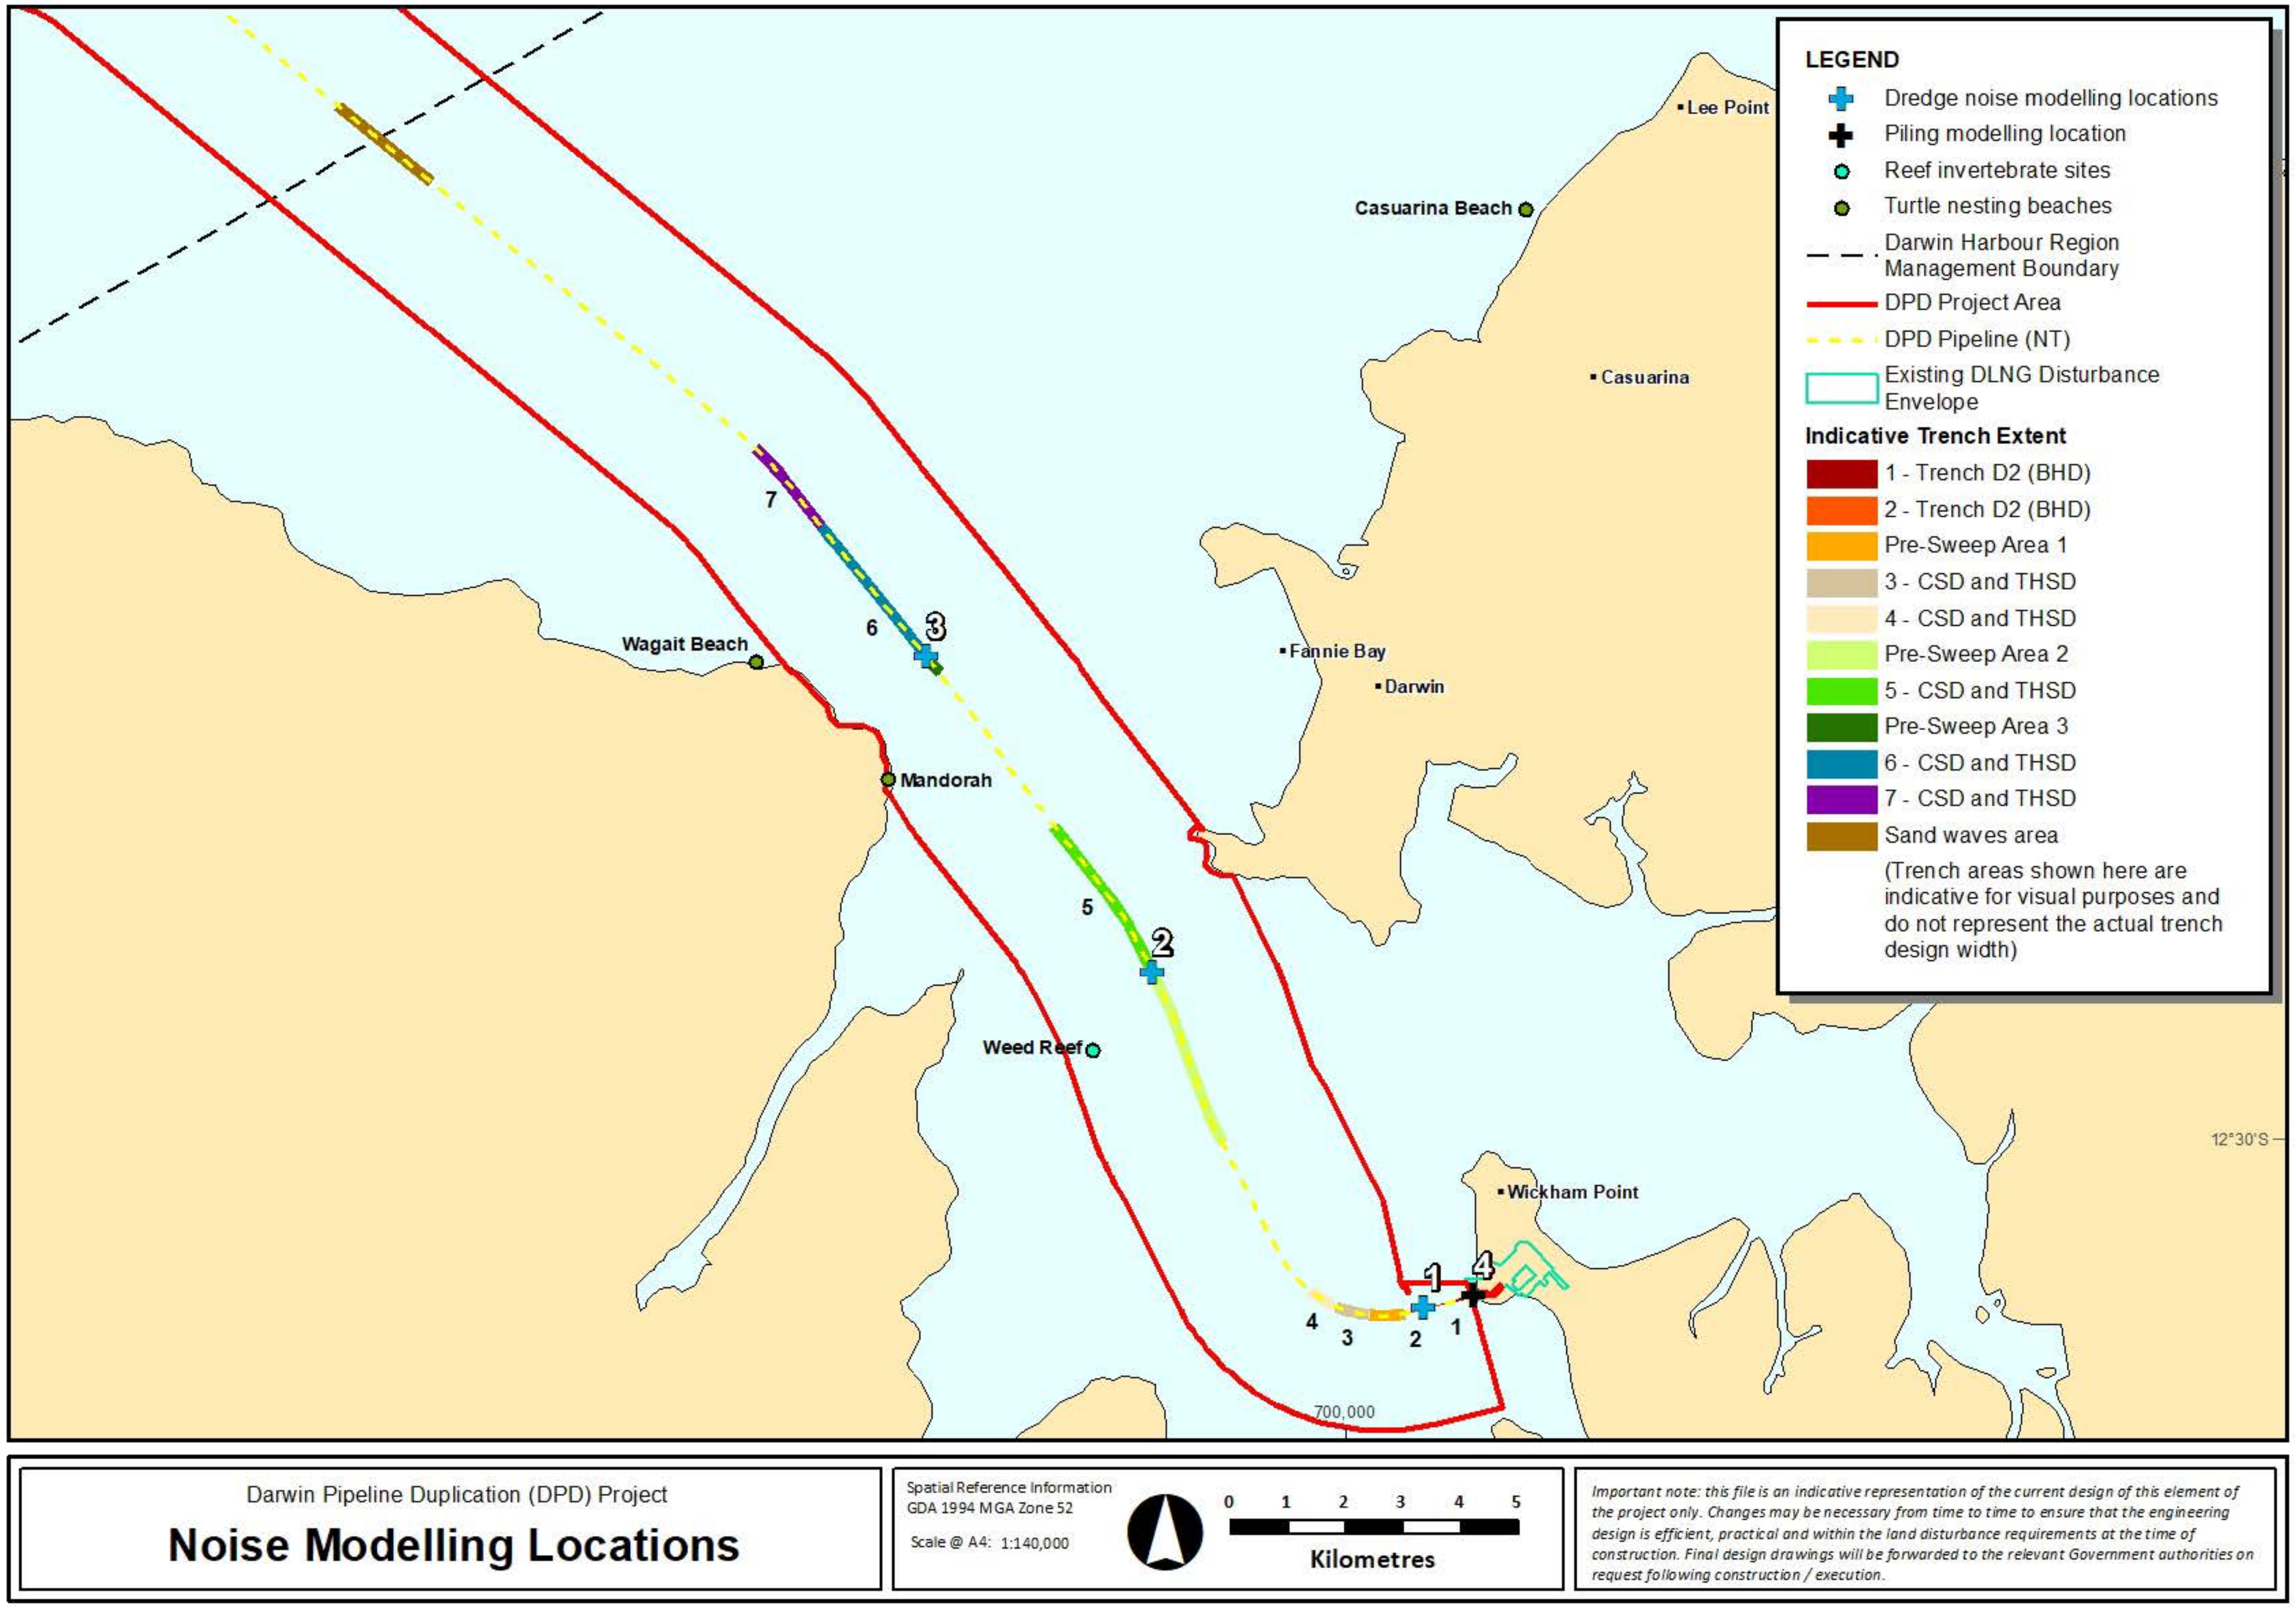

Figure 2-1 : Project Area and Trench and Noise Modelling Locations (source: RPS)

3 Underwater Noise

The ocean soundscape consists of naturally produced sounds and anthropogenically generated noise. Natural underwater sound occurs from marine life and events such as waves, storms, and underwater earthquakes. Anthropogenic noise results from activities such as piling, vessel traffic, seismic exploration, marine construction, and military activities.

The ambient underwater soundscape tends to be consistent and widespread across large areas of ocean, however, noise generated by anthropogenic activities can often be localised. If sufficiently loud, noise may be detrimental to certain marine species under some circumstances. The degree of impact is influenced by many factors, including the sound's duration, amplitude, and frequency; the distance between the sound source and marine life; the total time that the marine life is exposed to the sound and the sensitivity of marine life to the site-specific combination of these factors.

A two-year underwater noise measurement program [31] was undertaken by the Centre of Marine Science and Technology (CMST) between 2012 – 2015. The mean and minimum noise spectrum levels provided in the report are between 90 and 60 dB re 1µPa^2/Hz they are similar to the ambient sea noise in Australian waters given in Figure 3-1.

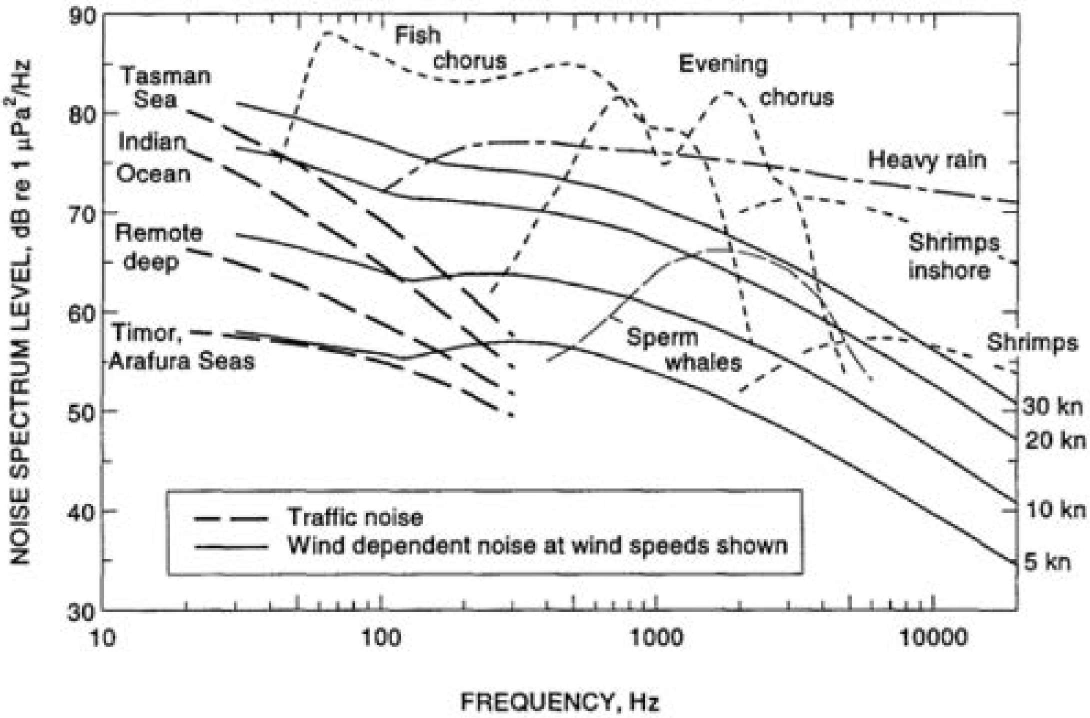

Figure 3-1 : Ambient Sea Noise in Australian Waters [6]

Sound travels further in the ocean than in air due to the natural duct created between the sea surface and the seabed, and the refractive properties of the water column. Additionally, the higher sound speeds in water result in longer wavelengths than in air, which result in low frequencies travelling further before they are absorbed to levels below ambient noise levels.

In shallow continental shelf water (< 200 m deep)[1], sound attenuates a lot faster than in the deeper, open ocean as the natural duct created between the sea surface and the seabed is very narrow,

[1] In the field of ocean acoustics, "shallow water" commonly refers to coastal waters extending from the shoreline out to the edge of the continental shelf to a depth of about 200 m, where the seafloor slope increases.

resulting in the acoustic pressure wave reflecting multiple times off the seabed and surface, with every reflection resulting in the pressure wave losing energy. Additionally, in very shallow water, low frequencies below a (depth dependant) cut off frequency attenuate very quickly, thus not having any impact at distance from the source.

4 Marine Fauna

4.1 Species of Interest

The conservation significant species with the highest likelihood of occurrence in the Project area are listed in Table 4-1. Fish are also included due to their potential commercial and recreational value.

Table 4-1 : Marine Fauna – Species of Interest for this study

Marine Fauna Type	Species
Cetaceans (high frequency dolphins)	• Indo-Pacific Humpback • Australian Snubfin • Spotted Bottlenose
Turtles	• Flatback • Olive Ridley • Hawksbill • Leatherback • Green • Loggerheads
Sirenians (SI)	• Dugong
Fish	• Various fish, sharks, and rays (including sawfish)

4.2 Assessment Criteria

Research has found that the noise levels at which Temporary Threshold Shift (TTS) and Permanent Threshold Shift (PTS) occur is dependent on whether the noise being generated is classed as impulsive or non-impulsive.

The definition of these two categories is as follows:

- **Impulsive** – sounds produced are typically transient, brief (less than one second), broadband and consist of high peak pressure with rapid rise time and rapid decay [2]. This noise source is associated with activities such as pile driving, seismic activities and underwater blasting and results in some of the most powerful sounds produced underwater [26], [27].
- **Non-impulsive** – sounds produced can be broadband, narrowband, or tonal, brief or prolonged, continuous or intermittent and typically do not have the high peak sound pressure with rapid rise / decay times that impulsive sounds do [2]. This type of noise source is associated with activities such as dredging, vessel noise, drilling and some construction activities.

See section 5.2 for a classification of the noise sources used in the study.

The assessment criteria for each fauna type are divided into noise levels that may result in TTS, PTS and behavioural disturbance (see Table 4-2). To determine the levels at which TTS and PTS occurs the study has relied on the following:

- **Dolphins**. For dolphins, the threshold levels for TTS and PTS for high frequency cetaceans as defined in Southall et al [1] and NOAA's 'Technical Guidance for Assessing the Effects of

Anthropogenic Sound on Marine Mammal Hearing' [2] respectively, are appropriate for this study. Behavioural threshold levels from NOAA's ESA Section 7 [2] have been used. Peak SPL levels at which PTS and TTS are provided for dolphins (see [1] and [2]) where peak levels of 230 and 224 dB re 1µPa are given for the onset of PTS and TTS respectively.

- **Sirenians**. For sirenians, the threshold levels for TTS and PTS for Sirenians as defined in Southall et al [1] and NOAA's 'Technical Guidance for Assessing the Effects of Anthropogenic Sound on Marine Mammal Hearing' [2] respectively, are appropriate for this study. Behavioural threshold levels from NOAA's ESA Section 7 [2] have been used.
- **Turtles.** The TTS and PTS criteria for turtles were taken from Criteria and Thresholds for U.S Navy Acoustics and Explosive Effect Analysis [22]. As there is a paucity of data regarding behavioural responses of turtles to non-impulsive sources a risk-based approach proposed by Popper et al [5] has been adopted. Using this approach, the risk is evaluated at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F).
- **Fish.** The fish threshold criteria were taken from Popper et al [5] . Due to the paucity of data for behavioural responses a relative risk (high, moderate, low) as proposed by Popper et al [5] has been adopted. Using this approach, the risk is evaluated at three distances from the source defined in relative terms as Near (N) (scale of 10's of metres), Intermediate (I) (scale of 100's of metres), and far (F) (scale of 1000's of metres).

Note: Behavioural disturbance levels are not based on cumulative exposure or SEL[2], but rather on a Root Mean Square (RMS) Sound Pressure Level (SPL[3]).

Table 4-2 : Behavioural Disturbance, TTS and PTS Onset Thresholds (24-hour)

Marine Fauna Type	Marine Hearing Groups	Hearing Bandwidth	Noise Type	SEL_{24hour} (Weighted) dB re 1µ Pa^2.s		SPL Possible Behavioural Disturbance dB re 1µ Pa
				TTS	PTS	
Dolphins	High Frequency (HF)	150 Hz to 160 kHz	Non-Impulsive	178	198	120
			Impulsive	170	185	160
Sirenians	SI	100 Hz to 50 kHz	Non-Impulsive	186	206	120
			Impulsive	175	190	160
Turtles	N/A	100 Hz to 2 kHz	Non-Impulsive	200	220	Relative risk*
			Impulsive	189	204	166
Fish	N/A	100 Hz to 1 kHz	Non-Impulsive	Relative risk*		Relative risk*
			Impulsive	186	203	

* High, Moderate, Low.

[2] Sound exposure levels (SEL) is the cumulative level of energy contained within underwater noise and is typically used to assess health and welfare impacts. This is also referred to as the "noise dose".

[3] Sound Pressure Level (SPL) is the measure of the amplitude of acoustic pressure compared to 1 µPa.

5 Methodology

5.1 Overview

The desktop study has been undertaken using a computer noise model to simulate underwater noise emissions. The underwater software calculation kernel[4] utilises the Monterey Miami Parabolic Equation (MMPE [36]) which was developed by the University of Miami and Naval Postgraduate School Monterey in the USA. The model can predict transmission loss from multiple noise emission sources simultaneously in both broadband and narrowband frequency ranges.

Underwater propagation models require inputs including bathymetric data, geo-acoustic information, and oceanographic parameters to produce three-dimensional (3D) estimates of the acoustic field at any depth and distance from the source. As with any model, the quality of the prediction is directly related to the quality of the environmental information used in the model.

5.2 Noise Sources

The selection of noise sources has been based on the best information available from the project. The noise sources were selected in collaboration and with the project team. The sources selected were based on the best possible match to the activities and equipment provided at the time. The noise source levels used for modelling have therefore been calculated based on a combination of project data and source levels from an in-house database of underwater noise sources which have been developed from publicly available data. All source levels include overall and spectral levels.

5.2.1 Sheet Piling Noise Source Level

The action of driving a sheet pile into the seabed excites bendy[5] waves in the sheet pile that propagate along the length of the pile and transfer into the sea and seabed (see Figure 5-1). The compression component of the wave propagates into the ocean, while both compression and transverse components propagate into the seabed. Once in the seabed, the energy will then propagate outwards as compression and shear waves. Vibratory piling generates pulses that have rapid rise time and rapid decay and can therefore be considered as impulsive. They can also be considered as non-impulsive as the acoustic signal has sufficient duration to overcome starting transients and reach a steady-state condition [2]. Field data from 57 projects [33] show that levels from vibrational piling are highly variable and cannot be summarized into one level for a certain type of pile. This is due to several factors such as hammer size and pile type water depth, geotechnical conditions, and topography. As a result, a conservative approach has been taken and the vibratory hammer has been classed as an impulsive source as the threshold criteria for impulsive sources are stricter than non-impulsive sources.

The Project may use a vibratory hammer to drive the sheet piles if a cofferdam is required to be built. The frequency of a vibratory hammer is a lot higher than that of a hydraulic hammer with hammering frequencies ranging from 1,600 to 2,500 Hz.

---

[4] The MMPE kernel used in this study has been rigorously tested at SWAM [32] and has undergone infield verification for both deep and shallow water.

[5] Bendy wave is a wave that comprises of a compression wave and a transverse wave.

The vibratory hammer specifications that have been used to calculate the source levels for modelling are given in Table 5-1.

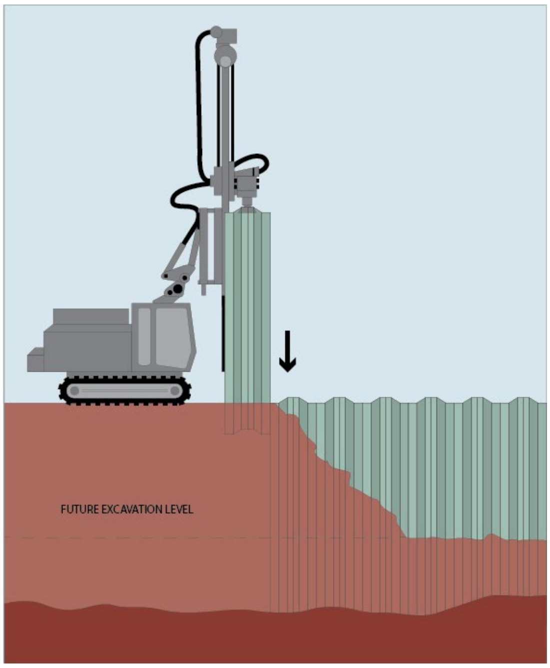

Figure 5-1 : Sheet piling using a vibratory hammer

Table 5-1 : Vibratory hammer specifications (based on 416L ICE) and modelled source level (SEL)[6]

Parameter	Value	SEL dB re 1µPa^2.s @ 1m	SPL Peak dB re 1µPa @ 10m
Eccentric moment kgm	23	165[6]	189[7]
Max. centrifugal force kN	645

Max. static line pull kN	400		
Max. oil flow L/min	359		
Dynamic weight kg	2350		
Total weight kg	3900		
L x W x H *) mm	2546 x 490 x 1566		

[6] Steel Sheet Pile [33] SWL calculated using 10*log10(2*pi*r) for approximated attenuation.

[7] Based on measured sheet pile levels at 10 m [33].

Parameter	Value	SEL dB re 1µPa^2.s @ 1m	SPL Peak dB re 1µPa @ 10m
Recommend. Power pack	400 series		
Recommended clamp	100TU		

Table 5-1 gives the sheet piling source level (SEL) for the vibratory hammer energy. Sheet piling is not planned to take place at high tide or at night-time. The cumulative impacts from sheet piling have been determined using the hammer energy source level multiplied by the frequency over a maximum duration of eight hours (thus by adding it cumulatively over 480 minutes) to give an overall cumulative SEL[8], as shown in Table 5-2.

Table 5-2 : Sheet piling noise source level

Parameter	Cumulative SEL $_{24\ hour}$
Source Level (SL)	227 dB re 1µPa^2.s @ 1m[8]

Note: If vibratory hammering only occurs during the low tide period, it has been assumed maximum of eight hours of driving will be undertaken.

The measured peak levels at 10m, as given in Table 5-1, are significantly less than the peak levels for the onset of PTS and TTS peak levels given in section 4.2. As a result, peak levels are not considered further in the assessment as sheet piling peak levels will be less than the threshold levels at ranges very close to the pile.

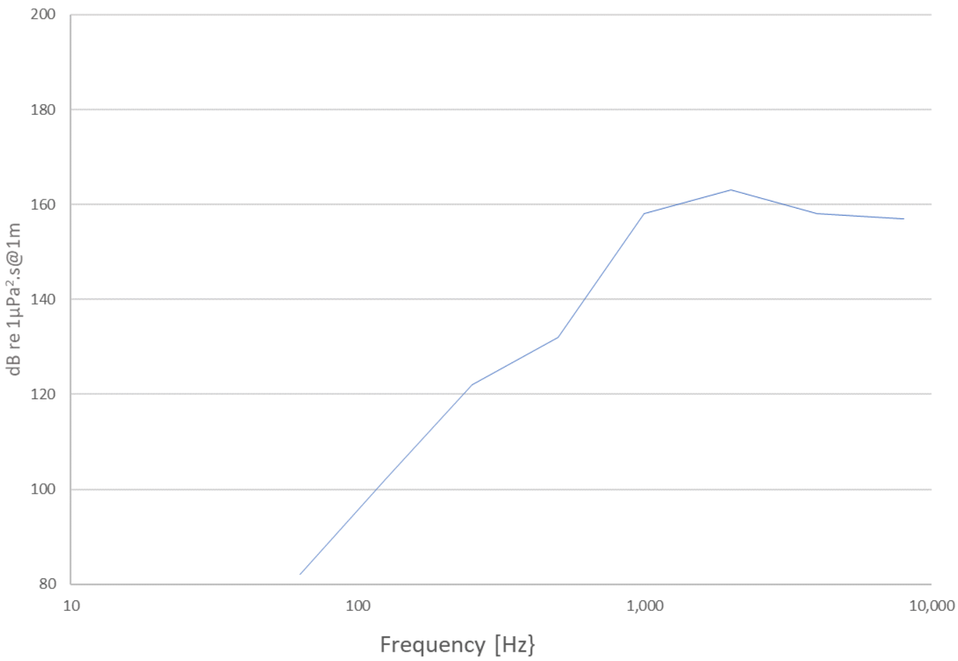

Figure 5-2 : Vibratory Hammer Sheet Piling source characteristics.

[8] 10*log10(N) where N is the number of minutes.

5.2.2 Dredging Noise Source Level[9]

Dredging is an underwater excavation activity used to increase the water depth, carried out by gathering up bottom sediment and disposing of the material at an approved spoil ground. Dredgers are non-impulsive noise sources.

The Project will use a TSHD, CSD and a BHD for trenching purposes. Dredging noise levels can vary significantly and are dependent on several factors including dredger design, equipment used, type of material being dredged and bathymetry. As RPS's 2022 pipeline route benthic habitat survey report [35] indicates that the pipeline route sediment consists of mud, gravel and sand, with sand being the predominate sediment, the dredging noise sources have been selected based on measurements undertaken of dredgers removing unconsolidated aggregate and sand [37].

Underwater noise measurements have been recorded from the CSD *Athena* conducting dredging operations at Walker Shoal in the East Arm of Darwin Harbour for the INPEX Ichthys project, as presented in Salgado-Kent et al [31]. These results have been reviewed but considered unlikely to be representative of CSD trenching operations for the DPD Project for the following reasons:

- Walker Shoal comprised areas of extremely high-strength conglomerate material (rock) which required special techniques to remove [39]. Some areas of rock were found to have had unconfined compressive strength (UCS) of 50 MPa to ~80 MPa; INPEX therefore determined that traditional dredging techniques, suitable for material strengths up to 30-50 MPa, could not be used [39].
- The CSD Athena was fitted with a specially modified cutting head (heavier with more teeth than a standard cutting head) to allow this high-strength rock to be removed [39]. The Athena was chosen on the basis that it was one of the few CSDs powerful enough to drive this cutting head [39].
- The DPD Project trenching areas does not comprise rock greater than 50 MPa and a conventional cutting head is considered sufficient to break up the rock encountered.

The equipment used and geology encountered during Ichthys project Walker Shoal dredging is therefore not considered representative for the DPD Project and CSD noise measurements in [31] have been used to inform the CSD source level used in this report.

A description of the dredging activities for the project are as follows:

- A TSHD uses a head suction pipe with nozzles connected to a high-pressure water installation to loosen the material on the seabed. The resulting lower pressure in the pipe lifts the material discharging it into a hopper. The SEL for the TSHD is based on a cycle time of dredging for 3 hours followed by 2 hours spent in transit/spoil dump repeated over period of 24 hours.
- A CSD is a vessel that includes a cutter head used to loosen the material and a suction mouth, inlet and pump used to mobilise the material from the seabed through piping into a hopper. The SEL for the CSD have been based on the cycle time of 10-hours of cutting and 2 hours of downtime repeated over 24 hours.
- A BHD will be used for digging and rock breaking. BHD noise was modelled in a rock-breaking phase (considered to be the noisiest activity undertaken by the BHD), whereby rock-breaking alternates with removal of broken rock via digging separate to the digging activities. The SEL

[9] Note: proposed equipment might not necessarily be the actual project equipment but are used as proxy sources reflective of actual equipment used by project.

for the BHD have been based on the cycle time of two cycles of 4 hours hammering, 4 hours of downtime followed by 4 hours of digging. As hydraulic hammering is impulsive, the exposure due to rock breaking has been calculated separately from the digging activity which has been modelled as non-impulsive noise.

The project dredge locations are shown in Figure 2-1 and the source levels used for modelling of dredging activities is given in Table 5-3.

Table 5-3 : Dredging noise source

Dredger Type	SPL[10] [dB re 1µPa @ 1m]	Reference Figure
TSHD [37]	184	**Figure 5-3**
CSD [37]	182	**Figure 5-4**
BHD (Digging) [26]	175	**Figure 5-5**

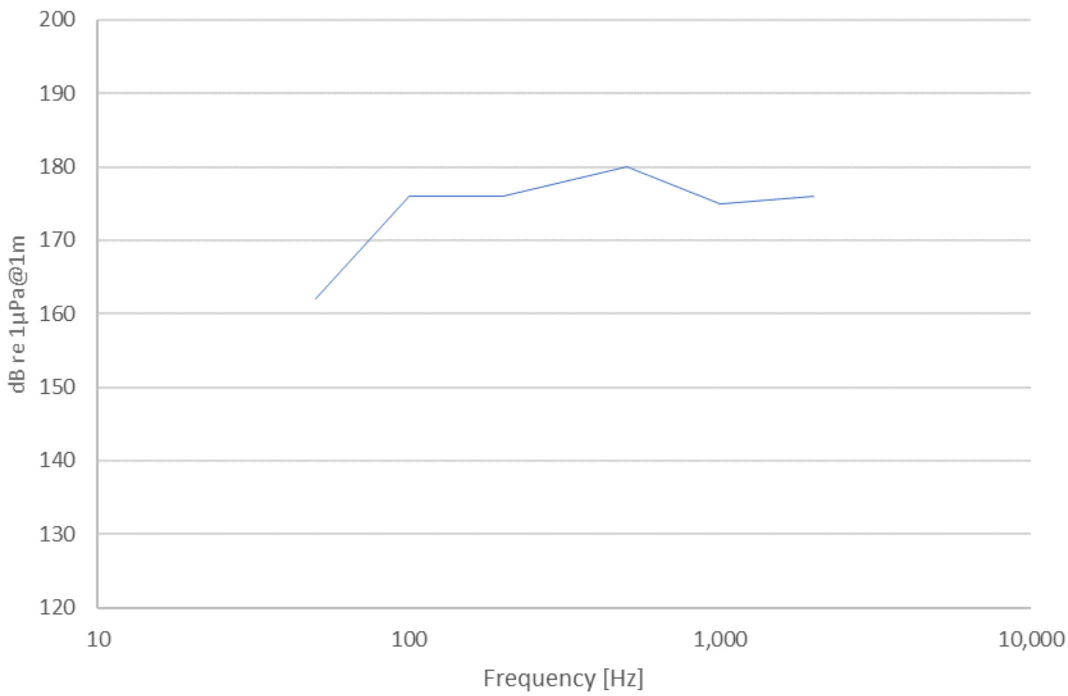

Figure 5-3 : TSHD noise source characteristics (at frequencies higher than reported a 20 dB/decade decay rate is assumed)

[10] Sound Pressure Level Root Mean Square.

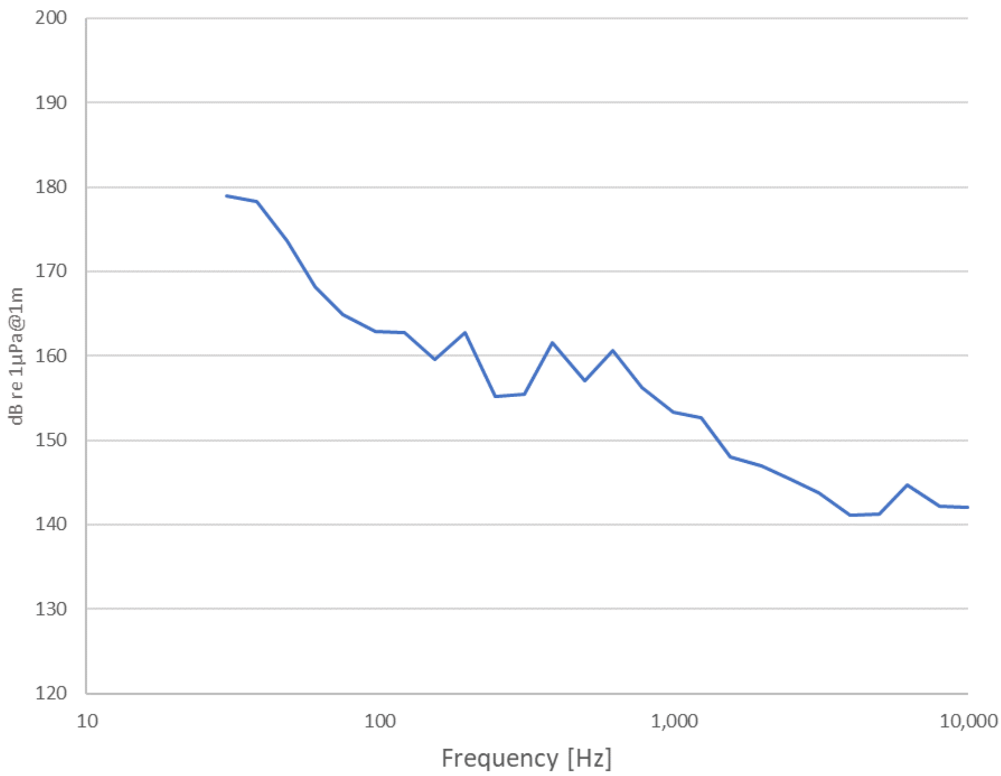

Figure 5-4 : CSD noise source characteristics

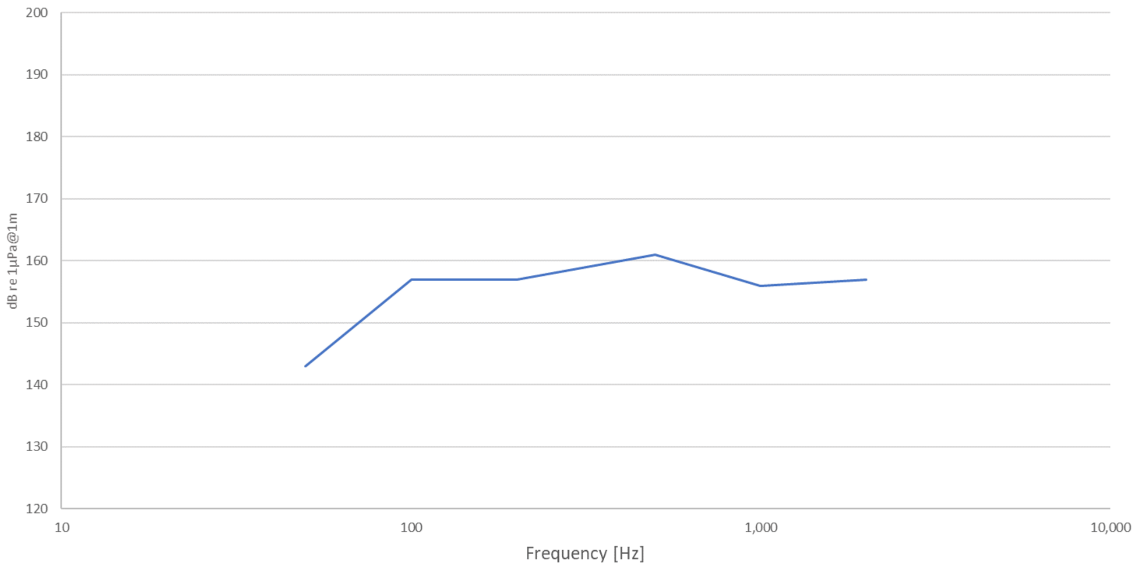

Figure 5-5 : BHD noise source characteristics (at frequencies higher than reported a 20 dB/decade decay rate is assumed)

5.2.3 BHD with Hydraulic Hammer

No publicly available underwater noise information could be found for hydraulic hammers. As a result, it has been assumed that the hydraulic hammer will have very similar levels to that of the vibratory hammer and the source levels in section 5.2.1 adopted as shown in Table 5-4.

Table 5-4 : Hydraulic Hammer noise source

Dredger Type	Cumulative SEL $_{24\ hour}$	Reference Figure
BHD Hydraulic Hammer	227 dB re 1µPa^2.s @ 1m	**Figure 5-2**

5.3 Noise Source Locations

Table 5-5 and Figure 2-1 gives the modelled noise source locations. For locations 1, 2 and 3, the source was positioned approximately halfway in the water column between surface and seabed.

Hydraulic sheet piling, if required, will be undertaken on the mud flats where there is no or very little water. As noise from the sheet piling can travel through the mud and reradiate into the water a noise source at Location 4 was placed 1m below the mud layer simulated in the model.

Table 5-5 : Noise Source model locations (MGA zone 52)

	Location Name	Easting	Northing
Location 1	Dredge Location 1	701366	8614382
Location 2	Dredge Location 2	696636	8620225
Location 3	Dredge Location 3	692710	8625712
Location 4	Sheet Pile Location	702240	8614600

5.4 Modelled Scenarios

Table 5-5 provides a summary of the modelled scenarios for each location and the 24 hour cycle time that was used to calculate exposure levels.

Notes:

- Noise sources are all static in the model.
- All model scenarios to SEL 24hour are at MSL. MSL was selected by the Project as Darwin harbour experiences extreme tidal ranges and high and low tide water levels occur for only a short period of time across a 24 hour period (or across spring-neap tidal cycle). A MSL therefore provides a more realistic representation of cumulative $SEL_{24\ hour}$ exposures as the water levels fluctuate around MSL over a 24 hour period.

Table 5-6 : Noise Model Scenarios

	Scenario	Water Depth [m]	Cycle Times within a 24 Hour periods
Location 1	BHD (Digging)	6	Two x 4 hours of digging over 24 hours during rock-breaking phase.
	BHD (Hydraulic Hammer)		Two x 4 hours hammering over 24 hours during rock-breaking phase.

	Scenario	Water Depth [m]	Cycle Times within a 24 Hour periods
Location 2	TSHD	17	3 hours dredging and 2 hours transit/spoil dump.
Location 3	TSHD	18	3 hours dredging and 2 hours transit/spoil dump
	Concurrent operations - TSHD and CSD		TSHD (3 hours dredging and 2 hours transit/spoil dump). CSD (10 hours of cutting and 2 hours downtime).
Location 4	Sheet Piling	0	8 hours over 24 hours.

5.5 Bathymetry

The bathymetry applied to the model was sourced from Geoscience Australia [38]. The bathymetry extended up to 20km from Darwin Harbour and 31km from the Project location. As shown in Figure 5-6, the water depth within the bathymetry which has been applied to the model is shallow (between 0m and ~25m).

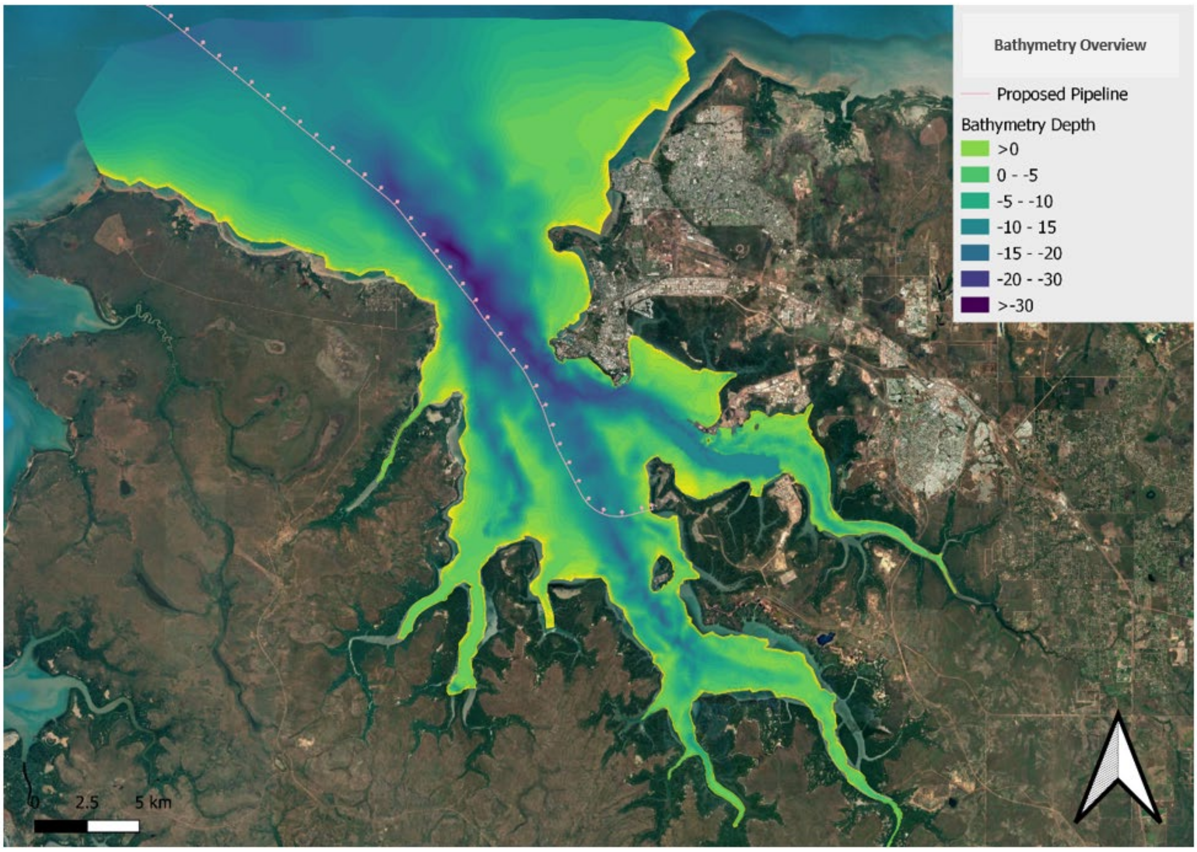

Figure 5-6 : Bathymetry (Mean Australian Sea Level)

5.6 Seabed Types

RPS's 2022 pipeline route benthic habitat survey report [35] shows that the pipeline route sediment consists of mud, gravel and sand, with sand being the predominant sediment. As a result, sand has been selected to represent the seabed for the study area with geo-acoustic properties as shown in Table 5-7. This is also a conservative approach as sand is more reflective in shallow water environments (i.e. shallow grazing angles) than limestone and other hard materials which absorb more of the energy of the pressure wave with each reflection [34]. This phenomenon is due to the properties of harder materials (such as limestone and calcarenite) where on reflection, the pressure wave at low grazing angles, excites both a compression and shear waves thus removing more energy from the wave. Sand on the other hand, excites only a compressional wave on reflection and therefore absorbs less energy.

Table 5-7 : Seabed geo-acoustic properties used in the model [34]

Type	Sound Speed (m/s)	Density (g/cm³)	Sound attenuation (dB/m/kHz)		Shear Speed (m/s)
			Compression	Shear	
Fine to medium sand	1774	2.05	0.374	0	0

5.7 Sound Speed Profile

The noise sources and a large proportion of the study area is in shallow water (<20m). The temperature profile through the water column has therefore been assumed to be isothermal (as sound speed profiles are not readily available). The sound speed profile used for modelling is for a constant water temperature of 28°C and a constant salinity of 27 parts per thousand (ppt), which are the mean values for water temperature and salinity in Darwin Harbour [11].

5.8 Hearing Threshold Weighting Curves

Hearing weighting curves used in the study are based on NOAA's technical guidance [2] for marine mammal species and the 2017 US Navy Acoustics and Explosive Effects report [22] for sirenians, fish and turtles. See Appendix F for a more detailed overview of the hearing curves.

5.9 Model Limitations

The following limitations apply to the noise modelling:

- **Reflection** – Specular reflection due to rough seabed surface and wave action is not accounted for in the model.
- **Airborne noise** – A small component of the airborne noise generated above the sea surface will be transferred into the water column. The levels from airborne noise will be a lot lower than for noise generated underwater. They will therefore not make a material difference to the outcomes of the underwater noise study.
- **Temperature, Salinity and Sound Speed Profiles** – The model has assumed negligible variation in sea temperature or salinity. It is assumed that the water column is isothermal (i.e. constant temperature) because the water depth in the modelling area is relatively shallow. Variation in the sound speed profile has been limited to the effects of water column pressure.

Technical Note on the impact of salinity, temperature and change of sound speed profile in shallow water:

- The Project area is in an acoustically shallow water environment (i.e. Depth <200 m [28]). In these environments sound is propagated to a distance by repeated reflections from both the surface and the bottom. In water that is acoustically shallow the acoustic characteristics of the surface and seabed are the most significant transmission paths. As a result, the interaction of the acoustic wave with the surface and the bottom becomes important for predicting received levels. As the project is in a very shallow environment and in an area where there is no major influx of cooler water or any other cooling effect the stratification of the water column won't be significant, and refraction will minimal.
- **Temperature**: In shallow water environments temperature affects the acoustic impedance between the water and seabed interface [29]. Water temperature has a cubic effect on sound speed and an increase or decrease in sound speed affects the efficiency of sound reflections. Due to uncertainty of the Projects schedule a mid-range temperature was appropriate.

[11] Darwin harbour water temperature ranges between 23°C in June-July and 33°C in October-November. Salinity ranges between 25 parts per thousand (ppt) and 29 ppt. See reference [25].

- **Salinity**: Salinity, when compared to temperature, has a far smaller effect on sound speed. Additionally, salinity does not have an impact on absorption [30]. Salinity therefore does not affect the absorption of the acoustic wave or the sound speed profile (note it will only make a marginal difference to the sound speed profile in deep water). As a result, a change in salinity will not affect the predicted outcomes.

6 Noise Model Results and Discussion

6.1 Location 1 – BHD

Section 6.1.1 presents the ranges of predicted disturbance to each hearing group from the BHD (i.e. non-impulsive source) at Location 1, and section 6.1.2 gives the predicted disturbance to each hearing group from the BHD using a hydraulic hammer (i.e. rock breaking) at Location 1.

6.1.1 Location 1 – BHD Digging

Table 6-1 provides the ranges at which TTS and PTS is expected to exceed the threshold for each hearing group for BHD digging activity at Location 1 (as defined in section 5.4), and the estimated disturbance ranges. These ranges are as follows:

- TTS exceedances are between <50m and 151m.
- PTS exceedances are predicted to be <50m.
- Behavioural disturbance risks for turtles and fish have been assessed as Low in the nearfield (i.e. scales of 10s of metres) as defined in [5].
- Behavioural disturbance for dolphins and dugongs is predicted to occur within 454m from the BHD.

Appendix B, section B.1 provides the TTS and PTS noise maps and Appendix C, section C.1 contains the behavioural noise maps for all the hearing groups. Appendix D, section D.1 and Appendix E, section E.1 provides the maximum received levels with distance graphs.

Table 6-1 : Behavioural disturbance, TTS and PTS Onset threshold ranges for BHD Digging (non-impulsive) at Location 1 (MSL)

Hearing Group	$SEL_{24\,hour}$ (Weighted) Threshold [dB re 1µ Pa².s]		Distance [m]		SPL Behavioural [dB re 1µ Pa]	Distance [m]
	TTS	PTS	TTS	PTS		
Turtle	200	220	<50	<50	RISK	10's of metres
Dugongs	186	206	200	<50	120	454
Dolphins	178	198	145	<50	120	454
Fish	RISK		10's of metres	10's of metres	RISK	10's of metres

6.1.2 Location 1 – BHD with Hydraulic Hammer

Table 6-2 provides the ranges at which TTS and PTS is expected to exceed the threshold for each hearing group for BHD using a hydraulic hammer during rock-breaking phase at Location 1 (as defined in Section 5.4), and the estimated disturbance ranges. These ranges are as follows:

- TTS exceedances are between <50m and 200m.
- PTS exceedances are predicted to be <50m.

- Behavioural disturbance risks for fish have been assessed as Moderate in the nearfield (10's of metres) as defined in [5].
- Behavioural disturbance for turtles is predicted to occur at 151m from the BHD with Hydraulic Hammer activity.
- Behavioural disturbance for dolphins and dugongs is predicted to occur at 100m from the BHD with Hydraulic Hammer activity.

Appendix B, section B.1 provides the TTS and PTS noise maps and Appendix C, section C.1 contains the behavioural noise maps for all the hearing groups. Appendix D, section D.1 and Appendix E, section E.1 provides the maximum received levels with distance graphs.

Table 6-2 : Behavioural disturbance, TTS and PTS Onset threshold ranges for BHD with Hydraulic Hammer at Location 1 (MSL)

Hearing Group	$SEL_{24\ hour}$ (Weighted) Threshold [dB re 1µ Pa².s]		Distance [m]		SPL Behavioural [dB re 1µ Pa]	Distance [m]
	TTS	PTS	TTS	PTS		
Turtle	189	204	<50	<50	166	151
Dugongs	175	190	200	<50	160	100
Dolphins	170	185	151	70	160	100
Fish	186	201	100	<50	RISK	100's of metres

6.2 Location 2 – TSHD

Table 6-3 provides the ranges at which TTS and PTS is expected to exceed the threshold for each hearing group for the TSHD activity at Location 2, and the estimated disturbance ranges. These ranges are as follows:

- TTS exceedances are between 131m and 303m.
- PTS exceedances are predicted to be <50m.
- Behavioural disturbance risks for turtles and fish have been assessed as Low in the nearfield (10's of metres) as defined in [5].
- Behavioural disturbance for dolphins and dugongs is predicted to occur at 1,667m from the TSHD.

Appendix B, section B.3 provides the TTS and PTS noise maps and Appendix C, section C.3 contains the behavioural noise maps for all the hearing groups. Appendix D, section D.3 and Appendix E, section E.3 provides the maximum received levels with distance graphs.

Table 6-3 : Behavioural disturbance, TTS and PTS Onset Threshold Ranges for TSHD at Location 2 (MSL)

Hearing Group	$SEL_{24\ hour}$ (Weighted) Threshold [dB re 1µ Pa².s]		Distance [m]		SPL Behavioural [dB re 1µ Pa]	Distance [m]
	TTS	PTS	TTS	PTS		
Turtle	200	220	131	<50	RISK	10's of metres
Dugongs	186	206	170	<50	120	1,667
Dolphins	178	198	303	<50	120	1,667
Fish	RISK		10's of metres	10's of metres	RISK	10's of metres

6.3 Location 3 – TSHD

Table 6-4 provides the ranges at which TTS and PTS is expected to exceed for each hearing group for TSHD at Location 3, and the estimated disturbance ranges. These ranges are as follows:

- TTS exceedances are between 120m and 303m.
- PTS exceedances are predicted to be <50m.
- Behavioural disturbance risks for turtles and fish have been assessed as Low in the nearfield (10's of metres) as defined in [5].
- Behavioural disturbance for dolphins and dugongs is predicted to occur at 2,273m from the TSHD.

Appendix B, section B.4 provides the TTS and PTS noise maps and Appendix C, section C.4 contains the behavioural noise maps for all the hearing groups. Appendix D, section D.4 and Appendix E, section E.4 provides the maximum received levels with distance graphs.

Table 6-4 : Behavioural disturbance, TTS and PTS Onset Threshold Ranges for TSHD at Location 3 (MSL)

Hearing Group	$SEL_{24\ hour}$ (Weighted) Threshold [dB re 1µ Pa².s]		Distance [m]		SPL Behavioural [dB re 1µ Pa]	Distance [m]
	TTS	PTS	TTS	PTS		
Turtle	200	220	120	<50	RISK	10's of metres
Dugongs	186	206	200	<50	120	2,273
Dolphins	178	198	303	<50	120	2,273
Fish	RISK		10's of metres	10's of metres	RISK	10's of metres

6.4 Location 3 – TSHD and CSD

Table 6-5 provides the ranges at which TTS and PTS is expected to exceed for each hearing group for concurrent TSHD and CSD at Location 3, and the estimated disturbance ranges. These ranges are as follows:

- TTS exceedances are between 160m and 350m.
- PTS exceedances are predicted to be <50m.
- Behavioural disturbance risks for turtles and fish have been assessed as Low in the nearfield (10's of metres) as defined in [5].
- Behavioural disturbance for dolphins and dugongs is predicted to occur at 3,181m from the TSHD and CSD activities.

Appendix B, section B.5 provides the TTS and PTS noise maps and Appendix C, section C.5 contains the behavioural noise maps for all the hearing groups. Appendix D, section D.5 and Appendix E, section E.5 provides the maximum received levels with distance graphs.

Table 6-5 : Behavioural disturbance, TTS and PTS Onset Threshold Ranges for TSHD and CSD at Location 3 (MSL)

Hearing Group	$SEL_{24\ hour}$ (Weighted) Threshold [dB re 1µ Pa².s]		Distance [m]		SPL Behavioural [dB re 1µ Pa]	Distance [m]
	TTS	PTS	TTS	PTS		
Turtle	200	220	160	<50	RISK	10's of metres
Dugongs	186	206	210	<50	120	3,181
Dolphins	178	198	350	<50	120	3,181
Fish	RISK		10's of metres	10's of metres	RISK	10's of metres

6.5 Location 4 – Sheet Piling

Table 6-6 provides the ranges at which TTS and PTS is expected to exceed for each hearing group for Sheet Piling at Location 3, and the estimated disturbance ranges. These ranges are as follows:

- TTS exceedances are between <50m and 85m.
- PTS exceedances are predicted to be <50m.
- Behavioural disturbance risks for fish have been assessed as low in the nearfield (10's of metres) as defined in [5].
- Behavioural disturbance for turtles, dolphins and dugongs is predicted to occur at <50m from the Sheet Piling.

Appendix B, section B.6 provides the TTS and PTS noise maps and Appendix C, section C.6 contains the behavioural noise maps for all the hearing groups. Appendix D, section D.6 and Appendix E, section E.6 provides the maximum received levels with distance graphs.

Table 6-6: Behavioural disturbance, TTS and PTS Onset Threshold Ranges for Sheet Piling at Location 4

Hearing Group	$SEL_{24\ hour}$ (Weighted) Threshold [dB re 1µ Pa².s]		Distance [m]		SPL Behavioural [dB re 1µ Pa]	Distance [m]
	TTS	PTS	TTS	PTS		
Turtle	189	204	<50	<50	166	<50
Dugongs	175	190	<50	<50	160	<50
Dolphins	170	185	<50	<50	160	<50
Fish	186	201	<50	<50	RISK	10's of metres

6.6 Behavioural Ranges for LAT, MSL and HAT

Darwin Harbour can experience large tidal swings, with up to 8m between Low Astronomical Tide (LAT) and Highest Astronomical Tide (HAT), although typically tidal ranges are approximately 6m between spring low and high tides, and approximately 2m between neap low and high tides.

Table 6-7 presents the behavioural ranges for LAT, MSL and HAT which have been given as these are representative of likely behavioural disturbances for a point in time[12] for turtles, dugongs, and dolphins.

The highest differential behavioural ranges between LAT and HAT were found to be at Location 2 and Location 3 where the water is deeper

Note: Low risk ratings in Table 6-7 are for nearfield (10's of metres) distances while Moderate risk ratings are for intermediate (100's of metres) distances as defined in [5].

Table 6-7: Behavioural disturbance Threshold Ranges for all locations for LAT, MSL and HAT.

Receptor Type	Sound Pressure Level (SPL) Behavioural Threshold (dB re 1µ Pa)	Threshold Range (metres) for tidal state		
		LAT	MSL	HAT
Location 1 – BHD (digging)				
Turtle	RISK	10's of metres	10's of metres	10's of metres
Dugong	120	303	454	909
Dolphin	120	303	454	909
Fish	RISK	10's of metres	10's of metres	10's of metres
Location 1 – BHD (hydraulic hammering)				
Turtle	166	<50	151	302
Dugong	160	<50	100	200
Dolphin	160	<50	100	200
Fish	RISK	10's of metres	10's of metres	100's of metres
Location 2 – THSD				
Turtle	RISK	10's of metres	10's of metres	100's of metres
Dugong	120	1,450	1,667	20,000

[12] A MSL provides a more realistic representation of cumulative $SEL_{24\ hour}$ exposures as the water levels fluctuate around MSL over a 24 hour period. The HAT and LAT $SEL_{24\ hour}$ exposures ranges are therefore not included in the study

Receptor Type	Sound Pressure Level (SPL) Behavioural Threshold (dB re 1µ Pa)	Threshold Range (metres) for tidal state		
		LAT	MSL	HAT

7 Conclusion

An underwater noise model has been developed to predict potential noise levels at distance from noise sources associated with the Project. The noise sources modelled in the report are representative of the Project design and construction. As noted in sections 5.1 and 5.2 the noise sources have been selected based on the best information available at the time of the study. Even so the information available in the public domain shows that noise sources with similar specifications can vary depending as described in section 5.2.

APPENDIX A Abbreviations, Acronyms and Symbols

dB	Decibel
CMST	Centre of Marine Science and Technology
HAT	Highest Astronomical Tide
HF	High Frequency
Hz	Hertz
kHz	Kilo Hertz
LAT	Lowest Astronomical Tide
LE,24h	Sound Exposure Level Cumulative 24 hours
LF	Low Frequency
LPK	Peak Sound Pressure Level
M	Metre
MASDP	Middle Arm Sustainable Development Precinct
MSL	Mean Sea Level
ms	Milliseconds
NOAA	National Oceanic and Atmospheric
Pa	Pascals
PTS	Permanent Treshold Shift
RMS	Root Mean Square
s	Seconds
SEL	Sound Exposure Level [dB re 1µPa^2.s]
SELcum	Cumulative Sound Exposure Level
SL	Source Level [dB re 1µPa @ 1m] or [dB re 1µPa^2.s @ 1m]
SPL	Sound Pressure Level [dB re 1µPa]

TTS	Temporary Treshold Shift
µPa	Micro Pascal
µPa2-s	Micro Pascal Square Second
W(f)	Weighting function

APPENDIX B
PTS and TTS Contours

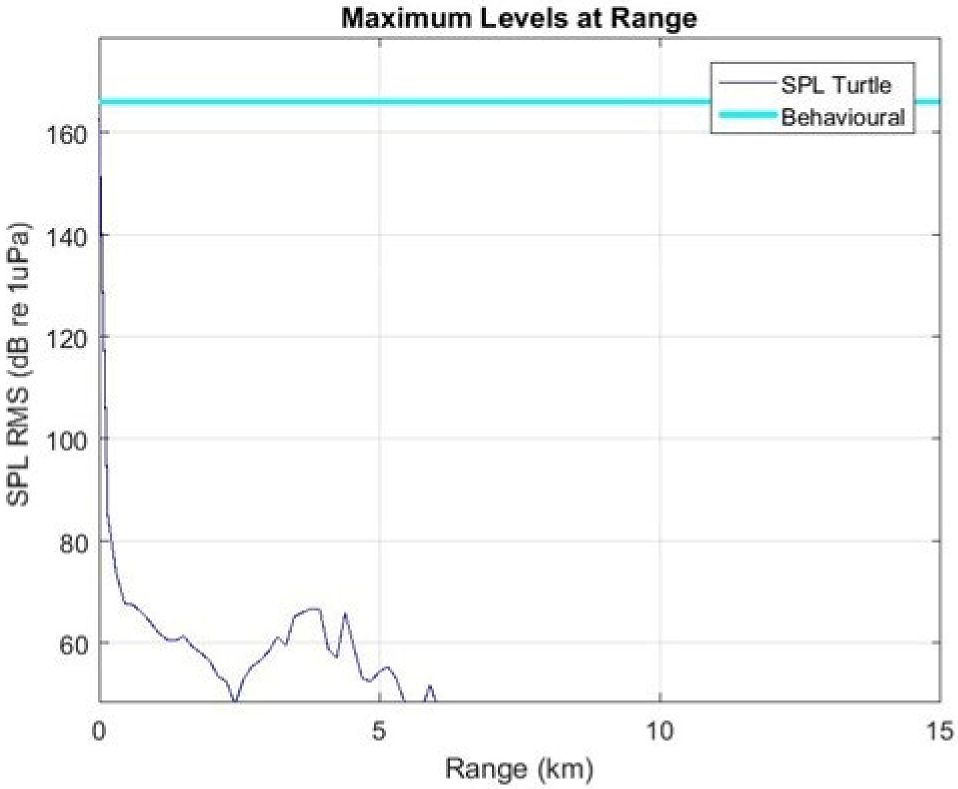

Figure 7-110 : Sheet Pile Driving behavioural distance for Turtles

APPENDIX F

Summary of Auditory Weighting and Exposure Function Parameters

Note: All of the following equations use SI units: Pascals, metres, seconds, and kilograms. For clarity, units are not included in every equation and constant.

Hearing Group	a	b	f_1 (kHz)	f_2 (kHz)	C (dB)	K (dB)
Low-frequency (LF) cetaceans	1.0	2	0.2	19	0.13	179
High-frequency (HF) cetaceans	1.6	2	8.8	110	1.20	177
Very High-frequency (HF) cetaceans	1.8	2	12	140	1.36	152

* Equations associated with Technical Guidance's auditory weighting ($W_{aud}(f)$) and exposure functions ($E_{aud}(f)$):

$$W_{aud}(f) = C + 10\log_{10}\left\{\frac{(f/f_1)^{2a}}{[1+(f/f_1)^2]^a[1+(f/f_2)^2]^b}\right\}$$

$$E_{aud}(f) = K - 10\log_{10}\left\{\frac{(f/f_1)^{2a}}{[1+(f/f_1)^2]^a[1+(f/f_2)^2]^b}\right\}$$

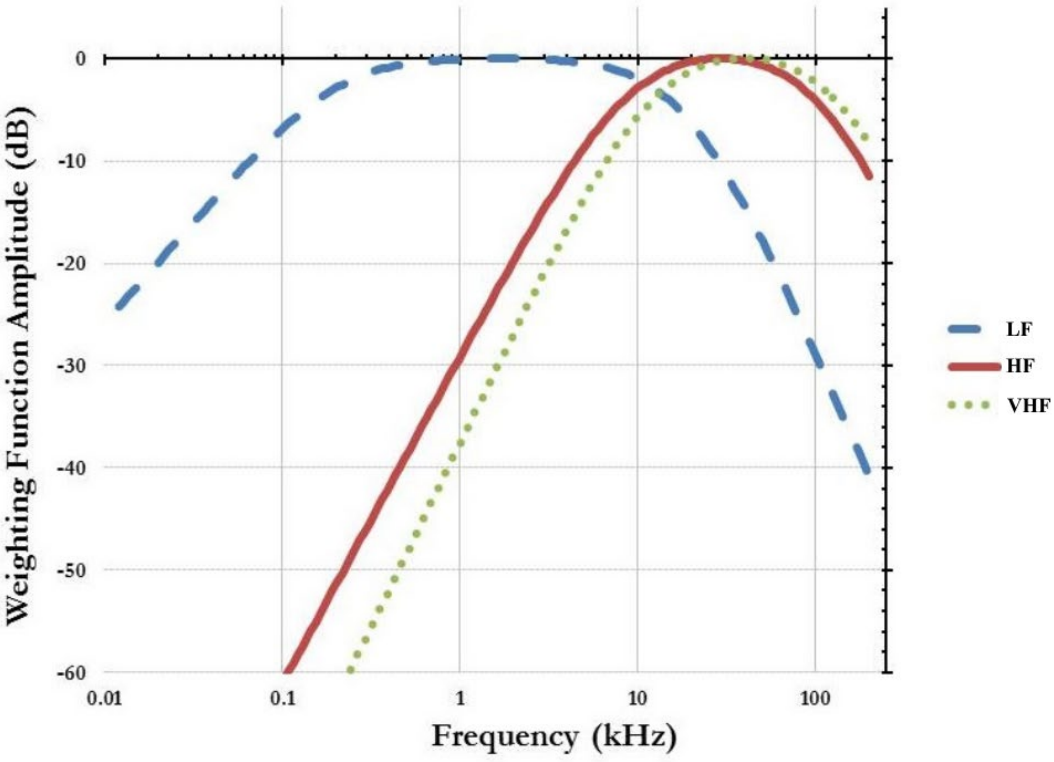

Figure 7-115: Hearing Sensitivity Curves for Cetaceans

Functional Hearing Group	K	a (Hz)	b (Hz)
Sea Turtles	0	10	2,000

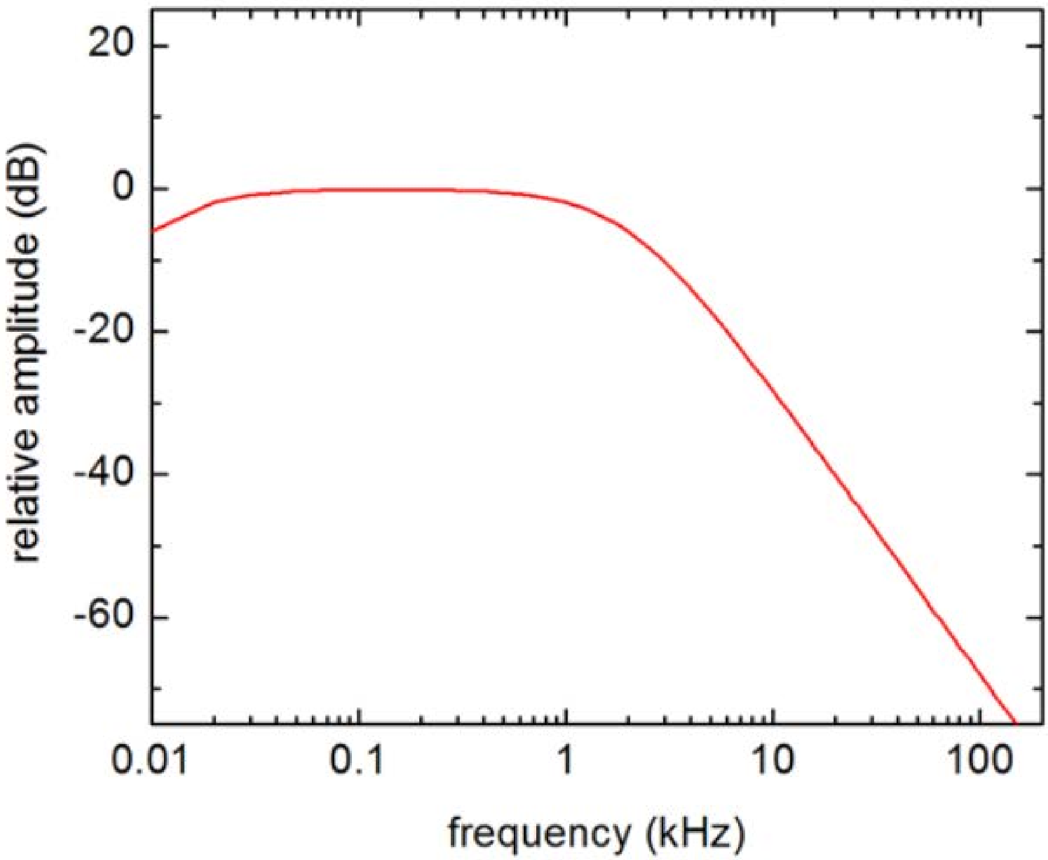

Figure 7-116: Hearing Sensitivity Curve for Turtles

Executive Summary

JASCO Applied Sciences (JASCO) performed a modelling study of underwater sound levels associated with the Santos Barossa Darwin Pipeline Duplication (DPD). The modelling study considers trenching activity using two sources – the Xcentric Ripper, considered to be a non-impulsive noise source, and a hydraulic hammer, considered to be an impulsive noise source.

The study predicted ranges to acoustic thresholds that may result in injury to or behavioural disturbance of marine fauna. The corresponding thresholds used in this study represented the best available science for behavioural response or disturbance, temporary threshold shift (TTS), and permanent threshold shift (PTS) or injury depending upon the fauna group. The fauna considered included marine mammals, sea turtles, and fish.

The modelling methodology was to characterise the sound sources and then determine how the sounds propagated at a specific location considering the environmental properties that influence the propagation of underwater sound. The models considered source levels of the trenching devices, and range-dependent environmental properties. It was assumed that any of the activities could be performed at any time during the year, therefore the most conservative season for the sound speed profile was considered.

Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p) and accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria and noise sources. In this report, the duration period for SEL accumulation is defined as an 8-hour period over which sound energy is integrated; the level is specified with the abbreviation SEL_{24h}.

SEL_{24h} is a cumulative metric that reflects the dosimetric effect of noise levels within 24 hours, based on the assumption that a receiver (e.g., an animal) is consistently exposed to such noise levels at a fixed position. More realistically, marine animals would not stay in the same location for 24 hours (especially in the absence of location-specific habitat) but rather a shorter period, depending on the animal's behaviour and the source's proximity and movements. Therefore, a reported radius for the SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be impaired, but rather that an animal could be exposed to the sound level associated with impairment (either PTS or TTS) if it remained at that location for 24 hours.

Marine Mammals

- The maximum distance where the NOAA (2019) marine behavioural response criterion of 120 dB 1 μPa for non-impulsive noise is shown in Table 1 and 160 dB 1 μPa for impulsive noise is shown in Table 2.
- The results for marine mammal injury considered the criteria from Southall et al. (2019). The metric used in this assessment is SEL_{24h}. The SEL_{24h} is a cumulative metric that reflects the dosimetric impact of noise levels within 24 hours based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. More realistically, marine mammals (and fish) would not stay in the same location for 24 hours. Therefore, a reported radius of SEL24h criteria does not mean that marine fauna travelling within this radius of the source will be injured, but rather that an animal could be exposed to the source level associated with injury (either PTS or TTS) if it remained in that location for 24 hours.
- The distance to PTS and TTS was always farthest towards the offshore direction and is shown in Tables 1 and 2.

Table 1. Summary of maximum (R_{max}) horizontal distances (in km) from the Xcentric Ripper at the modelled site to behavioural response thresholds, temporary threshold shift (TTS), and permanent threshold shift (PTS) for marine mammals.

Hearing group	Modelled distance to effect threshold (R_{max})		
	Behavioural response[1]	Impairment: TTS[2]	Impairment: PTS[2]
LF cetaceans	14.7	3.83	0.18
HF cetaceans		0.16	–
Sirenians		0.11	–

Noise exposure criteria: [1] NOAA (2019) and [2] Southall et al. (2019)
A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m)

Table 2. Summary of maximum (R_{max}) horizontal distances (in km) from the hydraulic hammer at the modelled site to behavioural response thresholds, temporary threshold shift (TTS), and permanent threshold shift (PTS) for marine mammals.

Hearing group	Modelled distance to effect threshold (R_{max})		
	Behavioural response[1]	Impairment: TTS[2]	Impairment: PTS[2]
LF cetaceans	0.27	20.1	5.78
HF cetaceans		2.44	0.20
Sirenians		2.78	0.23

Noise exposure criteria: [1] NOAA (2019) and [2] Southall et al. (2019)
A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m)

Sea Turtles

- The maximum distance to the SEL_{24h} metrics from the modelled sites Finneran et al. (2017). As is the case with marine mammals, a reported radius fir SEL_{24h} criteria does not mean that sea turtles travelling within the radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.
- Table 3 summarises the distances to where the criterion for behavioural response of sea turtles to 166 dB 1 µPa and the 175 dB 1 µPa threshold for behavioural disturbance could be exceed.

Table 3. *Xcentric Ripper*: summary of distances to sea turtle temporary threshold shift (TTS) and permanent threshold shift (PTS).

Hearing group	Modelled distance to effect threshold (R_{max})	
	Impairment: TTS[1]	Impairment: PTS[1]
Sea turtles	0.05	–

Noise exposure criteria: [1] Finneran et al. (2017)

Table 4. *Hydraulic hammer*: summary of distances to sea turtle behavioural response criteria, temporary threshold shift (TTS), and permanent threshold shift (PTS).

Hearing group	Modelled distance to effect threshold (R_{max})			
	Behavioural response[1]	Behavioural disturbance[1]	Impairment: TTS[2]	Impairment: PTS[2]
Sea turtles	0.09	0.27	1.18	0.12

Noise exposure criteria: [1] McCauley et al. (2000) and [2] Finneran et al. (2017)

NOTE: TTS and PTS for impulsive noise is considered as a dual metric with SEL_{24h} and peak thresholds and the longest range to threshold to be taken. Since the source levels were taken from measured data over 1 sec the time characteristics and hence peak could not be determined. Due to the noise source distance to thresholds is expected to be greater for SEL_{24h}

Fish, fish eggs, and fish larvae

- This modelling study assessed the ranges for qualitative criteria based on Popper et al. (2014) and considered SEL_{24h} metrics associated with mortality and potential mortal injury as well as impairment in the following groups:
  - Fish without a swim bladder (also appropriate for sharks in the absence of other information),
  - Fish with a swim bladder that do not use it for hearing,
  - Fish that use their swim bladders for hearing,
  - Fish eggs and fish larvae.
- Table 5 summarises distances to effect criteria for fish, fish eggs, and fish larvae.

Table 5. *Hydraulic Hammer*: Summary of maximum fish, fish eggs, and larvae injury and temporary threshold shift (TTS) onset distances for 24 h sound exposure level (SEL_{24h}) modelled scenarios.

Relevant hearing group	Effect Criteria	Modelled distance to effect threshold (R_{max})
Fish: No swim bladder	Recoverable injury	0.03
	TTS	4.27
Fish: swim bladder not involved in hearing and Swim bladder involved in hearing	Recoverable injury	0.34
	TTS	4.27
Fish eggs and larvae	Injury	0.09

1. Introduction

Jasco Applied Sciences (JASCO) performed a numerical estimation study of underwater sound levels associated with the planned trenching activities in relation to the Santos Barossa Darwin Pipeline Duplication (DPD) to assist in understanding the potential acoustic effect on receptors including marine mammals, sea turtles, and fish.

The modelling study predicted the distances at which underwater sound levels from operations reached noise effect thresholds and criteria. Due to the variety of species considered, there are several different thresholds for evaluating effects, including: mortality, injury, temporary reduction in hearing sensitivity, and behavioural disturbance.

The modelling methodology considered underwater acoustic propagation models used in conjunction with the parametrisation specific to modelled sources (source level, frequency content, and source directivity) and range-dependent environmental properties that effect the propagation of underwater sound. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p) and accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria for either non-impulsive (Xcentric Ripper) or impulsive (hydraulic hammer) noise sources.

Section 1.1 outlines the specific details of modelling study. Section 2 details the metrics used to represent underwater acoustic fields and the associated effect criteria considered. Section 3 details the methodology for predicting the source levels and modelling the sound propagation, including source levels and environmental parameters required by the propagation models. Section 4 presents the results, which are then discussed in Section 5.

1.1. Modelling Scenarios

The acoustic modelling study for trenching activities for the Santos Barossa DPD considers sites within Darwin Harbour with a water depth approximately 10 m deep. The project components considered two sources for trenching at three different tide datums for consistency with previous work – Lowest Astronomical Tide (LAT), Mean Sea Level (MSL), and Highest Astronomical Tide (HAT). The modelled site and scenarios considered are detailed in Table 6 with an overview map of the area shown in Figure 1.

Table 6. Modelled site locations and source information.

Site	Source	Latitude (S)	Longitude (E)	MGA[1] Zone 52 (GDA94)		Datum	Water Depth (m)	Duration (h)
				X (m)	Y (m)			
1	Xcentric Ripper XR-60	12° 31' 39.87"	130° 51' 11.43"	701366	8614382	LAT	5.0	2 x 4 h
						MSL	9.2	
						HAT	13.1	
	Hydraulic Hammer					LAT	5.0	2 x 4 h
						MSL	9.2	
						HAT	13.1

2. Noise Effect Criteria

To assess the potential effects of a sound–producing activity, it is necessary to first establish exposure criteria (thresholds) for which sound levels may be expected to have a negative effect on animals. Whether acoustic exposure levels might injure or disturb marine fauna is an active research topic. Since 2007, several expert groups have developed SEL–based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018) and Southall et al. (2019). The number of studies that investigate the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

Several impulsive metrics have been suggested to discern between impulsive and non-impulsive sounds for aerial and underwater sounds. Southall et al. (2007) proposed that regulations should use the Harris (1998) definition that says an impulse is present if there is more than a 3 dB difference between the impulse time weighted SPL and the slow-time weighted SPL (referred to here as the Harris impulse factor). Erdreich (1986) presented as an indicator of impulsiveness and demonstrated that kurtosis was a sensitive discriminator of the impulsiveness of noise. Kurtosis (β) (ISO 18405, 2017, Müller et al. 2020) is a statistical measure describing the distribution of acoustic energy across the frequency spectrum of a sound. It is a measure of the outliers in a given distribution (or time-series) relative to their occurrence in a normal distribution. Popper and Hawkins (2019) proposed kurtosis as a metric to distinguish impulsive sounds in the studies of fish and invertebrates. Martin et al. (2020) compared various types of impulsive and non-impulsive sounds in terms of their kurtosis, and the results strongly support using kurtosis for quantifying impulsiveness for future assessments and revised underwater noise regulations. The results also show that by applying this metric, it becomes irrelevant for assessing hearing impairment if impulsive signals seemingly merge into non-impulsive signals over distance due to dispersion as their kurtosis remains high (i.e., an indicator for impulsiveness). Guan et al. (2022) findings suggest that a simple dichotomy of classifying sounds as impulsive or non-impulsive may be overly simplistic for assessing auditory impacts (in marine mammals) and studies investigating the impacts from complex sound fields are needed.

The conclusions drawn in Guan et al. (2022) support the characterisation of the hydraulic hammer as an impulsive source while the Xcentric Ripper is used as a non-impulsive source. For these sound sources SPL and SEL are the relevant metrics. The period of accumulation associated with SEL is defined, with this report referencing either a “strikes in 1 sec” assessment or over 24 h. The acoustic metrics in this report reflect the ISO standard for acoustic terminology, ISO/DIS 18405:2017 (2017).

The following thresholds and guidelines for this study were chosen because they represent the best available science, and sound levels presented in literature for fauna with no defined thresholds:

1. Marine mammals:
   a. Marine mammal behavioural thresholds based on the current interim U.S. National Oceanic and Atmospheric Administration (NOAA) (2019) unweighted criterion for marine mammals of 120 dB re 1 µPa (SPL; L_p) and 160 dB re 1 µPa (SPL; L_p) for non–impulsive and impulsive sound sources, respectively.
1. Fish, fish eggs, and larvae:
   a. Sound exposure guidelines for fish, fish eggs, and larvae (Popper et al. 2014).
2. Sea turtles (also applied to other marine reptiles including crocodiles):
   a. Frequency–weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Finneran et al. (2017) for the onset of PTS and TTS in turtles for non–impulsive and impulsive sound sources.
   b. Sea turtle behavioural response threshold of 166 dB re 1 µPa (SPL; L_p) for impulsive noise, along with a sound level associated with behavioural disturbance 175 dB re 1 µPa (SPL; L_p) (McCauley et al. 2000).

The following sections (Sections 2.1 and 2.2, along with Appendix A.4 and A.5), expand on the thresholds, guidelines and sound levels for all marine fauna.

2.1. Impulsive Noise

Hydraulic hammering activities have been assessed as impulsive noise source as consistent with the considered thresholds and guidelines.

2.1.1. Marine Mammals

The criteria applied in this study to assess possible effects of impulsive noise sources on marine mammals are summarised Table 7; cetaceans were identified as the hearing group requiring assessment. Details on thresholds related to auditory threshold shifts or hearing loss and behavioural response are provided in Appendix A.4, with frequency weighting explained in detail in Appendix A.5. Whilst the newly published Southall et al. (2021) provides recommendations and discusses the nuances of assessing behavioural response, the authors do not recommend new numerical thresholds for onset of behavioural responses for marine mammals. The criteria from the current interim U.S. National Oceanic and Atmospheric Administration (NOAA) (2019) has been applied.

Table 7. Acoustic effects of impulsive noise on marine mammals: Unweighted SPL, SEL_{24h}, and PK thresholds.

Hearing group	NOAA (2019)	Southall et al. (2019)			
	Behaviour	PTS onset thresholds* (received level)		TTS onset thresholds* (received level)	
	SPL (L_p; dB re 1 µPa)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)	PK (L_{pk}; dB re 1 µPa)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)	PK (L_{pk}; dB re 1 µPa)
Low–Frequency (LF) cetaceans	160	183	219	168	213
High–frequency (HF) cetaceans		185	230	170	224
Sirenians		190	226	175	220

* Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS onset. If a non–impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.
L_p denotes sound pressure level period.
$L_{pk,flat}$ denotes peak sound pressure is flat weighted or unweighted.
L_E denotes cumulative sound exposure over a 24 h period.

2.1.2. Fish, Sea turtles, Fish Eggs, Fish Larvae

In 2006, the Working Group on the Effects of Sound on Fish and Sea Turtles was formed to continue developing noise exposure criteria for fish and sea turtles, work begun by a NOAA panel two years earlier. The Working Group developed guidelines with specific thresholds for different levels of effects for several species groups (Popper et al. 2014). The guidelines define quantitative thresholds for three types of immediate effects:

- Mortality, including injury leading to death,
- Recoverable injury, including injuries unlikely to result in mortality, such as hair cell damage and minor haematoma, and

- TTS.

Masking and behavioural effects can be assessed qualitatively, by assessing relative risk rather than by specific sound level thresholds. However, as these depend upon activity–based subjective ranges, these effects are not addressed in this report and are included in Tables 8 for completeness only. Because the presence or absence of a swim bladder has a role in hearing, fish's susceptibility to injury from noise exposure depends on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder (also appropriate for sharks and applied to whale sharks in the absence of other information), fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. Sea turtles, fish eggs, and fish larvae are considered separately.

Impulsive noise from hydraulic hammering is assessed in this study based on the relevant effects thresholds from Popper et al. (2014) listed in Table 8. In general, whether an impulsive sound adversely effects fish behaviour depends on the species, the state of the individual exposed, and other factors.

The SEL metric integrates noise intensity over some period of exposure. Because the period of integration for regulatory assessments is not well defined for sounds that do not have a clear start or end time, or for very long–lasting exposures, an exposure evaluation time must be defined. Southall et al. (2007) defines the exposure evaluation time as the greater of 24 h or the duration of the activity. Popper et al. (2014) recommend a standard period of the duration of the activity; however, the publication also includes caveats about considering the actual exposure times if fish move. Integration times in this study for hammering have been applied as 24 h even though the operational time is less than a day (2x4 h) following Southall et al. (2007).

Table 8. Criteria for pile driving noise exposure for fish, adapted from Popper et al. (2014).

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	> 219 dB SEL_{24h} or > 213 dB PK	> 216 dB SEL_{24h} or > 213 dB PK	>> 186 dB SEL_{24h}	Pile driving: (N) Moderate (I, F) Low Seismic: (N, I, F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	210 dB SEL_{24h} or > 207 dB PK	203 dB SEL_{24h} or > 207 dB PK	>> 186 dB SEL_{24h}	Pile driving: (N) Moderate (I, F) Low Seismic: (N, I, F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	207 dB SEL_{24h} or > 207 dB PK	203 dB SEL_{24h} or > 207 dB PK	186 dB SEL_{24h}	Pile driving: (N, I) High (F) Moderate Seismic: (N, I) Low (F) Moderate	(N, I) High (F) Moderate
Fish eggs and fish larvae	> 210 dB SEL_{24h} or > 207 dB PK	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Low (F) Low	Pile driving: (N) Moderate (I, F) Low Seismic: (N, I, F) Low	(N) Moderate (I, F) Low

Peak sound pressure level dB re 1 µPa; SEL_{24h} dB re 1µPa^2·s.
All criteria are presented as sound pressure even for fish without swim bladders since no data for particle motion exist.
Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F). Where near might be considered in the 10's of m, intermediate in the 100's of m and far in the 1000's of m.

There is a paucity of data regarding responses of turtles to acoustic exposure, and no studies of hearing loss due to exposure to loud sounds. Popper et al. (2014) suggested thresholds for onset of mortal injury (including PTS) and mortality for sea turtles and, in absence of taxon–specific information, adopted the levels for fish that do not hear well (suggesting that this likely would be conservative for sea turtles). Finneran et al. (2017) in turn presented revised thresholds for sea turtle injury and hearing impairment (TTS and PTS). Their rationale is that sea turtles have best sensitivity at low frequencies and are known to have poor auditory sensitivity (Bartol and Ketten 2006, Dow Piniak et al. 2012). Accordingly, TTS and PTS thresholds for turtles are likely more similar to those of fishes than to marine mammals (Popper et al. 2014).

McCauley et al. (2000) observed the behavioural response of caged sea turtles—green (*Chelonia mydas*) and loggerhead (*Caretta caretta*)—to an approaching seismic airgun. For received levels above 166 dB re 1 µPa (SPL), the sea turtles increased their swimming activity, and above 175 dB re 1 µPa they began to behave erratically, which was interpreted as an agitated state. The Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy et al. 2017) acknowledges the 166 dB re 1 µPa SPL reported (McCauley et al. 2000) as the level that may result in a behavioural response to marine turtles. The 175 dB re 1 µPa level from McCauley et al. (2000) is recommended as a criterion for behavioural disturbance.; these thresholds are shown in Table 9.

Table 9. Acoustic effects of impulsive noise on sea turtles: Unweighted sound pressure level (SPL), 24-hour sound exposure level (SEL_{24h}), and peak pressure (PK) thresholds

Effect type	Criterion	SPL (L_p; dB re 1 µPa)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa^2·s)	PK (L_{pk}; dB re 1 µPa)
Behavioural response	McCauley et al. (2000)	166	NA	
Behavioural disturbance		175		
PTS onset thresholds[1] (received level)	Finneran et al. (2017)	NA	204	232
TTS onset thresholds[1] (received level)			189	226

[1] Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS and TTS onset. If a non–impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.
L_p denotes sound pressure level period and has a reference value of 1 µPa.
$L_{pk,flat}$ denotes peak sound pressure is flat weighted or unweighted and has a reference value of 1 µPa.
L_E denotes cumulative sound exposure over a 24 h period and has a reference value of 1 µPa^{2}s.

2.2. Non-impulsive Noise

Xcentric Ripper operations have been assessed as non-impulsive noise source as consistent with the considered thresholds and guidelines.

2.2.1. Marine Mammals

The criteria applied in this study to assess possible effects of non-impulsive noise sources on marine mammals are summarised in Table 10.

Table 10. Criteria for effects of non–impulsive noise exposure for marine mammals: Unweighted SPL and SEL_{24h} thresholds.

Hearing group	NOAA (2019)	Southall et al. (2019)	
	Behaviour	PTS onset thresholds (received level)	TTS onset thresholds (received level)
	SPL (L_p; dB re 1 µPa)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa^2·s)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa^2·s)
Low–Frequency (LF) cetaceans	120	199	179
High–frequency (HF) cetaceans		198	178
Sirenians		206	186

L_p denotes sound pressure level period and has a reference value of 1 µPa.
L_E denotes cumulative sound exposure over a 24 h period and has a reference value of 1 µPa^2·s.

2.2.2. Fish, Sea Turtles, Fish Eggs, and Fish Larvae

Non-impulsive noise from the Xcentric Ripper is assessed in this study based on the relevant effects thresholds from Popper et al. (2014). Table 11 lists the relevant effects thresholds from Popper et al. (2014) for Xcentric Ripper operational noise. Some evidence suggests that fish sensitive to acoustic pressure show a recoverable loss in hearing sensitivity, or injury when exposed to high levels of noise (Scholik and Yan 2002, Amoser and Ladich 2003, Smith et al. 2006); this is reflected in the SPL thresholds for fish with a swim bladder involved in hearing. Finneran et al. (2017) presented revised thresholds for turtle injury, considering frequency weighted SEL, which have been applied in this study for non-impulsive sound sources (Table 12).

Table 11. Criteria for non–impulsive noise exposure for fish, adapted from Popper et al. (2014).

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	(N) Low (I) Low (F) Low	170 dB SPL for 48 h	158 dB SPL for 12 h	(N) High (I) High (F) High	(N) High (I) Moderate (F) Low
Sea turtles	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) High (I) Moderate (F) Low
Fish eggs and fish larvae	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low	(N) Moderate (I) Moderate (F) Low

Sound pressure level dB re 1 µPa.
Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F). Where near might be considered in the 10's of m, intermediate in the 100's of m and far in the 1000's of m.

Table 12. Acoustic effects of non–impulsive noise on sea turtles, weighted SEL_{24h}, Finneran et al. (2017).

PTS onset thresholds (received level)	TTS onset thresholds (received level)
220	200

3. Methods

This section describes the methods used to characterise acoustic sources considered in this study, the Xcentric Ripper and the Hydraulic Hammer; as well as the acoustic propagation models and associated inputs used to make numerical predictions of acoustic fields.

3.1. Sources

3.1.1. Xcentric Ripper

The Xcentric Ripper is a hydraulic rock breaking tool which can be attached to an excavator. Underwater measurements of an Xcentric Ripper XR-60 were performed at Acheron Head in Otago Lawrence (2016) by Marshall Day Acoustics. The measurement consisted of three hydrophones at approximate measurement distances of 430, 950, and 2000 m. From Barham and East (2018) a fit equation of $N\log_{10}(r) - \alpha r$ curve was fit to the data, giving values of $N = 14.8$ and $\alpha = -0.0075$.

To determine source level the received levels from Lawrence (2016) were backpropagated using the following method. Using the spectral data from Lawrence (2016), the closest hydrophone (430 m away from source) was backpropagated using the fit curve above. At a range approximately equal to 1 water depth levels were further backpropagated using a $20\log_{10}(r)$ spreading loss. A broadband source level was then calculated as 184.8 dB re 1 µPa^{2}m^{2}s with the associated spectra shown in Figure 2.

The additional backpropagation step was applied since the fit curve may not be appropriate in the near-field region close to the source. In this region, there is little interaction with the seabed with loss almost entirely ascribed to spherical spreading loss thus we have used $20\log_{10}(r)$. More accurate source levels could be determined through backpropagation using a propagation model, however this isn't possible with the information available.

Most acoustic energy from the Xcentric Ripper is output at frequencies in the hundreds to thousands of hertz. The sound produced was considered to be isotropic with the main source of noise a nominal 1 m above the seafloor.

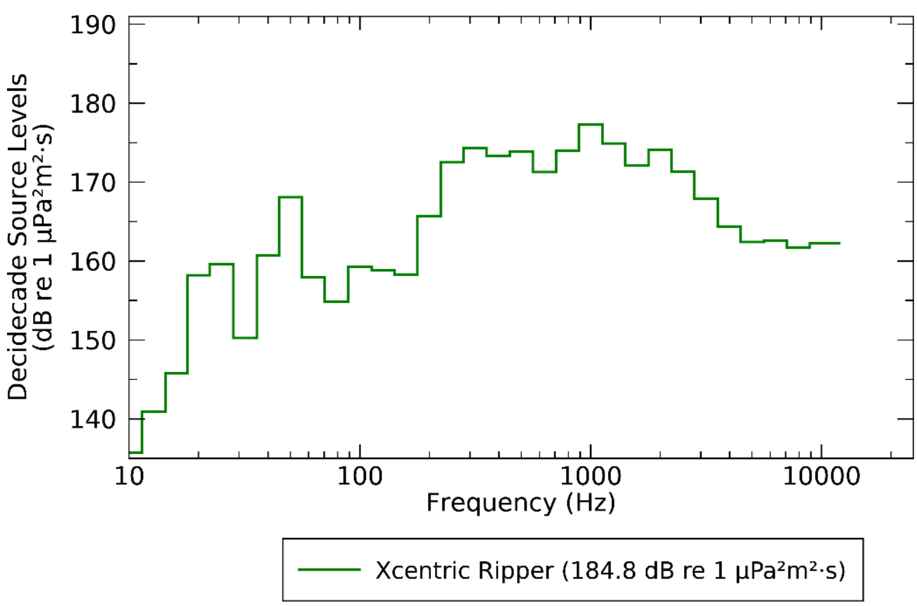

Figure 2. Source level spectra (in decidecade frequency-band) for the Xcentric Ripper.

3.1.2. Hydraulic Hammer

The Epiroc HB 10000 is a hydraulic rock breaking hammer tool, which can be attached to an excavator. Detailed measurements of the underwater source level were not available at the time of the study, therefore the source level spectra corresponding to Down-The-Hole (DTH) hydro-hammering were used as a proxy of the proposed hydraulic rock breaking hammer tool. DTH hydro-hammering is a percussive rotating drilling technique appropriate for hard rock formations. The proxy DTH levels correspond to a Numa Patriot 180 hammer, used to drive 24 inch (0.6 m) diameter piles at a ferry terminal at Kodiak, AK, USA (Denes et al. 2016). The acoustic signature for this activity was recorded at 10 to 30 m from the pile. The measured sound levels (in decidecade frequency bands) were adjusted to determine the levels at the pile, (i.e., backpropagated using spherical spreading) and averaged to provide the representative decidecade frequency-band energy source level (ESL) seen in Figure 3. This source level spectrum yields a broadband ESL of 192 dB 1 $\mu Pa^2 \cdot s\ m^2$.

Depending on several factors, mainly the repetition rate, hydraulic hammer tool could be impulsive or non-impulsive. Since the hydraulic rock breaking hammer tool operates at a repetition rate between 250-380 strikes/min we consider it an impulsive source, in a similar fashion to the DTH tool presented in Guan et al. (2022). However, it is close to the threshold where it may be considered quasi-continuous. While the hydraulic hammer tool is considered as impulsive, the measurements from Denes et al. (2016) give only a source level and spectra over 1 sec. The report does not provide enough temporal information needed to determine peak levels. The noise effect criteria for TTS and PTS (Section 2.1) are dual metrics which require the longest distance to threshold between peak and SEL_{24h}; however, based on JASCO's experience it is expected that SEL_{24h} will produce greater distances to threshold than peak pressure level for this source. It is unlikely that PK thresholds will be exceeded except within the close vicinity of the source.

Most acoustic energy from the hydraulic hammer tool is output at frequencies in the hundreds to thousands of hertz. The sound produced was considered to be isotropic with the main source of noise a nominal 1 m above the seafloor.

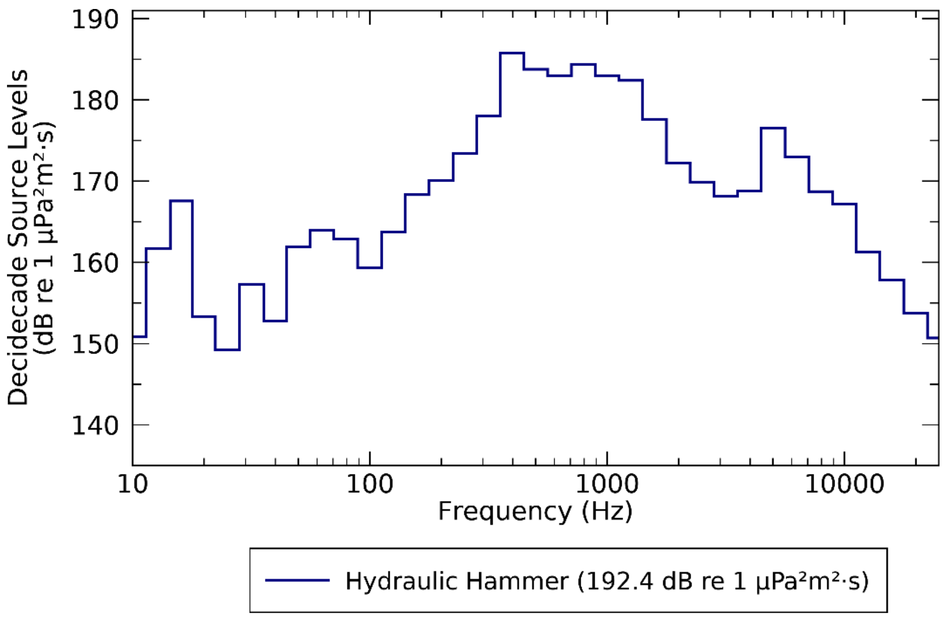

Figure 3. Source level spectra (in decidecade frequency-band) for the Hydraulic Hammer.

3.2. Geometry and Modelled Regions

To predict sound levels with MONM-BELLHOP was used to calculate propagation losses up to distances of 40 km from the source, with a horizontal separation of 20 m between receiver points along all modelled radials. The sound fields were modelled with a horizontal angular resolution of $\Delta\theta$ = 2.5° for a total of *N* = 144 radial planes. Receiver depths were chosen to span the entire water column over the modelled area, from 2 m to a maximum of 100 m, with step sizes that increased with depth. To supplement the MONM results, high-frequency results for propagation loss were modelled using BELLHOP for frequencies from 1.25 to 25 kHz. The MONM and Bellhop results were combined to produce results for the full frequency range of interest.

3.3. Accumulated Modelling

For both sources, the source levels were measured over a 1 sec period. As such SPL is equivalent to the SEL over the same duration. Modelling results were converted to SEL_{24h} by the duration of the measurement. As SEL was assessed over 8 h, the conversion from SEL over 1 second was obtained by increasing the levels by $10*\log_{10}(T)$, where T is 28,800 (the number of seconds in 8 h). Additional modelling times of 2, 4, and 6 h for the hydraulic hammer are presented in Appendix F.

4. Results

The results below are split into two sections Xcentric Ripper and hydraulic hammer. For the results and tables presented below where a dash is used in place of a horizontal distance, these thresholds may or may not be reached due to the discreetly sampled radial increments of the modelled sound fields. A dash therefore is an indication that effect levels for the associated metric may only be reached within a very close proximity to a given source.

4.1. Xcentric Ripper (non-impulsive sound source)

Table 13 presents the maximum and 95% distances to SPL. The SPL sound footprints presented represent the instantaneous sound field and do not depend on the accumulation time. Table 14 presents the maximum distances to frequency-weighted SEL_{24h} thresholds, as well as total ensonified area.

4.1.1. Tabulated Results

Table 13. *Xcentric Ripper*: Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to sound pressure level (SPL). A dash indicates the threshold is not reached within the limits of the modelled resolution (20 m).

5. Discussion and Conclusion

The modelling study predicted underwater sound levels associated with rock breaking activities for the Santos Darwin DPD. The underwater sound field was modelled for two types of rock breakers, the Xcentric Ripper and a hydraulic hammer. The source levels for each of these rock breakers were selected from measurement studies. However, a surrogate source (see Section 3.1.2) has been proposed to represent the potential spectral characteristics for the hydraulic hammer. No reliable information could be found on the underwater noise levels of this tool at the time of this study. The measurement of the hydraulic hammer source and subsequent use in re-modelling would increase accuracy of the estimates of distances to thresholds presented above.

An analysis of seasonal sound speed profiles indicates that April is the month most conducive to sound propagation; as such it was selected to ensure a conservative estimation of distances to received sound level thresholds (Appendix C.2.2). Modelling also accounted for site-specific bathymetric variations at three vertical height datums, LAT, MSL, and HAT (Appendix C.2.1) and local geoacoustic properties (Appendix C.2.3).The April sound speed profile was primarily slightly upward refracting between the sea surface and the sea floor due to the shallow water depth and the high surface temperature. The profile had a minimum sound speed at approximately 1532 m/s at the sea surface. The seafloor and sea surface create a waveguide which only allows energy of certain frequencies to be trapped.

Considering the activity location in shallow water within Darwin Harbour the bathymetry was used at three different vertical datums, LAT, MSL, and HAT, which results in a difference in water depth between LAT and HAT of ~8.1 m. These different datums also changed the water depth at the source location from 5.0 m to 8.2, and 13.1 m and these changes can influence the waveguide physics of propagating sound. For successive reflections between the sea surface and the seafloor energy is stripped from the water column mainly due to multiple interactions with the seabed. For shallow water environments, underwater sound propagation is generally better than free-field propagation at short and intermediate ranges but worse at longer ranges due to the increased number of interaction with the seabed at long range (see result for the hydraulic hammer tool, Section 4.2.1). However, this is not the case for the Xcentric Ripper (see Section 4.1.1). These can be understood by considering optimum propagation. Shallow water environment tend to have a high optimum propagation frequency than a deeper counter parts (Jensen et al. 2011), and if the source spectra overlaps with the optimum propagation frequencies then shallower water depths may lead to slightly higher levels at distance. The radii associated with sound level contours for LAT datum were marginally longer and persisted to longer ranges compared to the HAT scenario.

The vertical slice plots assist in demonstrating the propagation characteristics of the different water depths (Sections 4.1.2.2 and 4.2.2.2).

Glossary

Unless otherwise stated in an entry, these definitions are consistent with ISO 18405 (2017).

1/3-octave

One third of an octave. *Note*: A 1/3-octave is approximately equal to one decidecade (1/3 oct ≈ 1.003 ddec).

1/3-octave-band

Frequency band whose bandwidth is one 1/3-octave. *Note*: The bandwidth of a 1/3-octave-band increases with increasing centre frequency.

90 % energy time window

The time interval over which the cumulative energy rises from 5 to 95 % of the total pulse energy. This interval contains 90 % of the total pulse energy. Used to compute the 90 % sound pressure level. Unit: second (s). Symbol: T_{90}.

90 % sound pressure level (90 % SPL)

The sound pressure level calculated over the 90 % energy time window of a pulse. Unit: decibel (dB).

absorption

The conversion of sound energy to heat energy. Specifically, the reduction of sound pressure amplitude due to particle motion energy converting to heat in the propagation medium.

acoustic impedance

The ratio of the sound pressure in a medium to the volume flow rate of the medium through a specified surface due to the sound wave. It is a measure of how well sound propagates through a particular medium.

acoustic noise

Sound that interferes with an acoustic process.

ambient sound

Sound that would be present in the absence of a specified activity (ISO 18405:2017). It is usually a composite of sound from many sources near and far, e.g., shipping vessels, seismic activity, precipitation, sea ice movement, wave action, and biological activity.

attenuation

The gradual loss of acoustic energy from absorption and scattering as sound propagates through a medium. Attenuation depends on frequency—higher frequency sounds are attenuated faster than lower frequency sounds.

auditory frequency weighting

The process of applying an auditory frequency-weighting function. An example for marine mammals are the auditory frequency-weighting functions published by Southall et al. (2007).

auditory frequency-weighting function

Frequency-weighting function describing a compensatory approach accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity.

azimuth

A horizontal angle relative to a reference direction, which is often magnetic north or the direction of travel. In navigation it is also known as bearing.

bandwidth

A range within a continuous band of frequencies. Unit: hertz (Hz).

broadband level

The total level measured over a specified frequency range. If the frequency range is unspecified, the term refers to the entire measured frequency range.

cetacean

Member of the order Cetacea. Cetaceans are aquatic mammals and include whales, dolphins, and porpoises.

compressional wave

A mechanical vibration wave in which the direction of particle motion is parallel to the direction of propagation. Also called a longitudinal wave. In seismology/geophysics, it's called a primary wave or P-wave. Shear waves in the seabed can be converted to compressional waves in water at the water-seabed interface.

continuous sound

A sound whose sound pressure level remains above the background noise during the observation period and may gradually vary in intensity with time, e.g., sound from a marine vessel.

decade

Logarithmic frequency interval whose upper bound is ten times larger than its lower bound (ISO 80000-3:2006). For example, one decade up from 1000 Hz is 10,000 Hz, and one decade down is 100 Hz.

decibel (dB)

Unit of level used to express the ratio of one value of a power quantity to another on a logarithmic scale. Especially suited to quantify variables with a large dynamic range.

decidecade

One tenth of a decade. Approximately equal to one third of an octave (1 ddec ≈ 0.3322 oct), and for this reason sometimes referred to as a 1/3-octave.

decidecade band

Frequency band whose bandwidth is one decidecade. *Note*: The bandwidth of a decidecade band increases with increasing centre frequency.

delphinid

Member of the family of oceanic dolphins (Delphinidae), composed of approximately 35 extant species, including dolphins, porpoises, and killer whales.

energy source level

A property of a sound source equal to the sound exposure level measured in the far field plus the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa^2 m^2 s.

energy spectral density

Ratio of energy (time-integrated square of a specified field variable) to bandwidth in a specified frequency band from f_1 to f_2. In equation form, the energy spectral density E_f is given by:
$E_f = 2\int_{f_1}^{f_2}|X(f)|^2\,\mathrm{d}f/(f_2 - f_1)$ where $X(f)$ is the Fourier transform of the field variable $x(t)$:
$X(f) = \int_{-\infty}^{+\infty} x(t)\exp(-2\pi i f t)\,\mathrm{d}t$

The field variable $x(t)$ is a scalar quantity, such as sound pressure. It can also be the magnitude or a specified component of a vector quantity such as sound particle displacement, velocity, or acceleration. The unit of energy spectral density depends on the nature of x, as follows:

- If x = sound pressure: Pa^2 s/Hz
- If x = sound particle displacement: m^2 s/Hz
- If x = sound particle velocity: (m/s)^2 s/Hz
- If x = sound particle acceleration: (m/s^2)^2 s/Hz

Note: The factor of two on the right side of the equation for E_f is needed to express a spectrum that is symmetric about f = 0, in terms of positive frequencies only. See entry 3.1.3.9 of ISO 18405 (2017).

energy spectral density level

The level ($L_{E,f}$) of the energy spectral density (E_f) in a stated frequency band and time window. Defined as: $L_{E,f} = 10\log_{10}(E_f/E_{f,0})$. Unit: decibel (dB). As with energy spectral density, energy spectral density level can be expressed in terms of various field variables (e.g., sound pressure). The reference value ($E_{f,0}$) for energy spectral density level depends on the nature of the field variable.

energy spectral density source level

A property of a sound source equal to the energy spectral density level of the sound pressure measured in the far field plus the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa^2 m^2 s/Hz.

ensonified

Exposed to sound.

equal-loudness-level contour

Curve that shows, as a function of frequency, the sound pressure level required to produce a given loudness for a listener having normal hearing, listening to a specified kind of sound in a specified manner (ANSI S1.1-2013).

far field

The zone where, to an observer, sound originating from an array of sources (or a spatially distributed source) appears to radiate from a single point.

Fourier transform, Fourier synthesis

A mathematical technique which, although it has varied applications, is referenced in a physical data acquisition context as a method used in the process of deriving a spectrum estimate from time-series data (or the reverse process, termed the inverse Fourier transform). A computationally efficient numerical algorithm for computing the Fourier transform is known as the fast Fourier transform (FFT).

frequency

The rate of oscillation of a periodic function measured in cycles per unit time. The reciprocal of the period. Unit: hertz (Hz). Symbol: f. 1 Hz is equal to 1 cycle per second.

frequency weighting

The process of applying a frequency-weighting function.

frequency-weighting function

The squared magnitude of the sound pressure transfer function (ISO 18405:2017). For sound of a given frequency, the frequency-weighting function is the ratio of output power to input power of a specified filter, sometimes expressed in decibels. Examples include the following:

- *Auditory frequency-weighting function*: compensatory frequency-weighting function accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity.

functional hearing group

Category of animal species when classified according to their hearing sensitivity, hearing anatomy, and susceptibility to sound. For marine mammals, initial groupings were proposed by Southall et al. (2007), and revised groupings are developed as new research/data becomes available. Revised groupings proposed by Southall et al. (2019) include low-frequency cetaceans, high-frequency cetaceans, very high-frequency cetaceans, phocid carnivores in water, other carnivores in water, and sirenians. See auditory frequency-weighting functions, which are often applied to these groups. Example hearing groups for fish include species for which the swim bladder is involved in hearing, species for which the swim bladder is not involved in hearing, and species without a swim bladder (Popper et al. 2014).

geoacoustic

Relating to the acoustic properties of the seabed.

harmonic

A sinusoidal sound component that has a frequency that is an integer multiple of the frequency of a sound to which it is related. For a sound with a fundamental frequency of f, the harmonics have frequencies of $2f$, $3f$, $4f$, etc.

hearing threshold

For a given species or functional hearing group, the sound level for a given signal that is barely audible (i.e., that would be barely audible for a given individual in the presence of specified background noise during a specific percentage of experimental trials).

hertz (Hz)

Unit of frequency defined as one cycle per second. Often expressed in multiples such as kilohertz (1 kHz = 1000 Hz).

high-frequency (HF) cetaceans

See functional hearing group. *Note*: The mid- and high-frequency cetaceans groups proposed by Southall et al. (2007) were renamed high- and very-high-frequency cetaceans, respectively, by Southall et al. (2019).

impulsive sound

Qualitative term meaning sounds that are typically transient, brief (less than 1 s), broadband, with rapid rise time and rapid decay. They can occur in repetition or as a single event. Sources of impulsive sound include, among others, explosives, seismic airguns, and impact pile drivers.

isopleth

A line drawn on a map through all points having the same value of some specified quantity (e.g., sound pressure level isopleth).

knot (kn)

Unit of vessel speed equal to 1 nautical mile per hour.

level

A measure of a quantity expressed as the logarithm of the ratio of the quantity to a specified reference value of that quantity. For example, a value of sound pressure level with reference to 1 μPa^2 can be written in the form *x* dB re 1 μPa^2.

low-frequency (LF) cetaceans

See functional hearing group.

median

The 50th percentile of a statistical distribution.

mid-frequency (MF) cetaceans

See functional hearing group. *Note*: The mid-frequency cetaceans group proposed by Southall et al. (2007) was renamed high-frequency cetaceans by Southall et al. (2019).

monopole source level (MSL)

A source level that has been calculated using an acoustic model that accounts for the effect of the sea-surface and seabed on sound propagation, assuming a point source (monopole). Often used to quantify source levels of vessels or industrial operations from measurements. See also radiated noise level.

M-weighting

A set of auditory frequency-weighting functions proposed by Southall et al. (2007).

mysticete

Member of the Mysticeti, a suborder of cetaceans. Also known as baleen whales, mysticetes have baleen plates (rather than teeth) that they use to filter food from water (or from sediment as for grey whales). This group includes rorquals (Balaenopteridae, such as blue, fin, humpback, and minke whales), right and bowhead whales (Balaenidae), and grey whales (*Eschrichtius robustus*).

non-impulsive sound

Sound that is not an impulsive sound. Not necessarily a continuous sound.

octave

The interval between a sound and another sound with double or half the frequency. For example, one octave above 200 Hz is 400 Hz, and one octave below 200 Hz is 100 Hz.

odontocete

Member of Odontoceti, a suborder of cetaceans. These whales, dolphins, and porpoises have teeth (rather than baleen plates). Their skulls are mostly asymmetric, an adaptation for their echolocation. This group includes sperm whales, killer whales, belugas, narwhals, dolphins, and porpoises.

parabolic equation method

A computationally efficient solution to the acoustic wave equation that is used to model propagation loss. The parabolic equation approximation omits effects of backscattered sound (which are negligible for most ocean-acoustic propagation problems), simplifying the computation of propagation loss.

permanent threshold shift (PTS)

An irreversible loss of hearing sensitivity caused by excessive noise exposure. Considered auditory injury. Compare with temporary threshold shift.

point source

A source that radiates sound as if from a single point.

power spectral density

Generic term, formally defined as power in a unit frequency band. Unit: watt per hertz (W/Hz). The term is sometimes loosely used to refer to the spectral density of other parameters such as squared sound pressure. Ratio of energy spectral density, E_f, to time duration, Δt, in a specified temporal observation window. In equation form, the power spectral density P_f is given by $P_f = E_f/\Delta t$. Power spectral density can be expressed in terms of various field variables (e.g., sound pressure).

power spectral density level

The level ($L_{P,f}$) of the power spectral density (P_f) in a stated frequency band and time window. Defined as: $L_{P,f} = 10\log_{10}(P_f/P_{f,0})$. Unit: decibel (dB).

As with power spectral density, power spectral density level can be expressed in terms of various field variables (e.g., sound pressure, sound particle displacement). The reference value ($P_{f,0}$) for power spectral density level depends on the nature of the field variable.

power spectral density source level

A property of a sound source equal to the power spectral density level of the sound pressure measured in the far field plus the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa^2 m^2/Hz.

propagation loss (PL)

Difference between a source level (SL) and the level at a specified location, $\mathrm{PL}(x) = \mathrm{SL} - L(x)$. Unit: decibel (dB). See also transmission loss.

radiated noise level (RNL)

A source level that has been calculated assuming sound pressure decays geometrically with distance from the source, with no influence of the sea-surface or seabed. Often used to quantify source levels of vessels or industrial operations from measurements. See also monopole source level.

received level

The level of a given field variable measured (or that would be measured) at a given location.

reference value

Standard value of a quantity used for calculating underwater sound level. The reference value depends on the quantity for which the level is being calculated:

Quantity	Reference value
Sound pressure	p_0^2 = 1 μPa² or p_0 = 1 μPa
Sound exposure	E_0 = 1 μPa² s
Sound particle displacement	δ_0^2 = 1 pm²
Sound particle velocity	u_0^2 = 1 nm²/s²
Sound particle acceleration	a_0^2 = 1 μm²/s⁴

shear wave

A mechanical vibration wave in which the direction of particle motion is perpendicular to the direction of propagation. Also called a secondary wave or S-wave. Shear waves propagate only in solid media, such as sediments or rock. Shear waves in the seabed can be converted to compressional waves in water at the water-seabed interface.

sirenians (SI)

Members of the order Sirenia, which includes several manatee species and the dugong. See also functional hearing group.

sound

A time-varying disturbance in the pressure, stress, or material displacement of a medium propagated by local compression and expansion of the medium. In common meaning, a form of energy that propagates through media (e.g., water, air, ground) as pressure waves.

sound exposure

Time integral of squared sound pressure over a stated time interval in a stated frequency band. The time interval can be a specified time duration (e.g., 24 h) or from start to end of a specified event (e.g., a pile strike, an airgun pulse, a construction operation). Unit: pascal squared second (Pa² s). Symbol: E.

sound exposure level (SEL)

The level (L_E) of the sound exposure (E) in a stated frequency band and time window: $L_E = 10\log_{10}(E/E_0)$ (ISO 18405:2017). Unit: decibel (dB). Reference value (E_0) for sound in water: 1 μPa² s.

sound field

Region containing sound waves.

sound pressure

The contribution to total pressure caused by the action of sound (ISO 18405:2017). Unit: pascal (Pa). Symbol: p.

sound pressure level (SPL), rms sound pressure level

The level (L_p) of the time-mean-square sound pressure (p^2_{rms}) in a stated frequency band and time window: $L_p = 10\log_{10}(p^2_{\mathrm{rms}}/p^2_0) = 20\log_{10}(p_{rms}/p_0)$, where rms is the abbreviation for root-mean-square. Unit: decibel (dB). Reference value (p^2_0) for sound in water: 1 µPa^2. SPL can also be expressed in terms of the root-mean-square (rms) with a reference value of p_0 = 1 µPa. The two definitions are equivalent.

sound speed profile

The speed of sound in the water column as a function of depth below the water surface.

source level (SL)

A property of a sound source equal to the sound pressure level measured in the far field plus the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 µPa^2 m^2.

spectrum

Distribution of acoustic signal content over frequency, where the signal's content is represented by its power, energy, mean-square sound pressure, or sound exposure.

surface duct

The upper portion of a water column within which the gradient of the sound speed profile causes sound to refract upward and therefore reflect repeatedly off the surface resulting in relatively long-range sound propagation with little loss.

temporary threshold shift (TTS)

Reversible loss of hearing sensitivity caused by noise exposure. Compare with permanent threshold shift.

transmission loss (TL)

The difference between a specified level at one location and that at a different location: $\mathrm{TL}(x_1,x_2) = L(x_1) - L(x_2)$ (ISO 18405:2017). Unit: decibel (dB). See also propagation loss.

unweighted

Term indicating that no frequency-weighting function is applied.

very high-frequency (VHF) cetaceans

See functional hearing group.

wavelength

Distance over which a wave completes one cycle of oscillation. Unit: metre (m). Symbol: λ.

Appendix A. Acoustic Metrics

This section describes in detail the acoustic metrics, impact criteria, and frequency weighting relevant to the modelling study.

A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 μPa. Because the perceived loudness of sound, especially pulsed sound such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate sound and its effects on marine life. Here we provide specific definitions of relevant metrics used in the accompanying report. Where possible, we follow International Organization for Standardization definitions and symbols for sound metrics (e.g., ISO 2017, ANSI S1.1-2013).

The sound pressure level (SPL or L_p; dB re 1 μPa) is the root-mean-square (rms) pressure level in a stated frequency band over a specified time window (T; s). It is important to note that SPL always refers to an rms pressure level and therefore not instantaneous pressure:

$$L_p = 10\log_{10}\left(\frac{1}{T}\int_T g(t)\,p^2(t)\,dt/p_0^2\right)\text{ dB} \tag{A-1}$$

where $g(t)$ is an optional time weighting function. In many cases, the start time of the integration is marched forward in small time steps to produce a time-varying SPL function.

The sound exposure level (SEL or L_E; dB re 1 μPa^2·s) is the time-integral of the squared acoustic pressure over a duration (T):

$$L_E = 10\log_{10}\left(\int_T p^2(t)\,dt/T_0 p_0^2\right)\text{ dB} \tag{A-2}$$

where T_0 is a reference time interval of 1 s. SEL continues to increase with time when non-zero pressure signals are present. It is a dose-type measurement, so the integration time applied must be carefully considered for its relevance to impact to the exposed recipients.

SEL can be calculated over a fixed duration, such as the time of a single event or a period with multiple acoustic events. When applied to pulsed sounds, SEL can be calculated by summing the SEL of the N individual pulses. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the N individual events:

$$L_{E,N} = 10\log_{10}\left(\sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}}\right)\text{ dB .} \tag{A-3}$$

If applied, the frequency weighting of an acoustic event should be specified, as in the case of weighted SEL (e.g., $L_{E,LFC,24h}$; Appendix A.5). The use of fast, slow, or impulse exponential-time-averaging or other time-related characteristics should also be specified.

A.2. Decidecade Band Analysis

The distribution of a sound's power with frequency is described by the sound's spectrum. The sound spectrum can be split into a series of adjacent frequency bands. Splitting a spectrum into 1 Hz wide bands, called passbands, yields the power spectral density of the sound. This splitting of the spectrum into passbands of a constant width of 1 Hz, however, does not represent how animals perceive sound.

Because animals perceive exponential increases in frequency rather than linear increases, analysing a sound spectrum with passbands that increase exponentially in size better approximates real-world scenarios. In underwater acoustics, a spectrum is commonly split into decidecade bands, which are one tenth of a decade wide. A decidecade is sometimes referred to as a "1/3 octave" because one tenth of a decade is approximately equal to one third of an octave. Each decade represents a factor 10 in sound frequency. Each octave represents a factor 2 in sound frequency. The centre frequency of the ith band, $f_{\mathrm{c}}(i)$, is defined as:

$$f_{\mathrm{c}}(i) = 10^{\frac{i}{10}}\ \mathrm{kHz} \quad \text{(A-4)}$$

and the low (f_{lo}) and high (f_{hi}) frequency limits of the ith decade band are defined as:

$$f_{\mathrm{lo},i} = 10^{\frac{-1}{20}} f_{\mathrm{c}}(i) \quad \text{and} \quad f_{\mathrm{hi},i} = 10^{\frac{1}{20}} f_{\mathrm{c}}(i) \quad \text{(A-5)}$$

The decidecade bands become wider with increasing frequency, and on a logarithmic scale the bands appear equally spaced (Figure A-1). The acoustic modelling spans from band 10 (f_c (10) = 10 Hz) to band 44 ($f_{\mathrm{c}}(44)$ = 25 kHz).

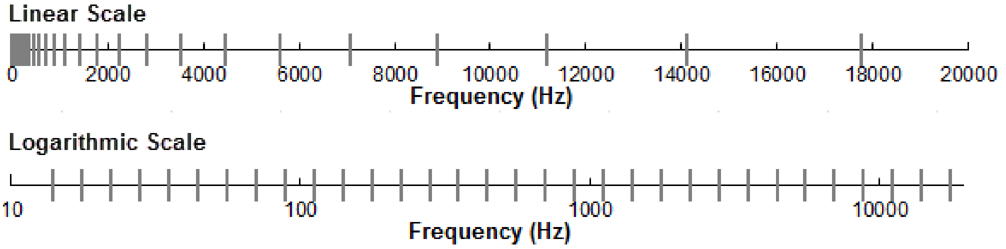

Figure A-1. Decidecade frequency bands (vertical lines) shown on a linear frequency scale and a logarithmic scale.

The sound pressure level in the ith band ($L_{p,i}$) is computed from the spectrum $S(f)$ between $f_{\mathrm{lo},i}$ and $f_{\mathrm{hi},i}$:

$$L_{p,i} = 10\, log_{10} \int_{f_{\mathrm{lo},i}}^{f_{\mathrm{hi},i}} S(f)\, \mathrm{d}f \ \ \mathrm{dB} \quad \text{(A-6)}$$

Summing the sound pressure level of all the bands yields the broadband sound pressure level:

$$\text{Broadband SPL} = 10 \log_{10} \sum_{i} 10^{\frac{L_{p,i}}{10}}\ \mathrm{dB} \quad \text{(A-7)}$$

Figure A-2 shows an example of how the decidecade band sound pressure levels compare to the sound pressure spectral density levels of an ambient sound signal. Because the decidecade bands are wider than 1 Hz, the decidecade band SPL is higher than the spectral levels at higher frequencies. Acoustic modelling of decidecade bands requires less computation time than 1 Hz bands and still resolves the frequency-dependence of the sound source and the propagation environment.

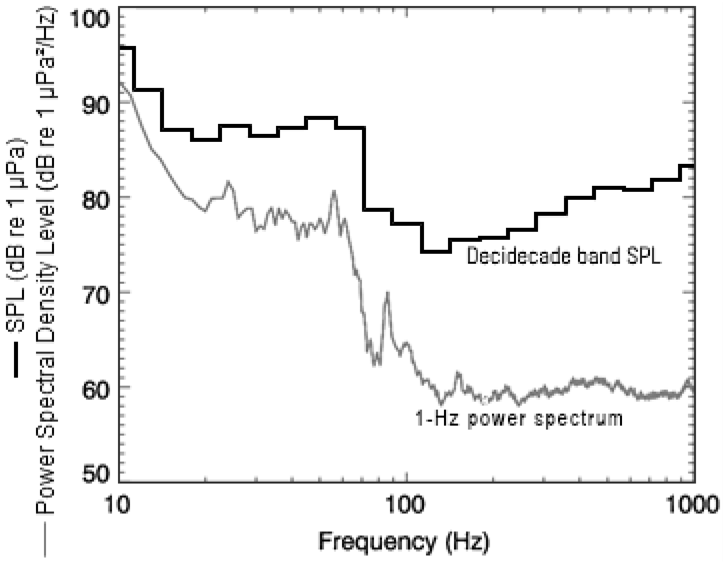

Figure A-2. Sound pressure spectral density levels and the corresponding decidecade band sound pressure levels of example ambient noise shown on a logarithmic frequency scale.Because the decidecade bands are wider with increasing frequency, the decidecade band SPL is higher than the power spectrum.

A.3. Marine Mammal Noise Effect Criteria – Non-impulsive

It has been long recognised that marine mammals can be adversely affected by underwater anthropogenic noise. For example, Payne and Webb (1971) suggest that communication distances of fin whales are reduced by shipping sounds. Subsequently, similar concerns arose regarding effects of other underwater noise sources and the possibility that impulsive sources—primarily airguns used in seismic surveys—could cause auditory injury. This led to a series of workshops held in the late 1990s, conducted to address acoustic mitigation requirements for seismic surveys and other underwater noise sources (NMFS 1998, ONR 1998, Nedwell and Turnpenny 1998, HESS 1999, Ellison and Stein 1999). In the years since these early workshops, a variety of thresholds have been proposed for auditory injury, impairment, and disturbance. The following sections summarise the recent development of thresholds; however, this field remains an active research topic.

A.3.1. Injury and Hearing Sensitivity Changes

In recognition of shortcomings of the SPL-only based auditory injury criteria, in 2005 NMFS sponsored the Noise Criteria Group to review literature on marine mammal hearing to propose new noise exposure criteria. Some members of this expert group published a landmark paper (Southall et al. 2007) that suggested assessment methods similar to those applied for humans. The resulting recommendations introduced dual auditory injury criteria for impulsive sounds that included peak pressure level thresholds and SEL24h thresholds, where the subscripted 24h refers to the accumulation period for calculating SEL. The peak pressure level criterion is not frequency weighted whereas SEL24h is frequency weighted according to one of four marine mammal species hearing groups: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively) and Pinnipeds in Water (PINN). These weighting functions are referred to as M-weighting filters (analogous to the A-weighting filter for humans; see Appendix A.5). The SEL24h thresholds were obtained by extrapolating measurements of onset levels of Temporary Threshold Shift (TTS) in belugas by the amount of TTS required to produce Permanent Threshold Shift (PTS) in chinchillas. The Southall et al. (2007) recommendations do not specify an exchange rate, which suggests that the thresholds are the same regardless of the duration of exposure (i.e., it implies a 3 dB exchange rate).

Wood et al. (2012) refined Southall et al.'s (2007) thresholds, suggesting lower PTS and TTS values for LF and HF cetaceans while retaining the filter shapes. Their revised thresholds were based on TTS-onset levels in harbour porpoises from Lucke et al. (2009), which led to a revised impulsive sound PTS threshold for HF cetaceans of 179 dB re 1 μPa^2·s. Because there were no data available for baleen whales, Wood et al. (2012) based their recommendations for LF cetaceans on results obtained from MF cetacean studies. In particular they referenced the Finneran and Schlundt (2010) research, which found mid-frequency cetaceans are more sensitive to non-impulsive sound exposure than Southall et al. (2007) assumed. Wood et al. (2012) thus recommended a more conservative TTS-onset level for LF cetaceans of 192 dB re 1 μPa^2·s.

As of present, a definitive approach is still not apparent. There is consensus in the research community that an SEL-based method is preferable, either separately or in addition to an SPL-based approach to assess the potential for injuries. In August 2016, after substantial public and expert input into three draft versions and based largely on the above-mentioned literature (NOAA 2013, 2015, 2016), NMFS finalised technical guidance for assessing the effect of anthropogenic sound on marine mammal hearing (NMFS 2016). The guidance describes auditory injury criteria with new thresholds and frequency weighting functions for the five hearing groups described by Finneran and Jenkins (2012). The latest revision to this work was published in 2018 (NMFS 2018). Southall et al. (2019) revisited the interim criteria published in 2007. All noise exposure criteria in NMFS (2018) and Southall et al. (2019) are identical (for impulsive and non-impulsive sounds); however, the mid-frequency cetaceans from NMFS (2018) are classified as high-frequency cetaceans in Southall et al. (2019), and high-frequency cetaceans from NMFS (2018) are classified as very-high-frequency cetaceans in Southall et al. (2019).

A.3.2. Behavioural Response

Numerous studies on marine mammal behavioural responses to sound exposure have not resulted in consensus in the scientific community regarding the appropriate metric for assessing behavioural reactions. However, it is recognised that the context in which the sound is received affects the nature and extent of responses to a stimulus(Southall et al. 2007, Ellison and Frankel 2012, Southall et al. 2016).

NMFS currently uses step function (all-or-none) threshold of 120 dB re 1 µPa SPL (unweighted) for non-impulsive sounds to assess and regulate noise-induced behavioural impacts on marine mammals (NOAA 2019). The 120 dB re 1 µPa threshold is associated with continuous sources and was derived based on studies examining behavioural responses to drilling and dredging (NOAA 2018), referring to Malme et al. (1983), Malme et al. (1984), and Malme et al. (1986), which were considered in Southall et al. (2007). Malme et al. (1986) found that playback of drillship noise did not produce clear evidence of disturbance or avoidance for levels below 110 dB re 1 µPa (SPL), possible avoidance occurred for exposure levels approaching 119 dB re 1 µPa. Malme et al. (1984) determined that measurable reactions usually consisted of rather subtle short-term changes in speed and/or heading of the whale(s) under observation. It has been shown that both received level and proximity of the sound source is a contributing factor in eliciting behavioural reactions in humpback whales (Dunlop et al. 2017, Dunlop et al. 2018).

A.4. Marine Mammal Impact Criteria – Impulsive

It has been long recognised that marine mammals can be adversely affected by underwater anthropogenic noise. For example, Payne and Webb (1971) suggested that communication distances of fin whales are reduced by shipping sounds. Subsequently, similar concerns arose regarding effects of other underwater noise sources and the possibility that impulsive sources—primarily airguns used in seismic surveys—could cause auditory injury. This led to a series of workshops held in the late 1990s, conducted to address acoustic mitigation requirements for seismic surveys and other underwater noise sources (NMFS 1998, ONR 1998, Nedwell and Turnpenny 1998, HESS 1999, Ellison and Stein 1999). In the years since these early workshops, a variety of thresholds have been proposed for both injury and disturbance. The following sections summarize the recent development of thresholds; however, this field remains an active research topic.

A.4.1. Injury

In recognition of shortcomings of the SPL-only based injury criteria, in 2005 NMFS sponsored the Noise Criteria Group to review literature on marine mammal hearing to propose new noise exposure criteria. Some members of this expert group published a landmark paper (Southall et al. 2007) that suggested assessment methods similar to those applied for humans. The resulting recommendations introduced dual acoustic injury criteria for impulsive sounds that included peak pressure level thresholds and SEL_{24h} thresholds, where the subscripted 24h refers to the accumulation period for calculating SEL. The peak pressure level criterion is not frequency weighted whereas the SEL_{24h} is frequency weighted according to one of four marine mammal species hearing groups: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively) and Pinnipeds in Water (PINN). These weighting functions are referred to as M-weighting filters (analogous to the A-weighting filter for human; Appendix 0). The SEL_{24h} thresholds were obtained by extrapolating measurements of onset levels of Temporary Threshold Shift (TTS) in belugas by the amount of TTS required to produce Permanent Threshold Shift (PTS) in chinchillas. The Southall et al. (2007) recommendations do not specify an exchange rate, which suggests that the thresholds are the same regardless of the duration of exposure (i.e., it implies a 3 dB exchange rate).

Wood et al. (2012) refined Southall et al.'s (2007) thresholds, suggesting lower injury values for LF and HF cetaceans while retaining the filter shapes. Their revised thresholds were based on TTS-onset levels in harbour porpoises from Lucke et al. (2009), which led to a revised impulsive sound PTS threshold for HF cetaceans of 179 dB re 1 $\mu Pa^2 \cdot s$. Because there were no data available for baleen whales, Wood et al. (2012) based their recommendations for LF cetaceans on results obtained from MF cetacean studies. In particular they referenced Finneran and Schlundt (2010) research, which found mid-frequency cetaceans are more sensitive to non-impulsive sound exposure than Southall et al. (2007) assumed. Wood et al. (2012) thus recommended a more conservative TTS-onset level for LF cetaceans of 192 dB re 1 $\mu Pa^2 \cdot s$.

As of present, an optimal approach is not apparent. There is consensus in the research community that an SEL-based method is preferable either separately or in addition to an SPL-based approach to assess the potential for injuries. In August 2016, after substantial public and expert input into three draft versions and based largely on the above-mentioned literature (NOAA 2013, 2015, 2016), NMFS finalised technical guidance for assessing the effect of anthropogenic sound on marine mammal hearing (NMFS 2016). The guidance describes injury criteria with new thresholds and frequency weighting functions for the five hearing groups described by Finneran and Jenkins (2012). The latest revision to this work was published in 2018; with the criteria defined in NMFS (2018). The latest criteria are from Southall et al. (2019) which is applied in this report.

A.4.2. Behavioural response

Numerous studies on marine mammal behavioural responses to sound exposure have not resulted in consensus in the scientific community regarding the appropriate metric for assessing behavioural reactions. However, it is recognised that the context in which the sound is received affects the nature and extent of responses to a stimulus (Southall et al. 2007, Ellison and Frankel 2012, Southall et al. 2016).

For impulsive noise, NMFS currently uses step function thresholds of 160 dB re 1 µPa SPL (unweighted) to assess and regulate noise-induced behavioural impacts for marine mammals (NOAA 2018, NOAA 2019). The threshold for impulsive sound is derived from the High-Energy Seismic Survey (HESS) panel (HESS 1999) report that, in turn, is based on the responses of migrating mysticete whales to airgun sounds (Malme et al. 1984). The HESS team recognised that behavioural responses to sound may occur at lower levels, but significant responses were only likely to occur above a SPL of 140 dB re 1 µPa. Southall et al. (2007) found varying responses for most marine mammals between a SPL of 140 and 180 dB re 1 µPa, consistent with the HESS (1999) report, but lack of convergence in the data prevented them from suggesting explicit step functions.

A.5. Marine Mammal Frequency Weighting

The potential for noise to affect animals depends on how well the animals can hear it. Noises are less likely to disturb or injure an animal if they are at frequencies that the animal cannot hear well. An exception occurs when the sound pressure is so high that it can physically injure an animal by non-auditory means (i.e., barotrauma). For sound levels below such extremes, the importance of sound components at particular frequencies can be scaled by frequency weighting relevant to an animal's sensitivity to those frequencies (Nedwell and Turnpenny 1998, Nedwell et al. 2007).

A.5.1. Marine Mammal Frequency Weighting Functions

In 2015, a US Navy technical report by Finneran (2015) recommended new auditory weighting functions. The overall shape of the auditory weighting functions is similar to human A-weighting functions, which follows the sensitivity of the human ear at low sound levels. The new frequency-weighting function is expressed as:

$$G(f) = K + 10\log_{10}\left[\left(\frac{(f/f_{lo})^{2a}}{\left[1+(f/f_{lo})^2\right]^a\left[1+(f/f_{hi})^2\right]^b}\right)\right] \quad \text{(A-8)}$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively), phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA's technical guidance that assesses acoustic impacts on marine mammals (NMFS 2018), and in the latest guidance by Southall (2019). The updates did not affect the content related to either the definitions of frequency-weighting functions or the threshold values, however, the terminology for mid- and high-frequency cetaceans was changed to high- and very high-frequency cetaceans. Table A-1 lists the frequency-weighting parameters for each hearing group relevant to this assessment, and Figure A-3 shows the resulting frequency-weighting curves.

Table A-1. Parameters for the auditory weighting functions used in this project as recommended by Southall et al. (2019).

Hearing group	a	b	flo (Hz)	fhi (kHz)	*K* (dB)
Low-frequency cetaceans *(baleen whales)*	1.0	2	200	19,000	0.13
High-frequency cetaceans *(most dolphins, plus sperm, beaked, and bottlenose whales)*	1.6	2	8,800	110,000	1.20
Sirenians *(Dugongs, manatees)*	1.8	2	12,000	140,000	1.36

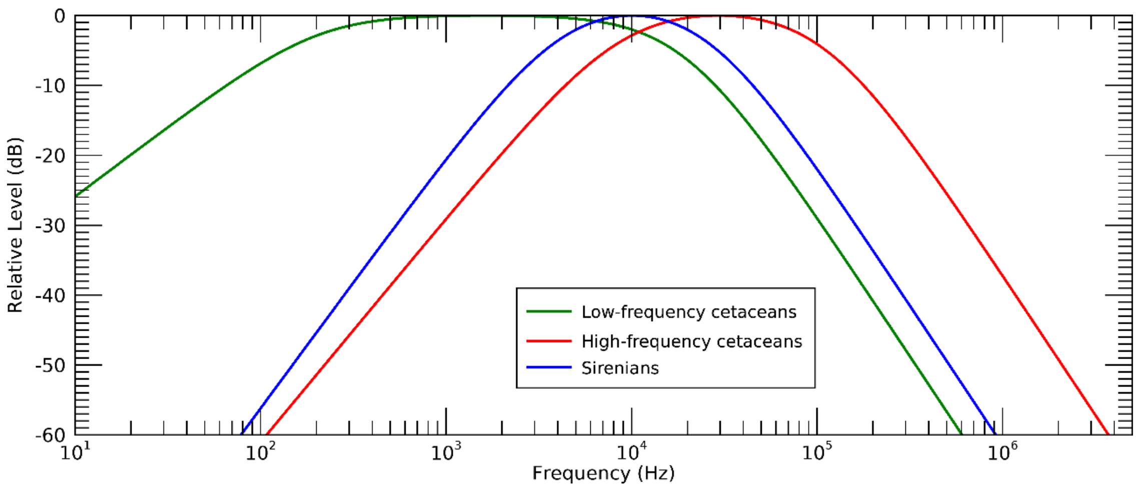

Figure A-3. Auditory weighting functions for functional marine mammal hearing groups used in this project as recommended by Southall et al. (2019).

Appendix B. Sound Propagation Models

B.1. MONM-BELLHOP

Long-range sound fields were computed using JASCO's Marine Operations Noise Model (MONM). MONM is well suited for effective long-range estimation. This model computes sound propagation at frequencies of 5 Hz to 1 kHz via a wide-angle parabolic equation solution to the acoustic wave equation (Collins 1993) based on a version of the US Naval Research Laboratory's Range-dependent Acoustic Model (RAM), which has been modified to account for a solid seabed (Zhang and Tindle 1995). MONM computes sound propagation at frequencies >1 kHz via the BELLHOP Gaussian beam acoustic ray-trace model (Porter and Liu 1994).

The parabolic equation method has been extensively benchmarked and is widely employed in the underwater acoustics community (Collins et al. 1996). MONM accounts for the additional reflection loss at the seabed, which results from partial conversion of incident compressional waves to shear waves at the seabed and sub-bottom interfaces, and it includes wave attenuations in all layers. MONM incorporates the following site-specific environmental properties: a bathymetric grid of the modelled area, underwater sound speed as a function of depth, and a geoacoustic profile based on the overall stratified composition of the seafloor.

This version of MONM accounts for sound attenuation due to energy absorption through ion relaxation and viscosity of water in addition to acoustic attenuation due to reflection at the medium boundaries and internal layers (Fisher and Simmons 1977). The former type of sound attenuation is significant for frequencies higher than 5 kHz and cannot be neglected without noticeably affecting the model results.

MONM computes acoustic fields in three dimensions by modelling transmission loss within two-dimensional (2-D) vertical planes aligned along radials covering a 360° swath from the source, an approach commonly referred to as N×2-D. These vertical radial planes are separated by an angular step size of $\Delta\theta$, yielding N = 360°/$\Delta\theta$ number of planes (Figure B-1).

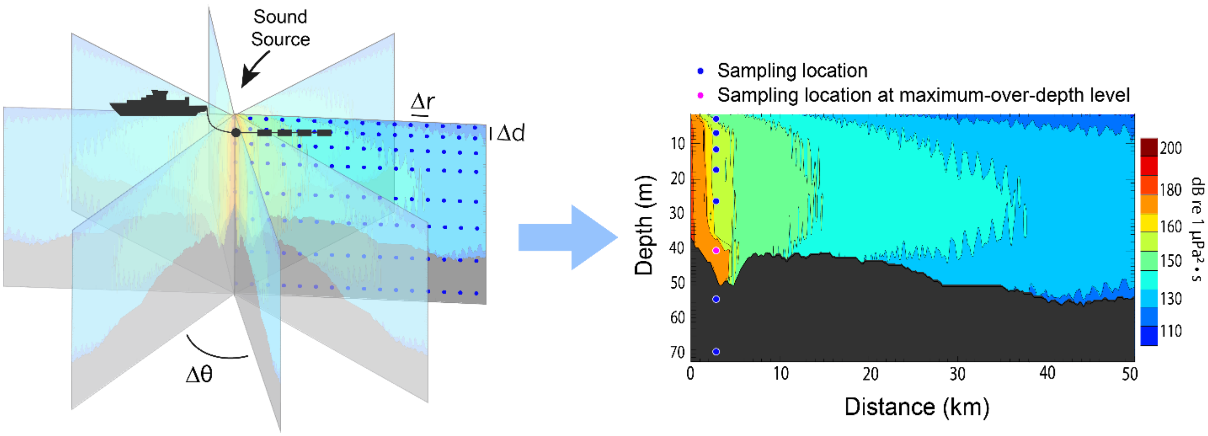

Figure B-1. The N×2-D and maximum-over-depth modelling approach used by MONM.

MONM treats frequency dependence by computing acoustic transmission loss at the centre frequencies of decidecade bands. Sufficiently many decidecade bands, starting at 10 Hz, are modelled to include most of the acoustic energy emitted by the source. At each centre frequency, the transmission loss is modelled within each of the N vertical planes as a function of depth and range from the source. The decidecade band received per-1s, for impulsive and non-impulsive noise sources respectively, SEL are computed by subtracting the band transmission loss values from the directional source level in that frequency band. Composite broadband received per-1s SEL are then computed by summing the received decidecade band levels.

The received per-1s SEL sound field within each vertical radial plane is sampled at various ranges from the source, generally with a fixed radial step size. At each sampling range along the surface, the sound field is sampled at various depths, with the step size between samples increasing with depth below the surface. The step sizes are chosen to provide increased coverage near the depth of the source and at depths of interest in terms of the sound speed profile. The maximum received per-1s SEL at many sampling depths are taken over all samples within the water column, i.e., the maximum-over-depth received per-pulse SEL. These maximum-over-depth per-1s SEL are presented as contours around the source.

Appendix C. Methods and Parameters

C.1. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure C-1).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure C-1(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure C-1(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.

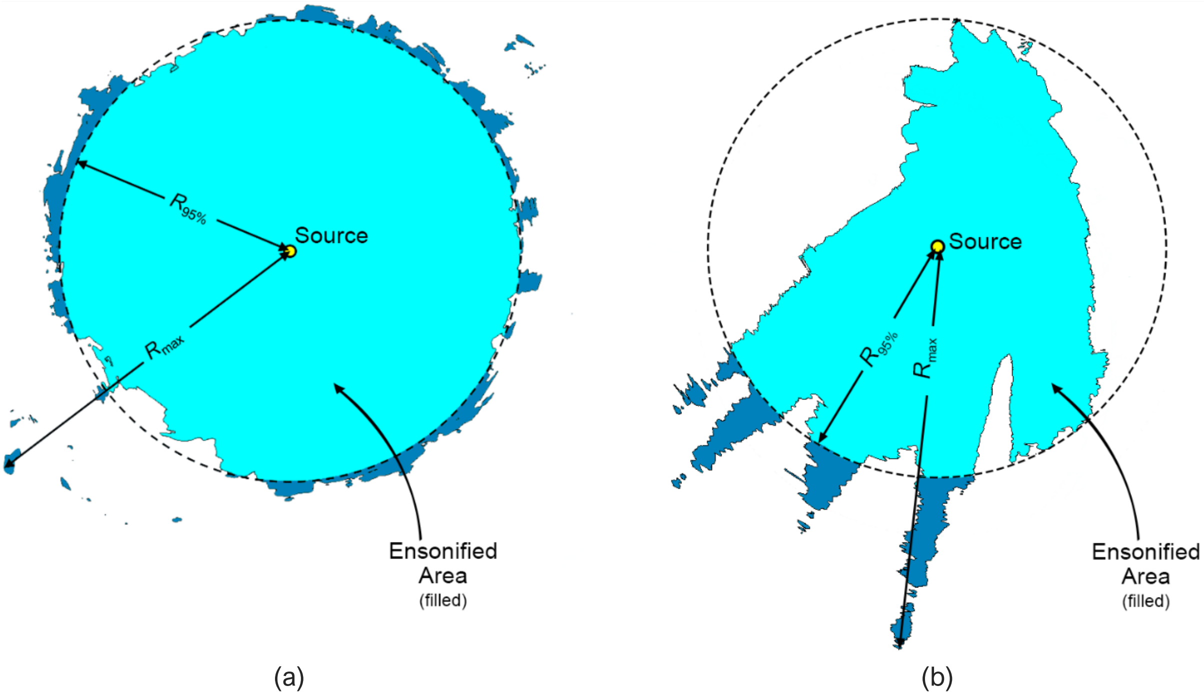

Figure C-1. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

C.2. Environmental Parameters

C.2.1. Bathymetry

Bathymetry throughout the modelled area was extracted from two sources, Darwin Inner Harbour with 1 m resolution (Geoscience Australia 2017) and where required this was supplemented with the high-resolution depth model for Northern Australia, a ~30 m grid rendered for Northern Australia (Beaman 2018) for the region shown in Figure 1. Bathymetry data were re-gridded and combined onto a Map Grid of Australia (MGA) coordinate projection (Zone 52) with a regular grid spacing of 40 × 40 m (Figure C-2). Bathymetry data is used at three different vertical height datums at lowest astronomical tide, mean sea level, and highest astronomical tide. For a reference level for LAT at 0.0 m, MSL is 3.2, and HAT at 8.1 m from Australian hydrographic charts AUS25 and AUS26.

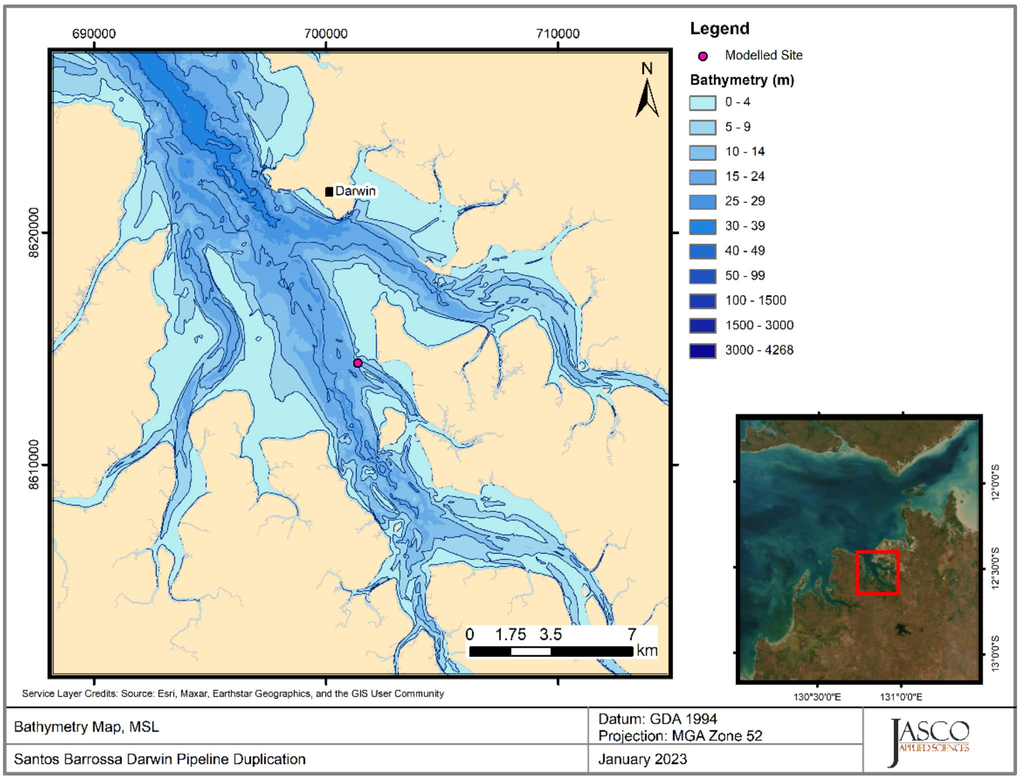

Figure C-2. Bathymetry in the modelled area.

C.2.2. Sound Speed Profile

The sound speed profiles for the modelled sites were derived from temperature and salinity profiles from the US Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the US Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles within a 40 km box radius encompassing each of the three areas. To determine the sound speed profile that is expected to be most favourable to longer-range sound propagation during the proposed survey time frame, each month was modelled for each area and the ranges were compared. As such, April was selected for sound propagation modelling to ensure precautionary estimates of distances to received sound level thresholds. Figure C-3 shows the resulting profile used as input to the sound propagation modelling.

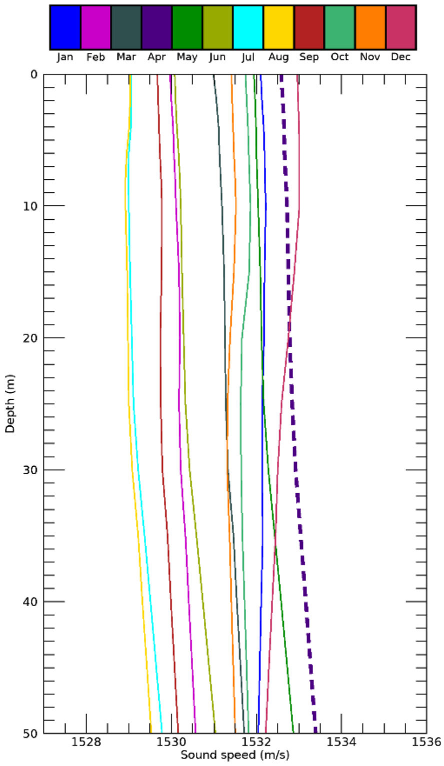

Figure C-3. The modelling sound speed profile corresponding to April is shown as the dotted line The profile is calculated from temperature and salinity profiles from Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

C.2.3. Geoacoustics

The geoacoustic profile in this area was constructed using client-supplied geotechnical reports. Multiple bore holes near the modelled site were considered such that the geologic profile that was most representative of the seabed within Darwin Harbour was chosen. The geology was modelled as thin layer of sand, over a layer of silt, underlain with increasingly consolidated sandstone. Representative grain sizes and porosity were used in the grain-shearing model proposed by Buckingham (2005) to estimate the geoacoustic parameters required by the sound propagation models.

Table C-1. Geoacoustic profile for Darwin Harbour.

Depth below seafloor (m)	Material	Density (g/cm^3)	P-wave speed (m/s)	P-wave attenuation (dB/λ)	S-wave speed (m/s)	S-wave attenuation (dB/λ)
0–1.5	Fine to coarse Sand with clay and gravel	2.09	1695–1910	0.18–0.92	283	3.65
1.5–5	Silt	2.01	1702–1754	0.40–0.59		
5–100	Sandstone	2.09	2039–2926	1.26–2.49		

Appendix D. Model Validation Information

Predictions from JASCO's propagation models (MONM, FWRAM, and VSTACK) have been validated against experimental data from a number of underwater acoustic measurement programs conducted by JASCO globally, including the United States and Canadian Artic, Canadian and southern United States waters, Greenland, Russia, and Australia (Hannay and Racca 2005, Aerts et al. 2008, Funk et al. 2008, Ireland et al. 2009, O'Neill et al. 2010, Warner et al. 2010, Racca et al. 2012a, Racca et al. 2012b, Matthews and MacGillivray 2013, Martin et al. 2015, Racca et al. 2015, Martin et al. 2017a, Martin et al. 2017b, Warner et al. 2017, MacGillivray 2018, McPherson et al. 2018, McPherson and Martin 2018).

In addition, JASCO has conducted measurement programs associated with a significant number of anthropogenic activities that have included internal validation of the modelling (including McCrodan et al. 2011, Austin and Warner 2012, McPherson and Warner 2012, Austin and Bailey 2013, Austin et al. 2013, Zykov and MacDonnell 2013, Austin 2014, Austin et al. 2015, Austin and Li 2016, Martin and Popper 2016, Austin et al. 2018, Beach Energy Limited 2020).

Executive Summary

Overview

Santos proposes to construct and operate a new pipeline segment, the Darwin Pipeline Duplication Project (the Project), enabling natural gas from the Barossa Field in the Timor Sea to be transported to the Santos-operated Darwin Liquified Natural Gas (DLNG) Facility at Wickham Point. The new gas pipeline would extend the existing Barossa Gas Export Pipeline and would comprise of approximately 100 kilometres of pipeline in Northern Territory waters and 23 kilometres of pipeline in Commonwealth waters.

The purpose of this report is to assess the potential traffic and transport impacts associated with the Project. This assessment will inform the preparation of the Supplementary Environmental Report (SER) for the DPD Project which will be submitted to the Northern Territory Environmental Protection Authority (NT EPA) for assessment in accordance with the Northern Territory Environmental Protection Act 2019 (NT EP Act).

Existing conditions

An existing transport conditions review was undertaken, which was informed via a combination of desktop reviews, site visit, crash/traffic data analysis and review of relevant policies and legislation. The key existing condition findings are summarised below:

- The road network within the study area is comprised of several Territory roads including Arnhem Highway and Stuart Highway. The Stuart Highway is the most heavily trafficked road in the area, with up to 27,800 vehicles travelling on the road on an average day.
- Stuart Highway, Tiger Brennan Drive and Berrimah Road all form part of the National Land Transport Network. Heavy vehicles (>3 axles) account for between 3.6% and 27.4% of traffic volumes on these roads.
- Traffic volumes on key roads in the study area generally peak during the month of September. Reduced levels of traffic are observed during the wet season (November to April).
- Arnhem Highway, Stuart Highway, Tiger Brennan Drive, Berrimah Road, Kirkland Road, Elrundie Avenue, Jenkins Road, Channel Island Road and Wickham Point Road all form part of the approved network for 53.5 m Road Train vehicles.
- Dedicated cyclist infrastructure in the study area is limited to an on-road bicycle lane on the eastern side of Berrimah Road between Marlow Road and Wishart Road. Several shared footpaths are provided adjacent to key roads in the study area including Berrimah Road, Tiger Brennan Drive, Stuart Highway and Arnhem Highway.
- There are no existing or proposed public bus services within 400 m of the DLNG facility or the intermediate stockpile site at Darwin Port, however CDC Northern Territory operates seven regular public bus services on roads forming part of the proposed Project haulage routes.
- The Adelaide-Darwin railway alignment is located approximately 750 m north-west of the intermediate stockpile site at Darwin Port. This railway line is grade separated from Berrimah Road at East Arm. However, two level railway crossings are located on Kirkland Road and one is located on Channel Island Road.
- In the five-year period from 2015 to 2019, a total of seven fatalities occurred on key roads in the study area. Five of these fatalities occurred on Tiger Brennan Drive.

Impact assessment

The key findings of the construction phase impact assessment are as follows:

- Mid-block capacity: a mid-block capacity assessment was undertaken for key roads in the study area to assess the impact of the Project on road capacity. The results indicate that all roads would operate under capacity in 2024 with the exception of Stuart Highway (between Temple Terrace and Howard Springs Road) and Wishart Road during the AM peak hour. Project-generated traffic would account for a very minor proportion of traffic on the local road network in 2024 and where the available capacity of a road has been exceeded, it is not a result of Project traffic.

- Intersection capacity and performance: traffic modelling using SIDRA Intersection (version 9.0) was performed to assess the impacts of the Project on the capacity and performance of three critical intersections. The modelling results indicate additional traffic movements generated by the construction of the Project in 2024 would result in negligible impacts.
- Preliminary haulage route assessment: routes have been established based on the approved road network for 53.3 metre Road Train vehicles. No road upgrades are anticipated to be required to accommodate Project traffic.

Overall, impacts to the local transport network during Project construction are expected to be negligible given the very low proportion of Project-generated traffic on the local road network.

Mitigation measures

To mitigate the potential impacts of the Project, the following mitigation measures have been recommended:

- All vehicle movements associated with the Project should be planned to occur outside of the identified AM and PM peak hours
- Group transport, such as shuttle buses and car-pooling schemes, should be implemented where practical to reduce the number of light vehicle movements on the local road network
- Heavy vehicle movements should be scheduled to minimise traffic disruption to the road network. This may include:
    - Scheduling of the movement of rock, equipment and other materials to occur outside of the identified AM and PM peak hours
    - Scheduling heavy vehicle movements to be evenly dispersed as far as practical to minimise the potential of convoying or platoons on the road network.
- The loading and unloading of heavy vehicles should be planned so that the capacity of each individual vehicle is fully utilised to reduce the total number of movements on the local road network
- A separate Traffic Management Plan (TMP) should be prepared, approved and implemented during the construction phase of the Project. The TMP will confirm final haulage routes and provide the necessary mitigation measures to ensure that construction vehicle movements can be accommodated on the local road network with minimal impacts.
- Coordination and consultation with key stakeholders to manage the interface of other projects occurring in the study area at the same time. This may include the coordination of traffic management arrangements between projects and the provision of regular project updates.
- Investigation of potential alternative haulage routes in the event that road closures or access restrictions are required to facilitate other projects in the study area.

Abbreviations

Abbreviation	Term
AADT	Average Annual Daily Traffic
AECOM	AECOM Australia Pty Ltd
DIPL	Department of Infrastructure, Planning and Logistics
DLNG	Darwin Liquified Natural Gas
DOS	Degree of saturation
FCGT	Flood / Clean / Gauge / Testing
Km	Kilometre
Km/h	Kilometres per hour
LOS	Level of service
M	Metre
NT	Northern Territory
OD	Over-dimensional vehicle
OSOM	Oversize Overmass
SER	Supplementary Environmental Report
TIA	Transport Impact Assessment
TMP	Traffic Management Plan
ToR	Terms of Reference

Glossary

Term	Description
AADT	This measurement provides the total volume of vehicle traffic of a road for a year divided by 365 days.
Access track	Tracks that are built by the project to facilitate construction, operation and maintenance.
Average delay	This is the average amount of time it takes a vehicle to negotiate an intersection, including the time to negotiate corners and the time stopped in queues or waiting for a green signal.
DOS	Ratio of demand to capacity. A DOS of 1.0 or more in theory represents saturated conditions where the demand exceeds the capacity. For a signalised intersection, a DOS of 0.9 is usually adopted as the capacity threshold.
Land	Any land, whether publicly or privately owned, and includes groundwater.
Landholder	A general term used to refer to the legal owner or manager of a parcel of land. It may be private landholder, Government or private utility, or a Government Agency responsible for management of a particular parcel of Crown land (e.g., National Parks or Forestry areas).
LOS	This is an alpha-numeric rating of the overall performance of an intersection, ranging from LOS A (very good) to LOS F (very poor).
Mid-block	A location around the mid-point between two intersections.
OD vehicle	Over-dimensional (OD) vehicles are those that exceed 5.0 metres wide/high or 30.0 metres long or 100.0 tonnes gross mass. OD vehicles should be reviewed for transportation with the DIPL permit process to permit travel. Other additional permits/conditions are required for access, such as escorts, travel times, etc.
OSOM vehicle	All vehicles travelling on NT roads must comply with the maximum dimension limits and maximum standard mass limits unless the vehicle has been given an exemption. The maximum vehicle dimensions for standard haulage vehicles are 4.3m height and 2.5m width and 22.5m tonne mass limit. Vehicles which fall outside of these dimensions are considered Oversized and/or Overmass and must apply for a permit to operate.
Trenching	Excavation of a trench for burial of a cable or pipeline system.

1.0 Introduction

1.1 Background

AECOM Pty Ltd Australia (AECOM) has been engaged by Santos NA Barossa Pty Ltd (Santos) to prepare a Traffic Impact Assessment (TIA) for the Barossa Darwin Pipeline Duplication Project (the Project). This assessment forms part of the Supplementary Environmental Report (SER) for the Project and has been undertaken to address the comment received from the Department of Infrastructure, Planning and Logistics (DIPL) – Transport and Civil Services Division relating to traffic and transport. Specifically:

> **Issue:** Insufficient information has been provided to assess the risks to land based transport networks. Traffic and transport regimes have changed considerably in this locality since the original establishment of Darwin LNG but are also expected to increase in the near future as a result of further industrial developments in this area. This will result in greater risks to road users and transport infrastructure along the routes to and from the proposal.
>
> **Recommended Action:** The proponent to submit a Traffic Impact Statement (TIS) to assess the road traffic impacts, to ensure the road authority can measure the proponent's acknowledgement of the risks associated with the works impact on NTG Roads, infrastructure and road safety. The assessment is to include, but is not limited to: details on what materials will be transported and their loads, traffic volumes and types of vehicles used for the transportation including the haulage routes and duration of the haulage operation specific to onshore movements including a risk assessment as part of the process to reflect how all roads and infrastructure on a local and regional level will be affected.

The SER and supporting TIA will be submitted to the Northern Territory Environmental Protection Authority (NT EPA) for assessment in accordance with the Northern Territory Environmental Protection Act 2019 (NT EP Act).

1.2 Project overview

Santos proposes to construct and operate a new pipeline segment, the Darwin Pipeline Duplication Project (the Project), enabling natural gas from the Barossa Field in the Timor Sea to be transported to the Santos-operated Darwin Liquified Natural Gas (DLNG) Facility at Wickham Point. The new gas pipeline would extend the existing Barossa Gas Export Pipeline and would comprise of approximately 100 kilometres of pipeline in Northern Territory waters and 23 kilometres of pipeline in Commonwealth waters. Project construction activities will include pre-lay works, including trenching of section of the pipeline route, installation of the pipeline and installation of rock armour along some sections of the pipeline.

The Project has been split into three geographical areas. These areas are:

- **Offshore NT waters** – the offshore Project Area extends from the Territorial waters limit, with a typical water depth of between 30-40 metres (m), through to the limit of Darwin Harbour, as shown in Figure 1-1. It includes a proposed spoil disposal ground directly adjacent to the existing INPEX Ichthys spoil ground.
- **Darwin Harbour** – the Darwin Harbour part of the Project area includes the Project Area from the outer boundary of Darwin Harbour to the location of the shore crossing at the existing DLNG facility as shown in Figure 1-1. The Project pipeline within Darwin Harbour follows the route of existing Bayu-Undan and Ichthys gas pipelines.
- **Shore crossing and onshore** – the shore crossing and onshore location for the Project is within the existing DLNG facility disturbance envelope at Wickham Point within the Middle Arm Peninsula industrial area, approximately 6 km south-to-south-east of Darwin (Figure 1-1).

The key phases of the Project are:

- Surveys
- Construction, including:
    - Pre-lay works
    - Spoil disposal
    - Pre-lay span rectification and foundation installation
    - Cable crossings
    - Onshore construction
    - Pipeline installation and pre-commissioning
- Commissioning and operations
- Decommissioning.

The Project phases of relevance to this TIA are discussed in Section 7.0. Subject to regulatory approval, construction of the Project is anticipated to commence in Quarter 4 of 2023 and is expected to be complete by the end of 2024, with first gas from the Barossa Field expected in the first half of 2025. The key components required for the construction of the Project include:

- **Pipeline** – approximately 23 km of pipeline would be constructed in Commonwealth waters and 100 km in NT waters and lands. The Project pipeline will run parallel to the existing Bayu-Undan to Darwin pipeline and comes onshore at the DLNG facility.
- **Shore crossing** – the pipeline will be trenched and buried at the shore crossing. The length of pipeline trenching onshore will be approximately 300 m.
- **Spoil disposal ground** – spoil that is collected during the trenching activities will be disposed at a location north-east of Darwin Harbour (Figure 1-1).
- **Onshore facilities** – all onshore facilities including the shore pull, laydown and ancillary facilities would be located within the existing DLNG disturbance envelope (Figure 1-1).
- **Quarry** – rock would be used to provide pipeline protection and stability within Darwin Harbour. The rock is proposed to be sourced from the HB Quarry at Mount Bundey (approximately 85 km south-east of Darwin.

Activities within the Project area will be vessel-based, for construction activities in Offshore NT waters and Darwin Harbour, or shore-based, for construction activities at the shore crossing and onshore at the DLNG facility. Transfer of personnel, materials and equipment via road networks will therefore be to vessel loading points in Darwin Harbour (primarily East Arm wharf, in the case of rock movements) and to the onshore/shore-crossing area at the DLNG facility.

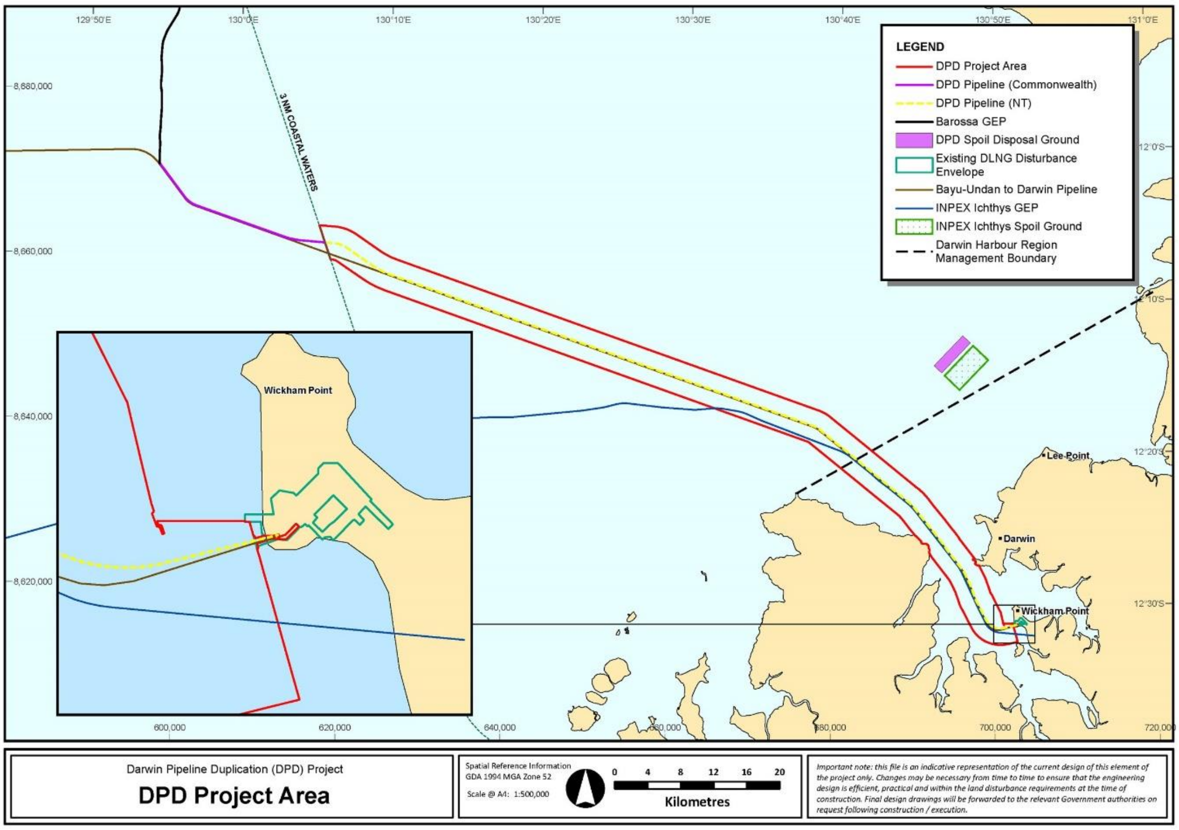

Figure 1-1 Project Area

Image source: Santos, 2021

2.0 Terms of Reference

The ToR for the Project SER identifies requirements for assessment and mitigation of impacts on transport and traffic in terms of social surroundings. This assessment addresses the requirements of the ToR.

Requirements of particular relevance to this report and where they have been addressed within this report are summarised as follows:

- Describe land traffic and transport activities during construction and operation including details on access, haulage routes, vehicle types, volumes of traffic (Section 7.0, 8.0, 9.0).
- Describe and quantify the potential impacts of Project infrastructure and activities, such as land transport and traffic impacts (Section 9.0, 10.0, 11.0)
- Address all potential impacts and risks identified through the impact assessment, and identify measures to avoid, reduce or mitigate these impacts (10.0, 11.0, 12.0)

3.0 Evaluation Framework

The assessment will consider legislation, policy and standards relevant to transport along with specific assessment criteria that have been derived for the purposes of the study.

3.1 Legislation, policy, guidelines and standards

The legislation, policy, guidelines and standards relevant to this study are summarised in Table 3-1.

Table 3-1 Legislation, policy, guidelines and standards relevant to the assessment

Document title	Summary	Relevance to the project
National		
Austroads – Guide to Traffic Management Part 3: Traffic Studies and Analysis	The *Guide to Traffic Management Part 3: Traffic Studies and Analysis* (Austroads, 2018) is concerned with the collection and analysis of traffic data for the purpose of traffic management and traffic control within a network. It serves as a means to ensure some degree of consistency in conducting traffic studies and surveys. It provides guidance on the different types of traffic studies and surveys that can be undertaken, their use and application, and methods for traffic data collection and analysis.	The *Guide to Traffic Management Part 3: Traffic Studies and Analysis* has been used to guide the collection and analysis of traffic data used in this assessment.
Austroads – Guide to Traffic Management Part 12: Integrated Transport Assessments for Developments	The *Guide to Traffic Management Part 12: Integrated Transport Assessments for Developments* (Austroads, 2020) is concerned with identifying and managing the impacts on the road system arising from land use developments. It provides guidance on the need and criteria for impact assessments, and a detailed procedure for identifying, assessing and mitigating traffic impacts. The aim is to ensure consistency in the assessment and treatment of traffic impacts, including addressing the needs of all road users and the effect upon the broader community.	The *Guide to Traffic Management Part 12: Integrated Transport Assessments for Developments* has been used to guide the structure and development of this assessment.
Austroads – Guide to Road Design Part 3: Geometric Design	The *Guide to Road Design Part 3: Geometric Design* (Austroads, 2021) provides road designers and other practitioners with information about the geometric design of road alignments. The purpose of the guide is to provide the information necessary to enable designers to develop safe and coordinated road alignments that cater for the traffic demand at the chosen speed. The guide also presents information leading to the choice of appropriate cross-section standards.	The *Guide to Road Design Part 3: Geometric Design* has been used to determine the potential impacts of the Project and associated traffic generation on the local road network.
Austroads – Guide to Road Design Part 4: Intersections and Crossings	The *Guide to Road Design Part 4: Intersections and Crossings* (Austroads, 2021) provides guidance on intersection design such as design considerations, design process, choice of design vehicle, pedestrian and cyclist crossing treatments, provision for public transport and property access.	The *Guide to Road Design Part 4: Intersections and Crossings* has been used to determine the potential impacts of the Project and associated traffic generation on intersections and crossings.

Document title	Summary	Relevance to the project
Northern Territory		
Northern Territory Environment Protection Act 2019	The *Northern Territory Environment Protection Act* aims to promote ecological sustainable development, manage significant disturbances through an environmental approval process, provide for broader community involvement and recognise the importance of participation of Aboriginal people and communities in environmental decisions. Under the Act, the NT EPA regulates the environment impact assessment process to identify potential environmental impacts of development proposals. There are four assessment methods provided for within the NT approvals process: 1) Assessment on referral information (Tier 1) 2) Assessment on a Supplementary Environmental Report (SER) (Tier 2) 3) Assessment by Environmental Impact Statement (EIS) (Tier 3) 4) Assessment by inquiry.	This impact assessment has been prepared to support the assessment by Supplementary Environmental Report (SER).
Control of Roads Act 1953	The Act, subject to section 64 of the *Planning Act 1999* and Part 12.3 of the *Local Government Act 2019*, stipulates that all roads in the Northern Territory, are under the care, control and management of the Minister. The Act outlines the process in which public roads can be opened and closed.	Any closure or change of access to a public road as a result of the Project would be required to follow the provisions of the *Control of Road Act 1953*.
Traffic Act 1987	The objective of this Act is to regulate traffic, which includes provisions in relation to the erection and operation of traffic control devices. Traffic control devices refer to signals, signs or markings displayed for the purpose of regulating, warning, or guiding traffic.	Under the *Traffic Act 1987*, consent from the applicable competent authority would be required prior to the erection and operation of traffic control devices.
Development Guidelines for Northern Territory Government Controlled Roads 2015	The *Development Guidelines for Northern Territory Government Controlled Roads* (Department of Transport, 2015) sets out the requirements for any development or infrastructure project that may impact the road or that will ultimately be transferred to the NTG for ongoing care, control and management. These Guidelines also outline the Department of Transport's involvement in the assessment of land use development applications under the Planning Act and provide details of the Department's approval processes.	The Project would be required to follow the requirements of the Guidelines.
Towards Zero Action Plan 2018-2022	The *Towards Zero Road Safety Action Plan* (DIPL, 2018) outlines a vision of zero deaths or accidents on roads within the Northern Territory. The plan establishes a strategy to reducing road deaths and accidents using a 'Safe Systems' approach, which considers how the whole road system can be more forgiving to reduce the consequence of mistakes by road users.	Road safety considerations represent a critical focus of this TIA.

Document title	Summary	Relevance to the project
Territory 2030 Strategic Plan	The Territory 2030 Strategic Plan (Northern Territory Government, 2009) provides a 20-year roadmap for development across the Northern Territory. The Plan foreshadows the establishment of Darwin as a key centre for oil and gas operations, maintenance and workforce.	The Project supports the Plan by further securing Darwin's place as an oil and gas hub.
Greater Darwin Plan 2012	The *Greater Darwin Plan 2012* (Northern Terriory Government, 2012) outlines seven strategic directions to support growth and sustainable development within the Greater Darwin area in the context of the broader strategic framework provided by the *Territory 2030 Strategic Plan*. The plan identifies that economic growth in the Darwin area will likely be sustained over the next decade and beyond by the oil and gas industries, as well as the mining and defence sectors. As such, the release of suitable land for industrial development is essential to realising the opportunities offered by economic growth.	The Project aligns with the Plan by further expanding Darwin's gas-based industry.
10 Year Infrastructure Plan 2019-2028	The *10 Year Infrastructure Plan* (DIPL, 2019) aims to provide transparency in planning and prioritises projects that have been identified as supporting future growth and prosperity of the Northern Territory. The Plan identifies natural resources, such as gas, to be integral to the growth of the Northern Territory's economy.	The Project will further grow and diversify the Northern Territory's gas industry in line with the Plan's vision.
Local Government		
City of Palmerston Development Guidelines 2015	The *Development Guidelines 2015* (City of Palmerston, 2015) establish the approvals and permits required for development within the City of Palmerston and provide minimum standards acceptable for a new development. The guidelines specify that a developer shall avoid obstruction or damage to roadways and footpaths, drains and watercourses and any public utility or other services on or adjacent to the site which are visible or the location of which can be ascertained by the developer from the appropriate authority and shall have any obstruction removed immediately and at own cost shall have made good all damage caused.	Ensuring access to and maintenance of the road network and adjacent public infrastructure represents a key consideration of this TIA.

3.2 Assessment criteria

The assessment criteria relevant to this TIA are outlined below.

TIAs include an evaluation against relevant State/Territory and industry guidelines (as summarised in Table 3-1) whilst also addressing specific local government planning clauses where applicable.

Ultimately the findings and proposed mitigation measures detailed in the TIA need to be agreed with the relevant road authorities. Once planning approval has been obtained for the project, those stakeholders will be consulted regarding the development of a Traffic Management Plan (TMP). Additionally, where secondary approvals are required under transport legislation, these approvals would be sought from the relevant road authorities.

4.0 Consultation and Engagement

Development of the project and preparation of the TIA have been informed by consultation with key stakeholders. Feedback from the Department of Infrastructure, Planning and Logistics (DIPL), local councils and other statutory parties is summarised in Table 4-1.

Table 4-1 Feedback from key stakeholders in relation to traffic and transport

Stakeholder feedback	Consideration in project design or impact assessment
Department of Infrastructure, Planning and Logistics (DIPL)	
A meeting with DIPL was held on Monday 19 September 2022, with the following feedback received: • There are several road projects proposed along the haulage route from HB Quarry to Darwin Port. Alternative haulage routes to Darwin Port will need to be considered in the event road closures are required to facilitate these road projects. • Impacts to level railway crossings, including traffic queuing and delays to trains, will need to be considered. • Transportation of staff, including vehicle type and timing of movements in relation to peak traffic periods, will need to be discussed. • Construction of the new overpass at the intersection of Tiger Brennan Drive and Berrimah Road will likely require traffic to be diverted. The assessment will need to consider the impacts of cumulative traffic diversion, including general traffic, project related traffic and traffic generated by other concurrent projects. • There are several other projects in the area (including mining projects) utilising Port Darwin. Traffic activity and use of the port by other projects will need to be aligned with the project, particularly as there is only one route in/out of Port Darwin.	The items outlined have been considered as reasonably possible at this planning stage of the Project, with the following items addressed in this TIA report: • Transportation of Project staff has been discussed in Section 9.1.1. • A cumulative impact assessment has been completed to assess the potential impacts of concurrent Projects. This assessment is included in Section 11.0.
City of Darwin and City of Palmerston	
Not undertaken at this stage, comments to be received as part of TRG process.	TBC

5.0 Methodology

The following tasks have been undertaken to complete the traffic and transport impact assessment for the Project:

- An initial review of the existing site and network conditions in the context of the Project.
- A review of relevant strategic plans to: contextualise this Project within the greater Darwin region; identify proposed cumulative impact of development; and identify relevant proposed network upgrades for land-based traffic that may impact this Project.
- A desktop analysis of the Project area to: establish existing traffic conditions; identify multi-modal networks and services; identify safety and accessibility issues particularly for heavy vehicles on proposed haulage routes.
- The collection and analysis of traffic data representative of existing site and network operations.
- A review of recent crash history for the Project study area to assist definition and avoidance of existing problem areas.
- Route selection and rock haulage duration associated with the construction of the Project, based on sourcing of rock material from the HB Quarry at Mount Bundey, fleet operation assumptions and heavy vehicle route restrictions.
- A review of the proposed Barossa Darwin Pipeline Duplication Project and estimated traffic generation based on an indicative construction program, construction transport fleet options and proposed hours of construction works and proposed operational activities and workforce.
- Undertake traffic impact assessment of the Project for the construction and operational phases. The assessment includes:
  - Haulage route option identification from the HB Quarry at Mount Bundey, to determine appropriate travel routes and any approvals required Project access.
  - Assessment of construction and operational traffic generation, including:
    - Traffic generation during the construction and operation of the Project, with the peak hour frequencies identified for the impact analysis
    - Potential impacts on the local road network, specifically mid-block road capacity assessments and intersection modelling
    - Undertake traffic impact review and summarise the potential impacts to multi-modal networks and services.
- Evaluation of potential cumulative impacts (where relevant) caused by the concurrent construction of the Project and other existing or proposed projects in the study area.
- Following the assessment of the potential Project traffic and transport impacts, recommendations for management and potential mitigation measures identified impacts have been made.

6.0 Existing Conditions

6.1 Study area

The study area for this impact assessment consists of the transport network servicing Darwin Port at East Arm, the DLNG facility at Wickham and the HB Quarry at Mount Bundey. The key roads of relevance to this impact assessment are shown in Figure 6-1 and include:

- Arnhem Highway
- Stuart Highway
- Tiger Brennan Drive
- Berrimah Road
- Wishart Road
- Kirkland Road
- Elrundie Avenue
- Jenkins Road
- Channel Island Road
- Wickham Point Road.

These roads are described in further detail in Section 6.2.

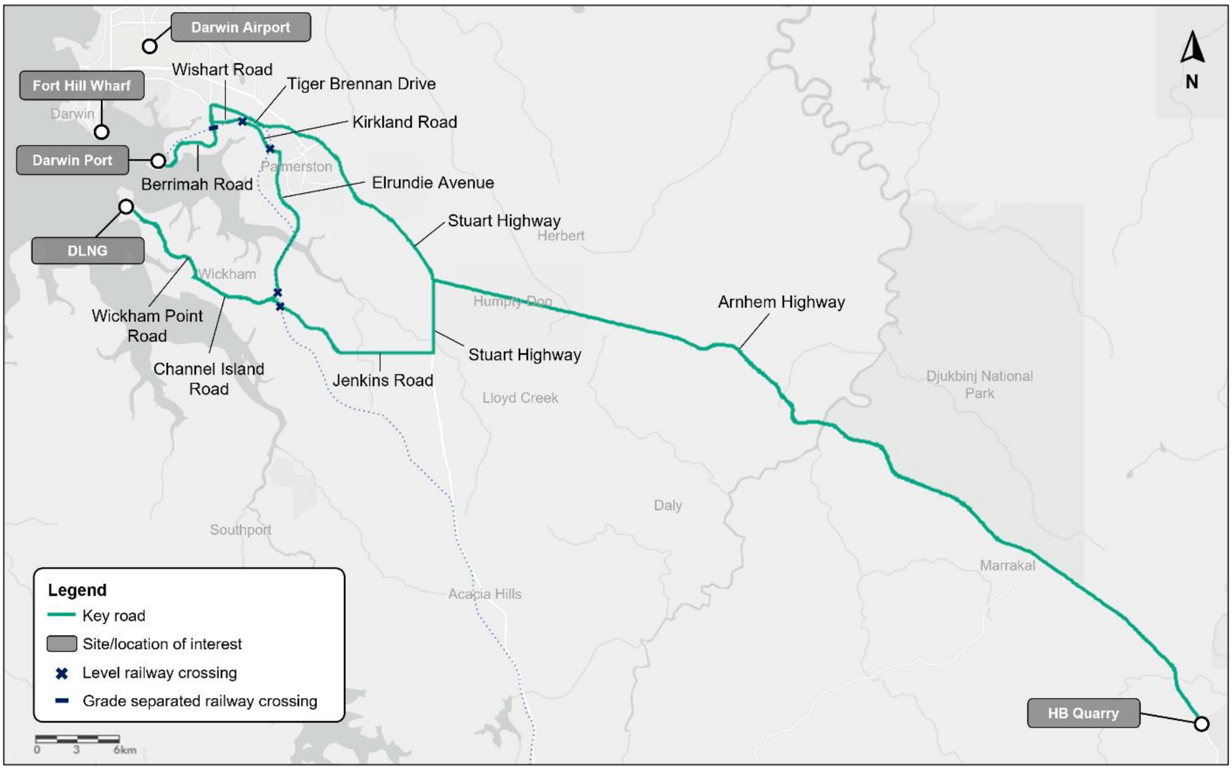

Figure 6-1 Study area

Basemap source: Esri

6.2 Existing road network

6.2.1 Arnhem Highway

The Arnhem Highway is a sealed road extending approximately 230 kilometres in the east-west direction between the outer rural area of Darwin and the Kakadu National Park. The road is classified as a State road and generally comprises a single carriageway with one traffic lane in each direction. The road features relatively narrow sealed shoulders along its entire length. A typical cross section of the Arnhem Highway is shown in Figure 6-2.

The posted speed limit of the Arnhem Highway varies along the proposed haulage route. Between the Stuart Highway and Kennedy Road at Humpty Doo, the road has a posted speed limit of 80 kilometres per hour (km/h). A variable speed limit zone is located adjacent to the Humpty Doo town centre with a speed limit of 60 km/h or 80 km/h typically enforced. Between Edwin Road at Humpty Doo and Anzac Parade at Middle Point, the Arnhem Highway has a posted speed limit of 100 km/h. The posted speed limit increases to 110 km/h east of Anzac Parade.

The western terminus of the Arnhem Highway connects with the Stuart Highway via a signalised intersection located 35 kilometres south-east of Darwin. There are no other signalised intersection treatments located along the Arnhem Highway.

Figure 6-2 Arnhem Highway west of Barr Road, facing east

Image source: Google Street View, December 2021

6.2.2 Stuart Highway

The Stuart Highway (A1) is a sealed major highway extending approximately 2,700 km from Darwin, NT to Port Augusta, South Australia (SA). The road forms part of the National Land Transport Network and functions as the principal north-south route for freight and passenger movements between the NT and SA.

In the study area, the Stuart Highway is a four-lane, two-way dual carriageway road with a grass median. The road reservation east of Yarrawonga Road is typically 50-55 m wide, expanding to provide dedicated right and left turn lanes at signalised intersections. A typical cross section of the Stuart Highway in the vicinity of the study area is shown in Figure 6-3. The road has a posted speed limit of 100 km/h in the study area.

Figure 6-3 Stuart Highway north of Sayer Road, facing north-west
Image source: Google Street View, December 2021

6.2.3 Tiger Brennan Drive

Tiger Brennan Drive (A15) is a major arterial road providing east-west connectivity between Darwin and Palmerston. The road forms part of the National Land Transport Network and generally extends parallel to the Stuart Highway, providing the most direct route for vehicles travelling to and from the port facilities at East Arm. In the study area, Tiger Brennan Drive is a two-lane, two-way dual carriageway road with a grass median. A typical cross section of Tiger Brennan Drive is shown in Figure 6-4.

Posted speed limits on Tiger Brennan Drive vary from 100 km/h in undeveloped and heavy commercial zones, to 60 km/h as the road approaches the Darwin CBD. The majority of major junctions on Tiger Brennan Drive are signalised with some residential streets connected via limited access slip roads. At its eastern end, Tiger Brennan Drive merges onto Stuart Highway via a grade separated interchange with Roystonea Avenue.

Figure 6-4 Tiger Brennan Drive west of Marjorie Street, facing west
Image source: Google Street View, December 2021

6.2.4 Berrimah Road

Berrimah Road is a major arterial road that provides north-south connectivity between the Stuart Highway at Berrimah and the port facilities at East Arm. Between the Stuart Highway and Tiger Brennan Drive, Berrimah Road is a single carriageway road with one lane in each direction. The road is a two-lane, two-way dual carriageway road between Tiger Brennan Drive and Cochrane Road at East Arm. South of Cochrane Road, Berrimah Road continues as a single carriageway road with one lane in each direction. A typical cross section of Berrimah Road is shown in Figure 6-5.

The posted speed limit of the Berrimah Road varies from 70 km/h between the Stuart Highway and Tiger Brennan Drive, to 80 km/h just south of Tiger Brennan Drive and 60 km/h approaching the port facilities at East Arm. A 40 km/h school zone exists near College Road from 7 am until 5 pm on school days.

Figure 6-5 Berrimah Road north of Tiger Brennan Road, facing south

Image source: Google Street View, December 2021

6.2.5 Wishart Road

Wishart Road provides a direct east-west connection from Berrimah Road to Tiger Brennan Drive and Kirkland Road. Wishart Road typically has one lane in each direction with dedicated left and right turn lanes provided at its intersection with Berrimah Road and Tiger Brannan Drive. The posted speed limit of Wishart Road is 80 km/h. A typical cross section of the road in the vicinity of the study area is shown in Figure 6-6.

Figure 6-6 Wishart Road between Tiger Brennan Drive and Kirkland Road, facing west
Image source: Google Street View, December 2021

6.2.6 Kirkland Road

Kirkland Road facilitates east-west travel between Tivendale and Palmerston. The road is generally a single carriageway road with one lane in each direction. The carriageway widens to provide dedicated left and right turns onto Woodlake Boulevard, Bree Street, Toft Road, Fowlestone Road and Syrimi Road. Figure 6-7 shows a typical cross section of Kirkland Road.

At its western end, Kirkland Road becomes a dual carriageway road and connects to Wishart Road via a signalised intersection. At its eastern end, Kirkland Road connects to Elrundie Avenue and University Avenue via a dual lane roundabout. Kirkland Road has a posted speed limit of 100 km/h reducing to 80 km/h at the intersections with Elrundie Avenue and Wishart Road. It has two level crossings for trains on the carriageway that are not grade separated, consequently resulting in some delay to traffic when barriers are activated. These are located at 200 m west of Woodlake Boulevard (Figure 6-8) and 50 m south of Wishart Road (Figure 6-9).

Figure 6-7 Kirkland Road
Image source: Google Street View, December 2021

Figure 6-8 At grade level crossing Kirkland Road facing west, 200 m west of Woodlake Boulevard
Image source: Google Street View, December 2021

Figure 6-9 At grade level crossing Kirkland Road facing north, 50 m south of Wishart Road
Image source: Google Street View, December 2021

6.2.7 Elrundie Avenue

Elrundie Avenue extends south from Kirkland Road and provides access to several residential areas at Driver, Marlow Lagoon, Moulden and Bellamack. At its southern end, Elrundie Avenue continues as Channel Island Road. Elrundie Avenue is a single carriageway road with one lane in each direction. The road has a posted speed limit of 80 km/h. A typical cross section of Elrundie Avenue is shown in Figure 6-10.

Figure 6-10 Elrundie Avenue south of Kirkland Road, facing north
Image source: Google Street View, December 2021

6.2.8 Jenkins Road

Jenkins Road extends in the east-west direction between the Stuart Highway and Channel Island Road. The road connects to the Stuart Highway via a signalised intersection and Channel Island Road via a priority ('Stop') controlled T-intersection. Jenkins Road is a single carriageway road with one lane in each direction. A typical cross section of Jenkins Road is shown in Figure 6-11.

Jenkins Road has a posted speed limit of 100 km/h. A level railway crossing is located on the road approximately 600 m east of its intersection with Channel Island Road (Figure 6-12).

Figure 6-11 Jenkins Road west of the Stuart Highway, facing west
Image source: Google Street View, December 2021

Figure 6-12 At grade level crossing Jenkins Road facing west, 600 m east of Channel Island Road
Image source: Google Street View, December 2021

6.2.9 Channel Island Road

Channel Island Road provides access to several industrial facilities at Wickham including the Weddell Power Station and Channel Island Power Station. The road extends south from Elrundie Avenue over

Elizabeth River before heading in the western direction to Channel Island where it terminates. Channel Island Road is a single carriageway road with one lane in each direction.

The road has a posted speed limit of 80 km/h. A typical cross section of Channel Island Road is shown in Figure 6-13. A level railway crossing is located on the road approximately 400 m north east of its intersection with Jenkins Road (Figure 6-14).

Image source: Google Street View, December 2021

Figure 6-14 At grade level crossing Channel Island Road facing north, 400 m north east of Jenkins Road
Image source: Google Street View, December 2021

6.2.10 Wickham Point Road

Wickham Point Road extends in the northern direction from Channel Island Road and provides access to the DLNG facility and Ichthys Liquefied Natural Gas Plant. The road connects to Channel Island

Road via a channelised T-intersection. Wickham Point Road is a single carriageway road with one lane in each direction. The road has a posted speed limit of 80 km/h. A typical cross section of Wickham Point Road is shown in Figure 6-15.

Figure 6-15 Wickham Point Road north of Channel Island Road, facing north

Image source: Google Street View, May 2008

6.2.11 Heavy vehicle networks

The approved roads for 53.5 m Road Train vehicles are shown in Figure 6-16 and include the Arnhem Highway, Stuart Highway, Tiger Brennan Drive, Berrimah Road, Kirkland Road, Elrundie Avenue, Jenkins Road, Channel Island Road and Wickham Point Road (Northern Territory Govenment, 2011).

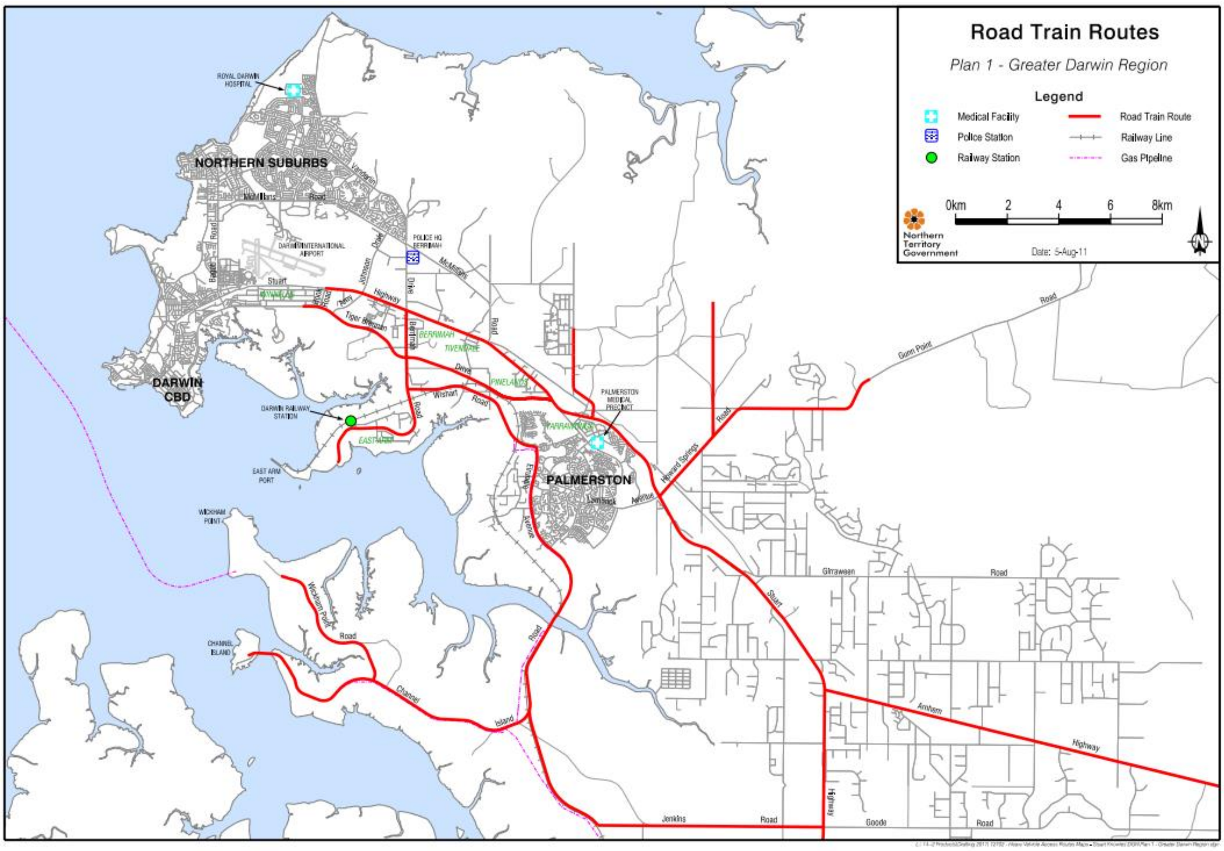

Figure 6-16 Approved roads for 53.5 m Road Train vehicles in the vicinity of the study area
Image source: Northern Territory Government, 2011

6.3 Existing traffic volumes

Traffic count data was extracted from DIPL's Annual Traffic Report for key roads within the study area (DIPL and Territory Traffic Surveys, 2021). A summary of the count stations is provided in Table 6-1 and the location of each count stations is shown in Figure 6-17.

Table 6-1 Traffic count stations on key roads in the study area

Road	Station ID	Location of station
Arnhem Highway	UDVDP019	500 m east of Stuart Highway
	RDVDP007	2 km west of Adelaide River Bridge
Berrimah Road	UDVDP028	400 m south of Tiger Brennan Drive
	UDVDP029	350 m west of Casey Street
Channel Island Road	UDVDC072	South of Elizabeth River Bridge
Elrundie Avenue	UDVDC062	100 m North of Chung Wah Terrace
Kirkland Road	UDVDP085	500 m west of West of Wishart Road
Stuart Highway	UDVDP017	500 m west of Howard Springs Road
	UDVDP020	500 m north of Arnhem Highway
	UDVDP034	500 m south of Bees Creek Road
Tiger Brennan Drive	UDVDP022	800 m west of Berrimah Road

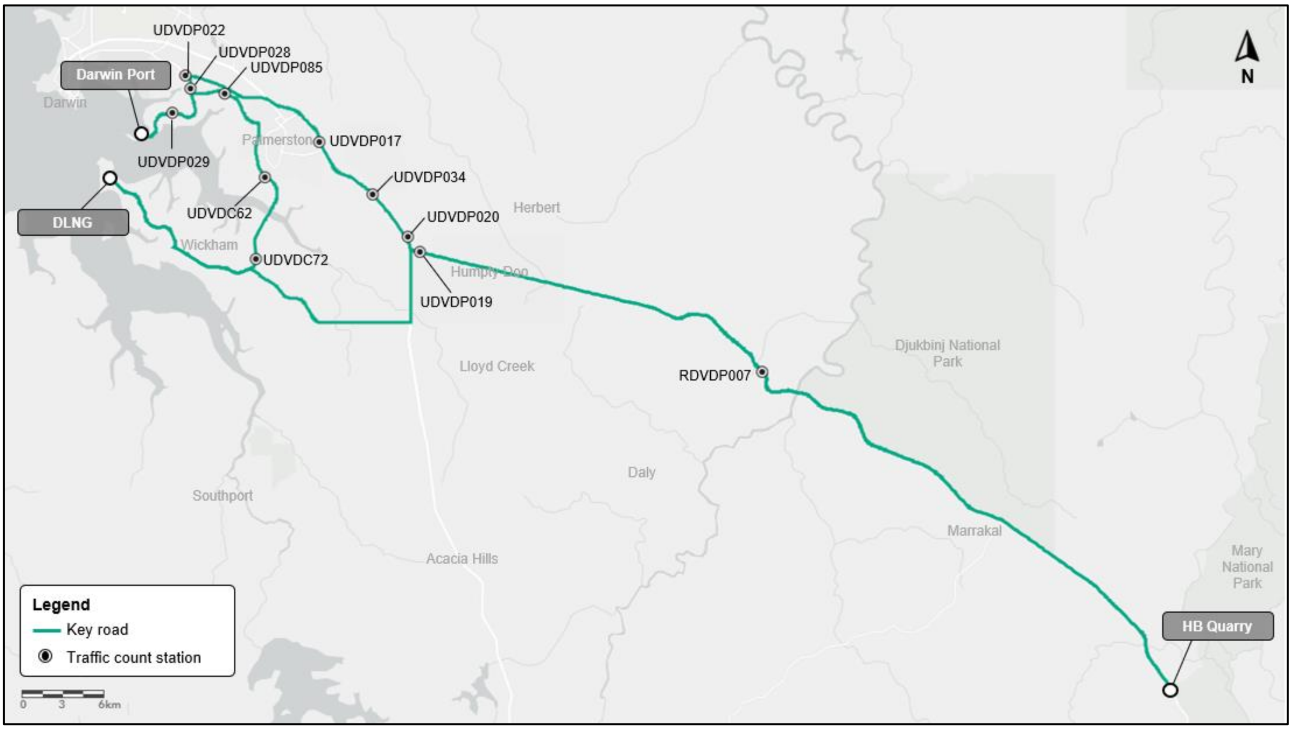

Figure 6-17 Locations of traffic count stations in the study area

Basemap source: Esri

A summary of the Annual Average Daily Traffic (AADT) volumes over the past five-year period (2017-2021) is shown in Table 6-2. The Stuart Highway experiences the highest traffic volumes in the study area, with an average of 27,790 vehicles travelling on the road each day west of Howard Springs Road. West of Berrimah Road, approximately 20,880 vehicles travelled Tiger Brennan Drive on an average day.

Traffic volumes on the Arnhem Highway typically range between 1,400 and 7,700 vehicles per day. The western end of Arnhem Highway experiences the highest volume of traffic due to a high proportion of vehicles entering and exiting the road from the surrounding residential land uses at Humpty Doo. Approximately 7,330 vehicles travel along Berrimah Road each day near Tiger Brennan Drive. Towards the port facilities at East Arm, traffic volumes on Berrimah Road reduce to 1,180 vehicles per day. Traffic volumes on Channel Island Road are relatively low with an average of 1,670 vehicles using the road each day.

Table 6-2 AADT volumes by year (2017-2021)

Road	Station ID	Station location	Direction of travel	Year				
				2017	2018	2019	2020	2021

Data source: DIPL and Territory Traffic Surveys, 2021

Monthly average daily traffic volumes are shown in Figure 6-18 to Figure 6-22. Traffic volumes in the study area generally peak during the month of September. Reduced traffic volumes are observed during the wet season (November to April).

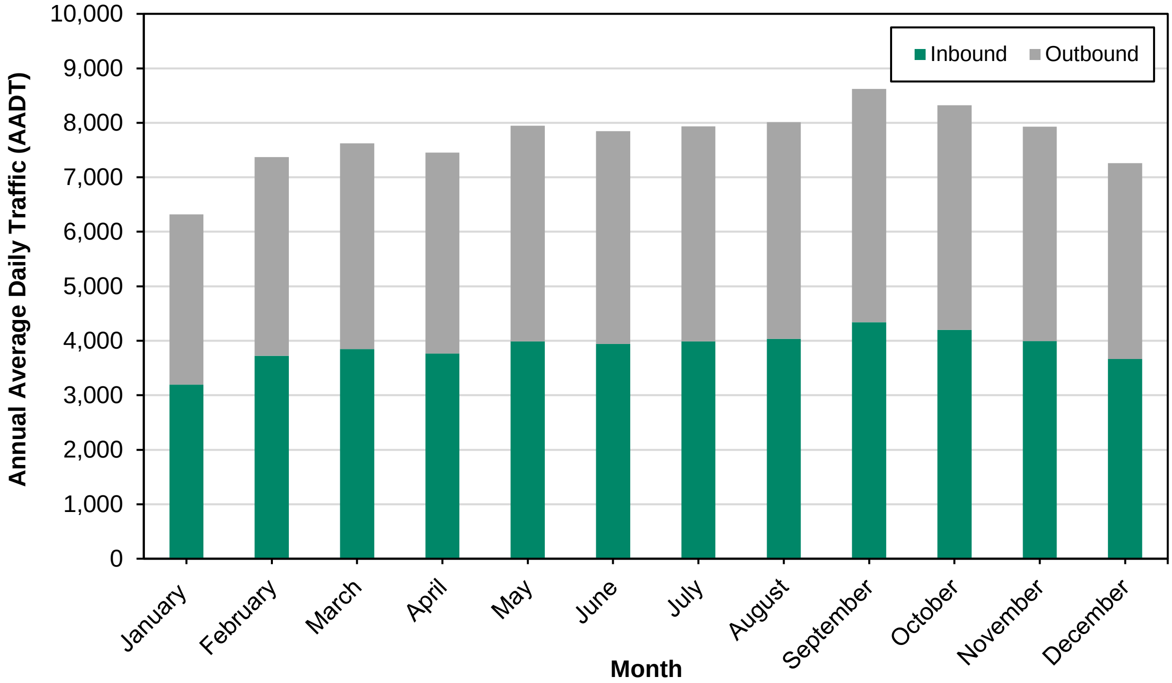

Figure 6-18 Traffic volumes on Arnhem Highway east of Stuart Highway (Station UDVDP019) by month of year

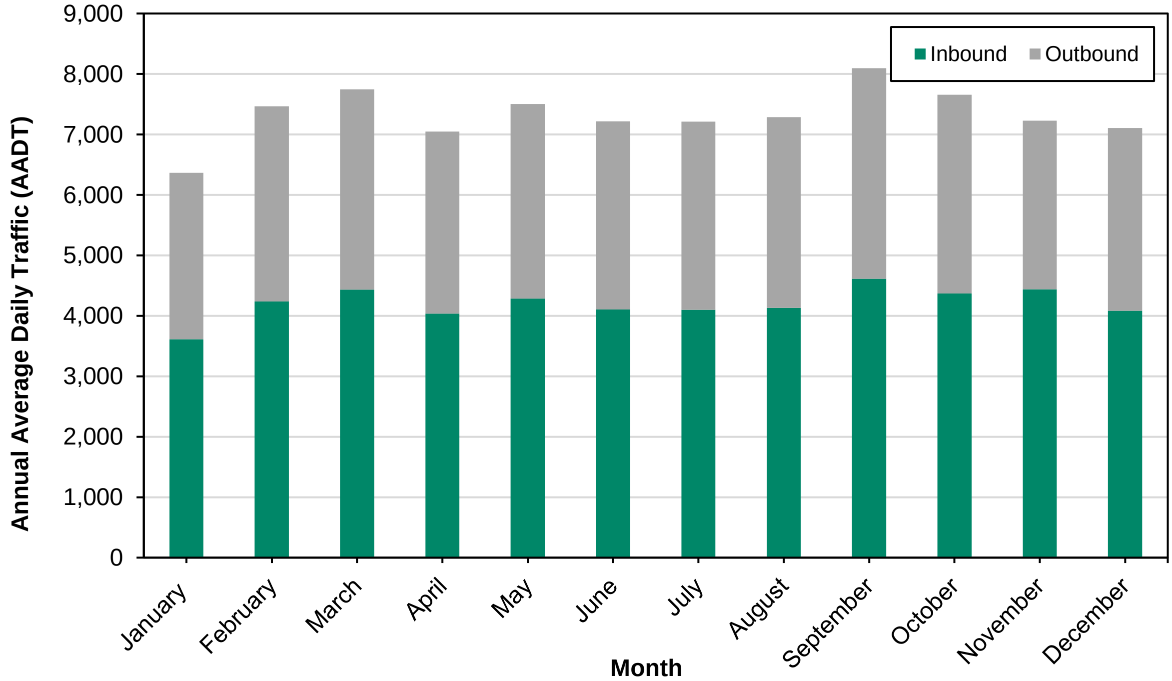

Figure 6-19 Traffic volumes on Berrimah Road south of Tiger Brennan Road (Station UDVDP028) by month of year

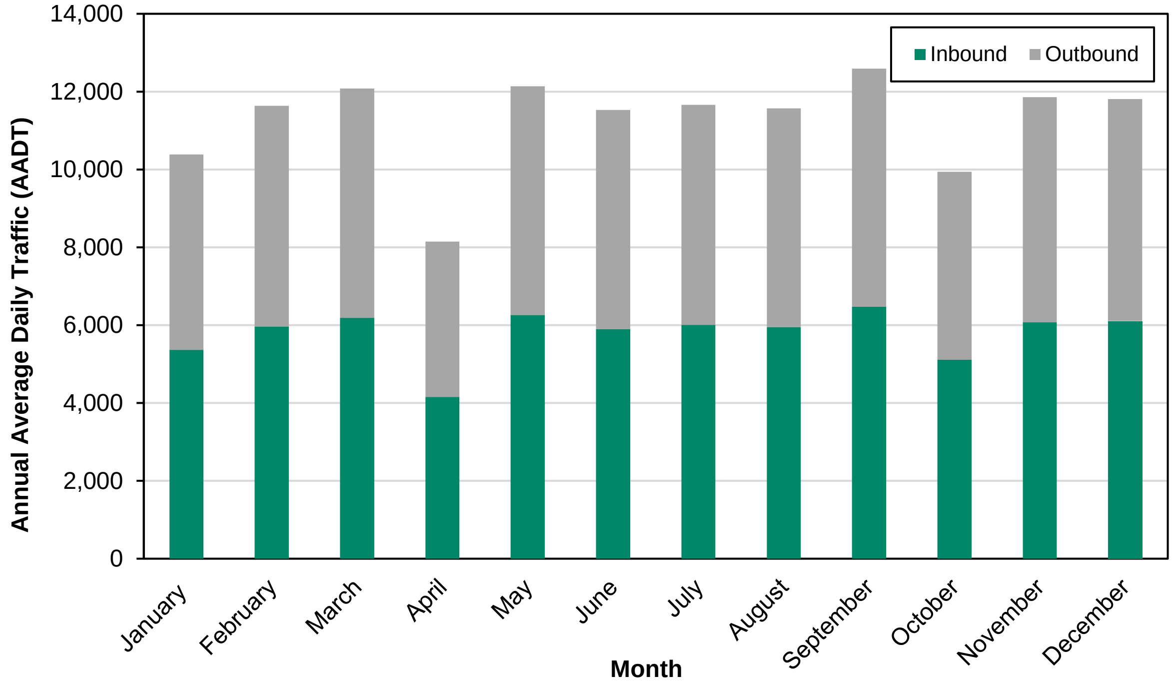

Figure 6-20 Traffic volumes on Kirkland Avenue (Station UDVDP085) by month of year

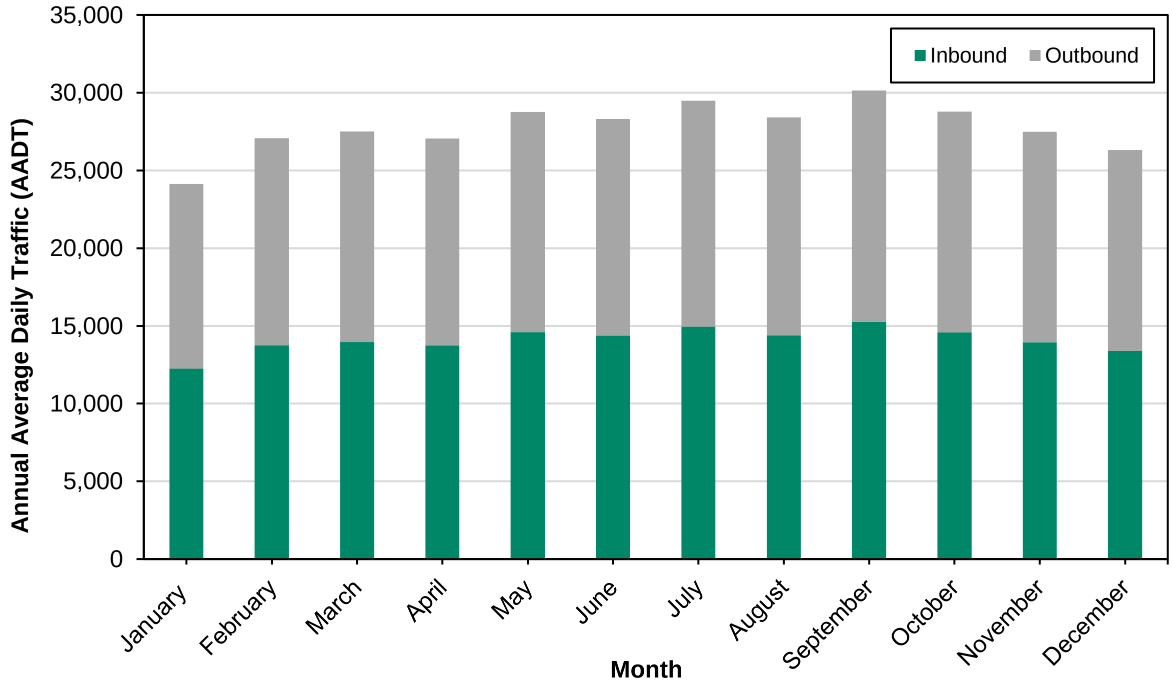

Figure 6-21 Traffic volumes on Stuart Highway (Station UDVDP017) by month of year

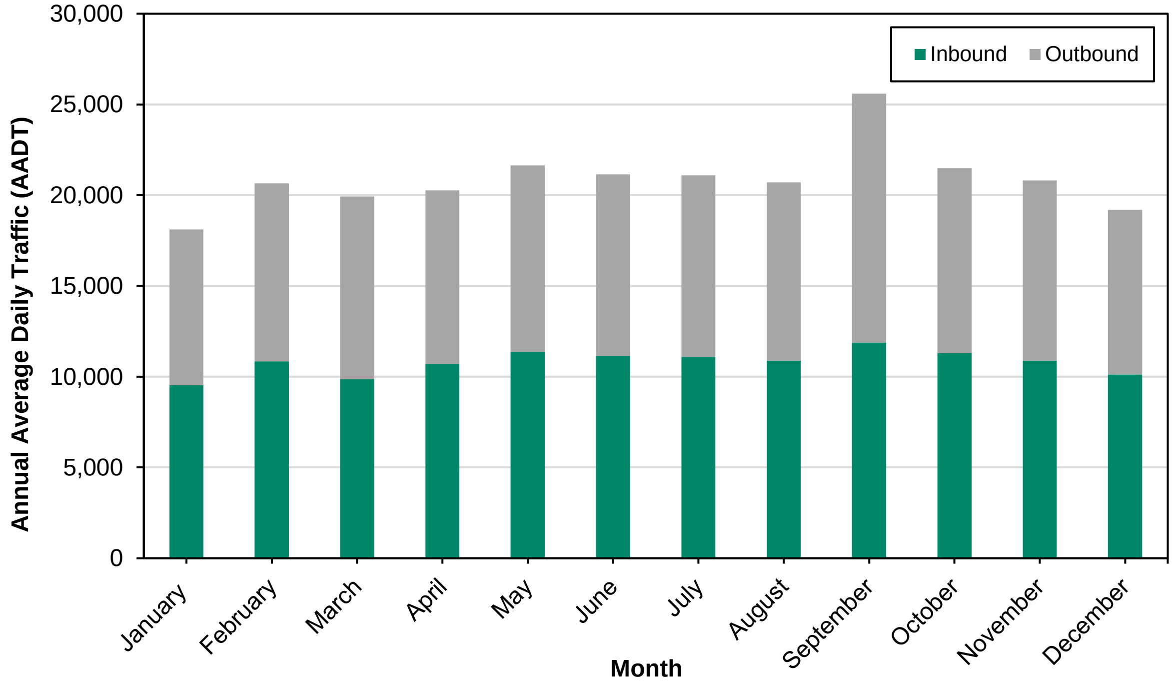

Figure 6-22 Traffic volumes on Tiger Brennan Drive (Station UDVDP022) by month of year

Table 6-3 shows a breakdown of traffic volumes by vehicle classification. Light vehicles (≤3 axles) account for the majority traffic on the local road network. Heavy vehicles (>3 axles) account for 3.6% of traffic volumes on the Arnhem Highway near the Stuart Highway and 11.6% of traffic volumes west of the Adelaide River Bridge.

Berrimah Road forms part of the National Land Transport Network, and as such, experiences a relatively high proportion of heavy vehicles (8.3% to 27.4%). The proportion of heavy vehicles increases on Berrimah Road west of Casey Street upon the approach to the port. It should be noted that while Tiger Brennan Drive also forms part of the National Land Transport Network, a low proportion of heavy vehicles is reflected in Table 6-3 as the count station is located to the west of Berrimah Road (where vehicles divert to access the port and rail facilities at East Arm).

Table 6-3 Traffic volume composition by vehicle classification

Road	Station ID	Station location	Direction of travel	Composition of traffic volume (%)		
				Light vehicles (≤3 axles)	Heavy vehicles (3 - 6 axles)	Long vehicles (>6 axles)
Arnhem Highway	UDVDP019	500 m east of Stuart Highway	Inbound	96.5	1.6	2.0

6.4 Critical intersections

This section describes the intersections that are expected to be impacted most by additional traffic volumes generated by the Project. The key intersections include:

A. Quarry Access Road / Arnhem Highway

B. Arnhem Highway / Stuart Highway

C. Stuart Highway / Henning Road / Girraween Road

D. Stuart Highway / Lambrick Avenue / Howard Springs Road

E. Stuart Highway / Temple Terrace / Glyde Point Road

F. Tiger Brennan Drive / Wishart Road / Tivendale Road

G. Tiger Brennan Drive / Berrimah Road

H. Berrimah Road / Wishart Road

I. Stuart Highway / Jenkins Road

J. Stuart Highway / Channel Island Road

K. Channel Island Road / Wickham Point Road.

The layout of each intersection is shown in Figure 6-23.

A) Quarry Access Road / Arnhem Highway
(uncontrolled intersection)

B) Stuart Highway / Arnhem Highway
(signalised intersection)

C) Stuart Highway / Henning Road
(signalised intersection)

D) Stuart Highway / Lambrick Avenue
(signalised intersection)

E) Stuart Highway / Temple Terrace
(signalised intersection)

F) Tiger Brennan Drive / Wishart Road
(signalised intersection)

G) Tiger Brennan Drive / Berrimah Road
(signalised intersection)

H) Berrimah Road / Wishart Road
(signalised intersection)

I) Stuart Highway / Jenkins Road
(signalised intersection)

6.5 Existing sustainable modes of transport

6.5.1 Pedestrians and cyclists

The active transport network surrounding the Project site is shown in Figure 6-24 and includes the following infrastructure for pedestrians and cyclists:

- An on-road bicycle lane on the eastern side of Berrimah Road between Marlow Road and Wishart Road
- A shared footpath on the southern side of Tiger Brennan Drive between Berrimah Road and the Darwin CBD
- A shared footpath on the northern side of the Stuart Highway between Coolalinga and the Darwin CBD
- A shared footpath on the southern side of the Arnhem Highway near Humpty Doo
- A shared footpath along the western side of Berrimah Road between Marlow Road the Stuart Highway.

Figure 6-24 Active transport network

Basemap source: Esri

6.5.2 Public transport

Seven regular public bus routes operate on roads forming part of the site access routes. These routes are operated by CDC Northern Territory and generally facilitate travel between Darwin, Palmerston and Humpty Doo, as shown in Figure 6-25. The frequencies of weekday bus services are shown in Table 6-4. Approximately 55 bus services travel along the proposed haulage routes on an average weekday (Northern Territory Government, 2022).

There are no existing or proposed public bus services within 400 m of the Project site at the DLNG facility or the intermediate stockpile site at Darwin Port, a distance that best represents the walkable catchment for access to bus stops.

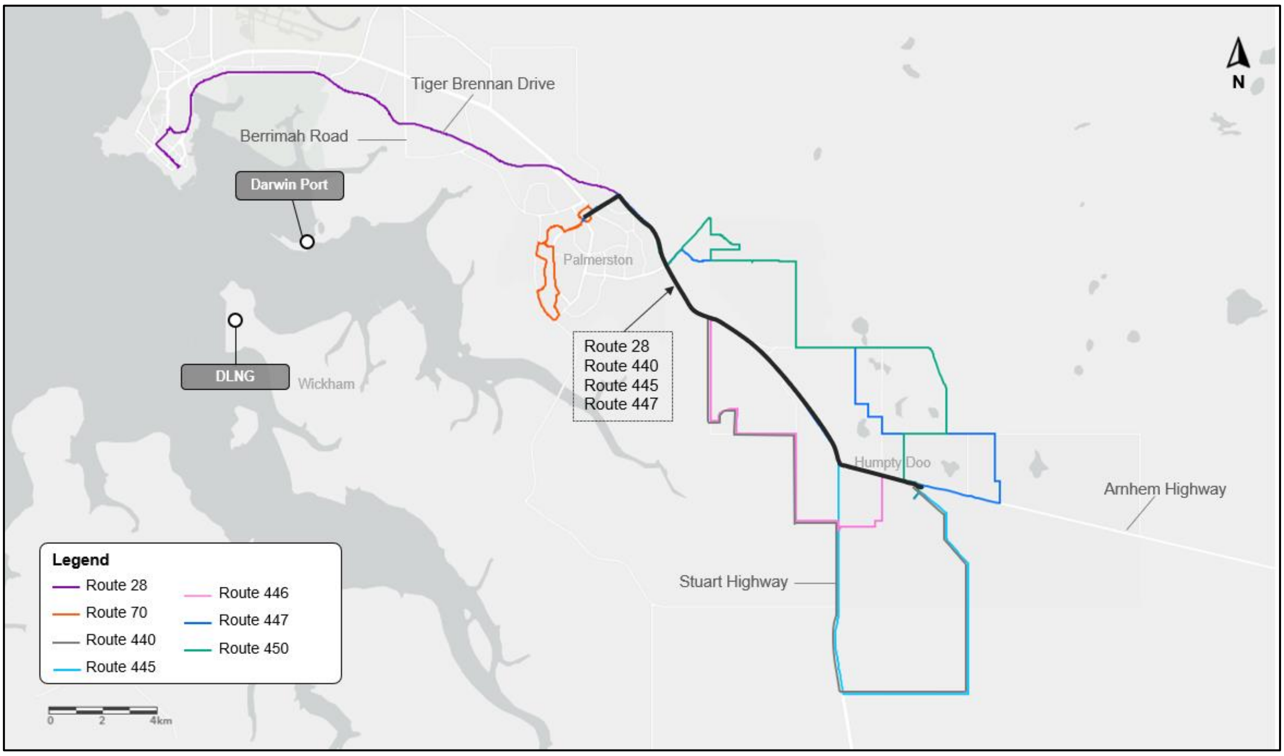

Figure 6-25 Public bus routes in the study area

Basemap source: Esri

Table 6-4 Public bus routes that travel along the proposed site access routes

Bus route	Direction	Number of weekday services	
		AM	PM
28	Humpty Doo Park and Ride to Darwin via Coolalinga Park and Ride and Palmerston	3	0
	Darwin to Humpty Doo Park and Ride via Palmerston and Coolalinga Park and Ride	0	3
70	Palmerston to Palmerston via Driver and Moulden	10	18
440	Humpty Doo Park and Ride to Humpty Doo Park and Ride via Coolalinga Park and Ride, Virginia, Noonamah and Palmerston	1	1
445	Humpty Doo Park and Ride to Palmerston via Cox Peninsula, Noonamah and Coolalinga Park and Ride	2	0
	Palmerston to Humpty Doo Park and Ride via Coolalinga Park and Ride, Noonamah and Cox Peninsula Road	0	3
446	Bees Creek to Palmerston	2	
	Palmerston to Bees Creek		3
447	Humpty Doo Park and Ride to Palmerston via McMinns Lagoon and Howard Springs	2	1
	Palmerston to Humpty Doo Park and Ride 447 via Howard Springs and McMinns Lagoon	0	4

Bus route	Direction	Number of weekday services	
		AM	PM
450	Humpty Doo Park and Ride to Palmerston via Girraween and Howard Springs	1	0
	Palmerston to Humpty Doo Park and Ride via Howard Springs and Girraween	0	1
	Total	**21**	**34**

Source: Northern Territory Government, 2022

The Adelaide-Darwin railway alignment is located approximately 750 m north-west of the intermediate stockpile site at Darwin Port. This transcontinental railway line serves both passenger and freight traffic and extends in the north-south direction between Adelaide and Darwin via Alice Springs.

The Ghan is a passenger service operated by the Great Southern. Two passenger services are provided per week from June until September and one service is provided per week during all other months. The Ghan passenger service originate / terminates at the Darwin Train Station located on Saloo Street, East Arm. Aurizon (formerly One Rail Australia) provides six weekly freight services between Adelaide and Darwin (Aurizon, 2022). A number of additional bulk trains operate on the line between various mine sites and the Port of Darwin.

The Adelaide-Darwin railway line is grade separated from Berrimah Road at East Arm. However, two level railway crossings are located on Kirkland Road and one is located on Channel Island Road.

6.6 Crash history

A review of historical crash data was undertaken to provide an assessment of crash statistics and trends associated with key roads in the study area. A summary of the results is provided in Table 6-5. It should be noted that the results include crashes recorded on the entire length of the carriageway and therefore some crashes may have occurred outside of the study area.

In the five-year period from 2015 to 2019, a total of 135 crashes were recorded on the Stuart Highway. 19 of these crashes occurred at the intersection of the Stuart Highway and Howard Springs Road and 13 occurred at the intersection of the Stuart Highway and Lambrick Avenue. Several road improvements works are proposed for the Stuart Highway corridor, including the road safety upgrades at Coolalinga and intersection works at Howard Springs Road and Lambrick Avenue.

Tiger Brennan Drive recorded a total of 91 crashes over the five-year period resulting in a total of five fatalities. Seven crashes occurred intersection of Tiger Brennan Drive and Berrimah Road. A grade-separated overpass is proposed to be constructed at the Tiger Brennan Driver and Berrimah Road. The overpass will enable the continuous flow of traffic along Tiger Brennan Drive and separate major traffic flows, reducing the crash risk at the intersection.

Berrimah Road recorded a total of 19 accidents of which one was fatal. Five of accidents occurred at the Wishart intersection and seven occurred at the Tiger Brennan Drive intersection. Much of the network has undergone upgrades since these incidents occurred, particularly at key, high profile intersections such as Stuart Highway / Howard Springs Road and intersections on Wishart Road.

Table 6-5 Crash history (2015-2019)

Road	Total accidents	Intersection	Total persons	
			Fatal	Admitted to hospital
Berrimah Road	19	Wishart Road – 5	1	2
		Tiger Brennan Drive – 7		
Kirkland Road	36	Elrundie Avenue – 2	0	9

Road	Total accidents	Intersection	Total persons	
			Fatal	Admitted to hospital
		Wishart Road – 6		
		University Avenue – 2		
Stuart Highway	135	Howard Springs Road – 19	1	33
		Roystonea Avenue – 4

7.0 Project Description

7.1 Construction

7.1.1 Construction schedule

While construction activities may begin in Q3, subject to regulatory approvals, for the purposes of the TIA an indicative construction schedule commencing in Quarter 4 of 2023 has been used which extends over a duration of approximately 12 months. This indicative construction schedule is shown in Figure 7-1, noting the precise timing and duration of construction activities will be subject to the Project design refinement and construction requirements.

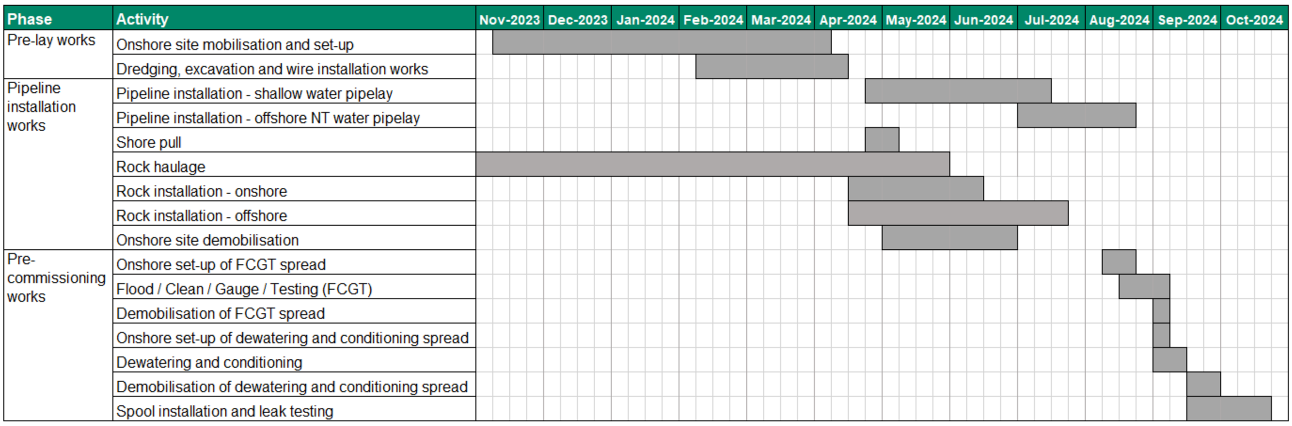

Figure 7-1 Indicative construction schedule

7.1.2 Construction hours

To enable the construction of the Project to be completed within the proposed timeline, construction activities are proposed to be undertaken on a 24-hour day and seven days per week basis. The current planning is two 12-hour shifts each day, commencing at 6:00 am and 6:00 pm.

7.1.3 Overview of construction traffic generating activities

7.1.3.1 Pre-lay works

Mobilisation at shore crossing

The onshore crossing site is located within the existing DLNG disturbance envelop at Wickham Point. This site would support the shore pull scope of works and would be used for the flood, clean, gauge, testing (FCGT) scope once the Project pipeline has been fully installed.

Mobilisation at the shore crossing would involve the following activities:

- Vegetation regrowth clearing
- Civil works and grading of the onshore shore pull site location, construction of a levelled lay-down area for the winch foundation
- Import of clean fill
- Preparation of lay down areas, access roads, hardstand (geotextile and road base) and site fencing
- Installation of the winch spread, including winch pad, holdback anchor and/or sheet piling
- Installation of bedding rock and or rollers for the shore pull
- Installation of facilities including offices, amenities, chemical and fuel storage, ASS storage and treatment.

Dredging and excavation

In shallower waters, some sections of the Project pipeline will require stabilisation due to exposure to waves, currents and tidal movement, and impact protection from third-party activities (i.e. anchors). As such, some sections of the Project pipeline will be installed in a trench in the seafloor to protect it from such instabilities and activities. Trenching will be required in both the Darwin Harbour (i.e. nearshore) and shore crossing locations.

Dredging vessels will be used to perform trenching within Darwin Harbour. Excavators would be used from onshore to dig the trench through the shore crossing at the DLNG facility. To support this, some temporary shoreline modifications may be required, including the construction of a cofferdam using sheet piling to help retain trench walls and a temporary groyne so the excavators can operate further from the current shoreline. The temporary groyne would be built with imported rock and fill and pushed out with the tide.

7.1.3.2 Pipeline installation

Shallow water and deep-water pipelay

The Project pipeline will be laid using a continuous assembly pipe-welding installation method, which involves the assembly of the single pipe joins (approximately 12 m in length) in a horizontal working plane onboard the pipelay vessel. The Project pipeline is proposed to be sequentially laid, beginning at the shore crossing and moving through Darwin Harbour. Shallow water pipelay, including waters of Darwin Harbour, will be performed using a shallow water pipelay barge. A deepwater pipelay vessel will be used in deeper water outside of Darwin Harbour. Some shallow water and deep-water pipelay may occur concurrently.

Pipeline shore pull

The Project pipeline will be pulled ashore from the pipelay vessel using a conventional winch operation. The arrangement for the shore pull consists of a winch spread installed on a winch pad and attached to a hold back anchor located onshore. The pulling arrangement will allow for the shore pull to be completed as a continuous operation, which may take approximately two weeks.

Trench backfill

The primary method of maintaining pipeline stability on the seabed will be through the concrete weighted pipeline coating. It will also be necessary to install localised secondary stabilisation/protection for sections within Darwin Harbour where the concrete weighted coating alone is not considered sufficient to provide stability and/or protection. Backfilling will be required at trench locations in Darwin Harbour and shore crossing to maintain pipeline stability and protection.

Rock is proposed to provide pipe stabilisation and protection. Rock placement works would likely occur via fallpipe vessel or side dump vessel; self-propelled dynamically-positioned vessels that are used to install rock the seabed with support barges used to transport rock. Backhoe dredges shall also be used to install rock in shallow water at the shore crossing with the rock being bought alongside the Backhoe dredges on barges.

The rock material is proposed to be sourced onshore from the HB Quarry at Mount Bundey and would be delivered via the road network to an intermediate stockpile located at Port Darwin (East Arm Wharf). The rock material would be internally transferred from the intermediate stockpile to quayside by means of trucks. Approximately two or three cranes would place the rock onto the vessel for rock placement activities.

A smaller proportion of rock material would be transported via the road network to the DLNG site for rock installation works at the shore crossing.

7.1.3.3 Pre-commissioning

Flood / Clean / Gauge / Testing (FCGT) and dewatering

Once installed, the Project pipeline internal surfaces need to be cleaned, tested and preserved in preparation to carry hydrocarbons. This is conducted through pigging. A series of pigs (inspection gauge used to manage liquid accumulation) will be pushed through the pipeline to clean the pipeline, gauge the pipeline and ensure all air is removed during the flooding process. Pig launcher/receivers

(PLRs) will be installed on the pipeline end termination point in Commonwealth waters and at the shore crossing.

7.1.3.4 Demobilisation at shore crossing

Following the completion of shoreline construction activities (i.e. shore pull and winch spread) and pre-commissioning activities, the pipeline will be backfilled with the remaining 20-30 m (at the DLNG end) left in the ground unburied for a period of time ready for plant tie-in. Following these works the pipeline trench will be completely backfilled, and the site returned to an agreed condition.

7.2 Operation

Operation of the Project is anticipated to commence in the first half of 2025. The activities associated with the operations phase include:

- Commissioning and transport of dry hydrocarbons through the pipeline
- Inspection, maintenance and repair (IMR) of the installed infrastructure.

Operations and maintenance of the Project pipeline is expected to follow the same, or very similar management procedures currently used by Santos to operate and manage the Bayu-Undan to Darwin pipeline. Routine planned vessel-based IMR activities are expected to occur on a scale of year/s between surveys. Therefore vessel-based activities during operations will be far lesser than for construction.

7.3 Decommissioning

The Project field life is expected to be approximately 25 years. At the end of the Project, the Project pipeline and associated facilities would be decommissioned in accordance with regulatory requirements at that time.

7.4 Site access

7.4.1 DLNG site

The DLNG site at Wickham Point would be accessed from Wickham Point Road. Access to the DLNG site would be required for the construction, operation and decommissioning phases of the Project. Normal pipeline operations will not require additional personnel over and above normal staffing of the DLNG facility.

Travel between the DLNG site and major centres located to the north of the Project, including Darwin and Palmerston, would be via Wickham Point Road, Channel Island Road and Elrundie Avenue. The delivery of rock materials to the DLNG site from the HB Quarry would occur via Wickham Point Road, Channel Island Road, Jenkins Road, Stuart Highway and Arnhem Highway. This haulage route is further discussed in Section 8.1.

7.4.2 Darwin Port

Darwin Port would be accessed via a secure gated entrance on Berrimah Road. Access to Darwin Port would be required during the construction phase of the Project for the delivery of rock materials to the intermediate stockpile. The proposed haulage route between the HB Quarry and Darwin Port is detailed in Section 8.1.

8.0 Heavy vehicle route assessment

8.1 Rock haulage route

The proposed transportation route of rock materials from the supplier, HB Quarry at Mount Bundey, to the stockpile area in Darwin Port at East Arm and DLNG facility at Wickham is have been reviewed for this TIA. Two routes are explored as below:

- **To DLNG** – Approximately 102 km from HB Quarry, estimated one-way trip – 1 hr 7 minutes.
- **To Darwin Port** – Approximately 98 km from HB Quarry, estimated one-way trip – 1 hr 11 minutes.

8.1.1 Darwin Port

The majority of rocks will be transported to the intermediate stockpile area at Darwin Port to provide pipe stabilisation and protection.

This haulage route will begin at HB Quarry and trucks will travel westbound on Arnhem Highway to reach the signalised intersection with Stuart Highway in Humpty Doo. The route will continue northbound via a dedicated right turn to stay on Stuart Highway and eventually merging with Tiger Brennan Drive (grade separated). Upon reaching the signalised interchange with Wishart Road, trucks will turn left, then make another left at Berrimah Road before reaching Darwin Port at the end of the road. It is expected that the same route will be taken in reverse for outbound trips.

This journey provides a direct and efficient route to Darwin Port. Additionally, these roads and intersections currently provide access for heavy vehicles meaning there are no additional provisions required and no concerns regarding turning movements.

The route will bypass the following intersections:

- Arnhem Highway / Stuart Highway
- Tiger Brennan Drive / Berrimah Road
- Berrimah Road / Wishart Road

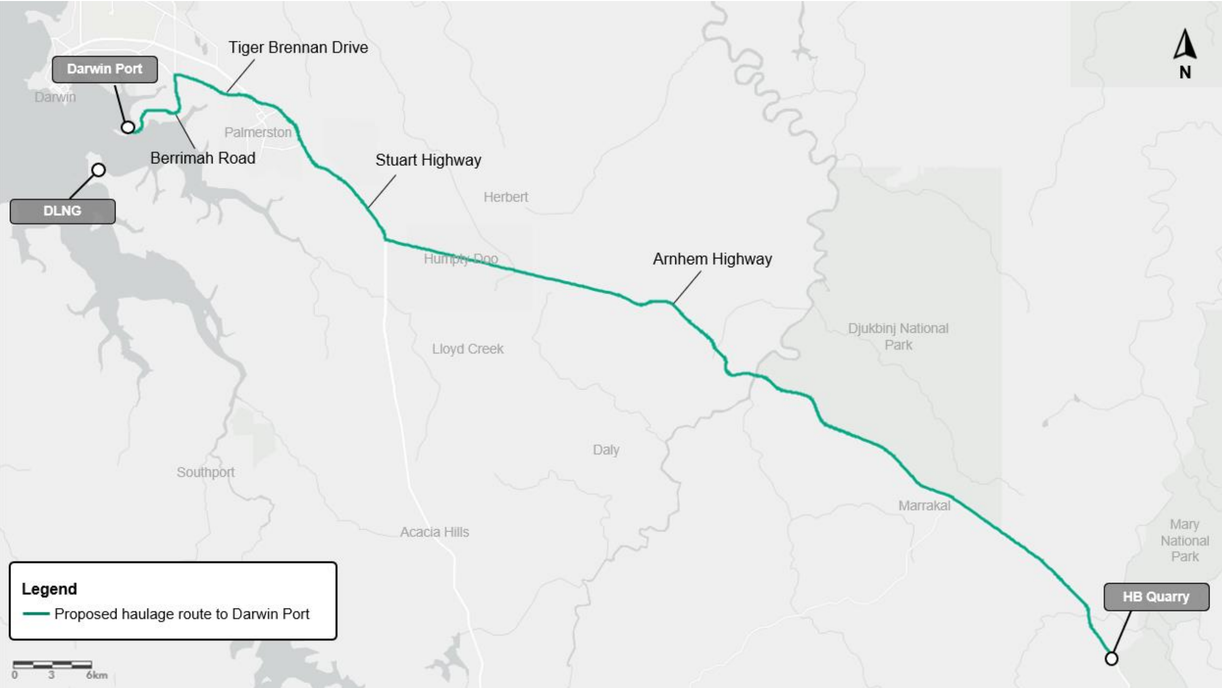

Figure 8-1: Proposed haulage route to Darwin Port

Source: Google Maps © 2022

8.1.2 DLNG

A small proportion of rock materials would be transported via the road network to the DLNG site for rock installation works at the shore crossing.

The haulage route to DLNG will begin at HB Quarry and take the same route as Darwin Port until the intersection of Arnhem Highway and Stuart Highway in Humpty Doo. Trucks will turn at the priority controlled left turn leg and continue on Stuart Highway then turn right at the Jenkins Road and Stuart Highway signalised intersection. At the end of Jenkins Road, the route will continue by taking a left onto Channel Island Road and then a right at Wickham Point Road intersection where the DLNG will be found at the end of the road. It is expected that the same route will be taken in reverse for outbound trips.

This haulage route provides the most direct and efficient route to DLNG. It uses roads and intersections which currently provide access for heavy vehicles meaning there are no additional provisions required and no concerns regarding turning movements.

The route will bypass the following intersections:

- Arnhem Highway / Stuart Highway
- Stuart Highway / Jenkins Road
- Jenkins Road / Channel Island Road
- Channel Island Road / Wickham Point Road

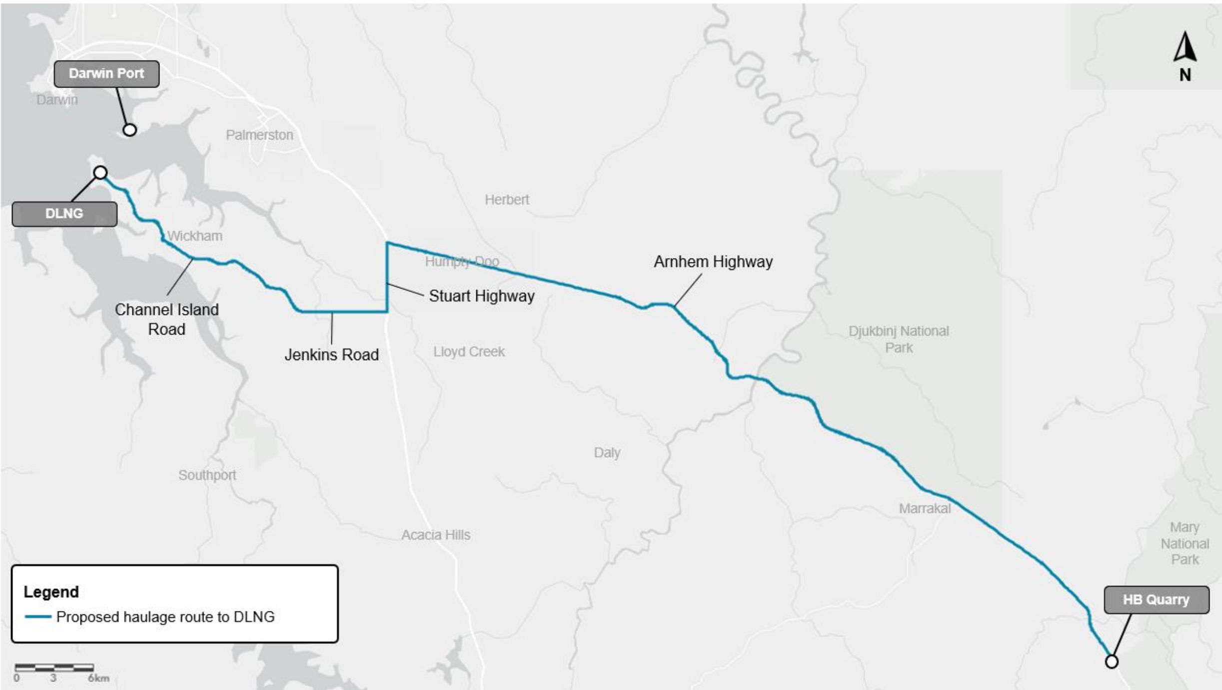

Figure 8-2: Proposed haulage route to DLNG

Source: Google Maps © 2022

8.2 Other haulage routes

General construction equipment (e.g. earth moving machinery and cranes) would likely be sourced from the greater Darwin region. As there may be multiple locations of suppliers, the exact haulage route will need to be planned prior to transportation by the relevant contractor. The routes must follow the road train route outline in Figure 8-3. In general, the Greater Darwin region is within 20 minute drive from the Darwin Port and accessible to many road train approved roads.

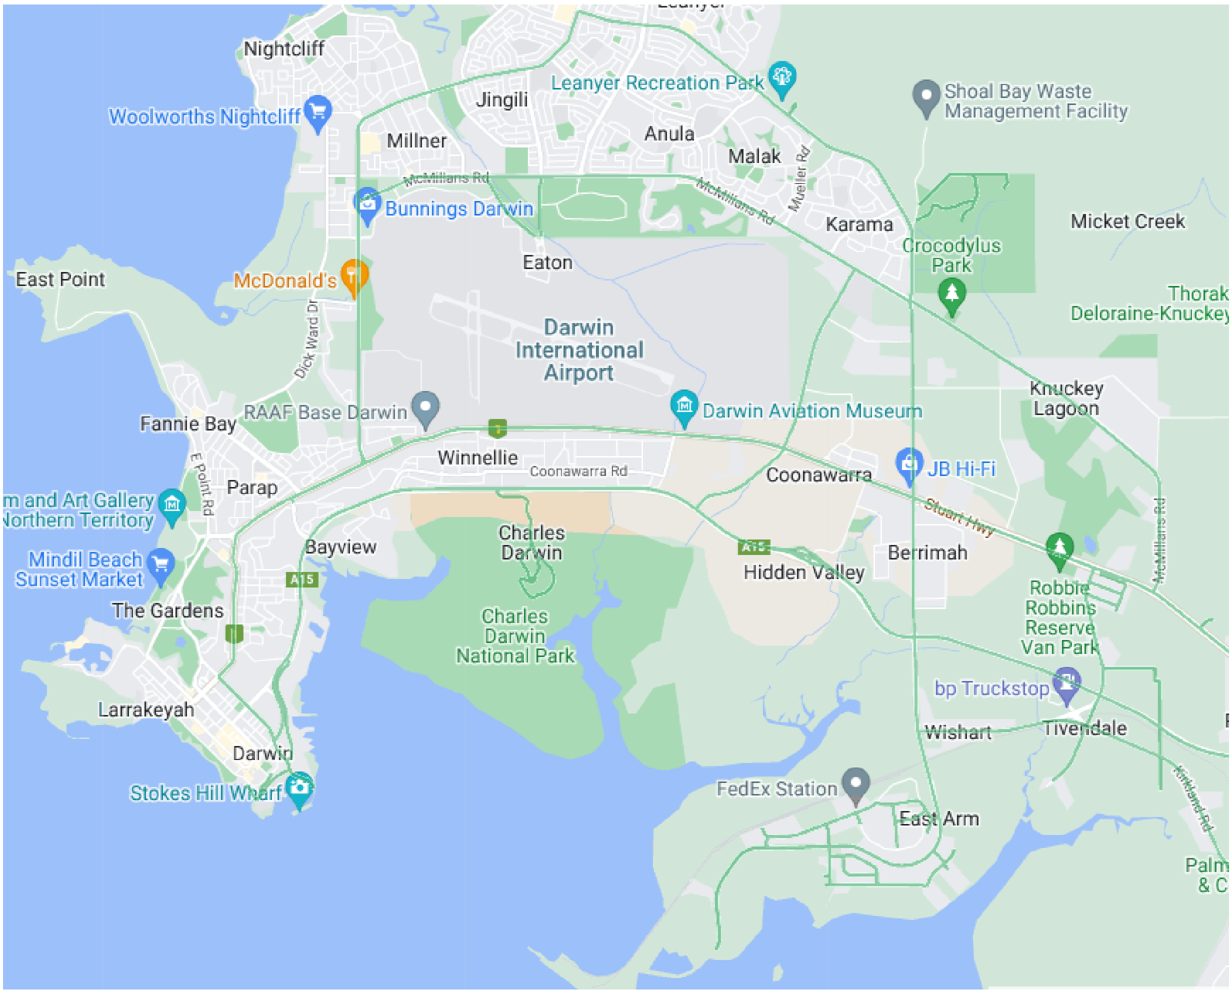

Figure 8-3: Road Train 53.5m approved networks in Greater Darwin

9.0 Traffic Generation

9.1 Construction phase

The traffic generating activities associated with the construction of the Project include the transportation of staff, haulage of rock and delivery of equipment and materials to Darwin Port, the DLNG site and Fort Hill Wharf. Further details on these traffic generating activities are provided in the sections below.

9.1.1 Construction staff

Accommodation would be provided on the Project vessel fleet for the majority of construction staff. Liveaboard construction staff are expected to be sourced from two locations. A portion of liveaboard construction staff will arrive at Darwin Airport and would be transported to the Fort Hill Wharf where staff will transfer to the vessels. Bus movements are anticipated to peak in July 2024, with up to seven buses transporting 364 personnel to the Fort Hill Wharf for the deep-water pipelay component of the Project every month.[1] There will also be liveaboard staff sourced locally in the Darwin region who will transfer daily between Fort Hill Wharf and residential areas within Darwin. The liveaboard construction staff will be responsible for the pipeline installation, offshore rock installation and dredging and excavation works.

Construction staff associated with the onshore works would likely commute daily to the DLNG site from an established workforce accommodation facility which is still to be determined. For the purpose of this TIA, the workforce accommodation facility is assumed to be located at Bladin Village, noting that any change to this arrangement may necessitate further assessment. Bladin Village can accommodate up to 750 people and is located approximately 8 km from the DLNG site on Channel Island Road. Staff are anticipated to travel to and from the DLNG site using a mix of light vehicles including cars, light utility trucks and vans.

Figure 9-1 provides a breakdown of the anticipated number of onshore based staff by construction activity. The number of staff commuting to the Project daily is expected to peak at 160 in March 2024. Approximately 120 staff would commute to the DLNG site each day, with the remaining 40 staff commuting to either the HB Quarry or Port Darwin to support the rock haulage scope of works. The majority of staff movements to the DLNG site would be split between the two 12-hour shifts commencing at 6:00 am and 6:00 pm. Staff movements associated with the site mobilisation and rock haulage activities are assumed to occur over the 12-hour day shift only. Staff are expected to arrive within the 30-minute period prior to shift start and depart within the 30-minute period after shift end. As such, the peak hours of traffic generation would be from 5:30 am to 6:30 am and 5:30 pm to 6:30 pm. The indicative peak number of light vehicle movements during construction is summarised in Table 9-1.

Table 9-1 Indicative light vehicle movements during peak construction

Site	AM Peak (5:30am-6:30am)		PM Peak (5:30pm-6:30pm)	
	To site	From site	To site	From site
DLNG	22	0	0	22
Port Darwin	18	0	0	18
HB Quarry	20	0	0	20
Fort Hill Wharf	50	50	50	50

[1] A bus capacity of 55 passengers has been assumed in this TIA

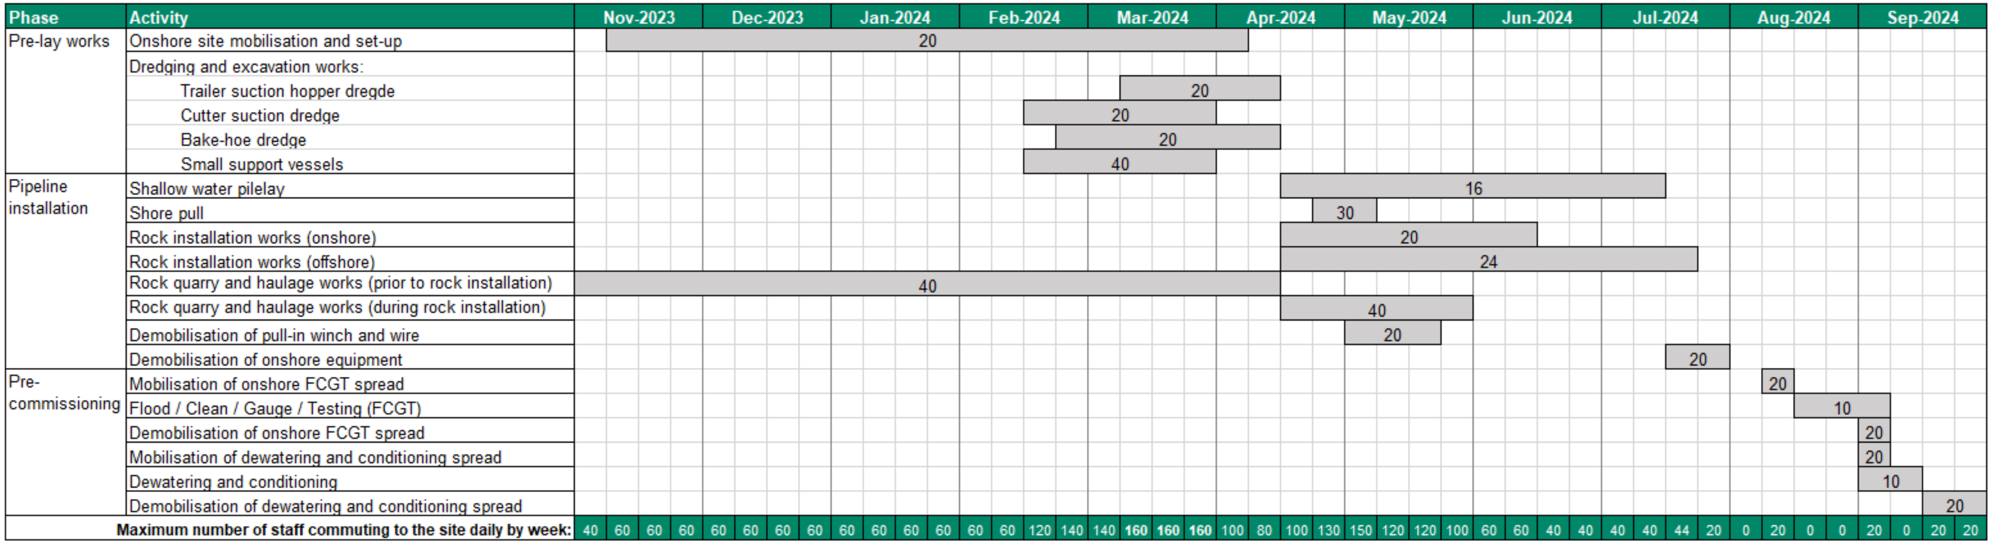

Figure 9-1 Indicative staff movements during construction of the Project

9.1.2 Rock haulage

As discussed in Section 7.1, large quantities of rock will be required to provide pipeline protection and stability within Darwin Harbour. The rock is proposed to be sourced from the HB Quarry at Mount Bundey and would be transported via the road network to Port Darwin and the DLNG site. The proposed haulage routes to are discussed in Section 7.1.2.

It is anticipated that 175,000 tonnes of rock will be required for the Project. The majority of rock (87.5%) will be delivered to the intermediate stockpile at Port Darwin, with the remaining rock (12.5%) delivered to Project area at the DLNG site.

The indicative number of one-way heavy vehicle movements generated by the transportation of rock summarised in Table 9-2. For the purpose of this impact assessment, the number of movements has been conservatively estimated by assuming the rock will be transported by Triple Road Trains (75 tonne payload). However, it is acknowledged that the local road network would support Quadruple Road Trains (100 tonne payload), which may achieve higher productivity and reduce the total number of heavy vehicle movements required.

Approximately 75% of the rock (1,750 loads) are proposed to be transported prior to the start of the rock placement works. The remaining 25% of rock (585 loads) would be transported while rock installation is ongoing. As shown in Table 9-3, the duration of rock installation works is anticipated to be 6.5 weeks, requiring approximately 13 loads to be delivered per day. The majority of heavy vehicle movements are expected to occur seven days a week during daylight hours.

Table 9-2 Indicative number of heavy vehicle movements required for rock transportation

Destination	Rock type	Quantity (tonnes)	Number of heavy vehicle movements (one-way)[1]
Port Darwin	Bedding	7,900	105
	Filter 30mm	42,800	570
	Armour 400mm	102,500	1,365
	Total	**153,200**	**2,040**
DLNG facility	Bedding	870	10
	Filter 30mm	1,400	20
	Armour 500mm	19,700	265
	Total	**22,000**	**295**

Table notes:

[1] Based on a vehicle payload of 75 tonnes and values have been rounded to the nearest five.

Table 9-3 Indicative daily and hourly heavy vehicle movements

	Indicative timing / duration	Number of loads per day	Number of one-way movements per hour[1]
Prior to rock placement works[2]	52 weeks	5	1
During rock placement works	Mid-April to May 2024 (6.5 weeks)	13	2

Table notes:

[1] Deliveries are assumed to be evenly distributed over a 12-hour period and occur seven days per week.

[2] Rock haulage prior to placement works is assumed to occur over a 52-week period.

9.1.3 Equipment and materials

Pipe for the offshore component of the pipeline would be shipped from international waters and transferred to the pipelaying vessel offshore. Pipe required to construct the onshore component of the pipeline is proposed to be transported to the Project area via the road network. Other equipment that would be transported to the DLNG site via the road network is detailed in Table 9-4.

General construction equipment (e.g. earth moving machinery and cranes) would likely be sourced from the greater Darwin region. Specialist equipment required for the pre-commissioning scope of works (FCGT and dewatering) is expected to originate from Perth. This equipment would be transported via the road network to a designated staging area located outside of Darwin prior to being transported to the DLNG site.

Heavy vehicle movements associated with the delivery of equipment and materials are expected to peak in September 2024 during the demobilisation of the FCGT spread and mobilisation of the dewatering spread. Up to 66 vehicles would be required, generating up to 132 one-way movements (66 movements to the DLNG site and 66 movements from the DLNG site) over a two-day period. Assuming heavy vehicle movements are evenly distributed over the two-day period and would occur over a 10-hour window, up to four inbound and four outbound movements would be generated each hour.

Table 9-4 Equipment to be transported to/from the DLNG site

Activity	Equipment	Delivery vehicle type	Number of vehicles	Indicative timings and duration	
				Mobilisation	Demobilisation
Earth moving	Offices/storage containers/workshop	Flatbed	6	November 2023 to March 2024 (30 days)	June 2024 (14 days)
	Gensets and miscellaneous equipment	Flatbed	2		
	Excavators	Low-loader	3		
	Front-end loaders	Low-loader	2		
	Moxies	Moxies	4		
	Dozer	Low-loader	1		
Crane[1]	100T self-drive crane	Crane	1	November 2023 to March 2024 (30 days)	September 2023 (10 days)
	20T self-drive Franna crane	Crane	1		
	Telehandlers	Low-loader	2		
Winch spread (pipe-pull to shore)	Linear winch	Flatbed	1	December 2023 to March 2024 (90 days)	May 2024 (14 days)
	Winch drums[2]	Low-loader	2		
	Control cabin and power packs	Flatbed	3		
Pipe (onshore pipelaying sections)	700m of onshore pipe[3]	Flatbed	30	November 2023 to March 2024 (30 days)	June 2024 (14 days)
	Telehandler	Low-loader	1		
	Side booms or excavators	Low-loader	4		
	Offices/storage containers /workshop	Flatbed	6		
	Gensets and miscellaneous equipment	Flatbed	2		
Flood / Clean / Gauge / Testing (FCGT)	20m^3 Iso Tanks for waste/condensate and hydrosure chemicals	Flatbed/ semi-trailer	3	August 2024 (3 days)	September 2023 (2 days)
	Hoses	Flatbed/ semi-trailer	2		
	Ablutions	Flatbed/ semi-trailer	2		

Activity	Equipment	Delivery vehicle type	Number of vehicles	Indicative timings and duration	
				Mobilisation	Demobilisation
	Stores container, workshop container, test cabin	Flatbed/ semi-trailer	3		
	Office	Flatbed/ semi-trailer	1		
	Water Winning Pontoon	Flatbed/ semi-trailer	1		
	Water Winning HDPE pipe	Flatbed/ semi-trailer	3		
	Frank tank	14.5 m wheeled trailer	1		
	Gensets and miscellaneous equipment	Flatbed/ semi-trailer	3		
	Pumps	Flatbed/ semi-trailer	3		
	Fuel tank	Flatbed/ semi-trailer	1		
	FCGT Pig launcher	Flatbed/ semi-trailer	1		
Dewatering	Compressors	Flatbed/ semi-trailer	16	September 2023 (2 days)	September 2023 (10 days)
	Air dryers	Flatbed/ semi-trailer	4		
	Nitrogen membrane units	Flatbed/ semi-trailer	4		
	Booster compressors	Flatbed/ semi-trailer	4		
	$20m^3$ Iso Tanks for MEG	Flatbed/ semi-trailer	10		
	Hoses and miscellaneous equipment	Flatbed/ semi-trailer	3		
	Hydrotest/dewatering Pig Launcher	Flatbed/ semi-trailer	1		

Table notes:

[1] Assumed to remain onsite for both pipelay and pre-commissioning scope of works

[2] Removed from site only

[3] Delivered to site only

9.2 Operation phase

Typical operation of the Project would involve the transportation of gas through the pipeline and the inspection, maintenance and repair of subsea and onshore infrastructure. Once construction of the Project has been completed, the DLNG facility would revert to the previous operational arrangements that have been in place since 2006. As such, operation of the Project is not expected to generate additional traffic movements on the local road network relative to existing operations and will not be further considered in this impact assessment.

9.3 Decommissioning phase

At the end of the Project, the Project pipeline and associated facilities would be decommissioned in accordance with regulatory requirements at that time. Traffic generated by the decommissioning phase of the Project would therefore be dependent on a Project decommissioning plan to be prepared and approved at a later date. As such, the decommissioning phase will not be further considered in this impact assessment.

10.0 Traffic Network Impact

10.1 Criteria and assumptions

10.1.1 Traffic generation and distribution

A summary of the traffic generation and distribution assumptions applied to this TIA is provided in Table 10-1.

Table 10-1 Summary of traffic generation and distribution assumptions

Assumption	
Liveaboard construction staff	
1.	The portion of liveaboard construction staff arriving at Darwin Airport travelling to Fort Hill Wharf would consist of up to 7 buses every 3-8 weeks and will avoid peak hour traffic.
2.	As the number of trips generated by the fly-in liveaboard staff is low and only occurs during the non-peak period once every 3-8 weeks, the impact is considered negligible and will not be considered in further detail.
3.	The exact routes and origin location of liveaboard staff residing in Darwin and transfer daily to and from the site are unknown at this stage. However, it can be assumed that the transfer routes and timings are unlikely to coincide. Alongside the low transfer volumes, the impact can be considered negligible and will not be considered in further detail.
Onshore construction staff	
4.	All staff commuting to the Project daily would originate from the existing workforce accommodation facility located at Bladin Village.
5.	All light vehicle movements generated by construction staff would occur within the 30-minute period prior to shift start and after shift end (i.e. 5:30 am to 6:30 am and 5:30 pm to 6:30 pm).
6.	The traffic generation rate in the peak periods would be one light vehicle per construction worker (i.e. no car-pooling or buses have been assumed).
7.	Construction staff would commute to the Project using a mix of light vehicles including cars, light utility trucks and vans.
8.	Staff movements associated with onshore site mobilisation/demobilisation and rock haulage activities would occur over the 12-hour day shift only.
9.	A cumulative maximum of 20 staff would be needed to support onshore mobilisation and demobilisation activities.
10.	Staff movements associated with general construction activities would be split between the two 12-hour shifts commencing at 6:00 am and 6:00 pm.
11.	Staff supporting the rock haulage scope of works would be split between the HB Quarry and the rock destination sites at Port Darwin and DLNG. An 87.5/12.5 percent staff split between Port Darwin and DLNG has been assumed in proportion to the rock distribution between the two sites.
Rock haulage activities	
12.	A vehicle payload of 75-tonnes has been assumed to provide a conservative impact assessment. It is acknowledged that the local road network would support Quadruple Road Trains (100 tonne payload), which may achieve higher productivity and reduce the total number of heavy vehicle movements required.

Assumption	
13.	Heavy vehicle movements generated by the rock haulage activities would occur seven days per week and be evenly distributed over daylight hours.
14.	Approximately 75% of the rock would be transported prior to the start of the rock placement works. The remaining 25% of rock would be transported over a 6.5 week period while the rock installation works is ongoing.
Equipment and material deliveries	
15.	Heavy vehicle movements associated with the delivery of equipment and materials would be evenly distributed over a 10-hour delivery window.

10.1.2 Lane capacities

Uninterrupted flow facilities

Section 4.2 in Austroads *Guide to Traffic Management Part 3: Traffic Studies and Analysis* establishes the capacity for a two-lane highway to be 1,700 passenger car units per hour (pcu/h) for each traffic lane. Accordingly, a capacity of 1,700 pcu/h for each traffic lane has been adopted for highways in the study area including the Arnhem Highway and Stuart Highway.

Interrupted flow facilities

Table 5.1 in Austroads *Guide to Traffic Management Part 3: Traffic Studies and Analysis* sets out typical one-way mid-block capacities for various types of urban roads with interruptions from cross and turning traffic at minor intersections. A capacity of 900 pcu/h for each traffic lane has been adopted for:

- Berrimah Road
- Wishart Road
- Kirkland Road
- Elrundie Avenue
- Jenkins Road
- Channel Island Road.

As Tiger Brennan Drive is a dual carriageway road with flaring at major intersections and absence of parking, a higher mid-block capacity of 1,200 pcu/h for each traffic lane has been adopted in accordance with Section 5.2.1 in Austroads *Guide to Traffic Management Part 3: Traffic Studies and Analysis.*

10.1.3 Annual background traffic growth

Growth factors have been applied to the 2022 traffic volumes in order to consider background traffic growth between existing conditions and the peak year of construction activity (2024).

The annual background traffic growth rates used in this study has been estimated based on the average growth in Annual Average Daily Traffic (AADT) observed over the last five-year period (2017-2021). As shown in Table 10-2, the Arnhem Highway has observed an average annual traffic growth rate of 2.2% near the Adelaide River Bridge since 2017. The Stuart Highway has experienced the highest average traffic growth rate in the study area at 4.6%. Several roads in the study area observed a decrease in AADT volumes including Berrimah Road, Channel Island Road and Kirkland Road. A growth rate of 0.0% has been adopted in this study for these roads to provide a conservative assessment.

Table 10-2 Growth in AADT on key roads within in the study area (2017-2021)

Road	Station	Location of station	Data range	Average annual traffic growth rate (%)[1]
	UDVDP019	500 m east of Stuart Highway	2017-2021	0.7

Road	Station	Location of station	Data range	Average annual traffic growth rate (%)[1]
Arnhem Highway	RDVDP007	2 km west of Adelaide River Bridge	2017-2021	2.2
Berrimah Road	UDVDP028	400 m south of Tiger Brennan Drive	2017-2021	-3.3
	UDVDP029	350 m west of Casey Street	2017-2021	-1.2
Channel Island Road	UDVDC072	South of Elizabeth River Bridge	2017-2021	-11.3
Elrundie Avenue	UDVDC062	100 m North of Chung Wah Terrace	2017-2021	1.1
Kirkland Road	UDVDP085	500 m west of West of Wishart Road	2017-2021	-1.4
Stuart Highway	UDVDP017	500 m west of Howard Springs Road	2017-2021	0.7
	UDVDP020	500 m north of Arnhem Highway	2017-2021	4.6
Tiger Brennan Drive	UDVDP022	800 m west of Berrimah Road	2017-2021	1.8

Table notes:

[1] *Where the growth rate is negative, a value of 0.0% has been adopted to provide a conservative assessment*

10.1.4 Passenger car unit equivalency factors

A passenger car unit equivalent (PCE) value of 2 will be used for heavy vehicles as per Table 4.1 in Austroads *Guide to Traffic Management Part 3: Traffic Studies and Analysis.*

10.2 Road mid-block capacity impact

10.2.1 Traffic volume data

Table 10-3, Table 10-4 and Table 10-5 compare the projected background 2024 traffic volumes with the estimated 2024 total traffic volume inclusive of construction volumes for each peak hour. The volumes have been calculated to represent a conservative estimate of the maximum traffic generated by the project on the road network at any given point. It is noted that these estimates are considered conservative as some works are unlikely to occur simultaneously following further refinement of the construction program for the Project.

The traffic volumes have been estimated based on the following:

- 2022 SCAT's data provided by DIPL (insert date provided)
- AADT data provided by DIPL (converted to peak hour volumes where SCAT's was not provided)
- Growth rates and other assumptions detailed in Section 10.1
- Construction traffic generation estimated in Chapter 9.0

The full assessment can be found in Appendix A.

The following conclusions are drawn from these findings:

- Berrimah Road, Wishart Road and Tiger Brennan Drive are used by heavy vehicles significantly more relative to the other assessed roads

- Traffic volumes are much lower in the midday peak than the AM or PM peaks for high use roads
- Project generated traffic makes up only a very small amount of the projected 2024 traffic.

Table 10-3 Two-Way Traffic generation AM peak

Road	Road Section	Without construction of Project (2024)			With construction of Project (2024)		
		LV	HV	HV%	LV	HV	HV%

Table notes:

[1] Peak hour traffic volumes have been estimated from AADT data

10.2.2 Mid-block capacity assessment

The results of the mid-block capacity assessment for the AM peak, midday peak and PM peak periods are shown in Figure 10-1, Figure 10-2 and Figure 10-3, respectively. It illustrates and compares the midblock volume to capacity ratio (V/C) of the existing road network and the construction volume added road network. Where a road's V/C is greater than 1, the volume of the road is deemed to have exceeded the capacity of the road and may affect the performance of road users.

The mid-block capacity has been assessed based on the following:

- Traffic volume data for the mid-block is sourced from Section 10.2.1
- Road capacity and other assumptions detailed in Section 10.1
- Where multiple sections of one road have been assessed, results are shown for the section of road presenting the maximum V/C ratio

The full assessment can be found in Appendix A.

The following conclusions are drawn from these findings:

- All roads in the study area would operate under capacity with the exception of the following two roads during the AM peak hour:
  - Stuart Highway between Temple Terrace and Howard Springs Road
  - Wishart Road
- Where V/C exceeds 1, it has already surpassed capacity in the existing case and is not a result of additional project volume
- On average, V/C is higher for most roads during the peak hour and lower during the midday peak.

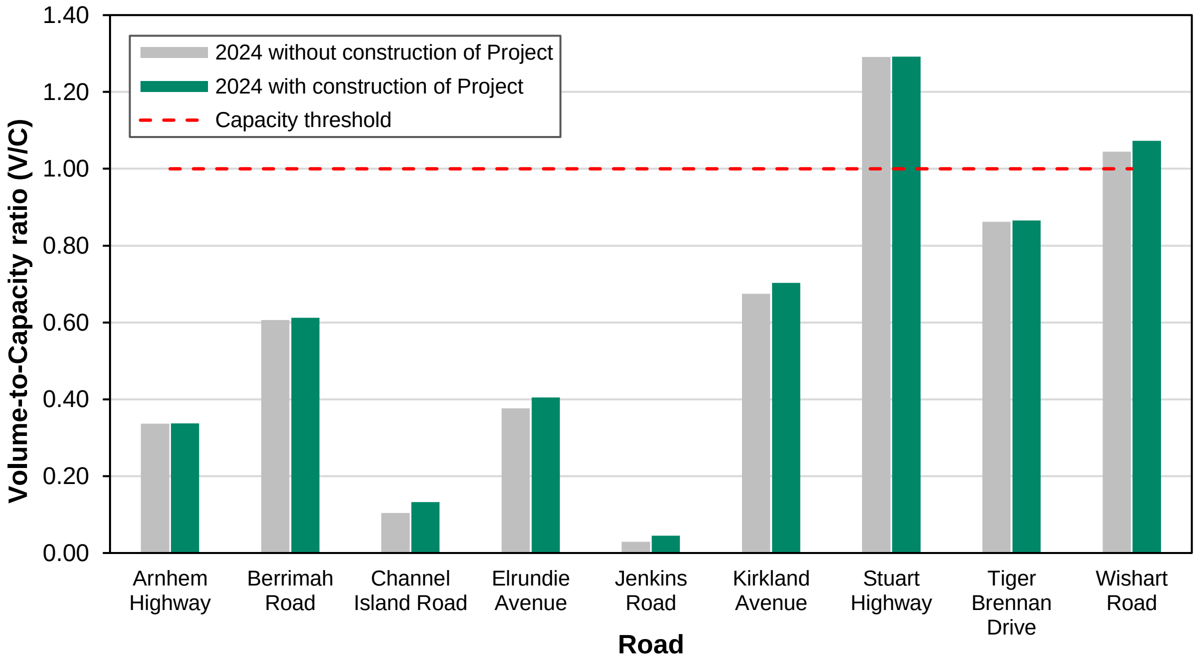

Figure 10-1 Mid-block capacity results for the 2024 AM peak

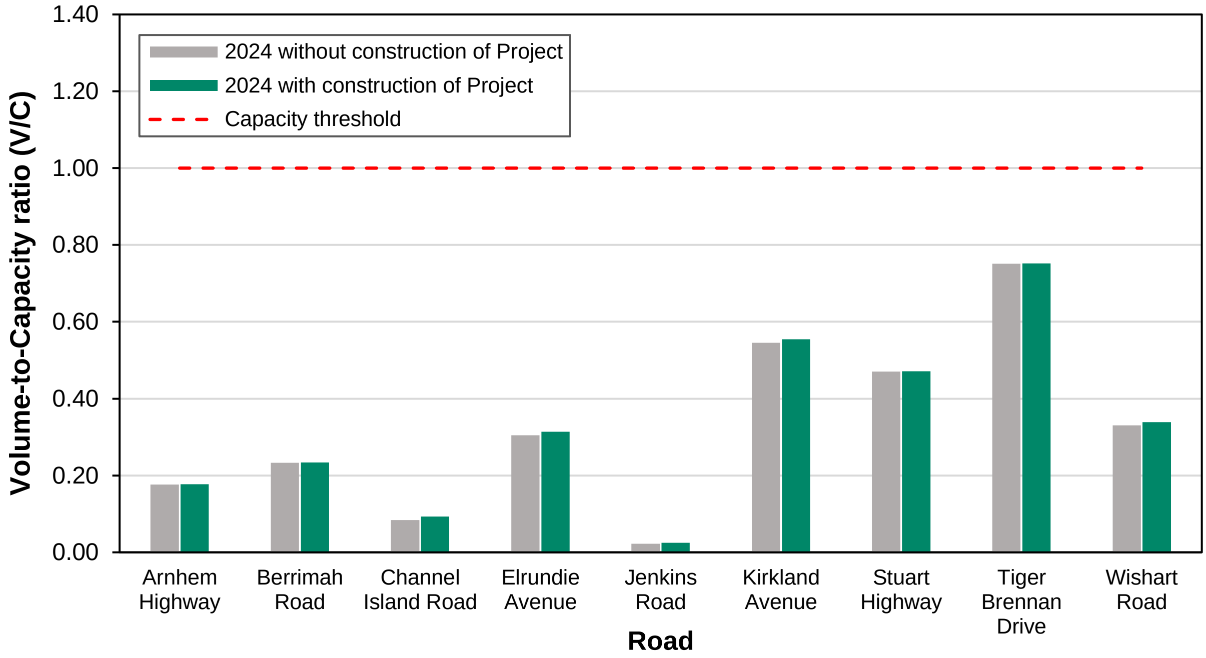

Figure 10-2 Mid-block capacity results for the 2024 midday peak

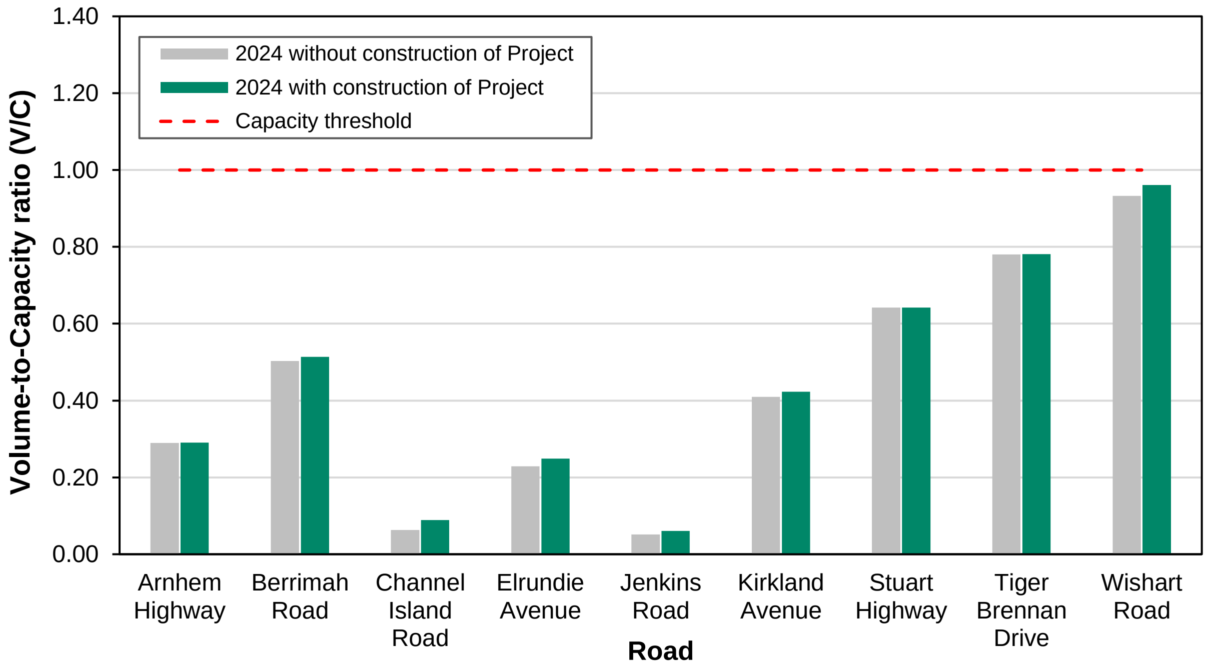

Figure 10-3 Mid-block capacity results for the 2024 PM peak

10.3 Intersection capacity and performance impact

To determine whether further intersection modelling and analysis was necessary, the critical intersections identified in Section 6.4 were assessed based on the following:

- Number of additional turning movements (particularly right turns) resulting from the Project
- Number of additional Project related movements compared to the overall volume of the intersection
- A high V/C midblock ratio for any roads within the intersection
- Any known intersection capacity issues.

From this assessment, the following intersections were deemed to have triggered further modelling and analysis:

- Tiger Brennan Drive / Wishart Road / Tivendale Road
- Tiger Brennan Drive / Berrimah Road
- Berrimah Road / Wishart Road.

Models for the critical intersections were developed using the SIDRA Intersection (version 9.0) software package. SIDRA Intersection is a micro-analytical tool used to evaluate intersection performance in terms of Degree of Saturation (DoS), delay, Level of Service (LoS), queue length and a variety of other performance measures. Key intersection performance measures are further discussed in Section 10.3.1.

It should be noted that the following constraints and assumptions are relevant to the intersection capacity and performance assessment:

- Intersection modelling was undertaken for the AM and PM peak hours only as these hours represent the periods when the road network experiences the maximum traffic demand and the available spare capacity of the road network is at its most limited. As such, the modellings results are indicative of a worst-case scenario as the traffic volumes throughout the remainder of the day decrease significantly. All intersections are assumed to perform adequately during the midday peak period.
- Signal cycle timing and phasing is based on Friday 9 September 2022 SCATS data. Average cycle time was determined via SCATS and individual phase times were determined by SIDRA.
- Background traffic growth has been assumed as per Section 10.1.3 of the report
- No calibration or validation has been undertaken as part of this assessment.

10.3.1 Performance indicators and targets

10.3.1.1 Level of Service

The criteria for evaluating the operational performance of intersections in summarised in Table 10-6. For signalised intersections, the performance is based on the average delay per vehicle across all movements. This average vehicle delay is equated to a corresponding Level of Service (LoS) from A (best) to F (worst). LoS D is typically considered as the minimum desirable performance level; a deterioration of LoS under this level would imply suitable remedial measures should be sought to improve performance.

Table 10-6 Level of Service definitions for signalised intersections

Level of Service	Average delay (seconds per vehicle)	General description
A	≤ 10	Free flow
B	11 to 20	Stable flow (slight delays)
C	21 to 35	Stable flow (acceptable delays)

Level of Service	Average delay (seconds per vehicle)	General description
D	36 to 55	Approaching unstable flow (tolerable delays)
E	56 to 80	Unstable flow (intolerable delay)
F	>80	Forced flow (jammed)

Source: SIDRA and Highway Capacity Manual 2016

10.3.1.2 Degree of Saturation

The Degree of Saturation (DoS) is defined as the ratio of arrival flow (demand) to the approach capacity. In general, a lower DoS indicates a better level of traffic service. A DoS greater than 1.0 indicates oversaturated conditions in which long queues of vehicles build up on the critical approaches. In theory, a DoS of 1.0 means that the intersection is operating at maximum capacity. However, a lower practical DoS is normally used, depending on the intersection control type. For signalised intersections, the practical DoS is 0.9. The intersection DoS is based on the highest DOS of all movements.

10.3.1.3 95th percentile queue

95th percentile queue is the length (in metres) below which 95% of all observed cycle queues lengths fall. In other words, this queue length is expected to be exceeded only for 5% of observed queues. Ideally, the 95th percentile queue should fit within the provided turning lane without spilling into adjacent lanes.

10.3.1.4 Average delay

Average delay refers to the average additional amount of time it takes a vehicle to pass through the intersection compared to free flow conditions. The average delay is measured in seconds per vehicle.

10.3.2 Intersection impact results

The results for the ‘without construction of Project’ (without vehicles generated by the construction of the Project) and ‘with construction of the Project’ (with vehicles generated by the construction of the Project) scenarios are presented in Table 10-7 for the AM and PM peak hours. The full assessment results can be found in Appendix B.

The following conclusions are drawn from the analysis:

- The model results indicate that all critical intersections are expected to operate at LoS D or above in 2024 without the construction of the Project. No critical intersection is expected to experience a deterioration in LoS due to additional traffic volumes generated by the construction of the Project.
- All critical intersections are expected to operate at a satisfactory DoS in 2024 with the exception of Tiger Brennan Drive / Berrimah Road during the AM peak hour. The DoS of this intersection is anticipated to exceed the generally accepted practical DoS value of 0.9 for signalised intersections. However, the Tiger Brennan Drive intersection will be upgraded to an overpass during the rock haulage period and this will likely impact on the use of this intersection. It is likely that the Project will instead use Wishart Road during these works.
- The maximum increase in average delay as a result of the Project is anticipated to be approximately two seconds and would occur at the intersection of Tiger Brennan Drive / Wishart Road / Tivendale Road during the PM peak hour. The increase in average delay at all remaining intersections is expected to be less than one second.

Therefore, the construction of the Project is expected to have an imperceptible impact on the capacity and performance of the critical intersections.

Table 10-7 Intersection performance results

Intersection	Peak Period	Without construction of Project (2024)				With construction of Project (2024)			
		Degree of Saturation	Average intersection delay (seconds)	Level of Service	95th percentile queue length (metres)	Degree of Saturation	Average intersection delay (seconds)	Level of Service	95th percentile queue length (metres)
Tiger Brennan Drive / Berrimah Road	AM	0.933	42.0	D	389.1	0.933	42.2	D	389.1

	PM	0.545	15.0	B	56.9	0.579	15.2	B	61.5

10.4 Recommended mitigation measures

To mitigate the potential impacts of the Project on road capacity and performance, the following mitigation measures are recommended:

- All vehicle movements associated with the Project should be planned to occur outside of the identified AM and PM peak hours
- Group transport, such as shuttle buses and car-pooling schemes, should be implemented where practical to reduce the number of light vehicle movements on the local road network
- Heavy vehicle movements should be scheduled to minimise traffic disruption to the road network. This may include:
    - Scheduling of the movement of rock, equipment and other materials to occur outside of the identified AM and PM peak hours
    - Scheduling heavy vehicle movements to be evenly dispersed as far as practical to minimise the potential of convoying or platoons on the road network.
- The loading and unloading of heavy vehicles should be planned so that the capacity of each individual vehicle is fully utilised to reduce the total number of movements on the local road network
- A separate Traffic Management Plan (TMP) should be prepared, approved and implemented during the construction phase of the Project. The TMP will confirm final haulage routes and provide the necessary mitigation measures to ensure that construction vehicle movements can be accommodated on the local road network with minimal impacts.

11.0 Cumulative Impacts

11.1 Coolalinga Road Safety Upgrades

The Northern Territory Government aims to improve road safety for all road users, improve accessibility to Stuart Highway and support future planning through the proposal of:

- 2 new signalised intersections on the Stuart Highway
- Multiple road extensions (service roads, roads behind Coolalinga Central, Henning Road)
- New road link between the Stuart Highway and Henning Road
- Reduced posted speed limit to 60km/h on the Stuart Highway

The construction of this project is scheduled for commencement by 2023. At the time of writing this report, the project has completed the first stage of detailed design shown in Figure 11-1.

Figure 11-1: Coolalinga Road Safety Upgrades Plan

Figure source: Northern Territory Government, 2022

Assuming the construction of the Coolalinga Road Project begins in January 2023, this construction period may overlap with the timings of the Barossa Darwin Pipeline Duplication Project (Figure 7-1). The Coolalinga signalisation project may result in the full or partial closure of Stuart Highway; a key road along the rock haulage route. If these closures coincide with the Project's rock delivery schedule, there is a potential that an alternate route may need to be considered.

11.2 Tiger Brenan Drive / Berrimah Road overpass works

Figure 11-2 Tiger Brennan Drive / Berrimah Road Overpass Plan

Figure source: Northern Territory Government, 2022

The Northern Territory Government is in partnership with the Australian Government to improve road safety at the Tiger Brennan Drive and Berrimah Road intersection through the construction of a new overpass (Northern Territory Government, 2022). This will separate the major traffic flow on Tiger Brennan Drive from those on Berrimah Road.

The project will enhance safety, reduce traffic delays during peak hours and improve connectivity for freight transport to East Arm Wharf through the proposal of:

- An overpass with Berrimah Road passing over Tiger Brennan Drive
- Realignment of Tiger Brennan Drive
- Improvements to Berrimah Road catering to requirement for road trains
- On and off ramps
- Earthworks, drainage works, pavement construction, asphalt works, line marking and road safety barriers
- Street lighting, traffic lights, improved pedestrian and cyclist accessibility
- Landscaping and urban design

The construction of the Tiger Brennan Overpass Project has commenced, with site and early works being undertaken at the time of writing this report. While these early works should not impact of traffic movements, construction is likely to extend through to mid 2024 there will likely be a cumulative traffic impact should construction be staged as described in the Traffic Impact Assessment AECOM prepared for Sitzler Pty Ltd (Figure 11-3). Potential detours may occur during the detailed design stage predicted to occur in early 2023.

Figure 11-3: Potential construction staging for Tiger Brennan Drive and Berrimah Road overpass

Figure source: AECOM 2022

11.3 Darwin Ship Lift

The Northern Territory Government is delivering the Darwin Ship Lift Project to establish Darwin as a thriving maritime services industry hub. The Darwin Ship Lift facility will be designed to meet the needs of the general maritime sector, current long-term needs of the Department of Defence and the Australian Border Force, while supporting local jobs and economic growth in the Territory.

In reference to the indicative concept design construction schedule in the Darwin Ship Lift Project draft preliminary documentation (Figure 11-4), construction work is planned to begin in quarter 3 of 2022.

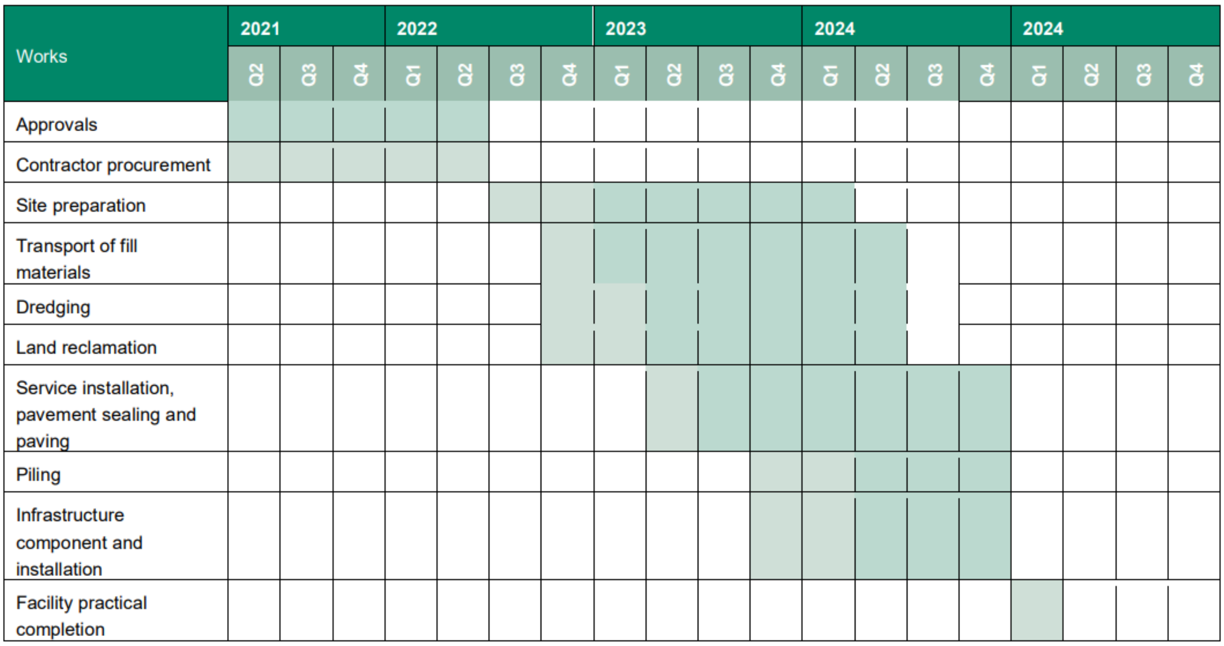

Figure 11-4: Darwin Ship Lift indicative construction schedule

Figure source: AECOM 2021

In reference to the traffic impact assessment AECOM completed for the Darwin Ship Lift Project in 2021, during the 24 months of project construction there will be heavy vehicle traffic generated on the last 20km section of the Barossa project's haulage route outlined in Section 8.0 (Figure 11-5). Whilst the additional heavy vehicle traffic has the potential to create additional trips on the network at the same time as the Project, the approximate traffic generation at peak would be approximately 10 heavy vehicle trips per hour. If the additional heavy vehicle trips occur during the off peak period as per the recommendations made in the report, there is likely to be a negligible cumulative impact on traffic.

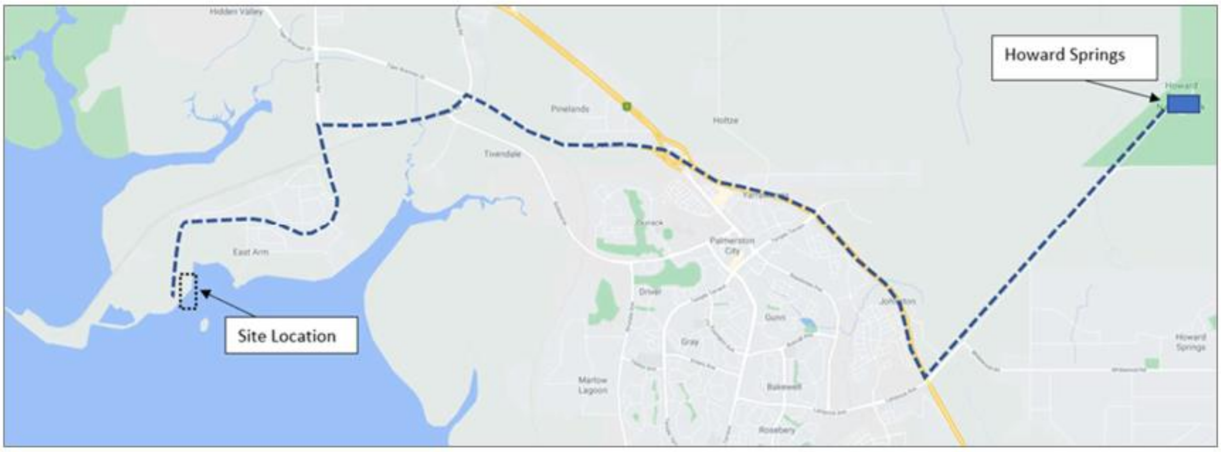

Figure 11-5: Darwin Ship Lift Project haulage route

11.4 Recommended mitigation measures

To mitigate the potential cumulative impacts of the Project and other concurrent projects, the following mitigation measures are recommended:

- Coordination and consultation with key stakeholders to manage the interface of projects occurring at the same time. This may include the coordination of traffic management arrangements between projects and the provision of regular project updates.
- Investigation of potential alternative haulage routes in the event that road closures or access restrictions are required to facilitate other projects.

12.0 Other Impacts and Mitigation Measures

12.1 Pedestrians and cyclists

As shown in section 6.5.1, there are a number of shared footpath and on-road bicycle paths on and around the project haulage routes. In addition, ad-hoc movements of recreational cyclists using highways and pedestrians through local roads can be expected.

Therefore, the Project should consider appropriate traffic management measures to ensure safe pedestrian (including school children in vicinity of school bus stops) and cyclist passage on nominated routes during construction (and if deemed required operation stage), in accordance with relevant road design standards and in consultation with relevant road authorities. The local community and road users should be notified in advance of any changes in transport conditions including details of any proposed road and traffic lane closures.

12.2 Public transport

As shown in section 6.5.2, multiple regular public bus routes operate on the proposed haulage route, notably between Darwin, Palmerston and Humpty Doo. Heavy vehicle movements associated with the Project would likely operate during bus operating times. Therefore, the Project must consider reducing potential impact if conflicts are unable to be suitably managed.

Consultation with local councils and bus operators during the development of the TMP to ensure any affected school routes have appropriate diversions in place that still service necessary stakeholders and deliver acceptable travel time changes should be considered. It is recommended that ongoing consultation with relevant stakeholders would be undertaken to manage the potential disruptions on bus services.

12.3 Road maintenance

This Project is expected to increase the number of axle repetitions the road pavement is exposed to, particularly during the construction period. It is assumed that the road pavements in the study area have been designed to withstand a certain number of axle repetitions which are forecast during the design life of the road due to the existing demand of heavy vehicles on the network.

However, the additional number of heavy vehicles forecast to be generated by the Project is expected to increase the wear on the pavement and increase the likelihood that minor maintenance might be required. With no assessment of the roads in the study areas outlining the current condition or age of the pavement, it is not possible at this time to quantify the impact the Project might have on the road surfaces. It is recommended that a pavement condition program be implemented to monitor the impact and identify any deterioration to the road pavement over the duration of construction. In order to do this a baseline study must be completed to identify the existing conditions of the existing public routes, which are to become part of the haulage routes.

All loads being transported to and from the site will be secured in accordance with the relevant legislation. All vehicles must be correctly licenced and compliant with relevant up to date legislation. Legislation: NT Traffic Regulations 1999.

12.4 Driver fatigue

During the construction there is the potential risk of driver fatigue due to the volume of materials required for completion of the works. This risk will be managed through the appropriate implementation of a Fatigue Management System (FMS) in accordance with the Northern Territory Road Transport Fatigue Management Code of Practice.

This code of practice, this has been developed “to assist transport operators to implement management systems which meet occupational health and safety obligations under the Work Health Act in relation to driver fatigue”.

12.5 Incident management

Due to the nature of the Project, it is expected that relevant guidelines will be adhered to. It is expected that an Incident Management Plan will be utilised in order to set out processes and response measures that are to be implemented in case of a non-compliance to relevant guidelines or should an emergency situation arise.

13.0 Summary and Conclusions

This report details the traffic and transport impact assessment for the Barossa Darwin Pipeline Duplication Project. The report findings are summarised below.

Existing conditions

An existing transport conditions review was undertaken, which was informed via a combination of desktop reviews, site visit, crash/traffic data analysis and review of relevant policies and legislation. The key existing condition findings are summarised below:

- The road network within the study area is comprised of several State roads including Arnhem Highway and Stuart Highway. The Stuart Highway is the most heavily trafficked road in the area, with up to 27,800 vehicles travelling on the road on an average day.
- Stuart Highway, Tiger Brennan Drive and Berrimah Road all form part of the National Land Transport Network. Heavy vehicles (>3 axles) account for between 3.6% and 27.4% of traffic volumes on these roads.
- Traffic volumes on key roads in the study area generally peak during the month of September. Reduced levels of traffic are observed during the wet season (November to April).
- Arnhem Highway, Stuart Highway, Tiger Brennan Drive, Berrimah Road, Kirkland Road, Elrundie Avenue, Jenkins Road, Channel Island Road and Wickham Point Road all form part of the approved network for 53.5 m Road Train vehicles.
- Dedicated cyclist infrastructure in the study area is limited to an on-road bicycle lane on the eastern side of Berrimah Road between Marlow Road and Wishart Road. Several shared footpaths are provided adjacent to key roads in the study area including Berrimah Road, Tiger Brennan Drive, Stuart Highway and Arnhem Highway.
- There are no existing or proposed public bus services within 400 m of the DLNG facility or the intermediate stockpile site at Darwin Port, however CDC Northern Territory operates seven regular public bus services on roads forming part of the proposed Project haulage routes.
- The Adelaide-Darwin railway alignment is located approximately 750 m north-west of the intermediate stockpile site at Darwin Port. This railway line is grade separated from Berrimah Road at East Arm. However, two level railway crossings are located on Kirkland Road and one is located on Channel Island Road.
- In the five-year period from 2015 to 2019, a total of seven fatalities occurred on key roads in the study area. Five of these fatalities occurred on Tiger Brennan Drive.

Impact assessment

The key findings of the construction phase impact assessment are as follows:

- Mid-block capacity: a mid-block capacity assessment was undertaken for key roads in the study area to assess the impact of the Project on road capacity. The results indicate that all roads would operate under capacity in 2024 with the exception of Stuart Highway (between Temple Terrace and Howard Springs Road) and Wishart Road during the AM peak hour. Project-generated traffic would account for a very minor proportion of traffic on the local road network in 2024 and where the available capacity of a road has been exceeded, it is not a result of Project traffic.
- Intersection capacity and performance: traffic modelling using SIDRA Intersection (version 9.0) was performed to assess the impacts of the Project on the capacity and performance of three critical intersections. The modelling results indicate additional traffic movements generated by the construction of the Project in 2024 would result in negligible impacts.
- Preliminary haulage route assessment: routes have been established based on the approved road network for 53.3 metre Road Train vehicles. No road upgrades are anticipated to be required to accommodate Project traffic.

Overall, impacts to the local transport network during Project construction are expected to be negligible given the very low proportion of Project-generated traffic on the local road network.

Mitigation measures

To mitigate the potential impacts of the Project, the following mitigation measures have been recommended:

- All vehicle movements associated with the Project should be planned to occur outside of the identified AM and PM peak hours
- Group transport, such as shuttle buses and car-pooling schemes, should be implemented where practical to reduce the number of light vehicle movements on the local road network
- Heavy vehicle movements should be scheduled to minimise traffic disruption to the road network. This may include:
  - Scheduling of the movement of rock, equipment and other materials to occur outside of the identified AM and PM peak hours
  - Scheduling heavy vehicle movements to be evenly dispersed as far as practical to minimise the potential of convoying or platoons on the road network.
- The loading and unloading of heavy vehicles should be planned so that the capacity of each individual vehicle is fully utilised to reduce the total number of movements on the local road network
- A separate Traffic Management Plan (TMP) should be prepared, approved and implemented during the construction phase of the Project. The TMP will confirm final haulage routes and provide the necessary mitigation measures to ensure that construction vehicle movements can be accommodated on the local road network with minimal impacts.
- Coordination and consultation with key stakeholders to manage the interface of other projects occurring in the study area at the same time. This may include the coordination of traffic management arrangements between projects and the provision of regular project updates.
- Investigation of potential alternative haulage routes in the event that road closures or access restrictions are required to facilitate other projects in the study area.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
Vehicle movement LOS values are based on average delay per movement.
Intersection and Approach LOS values are based on average delay for all vehicle movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Pedestrians

Level of Service (LOS) Method: SIDRA Pedestrian LOS Method (Based on Average Delay)
Pedestrian movement LOS values are based on average delay per pedestrian movement.
Intersection LOS value for Pedestrians is based on average delay for all pedestrian movements.

PHASING SUMMARY

Site: [Tiger Brennan Drive / Berrimah Road (Site Folder: Without Project 2024 - AM Peak)]

Tiger Brennan Drive / Berrimah Road
Site Category: Base Year
Signals - EQUISAT (Fixed-Time/SCATS) Isolated   Cycle Time = 140 seconds (Site User-Given Cycle Time)

Timings based on settings in the Site Phasing & Timing dialog
Phase Times determined by the program
Phase Sequence: SCATS 2022
Reference Phase: Phase A
Input Phase Sequence: A, D, E, F, G
Output Phase Sequence: A, D, E, F, G

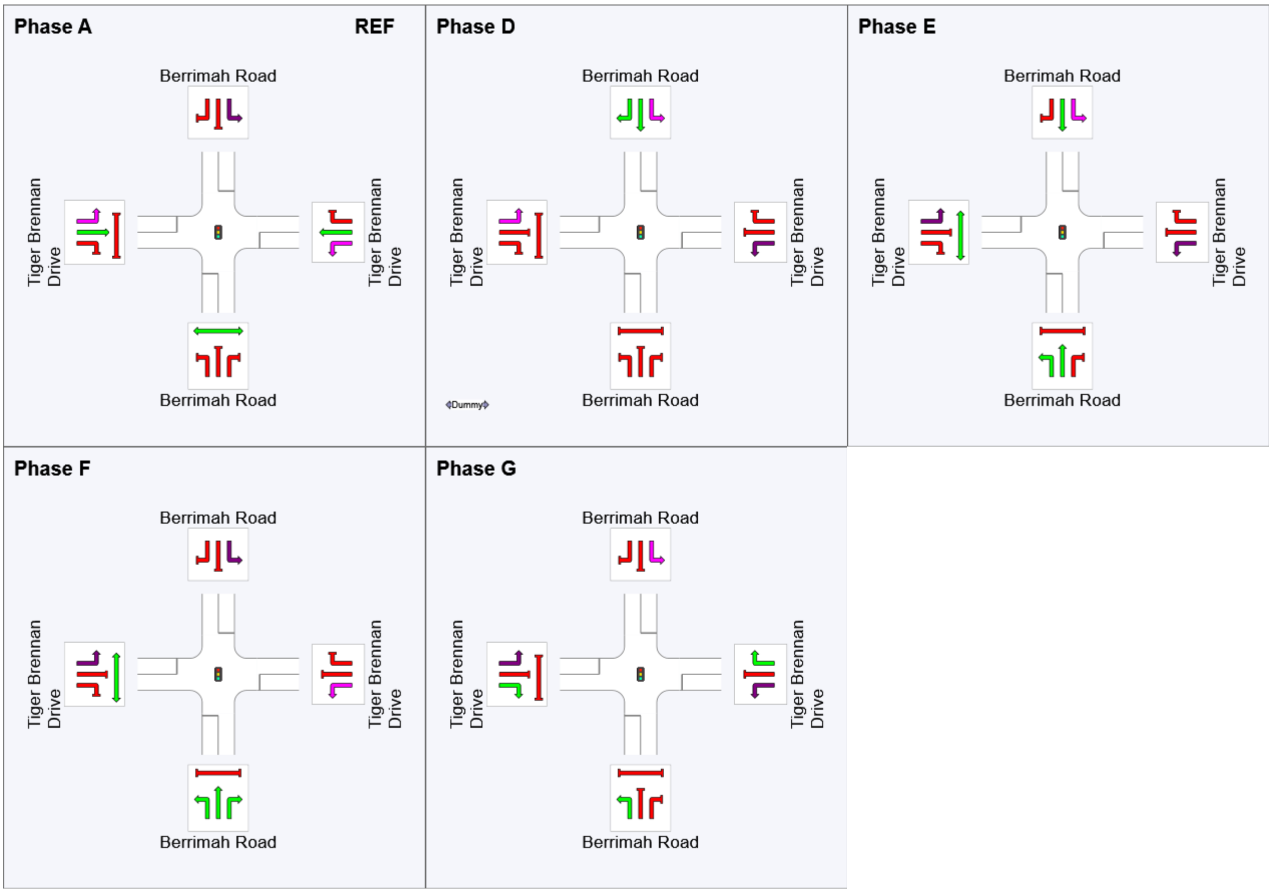
Phase Timing Summary

Phase	A	D	E	F	G
Phase Change Time (sec)	0	83	96	101	114
Green Time (sec)	77	6	***	6	20
Phase Time (sec)	84	13	5	12	26
Phase Split	60%	9%	4%	9%	19%

See the Timing Analysis report for more detailed information including input values of Yellow Time and All-Red Time, and information on any adjustments to Intergreen Time, Phase Time and Green Time values in cases of Pedestrian Actuation, Minor Phase Actuation and Phase Frequency values (user-specified or implied) less than 100%.

*** No green time has been calculated for this phase because the next phase starts during its intergreen time.
This occurs with overlap phasing where there is no single movement connecting this phase to the next, or where the only such movement is a dummy movement with zero minimum green time specified.
If a green time is required for this phase, specify a dummy movement with a non-zero minimum green time.

Output Phase Sequence



REF: Reference Phase
VAR: Variable Phase

	Normal Movement		Permitted/Opposed
	Slip/Bypass-Lane Movement		Opposed Slip/Bypass-Lane
	Stopped Movement		Turn On Red
	Other Movement Class (MC) Running		Undetected Movement
	Mixed Running & Stopped MCs		Continuous Movement
	Other Movement Class (MC) Stopped		Phase Transition Applied

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
Vehicle movement LOS values are based on average delay per movement.
Intersection and Approach LOS values are based on average delay for all vehicle movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Pedestrians

Level of Service (LOS) Method: SIDRA Pedestrian LOS Method (Based on Average Delay)
Pedestrian movement LOS values are based on average delay per pedestrian movement.
Intersection LOS value for Pedestrians is based on average delay for all pedestrian movements.

PHASING SUMMARY

Site: [Tiger Brennan Drive / Berrimah Road (Site Folder: Without Project 2024 - PM Peak)]

Tiger Brennan Drive / Berrimah Road
Site Category: Base Year
Signals - EQUISAT (Fixed-Time/SCATS) Isolated   Cycle Time = 130 seconds (Site User-Given Cycle Time)

Timings based on settings in the Site Phasing & Timing dialog
Phase Times determined by the program
Phase Sequence: SCATS 2022
Reference Phase: Phase A
Input Phase Sequence: A, D, E, F, G
Output Phase Sequence: A, D, E, F, G

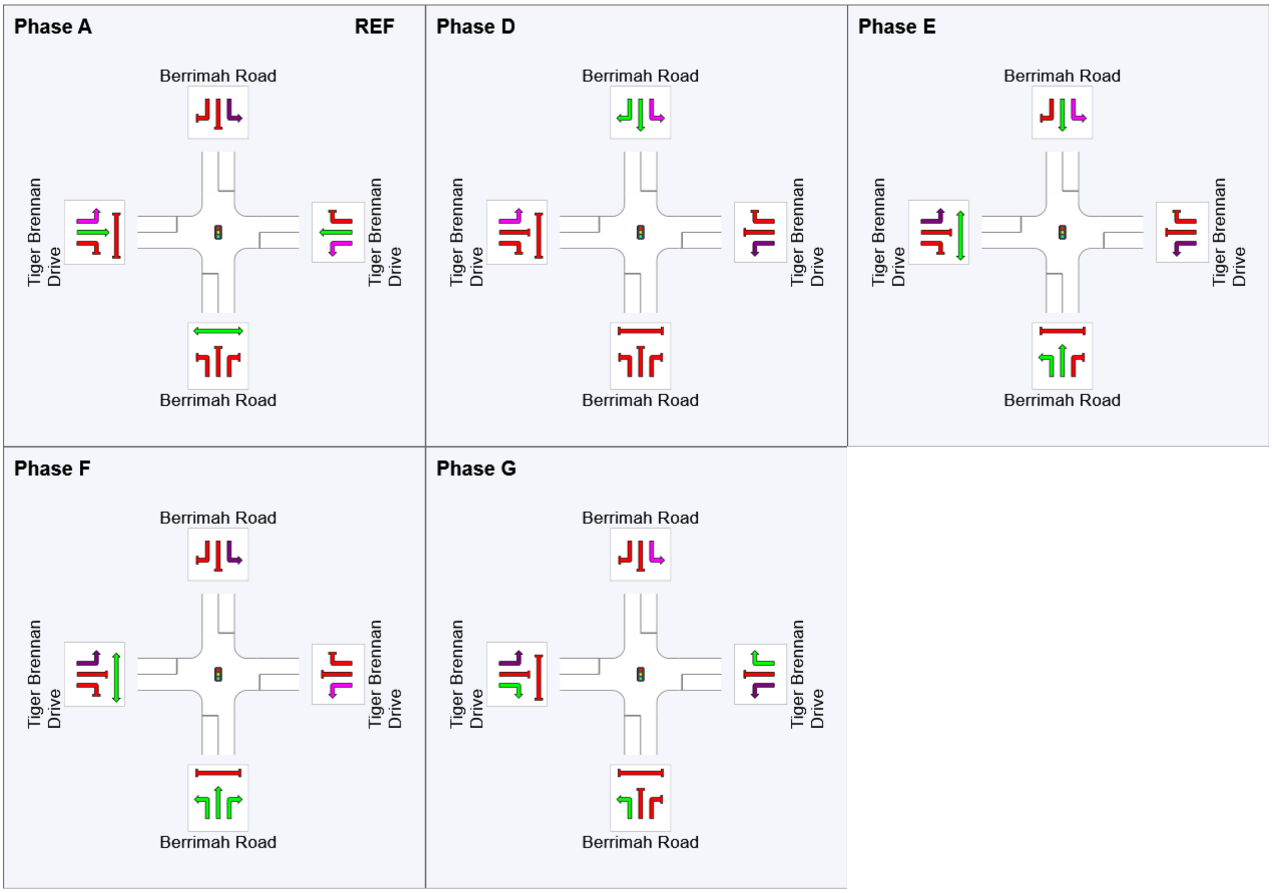
Phase Timing Summary

Phase	A	D	E	F	G
Phase Change Time (sec)	0	78	91	93	106
Green Time (sec)	72	6	***	6	18
Phase Time (sec)	79	13	2	12	24
Phase Split	61%	10%	2%	9%	18%

See the Timing Analysis report for more detailed information including input values of Yellow Time and All-Red Time, and information on any adjustments to Intergreen Time, Phase Time and Green Time values in cases of Pedestrian Actuation, Minor Phase Actuation and Phase Frequency values (user-specified or implied) less than 100%.

*** No green time has been calculated for this phase because the next phase starts during its intergreen time. This occurs with overlap phasing where there is no single movement connecting this phase to the next, or where the only such movement is a dummy movement with zero minimum green time specified.
If a green time is required for this phase, specify a dummy movement with a non-zero minimum green time.

Output Phase Sequence



REF: Reference Phase
VAR: Variable Phase

Normal Movement	Permitted/Opposed
Slip/Bypass-Lane Movement	Opposed Slip/Bypass-Lane
Stopped Movement	Turn On Red
Other Movement Class (MC) Running	Undetected Movement
Mixed Running & Stopped MCs	Continuous Movement
Other Movement Class (MC) Stopped	Phase Transition Applied

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
Vehicle movement LOS values are based on average delay per movement.
Intersection and Approach LOS values are based on average delay for all vehicle movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Pedestrians

Level of Service (LOS) Method: SIDRA Pedestrian LOS Method (Based on Average Delay)
Pedestrian movement LOS values are based on average delay per pedestrian movement.
Intersection LOS value for Pedestrians is based on average delay for all pedestrian movements.

PHASING SUMMARY

Site: [Tiger Brennan Drive / Berrimah Road (Site Folder: With Project 2024 - PM Peak)]

Tiger Brennan Drive / Berrimah Road
Site Category: Base Year
Signals - EQUISAT (Fixed-Time/SCATS) Isolated   Cycle Time = 130 seconds (Site User-Given Cycle Time)

Timings based on settings in the Site Phasing & Timing dialog
Phase Times determined by the program
Phase Sequence: SCATS 2022
Reference Phase: Phase A
Input Phase Sequence: A, D, E, F, G
Output Phase Sequence: A, D, E, F, G

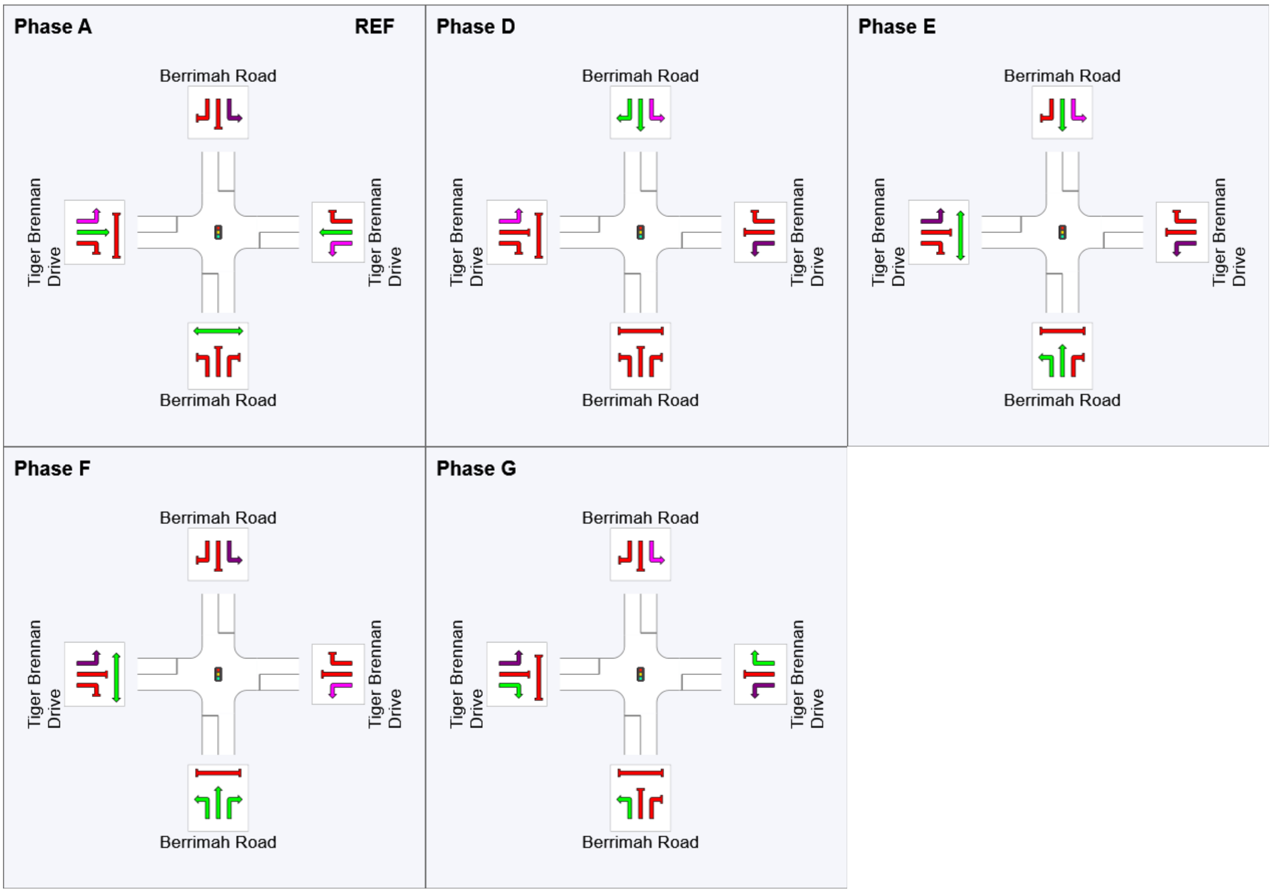
Phase Timing Summary

Phase	A	D	E	F	G
Phase Change Time (sec)	0	78	91	93	106
Green Time (sec)	72	6	***	6	18
Phase Time (sec)	79	13	2	12	24
Phase Split	61%	10%	2%	9%	18%

See the Timing Analysis report for more detailed information including input values of Yellow Time and All-Red Time, and information on any adjustments to Intergreen Time, Phase Time and Green Time values in cases of Pedestrian Actuation, Minor Phase Actuation and Phase Frequency values (user-specified or implied) less than 100%.

*** No green time has been calculated for this phase because the next phase starts during its intergreen time. This occurs with overlap phasing where there is no single movement connecting this phase to the next, or where the only such movement is a dummy movement with zero minimum green time specified.
If a green time is required for this phase, specify a dummy movement with a non-zero minimum green time.

Output Phase Sequence



REF: Reference Phase
VAR: Variable Phase

	Normal Movement		Permitted/Opposed
	Slip/Bypass-Lane Movement		Opposed Slip/Bypass-Lane
	Stopped Movement		Turn On Red
	Other Movement Class (MC) Running		Undetected Movement
	Mixed Running & Stopped MCs		Continuous Movement
	Other Movement Class (MC) Stopped		Phase Transition Applied

Acronyms, Terms, Definitions and Units of Measurement

Term	Definition
Acronyms	
AAPA	Aboriginal Areas Protection Authority
ALARP	As low as reasonably practicable
AMSA	Australian Maritime Safety Authority
AQIS	Australia Quarantine and Inspection Service
ASS	Acid sulfate soils
ASSDMP	Acid Sulfate Soils and Dewatering Management Plan
BOM	Bureau of Meteorology
CAMBA	China-Australia Migratory Bird Agreement
DAWE	Commonwealth Department of the Agriculture, Water and the Environment
DEPWS	Norther Territory Department of Environment, Parks and Water Security
DCCEEW	Commonwealth Department of Climate Change, Energy, the Environment and Water
DITT	Northern Territory Department of Industry, Tourism and Trade
DLNG	Darwin Liquefied Natural Gas
DoE	Commonwealth Department of the Environment
DoEE	Commonwealth Department of the Environment and Energy
DIPL	Northern Territory Department of Infrastructure, Planning and Logistics
DPD	Darwin Pipeline Duplication
DSEWPaC	Commonwealth Department of Sustainability, Environment, Water, Population and Communities
EDP	Exceptional Development Permit
ENVID	Environmental impact identification
EP Act	*Environment Protection Act 2019*
EP Regulations	Environment Protection Regulations 2020
EPBC Act	*Environmental Protection and Biodiversity Conservation Act 1999*
EPL	Environmental Protection Licence
EPO	Environmental performance objectives
EPS	Environmental performance standard
FCGT	Flood / clean / gauge / testing
GEP	Gas export pipeline
GHG	Greenhouse gas

Term	Definition
HAT	Highest astronomical tide
HSE	Health, safety and environment
JAMBA	Japan-Australia Migratory Bird Agreement
KP	Kilometre point
LNG	Liquid natural gas
LOR	Limit of reporting
MARPOL	The International Convention for the Prevention of Pollution from Ships
MMNMP	Marine Megafauna Noise Management Plan
MNES	Matters of National Environmental Significance
MoC	Management of change
NICNAS	National Industrial Chemicals Notification and Assessment Scheme
NR	Natural resource
NT	Northern Territory
NT EPA	Northern Territory Environment Protection Authority
ODS	Ozone depleting substances
OEMP	Operations Environmental Management Plan
PASS	Potential acid sulfate soils
PLET	Pipeline end termination
PMP	Pipeline management plan
PMST	Protected Matters Search Tool
ROKAMBA	Republic of Korea-Australia Migratory Bird Agreement
Santos	Santos NA Barossa Pty Ltd
SER	Supplementary Environmental Report
SMS	Santos Management System
TPWC Act	*Territory Parks and Wildlife Conservation Act 1976*
TSDMMP	Trenching and Spoil Disposal Management and Monitoring Plan
WONS	Weeds of National Significance

Licence	A licence granted under Part III or section 43 of the *Energy Pipelines Act 1981* (NT)
Licensee	The registered holder of a licence
Non-Indigenous	Refers to heritage artefacts or sites that are not deemed “sacred sites” per the *Northern Territory Aboriginal Sacred Sites Act 1989* (NT) or deemed Aboriginal or Macassan archaeological sites or artefacts per the *Heritage Act 2011* (NT).

Term	Definition
Pipeline	A pipe or system of pipes that has or have a maximum allowable operating pressure greater than 1050 kilopascals or a hoop stress (being a circumferential stress arising from internal pressure) that is, at one or more positions, greater than 20% of the specified minimum yield stress specified in the manufacturing standard with which the pipe complies and that are used or intended to be used for the conveyance of an energy-producing hydro-carbon, and includes: (a) all structures for protecting or supporting a pipeline; and (b) all loading terminals, works and buildings and all fittings, pumps, tanks, appurtenances and appliances, used in connection with a pipeline, but does not include: (c) a pipeline as defined in the *Petroleum (Submerged Lands) Act 1981*; (e) a pipeline constructed or to be constructed on land used for residential, business, agricultural, commercial or industrial purposes, designed for use solely for the residential, business, agricultural, commercial or industrial purposes carried on that land and situated wholly within the boundaries of that land; or (f) a pipeline or a pipeline of a class declared under section 4(2) to be a pipeline in respect of which a licence is not required
Pipeline management plan	Pipeline management plan in force, in relation to a pipeline, means: (a) a pipeline management plan for the pipeline submitted by or for the pipeline licensee and accepted under these Regulations; or (b) if the pipeline management plan is accepted in part – that part of the pipeline management plan that is accepted, as revised from time to time under these Regulations, but does not include a pipeline management plan for which the acceptance has been withdrawn.
Definitions	
DLNG team	The DLNG contractors
Environmental Performance Standard	A statement of performance required of a management action.
Environmental Performance Objective	Measurable level of performance required for the management of environmental aspects of an activity to ensure that environmental impacts and risks are of an acceptable level.
Measurement Criteria	A system of measurements that define whether a project is successful.
Onshore Project Area	Onshore Project Area is the same area as the Project Area, except it extends between the onshore termination point and the upstream weld of the beach valve.
Onshore termination point	The point (KP122.484; approximately 2 m above highest astronomical tide) to which the pipeline will be pulled ashore to by the shore-pull activity.
Performance Criteria	The standards by which success of management actions is evaluated.
Project Area	Project Area extends between the 3 nautical mile boundary and the upstream weld of the beach valve. Refer to
Target	Specific and measurable performance requirements to achieve EPOs.
Units of measurement	

Term	Definition
°	degrees
µS	microSiemens
cm	centimetre
dB	decibels
dB(A)	a-weighted sound pressure level in decibels
kHz	kilohertz
km	kilometre
km^2	square kilometre
m	metre
m^2	square metre
m AHD	metres Australian Height Datum
mg/L	milligrams per litre
nm	nautical mile

1 Introduction

1.1 Project overview

Santos NA Darwin Pipeline Pty Ltd (Santos) is the operator of the existing Bayu-Undan to Darwin Gas Export Pipeline (GEP). The Bayu-Undan to Darwin GEP is a dry natural gas export pipeline transporting gas from the Bayu-Undan field located in Timor-Leste waters to the Darwin Liquefied Natural Gas (DLNG) facility at Wickham Point peninsula near Darwin, Northern Territory (NT), Australia. The Bayu-Undan to Darwin GEP has been operational since 2005. In anticipation of the end of the Bayu-Undan field's commercial production in 2022 / 2023, the Barossa Field is being developed to supply gas to the DLNG facility. The supply of backfill gas to the DLNG facility was originally planned to be achieved through the installation of a 262 kilometre (km) Barossa GEP to a tie-in point on the existing Bayu-Undan to Darwin GEP.

In recognition of potential Carbon Capture and Storage opportunities at the Bayu-Undan, Santos has approved an alternative solution to transport backfill gas to the DLNG facility through the construction of an additional segment of pipeline to extend the Barossa GEP to the DLNG facility, instead of tying into the Bayu-Undan to Darwin GEP. Construction of this segment of pipeline is referred to as the Darwin Pipeline Duplication (DPD) Project, as it will be installed, parallel to the existing Bayu-Undan to Darwin GEP. The effective 'duplication' of the existing Bayu-Undan to Darwin GEP is considered the optimal route to minimise potential environmental and social impacts.

The pipeline will run from a location where the Barossa GEP approaches the existing Bayu-Undan pipeline and continue through Darwin Harbour into the DLNG facility (**Figure 1-1**). Santos' DPD Project includes a ~23 km segment in Commonwealth waters and a ~100 km segment in NT waters and lands adjacent to the existing Bayu-Undan to Darwin GEP. The DPD Project pipeline will be located for the most part approximately 50 – 100 m from the existing Bayu-Undan to Darwin pipeline, to minimise potential environmental and social impacts. The Project Area for the DPD Project includes a 2 km buffer around the pipeline route in NT waters, the onshore construction area at the DLNG facility and an offshore spoil disposal ground, and buffer, for the trench spoil disposal (**Figure 1-1**). The construction of the pipeline onshore is covered under this Construction Environmental Management Plan (CEMP) (**Figure 2-2**).

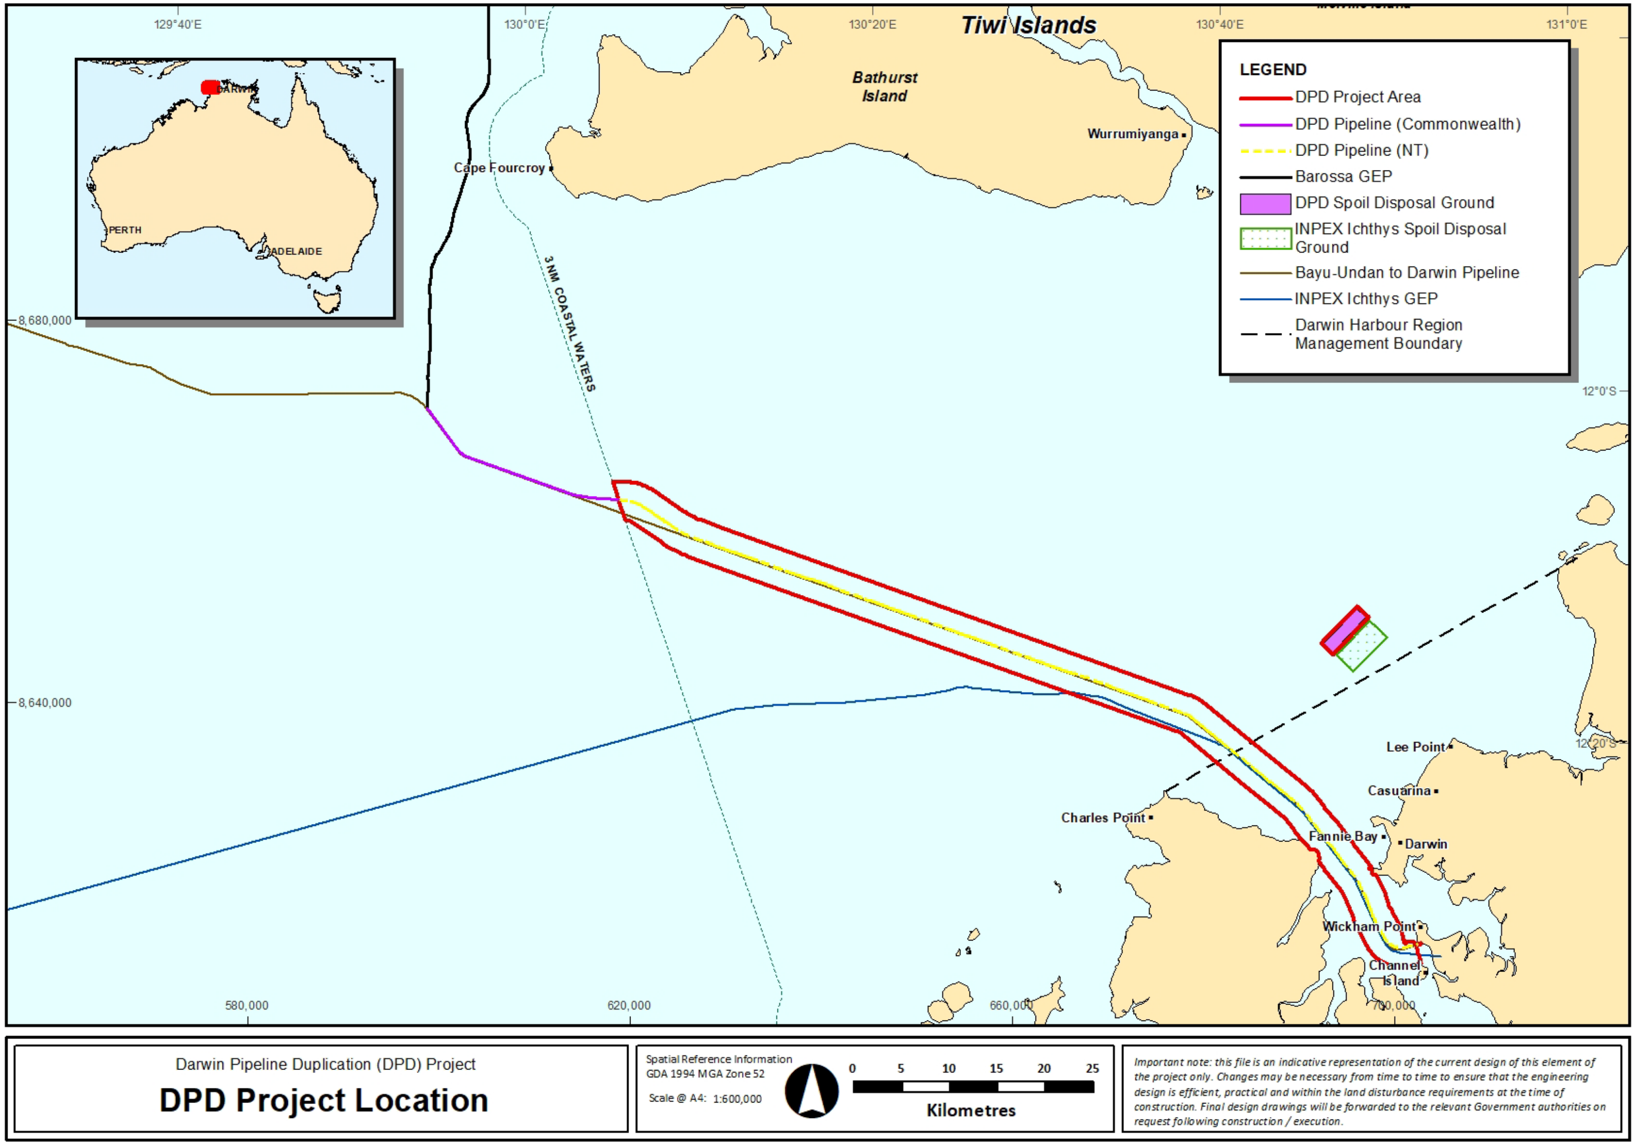

Figure 1-1: DPD Project Location

1.2 Purpose

This CEMP has been prepared to detail and provide guidance on environmental management requirements, to ensure the DPD Project pipeline construction activities on NT land are undertaken in an environmentally responsible manner and in line with regulatory requirements.

This CEMP will be submitted with the DPD Project Supplementary Environmental Report (BAS-210 0020) (SER) under the NT *Environment Protection Act 2019* and supporting regulations. This CEMP will be provided to the relevant Minister in support of the Pipeline Management Plan (PMP) required to construct a pipeline under the *Energy Pipelines Act 1981* (NT) and supporting regulations.

The purpose of this onshore CEMP is to meet the relevant requirements of the:

+ *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) as administered by Department of Climate Change, Energy, the Environment and Water (DCCEEW), including relevant management and recovery plans and conservation advice for Matters of National Environmental Significance (MNES).
+ The EP Act and Environment Protection Regulations 2020 (EP Regulations), as administered by the NT EPA.
+ NT Draft Guideline for the Preparation of an Environmental Management Plan (NT EPA, 2015)
+ NT Energy Pipelines Act 1981, and Energy Pipelines Regulations 2001 as administered by the NT Department of Industry, Tourism and Trade (DITT).

This CEMP details the environmental impacts and risks associated with the onshore activities and demonstrates how these will be reduced to an acceptable level. This CEMP provides an implementation strategy that will be used to measure and report on environmental performance during planned activities and unplanned events, to ensure impacts and risks are continuously reduced and are maintained at an acceptable level. The environmental management of the activity described in this CEMP complies with the Santos Environment, Health and Safety Policy (**Appendix 1**) and with all relevant legislation (**Section 3**). All relevant stakeholder consultation performed has been considered in the development of this CEMP (**Section 9**).

1.3 Scope

This CEMP is relevant to the onshore section of the DPD pipeline only, which is approximately 200 metres (m) in length between the onshore termination point (kilometre point (KP) 122.484) which is approximately 2 m above highest astronomical tide [HAT]) to which the pipeline will be pulled ashore by the shore-pull activity) and the upstream weld of the beach valve (KP 122.692). This onshore section of the DPD pipeline will be designed and constructed by the Santos DLNG team and contractors. This CEMP is therefore termed the DPD Project Onshore Pipeline CEMP (Onshore CEMP). The construction of the remainder of the DPD pipeline, from the onshore termination point to the 3 nautical mile (nm) Commonwealth/NT waters boundary, will be designed and constructed by the Santos Barossa DPD Project team (and contractors) (referred to in this document as the Barossa team) and subject to another CEMP termed the DPD Project Offshore Pipeline CEMP (BAS-210 0024).

A summary of activities relevant to each CEMP is provided in **Table 1-1**.

This CEMP forms part of a suite of environmental management plans which collectively cover all activities from the 3 nm Commonwealth/NT waters boundary to the upstream weld of the beach valve. (**Figure 1-2**).

There are three additional management plans that address specific activities during construction (**Figure 1-2**). These are the:

+ Trenching and Spoil Disposal Monitoring and Management Plan (TSDMMP) (BAS-210 0023) that addresses all trenching and spoil disposal activities from the 3 nm Commonwealth/NT waters boundary to the onshore termination point.
+ Marine Megafauna Noise Management Plan (MMNMP) (BAS-210 0045) that addresses all activities associated with underwater noise impacts to marine megafauna from the 3 nm Commonwealth/NT waters boundary to the onshore termination point.
+ Acid Sulfate Soil and Dewatering Management Plan (ASSDMP) (BAS-210 0049) that addresses all activities associated with acid sulfate soils (ASS) from lowest astronomical tide (LAT) to the upstream weld of the beach valve.

Table 1-1: DPD Project Activities within the Project Area covered by the CEMPs

Phases	Activities		
	Offshore CEMP	**Onshore CEMP**	**Outside scope of CEMPs**
Surveys	+ Offshore Surveying during construction + Environmental surveys during construction	Onshore surveying during construction	+ Low impact pre-construction surveys required to gather information for Project planning and approvals are out of scope for the CEMPs. These surveys include, but are not limited to, environment, heritage, geotechnical, geophysical and unexploded ordinance (UXO) surveys + Any surveys in Commonwealth waters
Pre-lay works	+ Installation of offshore pipeline from the onshore termination point to the 3 nm Commonwealth/NT waters boundary + Trenching and spoil disposal from the onshore termination point to the 3 nm Commonwealth/NT waters boundary + Spoil disposal at nominated spoil disposal grounds and in situ + Pre-lay span rectification + Cable crossings along the Pipeline pathway + Installation of site buildings and generators + Construction of the site access road + Installation of traffic plates over the existing Bayu-Undan pipeline + Preparation of the site pad, including installation of geotextile and site hard stand areas, installation of holdback	Onshore trenching of the onshore pipeline from the upstream weld of the beach valve to the onshore termination point and onshore stockpile of trench material for use as trench backfill. This will involve: + Excavation of trench from the upstream weld of the beach valve to site pad + Extension of trench to the onshore termination point through the site pad once no longer in use + Storage of any identified ASS / PASS on limestone pads and treated with lime prior to reuse or disposal to landfill	Any pre-lay works within Commonwealth waters

Phases	Activities		
	Offshore CEMP	**Onshore CEMP**	**Outside scope of CEMPs**
	anchor, linear winch, trench and shore pull wire.		
Pipeline installation and pre-commissioning	+ Pipelay activities + In-line tee installation + Pipeline shore pull + Rock backfill + Post-lay span rectification + Testing and pre-commissioning the offshore pipeline + Post-lay trenching + Pipelay contingencies	+ Installation of the onshore pipeline from the upstream weld of the beach valve to the onshore termination point + Testing and pre-commissioning the onshore pipeline + Tie-in onshore pipeline to the offshore pipeline at the onshore termination point	+ Any installation or pre-commissioning within Commonwealth waters, including: – DPD Project Pipeline end termination (PLET) installation – Spool installation (between DPD Project PLET and Offshore Barossa GEP PLET) + Installation of the beach valve and the pipeline between the beach valve and the DLNG facility + Installation of the shore crossing CP monitoring system
Demobilisation	+ Removal of the pre-commissioning spread + Removal of the hard stand and geotextile + Re-contouring of the site as applicable + Removal of causeway/s	+ Backfilling onshore pipeline trench + Site returned to pre-construction condition	
Operations	N/A	N/A	+ Operations + Inspection maintenance and repair
Decommissioning	N/A	N/A	+ Decommission pipeline + Removal of subsea infrastructure + Onshore decommissioning and rehabilitation + As-left/ post-surveys

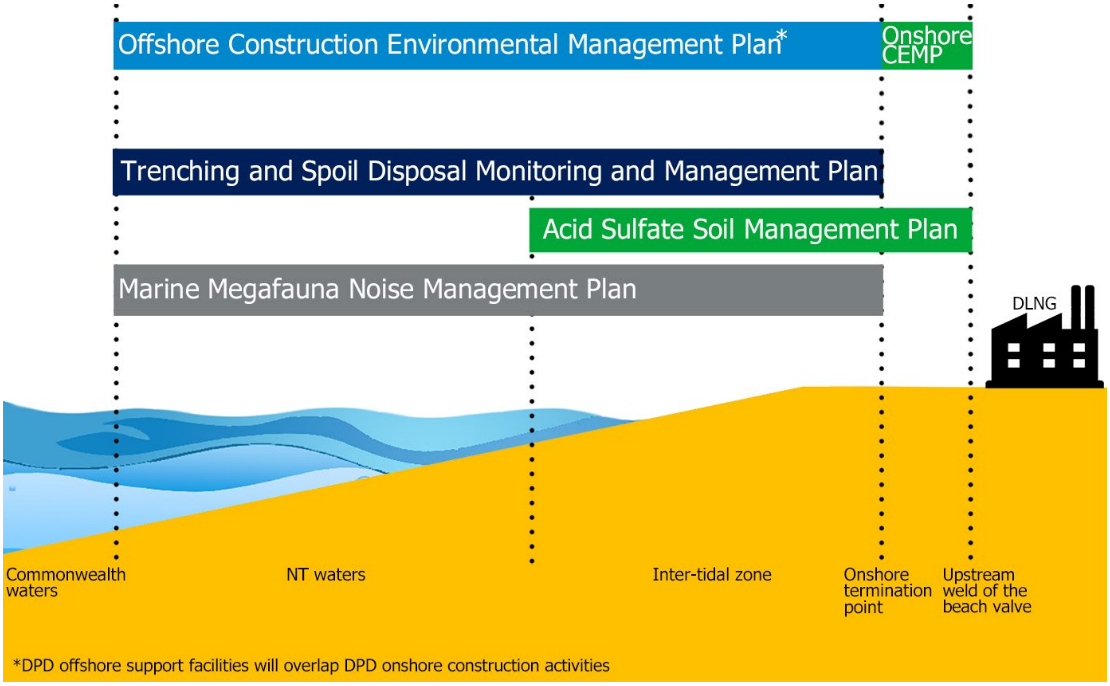

Figure 1-2: Conceptual model of management plan geographical scopes

1.4 Plan structure

This CEMP has been prepared and structured in accordance with the Guideline for the Preparation of an Environmental Management Plan (in draft) (NT EPA, 2015). The guideline requirements and where they have been addressed within the CEMP are detailed in **Table 1-2**.

Table 1-2: Construction Environmental Management Plan Structure

Communication	**Section 9:** **Stakeholder Consultation**

1.5 Proponent

1.5.1 Details of the proponent

Santos, as the operator of the Barossa Joint Venture, has applied to the DITT for two pipeline licences for the nearshore section of the DPD pipeline:

+ Coastal and Territorial Waters Licence for the section of the pipeline under the jurisdiction of the *Petroleum (Submerged Lands) Act 1981* (NT) (i.e. between the NT Coastal Waters Limit and the Territorial Sea Baseline)
+ Inland Waters Licence for the section of pipeline under the jurisdiction of the *Energy Pipelines Act 1981* (NT) (i.e. between the Territorial Sea Baseline and the upstream weld of the beach valve at the DLNG Facility).

The Inland Waters Licence is applicable to the section of pipeline within the scope of this CEMP. The proposed proponent details are provided in **Table 1-3**, with the nominated operator shown in bold.

Table 1-3: Proponent details for Barossa DPD Project's future Inland Waters Licence

Title	Proponent (nominated operator in bold)	ABN	Interest	Contact details
Inland Waters License	**Santos NA Barossa Pty Ltd**	44 109 974 932	25.0%	Business Address: Level 7, 100 St Georges Terrace, Perth, Western Australia, 6000 Telephone number: (08) 6218 7100 Fax number: (08) 6218 7200 Email address: barossa.regulatory@santos.com
	Santos Offshore Pty Ltd	38 005 475 589	25.0%	
	SK E&S Australia Pty Ltd	55 158 702 071	37.5%	Business Address: Level 6, 60 Martin Place, Sydney NSW 2000, Australia Telephone number: (02) 21213304 Fax number: None Email address: hyunjoon-kim@sk.com
	JERA	18 654 004 387	12.5%	Business Address: Level 9 Brookfield Place, 125 St Georges Tce, PERTH, WA, 6000

1.5.2 Details of nominated liaison person

Details for Santos's nominated liaison person for the activity are as follows:

Name Dr Lachlan MacArthur

Title: Environmental Approvals Adviser

Business address: Level 7, 100 St Georges Terrace, Perth, WA 6000

Telephone number: (08) 6218 7100

Email address: Barossa.regulatory@santos.com

1.5.3 Notification procedure in the event of changed details

If there is a change in the nominated operator, or a change in the contact details for the operator or liaison person, Santos will notify the DITT and provide the updated details.

1.6 Document review, revision and availability

This CEMP has been prepared for submission with the SER (BAS-210 0020) and other supporting documents to the NT EPA, under the EP Act, and will be updated to reflect any relevant regulatory conditions associated with the DPD Project approvals.

This CEMP will be provided to the relevant Minister in support of the PMP required to construct a pipeline under the *Energy Pipelines Act 1981* (NT) and Energy Pipelines Regulations 2001. A pipeline licensee for a pipeline for which a PMP is in force must submit to the Minister a proposed revision of the PMP in the event of a change, or proposed change, of circumstances or operations under Regulation 33, when requested by the Minister under Regulation 34 or at the end of each five-year period under Regulation 35.

Santos will review and update the document as required based on regulatory feedback and any regulatory conditions on DPD Project approval as applicable. The final CEMP will be made publicly available on an Australian website.

2 Detailed Activity Description

2.1 Overview

Table 2-1 provides the key attributes of the construction activity covered by this CEMP. A detailed activity description is provided in **Sections 2.3.1** and **2.3.8**.

Table 2-1: Attributes of the Activity

Attribute	Summary
Activity location	The relevant onshore section of the DPD pipeline extends from the onshore termination point (KP 122.484) to the upstream weld of the beach valve. The beach value is located at KP122.692. It is located at the shore crossing of the DLNG Facility on the Wickham Point peninsula, near Darwin (**Figure 2-1**). The onshore termination point is two metres above HAT. The nominal coordinates of the KPs are provided in **Table 2-2**. The onshore section of the Project Area is located within the existing DLNG disturbance footprint.
Pipeline installation	Approximately 200 m of 34-inch diameter carbon steel pipe. Pre-lay works phase: + Onshore trenching from the upstream weld of the beach valve to onshore termination point Pipeline installation and pre-commissioning phase: + Installation of the onshore pipeline from the upstream weld of the beach valve to the onshore termination point + Testing and pre-commissioning the onshore pipeline + Tie-in (welding) of the onshore pipeline to the offshore pipeline at the onshore termination point Demobilisation phase: + Backfilling onshore pipeline trench + Undertaking site remediation Refer to further detail in **Table 1-1**.
Machinery and vehicles	+ Light vehicles + Mobile equipment such as excavators, graders, trucks, fuel trucks + Heavy equipment such as cranes + Water cart
Proposed schedule	Work is scheduled to be performed in early 2024 and take up to 1 months

The locations for activities along the DPD Project pipeline are described using 'kilometre points' (KP), where KP 0 is the beginning of the DPD Project pipeline from the "pipeline end termination point C" (PLET C) in Commonwealth waters and KP 122.692 is the end of the onshore section of the DPD Project Pipeline.

Table 2-2: Onshore pipeline start and end locations.

Location	Kilometre Point	MGA Zone *	Easting*	Northing*
Onshore termination point	KP122.484	52	702272.73 E	8614606.40 S
Upstream weld of the beach valve	KP122.692	52	702,472.29 E	8,614,655.73 S

*Coordinates in GDA 94, MGA zone 52

2.2 Onshore project area

The Onshore Project Area is defined as the area within which the construction activity will take place and extends between the onshore termination point and the upstream weld of the beach valve (**Figure 2-1**). The onshore Project Area is contained within the existing DLNG disturbance envelope, which was previously subject to vegetation clearing. Areas within the DLNG disturbance envelope outside of the onshore Project Area may be used by the DLNG team for equipment laydown or trench material stockpiling.

The Project Area is shown in **Figure 2-1** with the DPD offshore support facilities shown in **Figure 2-2**.

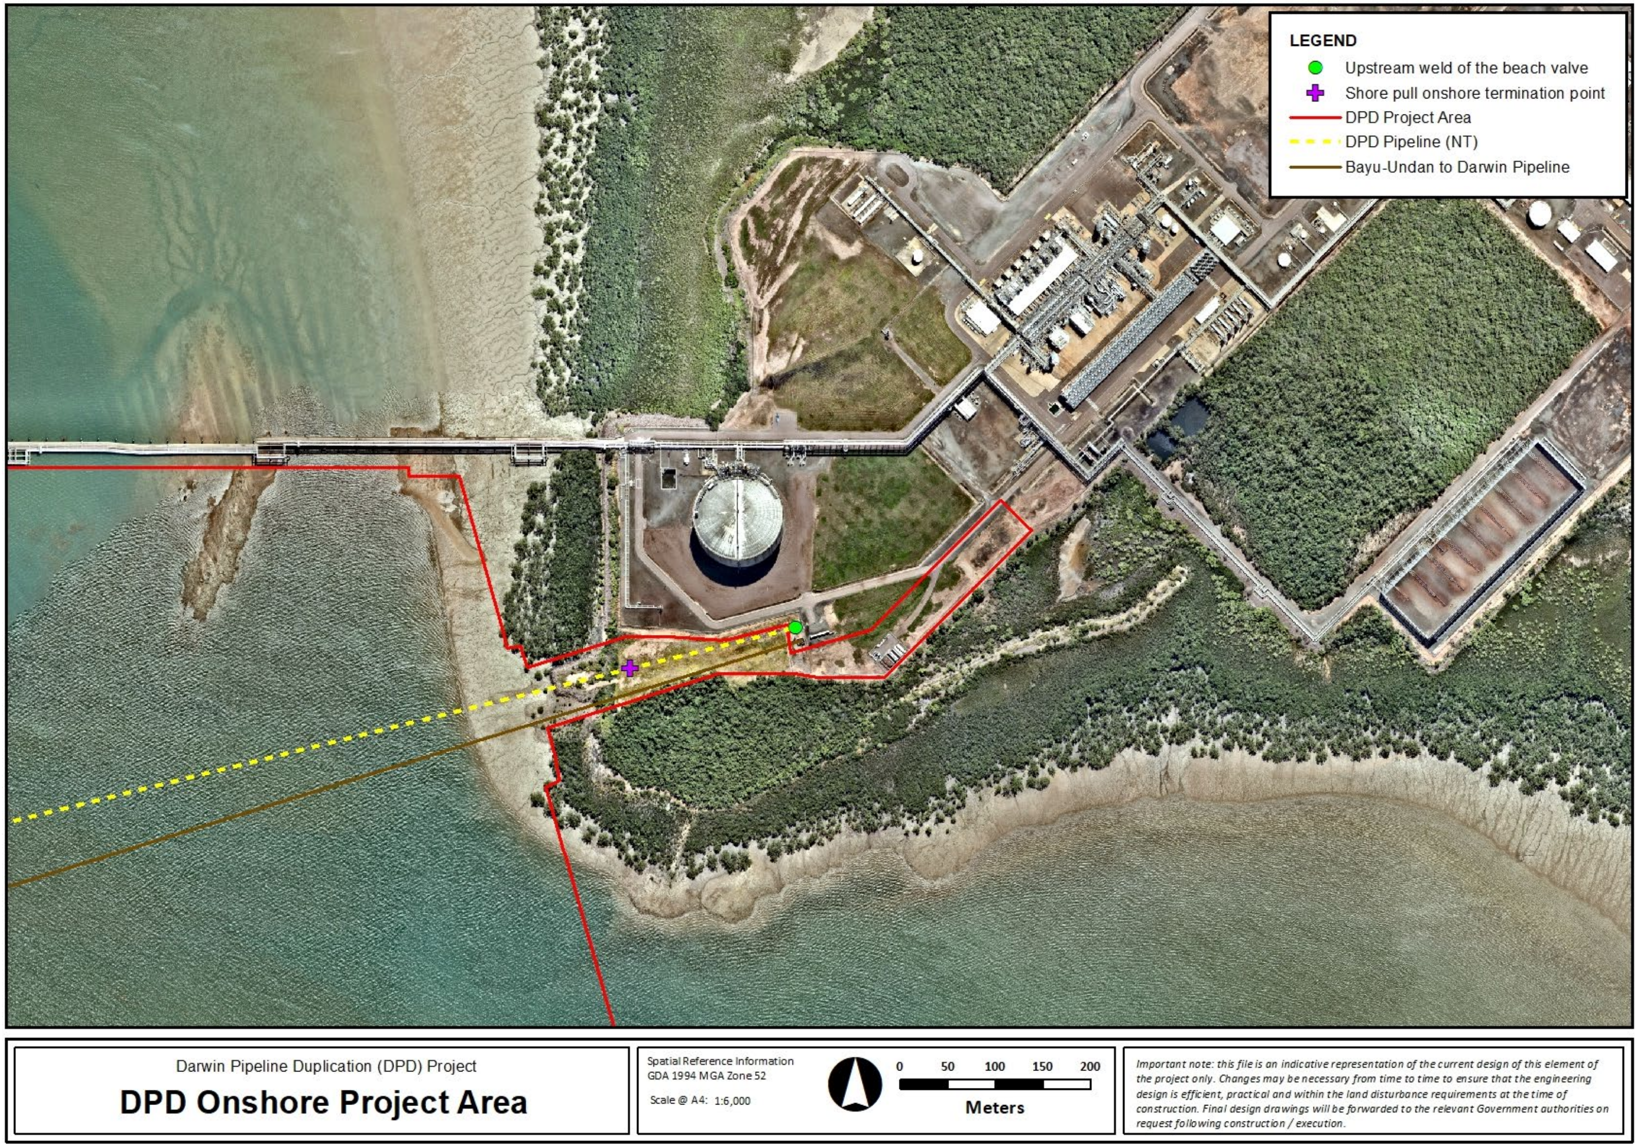

Figure 2-1: Onshore Project Area

2.3 Onshore construction

2.3.1 Onshore pre-lay works

2.3.1.1 Site establishment

The onshore construction site layout for the Barossa team is illustrated in **Figure 2-2.** The DLNG team's support facilities (i.e. site office, spoil stockpile, laydown areas) will be located within the existing DLNG disturbance envelope. Primary site access for both the Barossa and DLNG teams will be via the site access road shown in **Figure 2-2**.

2.3.1.2 Onshore trenching

Geophysical and/or geotechnical surveys will be undertaken before the commencement of construction of the onshore site, which will involve digging test pits and sampling extending down to the anticipated depth of the trench of ~2.5 m.

The construction works will be undertaken simultaneously with the Santos Barossa DPD Project team's onshore and intertidal construction works. Therefore, trenching will initially be completed from the upstream weld of the beach valve location to the extent of the DPD site pad (which will be used by the Barossa team). This section will be approximately 130 m in length. Once the shore crossing facilities have been removed by the Barossa team, the DLNG team will extend the trench from the extent of the DPD site pad down to the onshore termination point. This trench will be approximately 70 m in length and up to a maximum of 40 m wide. The onshore construction site layout is shown in **Figure 2-2.**

Trenching works may be scheduled either during or after the offshore pipeline's pre-commissioning works have been completed. Timing will be detailed through simultaneous operations (SIMOPS) once a detailed schedule of all onshore activities is developed.

The onshore trenching works will be undertaken during wet and/or dry seasons. Dewatering due to rainwater will be primarily managed by a diesel-powered suction pump combined with a silt separator, where the water that has been separated from solids is then discharged to grade (Downer, 2022). Additional sparges and hoses may be used to manage removal of water. While unlikely, dewatering of groundwater may be required, and is included in the Acid Sulfate Soils Management Plan (ASSDMP [BAS-210 0049]) to ensure management of any acidic groundwater.

Excavation will be completed by a 35-tonne excavator, articulated dump trucks and a water truck for dust suppression (Downer, 2022). The area of the onshore pipeline has been previously disturbed and was cleared of native vegetation during construction of the Bayu-Undan to Darwin Gas Export Pipeline. It is currently covered with naturally regrown native grasses and weeds. The grasses and topsoil will be stripped, and the trench will be excavated to ~2.5 m deep and will be ~3m wide at the base. At each welded pipeline connection, a wider excavation will be completed to provide suitable access and working area for the piping and welding crew (Downer, 2022). When trenching, all sides will be adequately supported by either shoring, benching or battering.

The trenched material will be placed on the non-working side of the trench (Downer, 2022) or stockpiled within the onshore Project Area or the DLNG disturbance envelope for future reuse as backfill. Surplus material will be removed offsite. The trenched material will be stockpiled onsite for testing and will be removed offsite to an appropriately licensed landfill as required.

While considered highly unlikely, if ASS or Potential ASS (PASS) are identified during trenching works the ASS / PASS material will be stored on limestone pads within the onshore Project Area or the DLNG disturbance envelope and treated with lime prior to reuse or disposal to an appropriately licensed landfill. Further context on ASS/PASS is provided in the ASSDMP (BAS-210 0049).

2.3.2 Onshore pipeline installation

The DLNG team are responsible for the fabrication of the structural steel and pipework, which will occur offsite at the nominated subcontractor's fabrication workshop (Downer, 2022). The pipe spool configuration will require field welding; therefore surface treatment and non-destructive examination (NDE) will be completed offsite and final weld testing, surface treatment and hydrostatic testing will be completed onsite. Structural steel will be fabricated by either welded assembly or stick build. Standalone pipe supports will be fabricated as one item and will require no assembly. The piping and structural steel will be transported to site by road and unloaded by a site-based crane at a laydown area onto timbers or dunnage (Downer, 2022). Lay-down areas will be defined by the installation contractor during detailed design (**Figure 2-2**).

The onshore pipeline will be approximately 200 m length of 34-inch diameter carbon steel with an external anti-corrosion coating to maintain the pipeline integrity. The pipeline assembly configurations between the upstream weld of the beach valve and the onshore termination point are outlined in the Barossa Onshore Tie-In Project Delivery Management Plan (Downer, 2022). Pipe will be strung out alongside the trench, lifted onto temporary pipe supports and cut to length, subjected to end preparation works and aligned for welding. This will be followed by butt welding of the joint and NDE until the sub-assembly is completed. The sub-assemblies will be lifted onto temporary pipe supports in the trench, aligned for welding and butt welding of the joint. The final NDE and coating will be completed prior to the hydrotesting. A 25-tonne Franna crane will be available for minor lifts and pipe placement and two 55-tonne rough terrain cranes will be used for placement of the welded pipes into the trench.

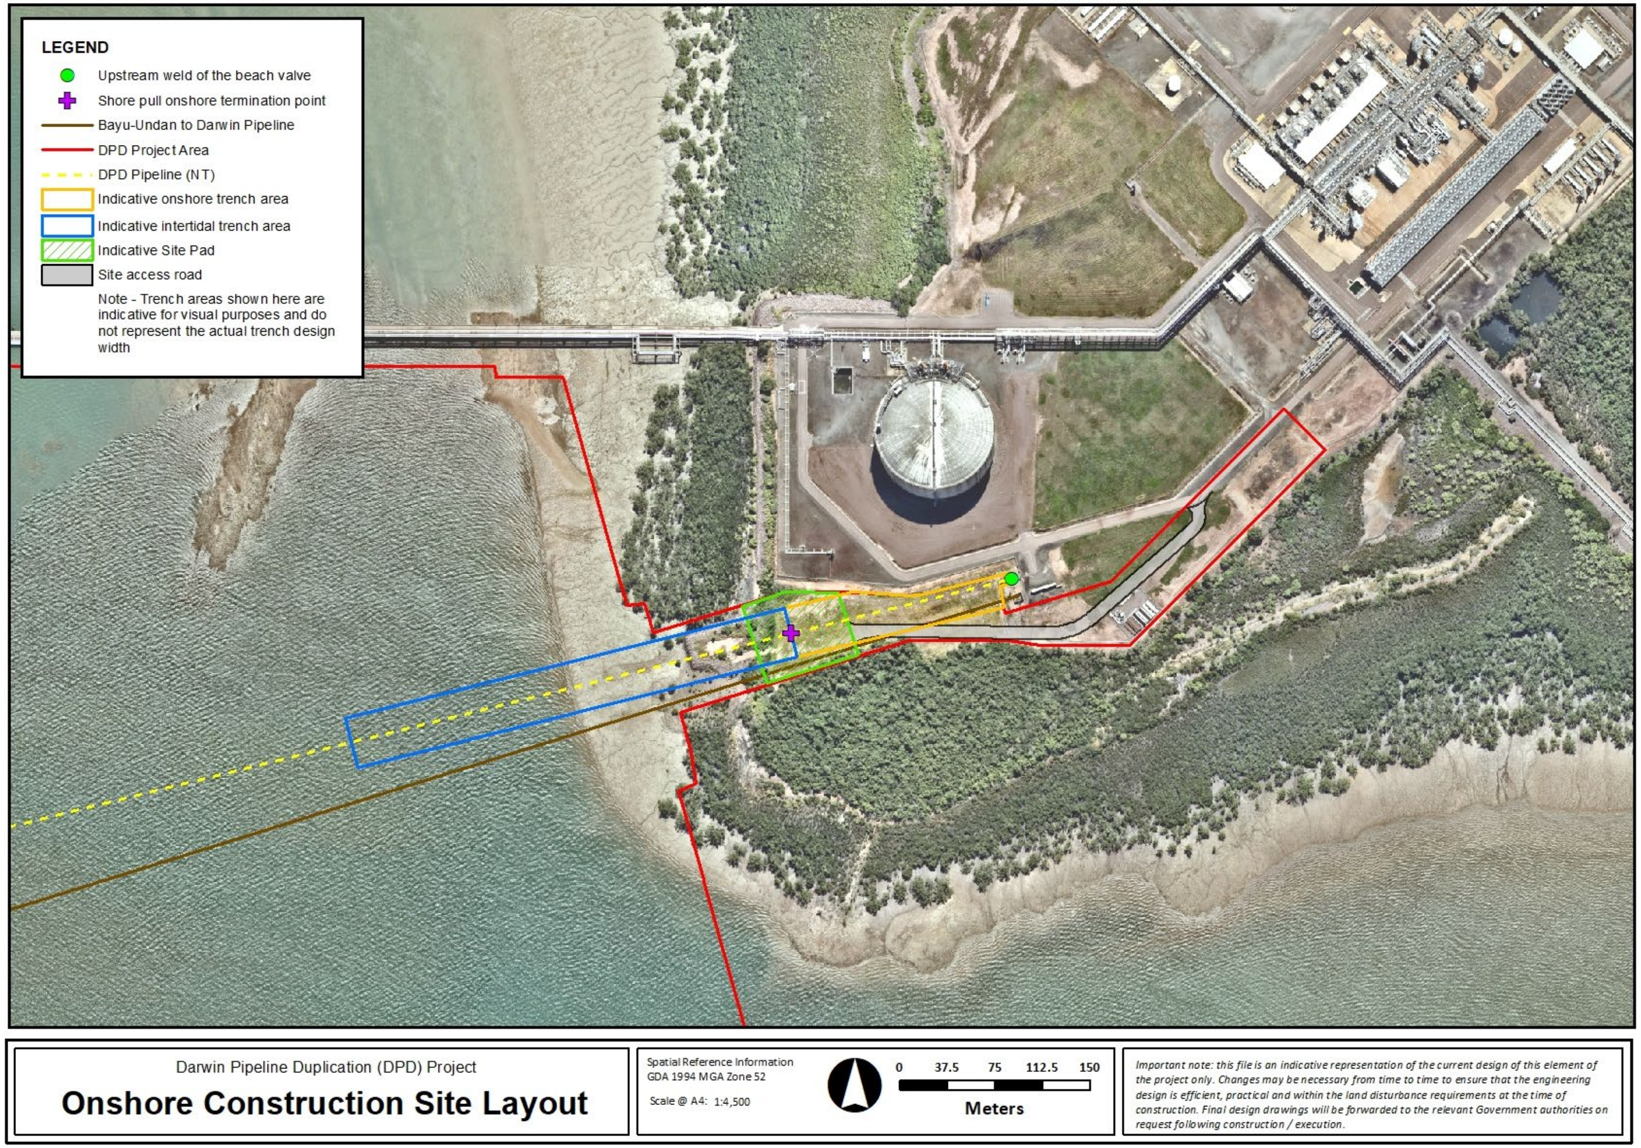

Figure 2-2: Onshore site layout and Santos Barossa DPD Project teams shore crossing at the intertidal area

2.3.3 Pre-commissioning

Once the DLNG team has installed the onshore pipeline, it will be subjected to a hydrostatic pressure test (hydrotest). Hydrotesting will be completed in line with Santos' specification, Pressure Testing of Process and Utility Piping (1540-120-SPC-0018), and Downer standard, Hydrostatic Testing (SM-QA-ST014) (Downer, 2022). The Barossa team will source hydrotesting water for pre-commissioning the offshore pipeline by water extraction from Darwin Harbour. The water will be filtered to remove particulates and then chemically treated. The DLNG team will use this treated seawater for their hydrotesting activities of the onshore pipeline. As water extraction from Darwin Harbour and filter backflushing is managed by the Barossa team and is described and assessed in the Offshore CEMP (BAS-210 0024) it is not described or assessed further within this CEMP.

A volume of chemically treated seawater will be pushed into the pipeline to raise its pressure. This hydrotest pressure will be held for a period of time as per the relevant standard to test the pipeline integrity. The discharged hydrotest water will be temporarily stored in an enclosed bladder for offsite disposal (enclosed bladder within steel retaining wall). This bladder will be installed in the onshore Project Area, potentially on the DPD site pad, where bulk chemical storage will also be located.

In the event of a pipeline issue that requires remedial construction work, contingency plans will be implemented and the onshore pipeline's hydrotest section will be emptied to the bladder to facilitate these repairs. Once the onshore pipeline is successfully tested and pre-commissioned, the DLNG team will complete the tie-in with a golden weld to the offshore pipeline at the onshore termination point.

Alternatively, the onshore pipeline may be connected to the offshore pipeline at the onshore termination point (KP122.484) before the offshore pipeline is pre-commissioned so that FCGT can be undertaken by the Barossa team for the entire DPD pipeline (onshore and offshore sections).

2.3.4 Trench backfill and demobilisation at shore crossing

At the completion of the pipeline installation and pre-commissioning activities, the onshore trench will be backfilled with soil and topsoil from trenching and additional fill of specific parameters should engineering backfill be required. The disturbed onshore area relevant to the DLNG team will be returned to natural grade to match existing topography. Revegetation works are not proposed in this CEMP.

The Barossa team will be responsible for removal of the-onshore support facilities shown in **Figure 2-2**. The DLNG team will be responsible for the removal of equipment and demobilisation as relevant to their scope.

2.3.5 Resource requirements and access

Other requirements of the onshore construction activity include the following:

+ Personnel will be required during the construction period. Labour will be recruited from the domestic and local labour market where possible; this is subject to the contractors' resourcing requirements at the time. Accommodation will be provided for the workforce within the Darwin area.
+ Power will likely be supplied by onsite generators to support construction amenities and operation of equipment.
+ Water usage including for dust suppression, washdown facilities and ablutions supply will likely be sourced from mains water supply within the DLNG Facility, or provided as self-sufficient water through containerised water trucks; and

+ Access to the onshore site will be via the existing DLNG access at the end of Middle Arm Peninsula into Wickham Point.

2.3.6 Fuels and chemicals

Chemical and fuel storage will be stored onsite within self-bunded fuel storage/tanks. Fuel trucks will likely be used to supply fuel to construction equipment, including excavators, graders, cranes, and generators, in accordance with standard refuelling procedures. Hydrotest chemicals will also be stored onshore within a bunded hydrotest spread (i.e. biocides, oxygen scavenger and dye).

2.3.7 Atmospheric Emissions

A GHG emissions study was conducted to determine the scope 1, 2 and 3 emissions from the DPD Project. The scope 1 emissions, within NT jurisdiction, are emissions that result directly from the construction DPD Project and include those from:

+ Vessel-based construction activities (offshore activities only)
+ Onshore power generating equipment (i.e. engines and generators)

Scope 2 and Scope 3 emissions are associated with the broader Barossa project and comprise emissions related to electricity use, transport and construction of materials and consumption of Barossa products by customers.

The total scope 1 emissions for the DPD offshore and onshore Project construction activities in the NT are approximately 50,000 tCo2-e

2.3.8 Wastes

Construction of the pipeline will produce the following wastes:

+ Onshore wastes including water from dewatering and general rubbish / food waste.
+ Trench spoil

Section 4.4.3 outlines waste management for the DPD project in more detail.

2.4 Indicative construction schedule

The indicative schedule to complete construction works is shown in **Figure 2-3**.

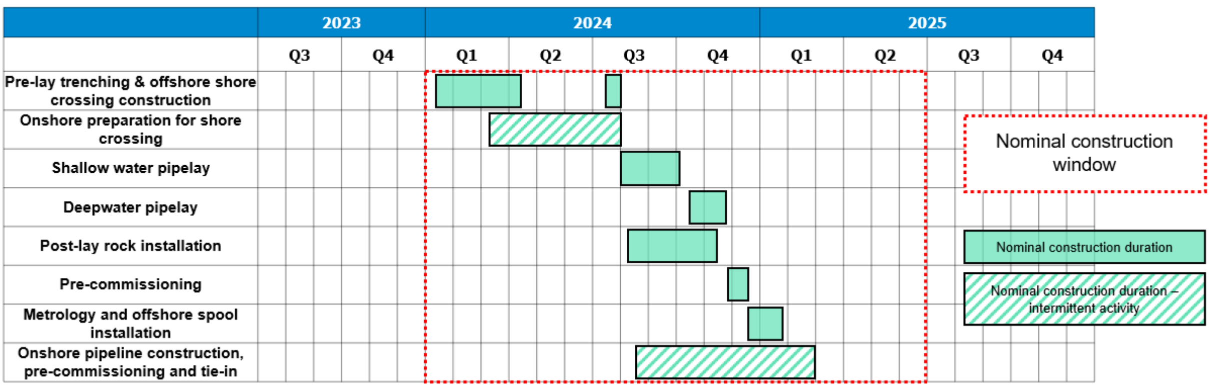

Figure 2-3: Nominal construction sequence and durations for the DPD Project

Santos

3 Legal and Other Obligations

The following sections describe the legislative framework governing the impacts from the construction of the DPD Pipeline (NT).

3.1 Barossa DPD project approvals

3.1.1 Commonwealth environmental approvals

The DPD Project including the DPD Pipeline section in Commonwealth waters was referred to the DCCEEW under the EPBC Act on 7 October 2022 (EPBC 2022/9372). On 6 December 2022 the DPD Project was determined to be a Controlled Action requiring further assessment based on Preliminary Documentation. Further information was requested under section 95A(2) of the EPBC Act on 23 December 2022.

It was determined that the Project may have a significant impact on the following controlling provisions under the EPBC Act:

+ Listed threatened species and communities (sections 18 & 18A)
+ Listed migratory species (sections 20 & 20A)
+ Commonwealth marine areas (sections 23 and 24A)

The Preliminary documentation is currently being prepared for submission to DCCEEW.

This CEMP will be updated to reflect any relevant regulatory conditions associated with this approval.

3.1.2 Northern Territory environmental approvals

The DPD Project was referred to the NT EPA on 14 January 2022 under Section 55 of the EP Act. The NT EPA determined the DPD proposal required assessment by SER (Tier 2) in accordance with the EP Regulations. The SER is required to address public submissions and include information additional to the referral document in relation to specific aspects of potential significance. T

The following approvals are also required for construction of the DPD Project under NT legislation:

+ Department of Infrastructure, Planning and Logistics (DIPL) – Development Permit (*Planning Act 1999)* and Occupational Licence (*Crown Lands Act (1992)*)
+ DITT – Energy Division Consent to construct and Consent to Test (*Energy Pipeline Act 1981* and *Petroleum (Submerged Lands) Act 1981*) Pipeline Licence *(Energy Pipeline Act 1981*)

Conditions within these permits, where they are relevant to the environmental management of works will be incorporated into future revisions of the CEMP.

Native vegetation clearing in the NT requires a permit issued under either the *Planning Act 1999* (NT) or the *Pastoral Land Act 1992* (NT). The onshore Project Area is within freehold land, therefore any native vegetation clearing for the activity will be controlled, as required, by the *Planning Act 1999* (NT) through a Development Permit.

3.1.3 Aboriginal Areas Protection Authority certificates

Aboriginal Areas Protection Authority (AAPA) certificates aim to protect indigenous sacred sites preventing damage from nearby works and outlines conditions to be followed when carrying out works on land and sea near to sacred sites across NT. The AAPA administer these certificates under the *Northern Territory Aboriginal Sacred Sites Act 1989* (NT).

Santos has received an AAPA Authority Certificate (C2022-098) from AAPA on 23 December 2022 and will ensure the requirements of the certificate (including avoidance of restricted work areas) and the *Northern Territory Aboriginal Sacred Sites Act 1989* are met.

3.2 Legislative framework

Environmental legislative requirements governing DPD project are described in the following sections. All activities will comply with legislative requirements established under relevant Commonwealth and NT legislation. Key legislation is described below in **Sections 3.2.1.1**, **3.2.1.2** and **3.2.1.3**. Other relevant legislation is described in **Table 3-1** and **Table 3-2**.

3.2.1 Key legislation

3.2.1.1 Environment Protection and Biodiversity Conservation Act 1999 (Cth)

The EPBC Act is administered by DCCEEW. The EPBC Act provides a legal framework to protect and manage nationally and internationally important flora, fauna, ecological communities, and heritage places, which are defined in the EPBC Act as matters of national environmental significance. There are nine matters of national environmental significance to which the EPBC Act applies these are: world heritage properties, national heritage places, wetlands of international importance, nationally threatened species and ecological communities, migratory species, Commonwealth marine areas, the Great Barrier Reef Marine Park, nuclear actions, and water resources (in relation to coal seam gas development and large coal mining development) (DCCEEW, 2022a). When a person proposes to take an action that they consider may need approval under the EPBC Act, they must refer the proposal to the Commonwealth Minister for Environment.

Section 3A of the EPBC Act sets out the principles of ecologically sustainable development, which are:

- Decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations.
- If there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation.
- The principle of inter-generational equity—that the present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations.
- The conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making; and
- Improved valuation, pricing and incentive mechanisms should be promoted.

The construction and operation of the DPD Project (including the Commonwealth waters section) has been referred to DCCEEW under the EPBC Act and assessed to be a Controlled Action (referral number EPBC 2022/9372) requiring further assessment based on Preliminary Documentation (in progress).

3.2.1.2 *Environment Protection Act 2019* (NT)

The EP Act and associated EP Regulations are administered by DEPWS. The EP Act protects the environment and related purposes of the NT. The Act also:

- Promotes ecologically sustainable development
- Recognises the role of environmental impact assessment and environmental approval in promoting the protection and management of the environment of the Territory

+ Provides for broad community involvement during the process of environmental impact assessment and environmental approval
+ Recognises the role that Aboriginal people have as stewards of their country as conferred under their traditions and recognised in law, and the importance of participation by Promotion of ecologically sustainable development.

This CEMP has been developed under the guidance of this Act and the NT EPA Draft Guidelines for an Environmental Management Plan (NT EPA, 2015), and will be submitted to NT EPA with the DPD SER (BAS-210 0020) for assessment.

3.2.1.3 Energy Pipelines Act 1981 (NT)

The *Energy Pipelines Act 1981* (NT) allows for the creation of provisions for the construction, operation, maintenance and cessation of use or abandonment of pipelines for the conveyance of energy-producing hydrocarbons, and for related purposes. The *Energy Pipelines Act* applies to the DPD pipeline inshore from the NT Territorial Sea Baseline to the Onshore termination point.

The *Energy Pipelines Act 1981* (NT) and subsidiary Energy Pipelines Regulations require the proponent to operate licensed pipelines in accordance with an accepted Pipeline Management Plan (PMP). The Energy Pipelines Regulations do not require the PMP to explicitly consider environmental impacts and risks, however it is DITT- Energy Division policy that an environmental management plan (EMP), is submitted to, with the PMP for approval. This CEMP and supporting plans will constitute the EMP to be provided with the PMP for approval under the *Energy Pipelines Act 1981.*

3.2.2 Other relevant legislation

3.2.2.1 Commonwealth legislation

Commonwealth legislative requirements relevant to the DPD Project onshore construction activities are outlined in **Table 3-1**.

Table 3-1: Commonwealth legislation relevant to the activity

Commonwealth	
Title	**Description**
Aboriginal and Torres Strait Islander Heritage Protection Act 1984	The purpose of this act is to preserve and protect places and objects in Australia and in Australian waters from injury or desecration; places or objects in question must be of particular significance to Aboriginal people with Aboriginal tradition.
Biosecurity Act 2015	The Act describes how to manage biosecurity threats to plant, animal and human health in Australia and its external territories, ensuring a very low level of risk.
Industrial Chemicals (Notification and Assessment) Regulations 1990 (Cth) National Industrial Chemicals Notification and Assessment Scheme (NICNAS)	Industrial chemicals are regulated by the Australian Government and administered by NICNAS. NICNAS provides a national notification and assessment scheme to protect the health of the public, workers and the environment from the harmful effect of industrial chemicals. NICNAS also assess all chemicals new to Australia and existing chemicals on a priority basis, in response to concerns about their safety on health and environmental grounds.
National Greenhouse and Energy Reporting Act 2007	Introduces a single national reporting framework for the reporting and dissemination of information about GHG emissions, GHG projects and energy use and production of corporations.

Commonwealth	
Title	**Description**
Native Title Act 1993	This Act provides for the recognition and protection of native title and provides or permits for the validation of past acts and intermediate period acts, invalidated because of the existence of native title. It additionally establishes ways in which future dealings affecting native title may proceed and sets standards for those dealings and establishes mechanisms for determining claims to native title. There is a Native Title Determination (Tribunal ID DCD2006/001) over the onshore Project Area, Larrakia (Part A – consolidated proceeding). The outcome of the determination found that Native Title does not exist (National Native Title Tribunal, 2022).
Ozone Protection and Synthetic Greenhouse Gas Management Act 1989	This Act, and associated regulations, implements the requirements of the Vienna Convention and Montreal Protocol to avoid using ozone depleting substances.

3.2.2.2 Northern Territory legislation

NT legislative requirements relevant to the DPD Project onshore construction activities are outlined in **Table 3-2.**

Table 3-2: Northern Territory legislation relevant to the activity

Northern Territory	
Title	**Description**
Aboriginal Land Rights (Northern Territory) Act 1976	The Act provides the basis upon which Aboriginal Australian people in the Northern Territory can claim rights to land based on traditional occupation
Aboriginal Land Act 1978	This Act provides for the access to Aboriginal land, certain roads bordered by Aboriginal land and the seas adjacent to Aboriginal land.
Bushfires Management Act 2016 Bushfires Management (General) Regulations 2017	The Act establishes the Bushfires Council and provides for the prevention and control of bushfires in the NT.
Dangerous Goods Act 1998 and *Dangerous Goods Regulations 2017*	This Act provides for the safe storage, handling, and transport of certain dangerous goods. These being explosives (including fireworks) and fuel gas (including Autogas) (NT WorkSafe, 2020).
Environmental Offences and Penalties Act 2011	This Act defines levels and penalties for environmental offences
Fire and Emergency Act 1996 Fire and Emergency Regulations 1996	This Act provides for the establishment and operation of the NT Fire and Rescue Service and their operational and emergency response activities. The Regulations outline general requirements under the Act, such as storing flammable or combustible material and using cutting, heating and welding equipment.

Northern Territory	
Title	**Description**
Northern Territory Environment Protection Authority Act 2012	This act aims to: a) promote ecology sustainable development; b) to protect the environment, having regard to the need to enable ecologically sustainable development; (c) to promote effective waste management and waste minimisation strategies; and (d) to enhance community and business confidence in the environmental protection regime of the Territory.
Planning Act 1999 Planning Regulation 2000	The Act provides framework of controls for the orderly use and development of land. The objective of the Act includes ensuring that strategic planning is applied to planning schemes and implemented in individual planning decisions, promotion of sustainable development of land and promotion of the responsible use of land and water resources to limit the adverse effects on development of ecological processes. Division 2 of the Act provides the planning basis for the submission, review and authorisation of Exceptional development permits (EDPs), and related EDP variations. An EDP has been issued for the DLNG Facility. Approval for the DPD Project will be obtained under the *Planning Act 1999* (NT), Santos is consulting with DIPL regarding the pathway for this approval.
Territory Parks and Wildlife Conservation Act 1976	This Act provides for the establishment of Territory Parks and other parks and reserves and for the study, protection, and conservation of wildlife in NT. This includes provisions on changes and revocation of parks, reserves and sanctuaries, the preparation and implementation of plans of management, the creation and management of sanctuaries and on the management of wildlife, flora, and fauna.
Waste Management and Pollution Control Act 1998 Waste Management and Pollution Control (Administration) Regulations 1998	This Act provides for the protection of the environment through encouragement of effective waste management and pollution prevention and control practices and for related purposes.
Weeds Management Act 2001	This Act allows for the classification of declared weeds or potential weeds, requirements for managing declared weeds or potential weeds and preparing management plans.

3.2.3 International conventions and agreements

Australia is signatory to numerous international conventions and agreements that obligate the Commonwealth government to prevent pollution and protect specified habitats for flora and fauna. Those which are relevant to the activity are outlined in **Table 3-3**.

Table 3-3: International agreements and conventions relevant to the activity

International agreements and conventions	
Title	**Description**
China-Australia Migratory Bird Agreement (CAMBA)	This agreement recognises the special international concern for the protection of migratory birds and birds in danger of extinction that migrate between Australia and China. Implemented in the EPBC Act.

International agreements and conventions	
Title	**Description**
Japan-Australia Migratory Bird Agreement (JAMBA)	This agreement recognises the special international concern for the protection of migratory birds and birds in danger of extinction that migrate between Australia and Japan. Implemented in the EPBC Act.
Republic of Korea-Australia Migratory Bird Agreement (ROKAMBA)	This agreement recognises the special international concern for the protection of migratory birds and birds in danger of extinction that migrate between Australia and Korea. Implemented in the EPBC Act.
United Nations Convention on Biological Diversity – 1992	An international treaty to sustain life on earth.
United Nations Framework Convention on Climate Change (1992)	The objective of the convention is to stabilise GHG concentrations in the atmosphere at a level that would prevent dangerous interference with the climate system. Australia ratified the convention in December 1992, and it came into force on 21 December 1993.

3.3 Standards, codes and guidelines

There are several Australian Standards, Codes of Practise and Guidelines relevant to this CEMP, which have been identified below.

+ AS2885 Pipelines – Gas and Liquid Petroleum
+ AS/NZS 4801 Occupational Health and Safety Management
+ AS/NZS ISO 9001:2008, Quality management systems – Requirements
+ AS/NZS ISO 14001:2004, Environmental management system – Requirements with guidance for use
+ AS/NZS ISO 31000:2009, Risk management – Principles and guidelines
+ HB 203:2006 Environmental Risk Management – Principles and Process
+ Draft Guidelines for the Preparation of an Environmental Management Plan (NT EPA, 2015)
+ Guideline for Reporting on Environmental Monitoring (NT EPA, 2016)

4 Environmental Management Framework

4.1 Santos management system

Santos's Management System (known as the SMS) exists to support its moral, professional, and legal obligations to undertake work in a manner that does not cause harm to people or the environment. The framework of policies, standards, processes, procedures, tools, and control measures that, when used together by a properly resourced and competent organisation, result in:

+ A common HSE approach is followed across the organisation.
+ HSE is proactively managed and maintained.
+ The mandatory requirements of HSE management are implemented and are auditable.
+ HSE management performance is measured, and corrective actions are taken.
+ Opportunities for improvement are recognised and implemented.
+ Workforce commitments are understood and demonstrated.

The Implementation Strategy and Stakeholder Consultation sections within this CEMP (**Section 8** and **Section 9**) align with the Santos Management System structure and are designed to require that:

+ environmental impacts and risks continue to be identified for the duration of the activity and reduced to ALARP.
+ controls are effective in reducing environmental impacts and risks to ALARP and acceptable levels.
+ environmental performance objectives (EPOs) and environmental performance standards (EPSs) set out in this CEMP are met.
+ consultation with relevant and interested persons is maintained throughout the activity as appropriate.

4.2 Santos' Environment, Health, and Safety Policy

Santos' Environment, Health and Safety Policy (**Appendix 1**) clearly sets out its strategic environmental objectives and the commitment of the management team to continuous environmental performance improvement. This CEMP has been prepared in accordance with the fundamentals of this policy. By accepting employment with Santos, each employee and contractor is made aware during the recruitment process that he or she is responsible for the application of this policy.

4.3 DPD Project environmental management plans

This CEMP is part of a suite of environmental management plans covering all activities from the 3 nm Commonwealth/NT waters boundary to the upstream weld of the beach valve. This Onshore CEMP covers activities between the onshore termination point and the upstream weld of the beach valve and the offshore CEMP (BAS-210 0024) covers activities between the Commonwealth/NT waters boundary and onshore termination point. The TSDMMP (BAS-210 0023), ASSDMP (BAS-210 0049) and MMNMP (BAS-210 0045) sit under the CEMPs addressing specific activities. These activities are described in **Section 1.3**. outlines this management plan hierarchy.

4.4 Supporting management processes and procedures

4.4.1 Contractor Health, Safety and Environment requirements

The HSE requirements for contracts/contractor management during pre-contract planning, contracting, contract execution and contract completion and evaluation are outlined in the HSE Contractor Management Operating Standard (SMS-HSS-OS08) and the Contracting and Procurement Operating Standard (SMS-PRC-OS01). It includes the following minimum requirements:

+ Contractors to comply with all applicable HSE laws and regulations and any additional guidelines, operating standards, policies and management plans provided to the Contractor.
+ A review of the Contractor HSE Management System is completed before being contracted.
+ Provisions for Santos to conduct audits/inspections of the Contractor’s operations, equipment and emergency procedures at any time.

4.4.2 Chemical selection and assessment procedure

All chemicals that are planned to be used on site during the DLNG construction activity will be evaluated using a defined framework and set of tools to ensure potential impacts are acceptable, ALARP and met Santos’ expectation for environmental performance.

DLNG construction personnel and contractors will adhere to the process outlined in the Chemical Management Procedure (ALL/HSE/PRO/044) and approved chemicals and hazardous substances will be recorded on the DLNG Approved Chemicals and Hazardous substances register (DLNG/HSE/REG/001).

4.4.3 Santos waste management process

As per the Santos Environment Hazard Controls Procedure (SMS-EXA-OS01-PD02), Santos requires that for all waste generated at its facilities and by contractors under its influence, the hierarchy of waste management applies whereby wastes are (in order of preference) avoided, reduced, re-used, recycled, treated and/or disposed of at an appropriately licensed facility. A waste inventory must be documented and records of waste disposal from the onshore site are standardised (Waste Monitoring and Reporting Procedure - SMS-EXA-OS01-PD02-PD01) to allow accurate and consistent waste tracking. Contractors under this CEMP will demonstrate waste management processes will be aligned with regulatory and Santos’ requirements through the provision of Waste Management Plan for Santos acceptance.

5 Existing Environment

This section describes the key physical, biological, socio-economic and cultural characteristics of the existing environment that may be impacted by planned and unplanned events associated with the activity.

The description of the environment applies to the terrestrial land within which planned activities will occur (onshore Project Area; see **Figure 2-1**), and the terrestrial land and coastal waters that may be impacted by unplanned events. While highly unlikely, unplanned events could impact marine receptors within a few kilometres of the onshore Project Area.

5.1 Information sources

A summary of information derived from the following documents are provided in this section:

+ Darwin Pipeline Duplication (DPD) Project – EPBC Referral Supporting Information (BAA-201 0004; Santos, 2022a), including a Protected Matters Search Tool (PMST) report undertaken in October 2021 for a 5 km radius from the DPD pipeline
+ DLNG Operations Environmental Management Plan (OEMP) (ConocoPhillips, 2018)
+ Ichthys Gas Field Development Project – Draft Environmental Impact Statement (INPEX Browse Ltd, 2010)
+ Fauna conservation advice and recovery plans relevant to the onshore Project Area and within a few kilometres of it.

5.2 Key environmental factors

5.2.1 Terrestrial environmental quality

5.2.1.1 Bioregion

Based on the Interim Biogeographic Regionalisation for Australia Version 7, the onshore Project Area and surrounding areas are within the Darwin Coastal bioregion (Australian Government, 2022).

The Darwin Coastal bioregion comprises gently undulating plains on lateritised Cretaceous sandstones and siltstones; sandy and loamy red and yellow earths and siliceous sands from near the mouth of the Victoria River to just west of Cobourg Peninsula. The most notable vegetation feature is the extensive and diverse floodplain environment associated with the lower reaches of the many large river systems. There are also substantial areas of mangroves, and rainforest and other riparian vegetation fringing the rivers. Inland from the coast, the dominant vegetation type is eucalypt tall open forest, typically dominated by Darwin woollybutt (*Eucalyptus miniata*) and Darwin stringybark (*E. tetrodont*a) (Baker *et al.*, 2005).

5.2.1.2 Geology, soils and geomorphology

The bedrock of the onshore Project Area is comprised of meta-sediments that have metamorphosed and undergone one major deformation, resulting in steep dips and a north-north-east orientated strike of the strata (BAA-201 0003; Santos, 2021). The shore crossing's Burrell Creek Formation comprises of a sequence of phyllite, siltstone, shale, sandstone and conglomerate (ConocoPhillips, 2019).

The Koolpinyah Surface was developed in the Later Tertiary through an extensive cycle of deep weathering, erosion, re-sorting and lateralisation occurred throughout the Top End of the NT (Dames & Moore Pty Ltd, 1997). Parts of the Koolpinyah Surface are present on the Wickham Point peninsula, forming laterite deposits on the lower slopes' bench areas of the flanks of the ridges and as extensive platforms near sea level. There is a prominent ferricrete pavement near sea level that extends seawards out to the low tide level. It forms a capping on the shallow near shore reefs (ConocoPhillips, 2019).

Tidal mudflats surround the Wickham Point peninsula, which includes mangrove flats or salt flats. The mudflats are composed of Quaternary marine alluvium which consists of clay, silt and some fine sand, commonly with shell and coral fragments and organic matter in the mangrove zone and salt crusting on the salt flats (Dames & Moore Pty Ltd, 1997).

5.2.1.3 Topography and land units

The Darwin Coastal bioregion is characterised by generally flat, low-lying country that is drained by several large rivers (Bastin and the ACRIS Management Committee, 2008). The local topography at 1:2,500 scale of the onshore pipeline area is approximately 8 to 10 metres above Australian Height Datum (m AHD) and the broader onshore Project Area gently slopes to 6 m AHD along its southern boundary (DEPWS, 2022). The majority of the onshore Project Area has a slope of less than 2% (BAA-201 0003; Santos, 2021).

Two land units have been mapped over the onshore Project Area, noting that this area has been highly disturbed due to the DLNG Facility and the Bayu-Undan pipeline. The land units included (DEPWS, 2022; DLRM, 2015):

+ Low Hills – Steeply sloping ridge terrain; gradient 10 – 40%; shallow stony lithosols: Eucalypt Woodland, minor Open Woodland
+ Rises – Low rises (adjacent to estuarine areas); gradient 1 – 2.5%; shallow gravelly lithosols: Variable Tall Shrubland or Eucalypt Open Forest.

Soil orders across Wickham Point vary with the land units, generally Kandosols in the higher landscapes and Hydrosols in the lower landscapes (BAA-201 0003; Santos, 2021). The Keefers Hut and Littoral land systems overlap the onshore Project Area (DEPWS, 2022). The Keefers Hut land system area has largely been disturbed by the DLNG Facility and is described as plains and rises associated with deeply weathered profiles (laterite) including sand sheets and other depositional products and sandy and earth soils. The Littoral land system which encompasses most of Wickham Point, is characterised as tidal mudflats and coastal floodplains with channels and estuaries. It is subject to tidal inundation and has poorly drained clays and muds.

5.2.1.4 Rainfall and cyclone activity

The mean annual rainfall for Darwin is 1723.8 mm with the majority of this (87%) rainfall coming in wet season months between November and March. Mean 9am and 3pm relative humidity is also higher in the wet season following similar trends to rainfall (BOM, 2022).

5.2.1.5 Acid sulfate soils

ASS are formed naturally and often occur in low lying coastal areas (BAA-201 0003; Santos, 2021). Coastal estuarine and mangrove environments develop ASS due to its typical waterlogged nature, saltwater influences and anaerobic soils.

ASS mapping over the Darwin region indicates that the onshore Project Area has a high potential for PASS to occur (BAA-201 0003; Santos, 2021). As a result of the historical earthworks undertaken as part of the development of the DLNG facility, the natural material has been removed across the onshore zone and replaced by imported (non-ASS) fill material (generally sand) up to a depth of approximately 6 m below ground level (Santos, 2022b).

5.2.2 Terrestrial ecosystems

5.2.2.1 Flora, vegetation communities and weeds

5.2.2.1.1 Flora

A search of the DEPWS Natural Resource (NR) Maps database for threatened flora and significant flora within 5 km of the onshore Project Area identified one significant flora species, Byblis (*Byblis aquatica*) (DEPWS, 2022). This species is listed as near threatened under the *Territory Parks and Wildlife Conservation Act 1976* (TPWC Act) and was recorded approximately 5 km to the south-east of the onshore Project Area. It grows in semi-aquatic conditions and is insectivorous to acquire nutrients in nutrient-poor environments (Atlas of Living Australia, 2022). This species is commonly found in areas specifically between Darwin and Berry Springs.

Previous flora surveys of the DLNG Facility disturbance envelope did not identify the presence of any threatened or conservation significant flora species (BAA-201 0003; Santos, 2021). The Byblis is unlikely to occur within the onshore Project Area as it has been previously disturbed and there are no permanent freshwater habitats present (BAA-201 0003; Santos, 2021).

5.2.2.1.2 Vegetation communities

The vegetation on the Middle Arm Peninsula and inland of Darwin is consistent with the Darwin Coastal Bioregion and is classified as various closed forest and woodland communities, that is dominated by *Eucalyptus* woodlands and *Acacia* forest (BAA-201 0003; Santos, 2021).

CDM Smith (2021b) undertook a vegetation assessment of the DPD shore crossing location, inclusive of the approximately 200 m of onshore pipeline. The onshore pipeline alignment is maintained in a cleared state and is currently covered with naturally regrown native grasses and weeds. Visible vegetation along the southern extent of the onshore Project Area is dominated by common and fast growing *Acacia* species (*A. auriculiformis*) (CDM Smith, 2021b). Vegetation mapped outside of the onshore Project Area is described as closed forests, including *Acacia* closed forest, *Rhizophora* mid closed forest and *Sonneratia* low closed forest (DEPWS, 2022). No ecological communities listed under territory or Commonwealth legislation were recorded by CDM Smith (2021b) within the Project Area.

5.2.2.1.3 Mangroves

Monitoring of the mangrove communities surrounding the DLNG Facility has being ongoing since 2006 (CononoPhillips, 2018). They are comprised of predominately *Rhizophora* and *Sonneratia* species and to a lesser extent *Aegialitis*, *Avicennia*, *Osbornia* and *Aegiceras* species. The data collected indicates that the mangrove communities are in good health, with no significant deterioration or stress resulting from DLNG Facility operations.

CDM Smith's (2021b) vegetation assessment of the DPD shore crossing location identified less than five individuals of one mangrove species, *Sonneratia alba*, within 20 m either side of the DPD pipeline alignment. This species of mangrove is a common taxon that is well represented and characterised in the DLNG Facility's mangrove monitoring program. CDM Smith (2021b) concluded that the vegetation in proximity to the DPD pipeline is of low ecological value and well represented in the area.

These mangroves are located outside of the pipeline alignment for the approximately 200 m section of onshore pipeline, therefore are unlikely to be impacted by the onshore works relevant to this CEMP.

5.2.2.1.4 Introduced flora species

A desktop assessment of the NT DEPWS's NR Maps identified 11 introduced species (weeds) within approximately 5 km of the onshore Project Area (DEPWS, 2022) (**Table 5-1**). Three of the weed species are declared under the *Weeds Management Act 2001* (NT) and are Weeds of National Significance (WONS) (Centre for Invasive Species Solutions, 2020).

The DLNG Facility currently manages weeds in accordance with the DLNG OEMP (ConocoPhillips, 2018) which includes annual monitoring of weeds within the DLNG Facility site and lease area, and active weed management through herbicide application by grounds services contractor. Considering the onshore Project Area is entirely within the DLNG disturbance envelope, control measures to limit the introduction or spread of weeds during construction will be in line with the DLNG operational requirements (BAA-201 0003; Santos, 2021).

Table 5-1: Introduced species potentially found within and proximate to the onshore Project Area

Name	Status		Potential for occurrence within the onshore Project Area
	Declared under *Weeds Management Act 2001* (NT)	WONS	
Adenosma indiana	No	No	The closest recording of *Adenosma indiana* is approximately 3 km to the south-east on the Wickham Point peninsula. It is possible that this species could occur within the onshore Project Area.
Gamba Grass *Andropogon gayanus*	Yes	Yes	Gamba Grass may occur within the onshore Project Area as it has been previously identified within the DLNG Facility site (Greening Australia, 2015).
Aristolochia *Aristolochia indica*	No	No	The closest recordings of Aristolochia are on Channel Island, approximately 2.4 km to the south. It is possible that this species could occur within the onshore Project Area.
Rubber Bush *Calotropis procera*	Yes	No	The closest recording of a Rubber Bush is approximately 3.5 km to the south-east on the Wickham Point peninsula. It is possible that this species could occur within the onshore Project Area.
Golden Rain Tree *Cassia fistula*	No	No	The closest recordings of Golden Rain Tree are on Channel Island, approximately 3 km to the south. It is possible that this species could occur within the onshore Project Area.
Couch Grass *Cynodon dactylon*	No	No	The closest recording of Couch Grass is approximately 2 km to the south-east on the Wickham Point peninsula. It is possible that this species could occur within the onshore Project Area.
Bellyache Bush *Jatropha gossypiifolia*	Yes	Yes	The closest recordings of Bellyache Bush are on Channel Island, approximately 3 km to the south. It is possible that this species could occur within the onshore Project Area.

Name	Status		Potential for occurrence within the onshore Project Area
	Declared under *Weeds Management Act 2001* (NT)	WONS	
Lantana *Lantana camara*	Yes	Yes	Lantana may occur within the onshore Project Area as it has been previously identified within the DLNG Facility site (Greening Australia, 2015) and it has been recorded immediately adjacent to the onshore Project Area's southern boundary (DEPWS, 2022).
Coffee Bush *Leucaena leucocephala* subsp. *leucocephala*	No	No	The closest recordings of Coffee Bush are on Channel Island, approximately 3.3 km to the south. It is possible that this species could occur within the onshore Project Area.
Passiflora *Passiflora foetida*	No	No	Passiflora may occur within the onshore Project Area as it has been previously identified within the DLNG Facility site (Greening Australia, 2015).
Flannel Weed *Sida cordifolia*	Yes	No	The closest recording of Flannel Weed is approximately 2 km to the south-east on the Wickham Point peninsula. It is possible that this species could occur within the onshore Project Area.

5.2.2.2 Terrestrial fauna and fauna habitat

5.2.2.2.1 Threatened and migratory terrestrial fauna

A desktop assessment of the NT EPA referral's PMST search results and the NT DEPWS's NR Maps identified a number of threatened and significant fauna species within 5 km of the onshore Project Area (BAA-201 0003; Santos, 2021; DEPWS, 2022). These species may be present proximate to the onshore Project Area. However, given that the onshore Project Area has been previously cleared and is currently comprised of regenerating native grasses and weeds, it is not considered to be representative of habitat where most of the identified fauna species would likely occur (BAA-201 0003; Santos, 2021).

The criteria applied to define the likelihood of occurrence for terrestrial fauna is:

+ Unlikely: the Project Area is not within the species known distribution; and/or suitable habitat is not present within the Project
+ Potential: the Project Area is within the species known distribution, but the species has not been recorded within 5 km of the Project; and the Project Area contains suitable habitat for the species.
+ Likely: the species has been recorded within 5 km of the Project in the past 10 years; and the Project Area contains suitable habitat for the species.
+ Known to occur: the species has been recorded (directly by commissioned surveys or from database records) within the Project Area in the past 10 years.

The likelihood of conservation significant terrestrial fauna species occurring within the onshore Project Area, as determined in the NT EPA referral, is summarised in **Table 5-2**. Note the terrestrial fauna with a likelihood defined as "unlikely" are not listed in **Table 5-2.**

Santos

Table 5-2: Conservation significant terrestrial fauna species potentially found within and proximate to the onshore Project Area

Name	Status		Occurrence likelihood	Potential for occurrence within the onshore Project Area
	EPBC Act	TPWC Act		
Terrestrial mammals				
Migratory Terrestrial / Wetland Species				
Common Sandpiper *Actitis hypoleucos*	Migratory	Not Listed	Potential	In Australia, the common sandpiper is found along all coastlines and in many areas inland, the common sandpiper is widespread in small numbers. The species utilises a wide range of coastal wetlands and some inland wetlands, with varying levels of salinity, and is mostly found around muddy margins or rocky shores and rarely on mudflats (DCCEEW, 2022b. The common sandpiper has been recorded in estuaries and deltas of streams, as well as on banks farther upstream, around lakes, pools, billabongs, reservoirs, dams and claypans, and occasionally piers and jetties. There is no suitable habitat for nesting or roosting within the onshore Project Area. However, there is potential habitat for foraging in the surrounding area, therefore individuals may traverse the onshore Project Area.
Oriental Plover *Charadrius veredus*	Migratory	Not Listed	Potential	This species has not been recorded within a 5 km radius of the onshore Project Area (DEPWS, 2022). The oriental plover is a non-breeding visitor to Australia where it occurs in both coastal and inland areas (DCCEEW, 2022c). In coastal habitats this species is found on estuarine mudflats and sandbanks, sandy or rocky ocean beaches or nearby reefs, or in near-coastal grasslands. In inland regions the oriental plover inhabits flat, open, semi-arid or arid grasslands, where the grass is short and sparse, and interspersed with hard, bare ground, such as claypans, dry paddocks, playing fields, lawns, and cattle camps. There are regrown grasses located near the coastline within the onshore Project Area, which may provide habitat for the oriental plover. Therefore, individuals may occasionally visit the onshore Project Area.

Name	Status		Occurrence likelihood	Potential for occurrence within the onshore Project Area
	EPBC Act	TPWC Act		
Osprey *Pandion haliaetus*	Migratory	Not Listed	Potential	Ospreys occur in littoral and coastal habitats and terrestrial wetlands of tropical and temperate Australia and offshore islands (DCCEEW, 2022d). They are mostly found in coastal areas but occasionally travel inland along major rivers, particularly in northern Australia. They require extensive areas of open fresh, brackish, or saline water for foraging. They frequent a variety of wetland habitats including inshore waters, reefs, bays, coastal cliffs, beaches, estuaries, mangrove swamps, broad rivers, reservoirs and large lakes and waterhole. Nests are usually located near a suitable area of foraging habitat and are a bulky structure made from piled sticks, often positioned in a tall dead tree or artificial structures such as telecommunication towers or poles. There is no suitable habitat for nesting or roosting within the onshore Project Area, however the onshore Project Area and surrounds contain suitable foraging habitat for the species. There is an osprey nest on the DLNG Facility site (BAA-201 0003; Santos, 2021).
Grey Plover *Pluvialis squatarola*	Migratory	Not Listed	Potential	Non-breeding birds occur around coastal Australia, with approximately 12,000 annually migrating to Australia (DCCEEW, 2022e). They inhabit intertidal mud flats, salt marshes, sand flats and beaches and feed on polyochaete worms, molluscs and crustaceans. There is no suitable habitat for nesting or roosting within the onshore Project Area. However, there is suitable habitat for foraging in the surrounding area, therefore individuals may traverse the onshore Project Area.

5.2.2.2.2 Introduced terrestrial fauna species

There are six introduced species that have been recorded within 5 km of the onshore Project Area (DEPWS, 2022). This included Rock Dove (*Columba livia*), Cane Toad (*Rhinella marina*), Asian House Gecko (*Hemidactylus frenatus*), Cat (*Felis catus*), Pig (*Sus scrofa*) and Black Rat (*Rattus rattus*).

Cats are established at Wickham Point, likely prior to the DLNG Facility was constructed, and are currently present in relatively low numbers (ConocoPhillips, 2018). Wild dogs are also present in low numbers, according to the presence of scats and tracks and observations by the DLNG Facility staff. There are no cat or dog control programs in place as there is no reason to implement one at this time. Cane toads are established at Wickham Point and may pose a threat to native predator populations (ConocoPhillips, 2018). Browsing ants (*Lepisiota frauenfeldi*) have been recorded at Darwin Port region in 2015, with known infestations found at Wickham Point, East Arm, Frances Bay and Berrimah (NT Government, 2022). Browsing ants can cause native species decline and alter ecosystem function by forming large colonies that displace native ants and invertebrates and strip native vegetation.

5.2.2.2.3 Biting pests

The Middle Arm Peninsula is known to have large populations of biting insects (i.e. mosquitos and midges) due to nearby mudflats and mangroves breeding sites along the peninsula shoreline, Hudson Creek and Bleesers Creek (Department of Health, 2011). There are also a number of breeding sites within constructed surfaces, including large mud ponds, shallow depressions on reclaimed land and on a site used for borrowing material, drainage lines and small sediment traps (BAA-201 0003; Santos, 2021).

Two mosquito species, northern salt marsh mosquito (*Aedes vigilax*) and common banded mosquito (*Culex annulirostris*), have been recorded in high numbers during the wet season at Middle Arm (Warchot and Whelan, 2010). They can occupy the same breeding sites, with breeding occurring when flooding lasts over seven days (BAA-201 0003; Santos, 2021). The northern salt marsh mosquito is recorded in high numbers from December to January, while the common banded mosquito is recorded in high numbers from January to April.

5.2.3 Inland and intertidal water quality

5.2.3.1 Groundwater and surface water

There are no permanent surface water features located in the onshore Project Area or its surrounds, however there are several minor creek lines that flow from high areas into Darwin Harbour during the wet season (ConocoPhillips, 2019). Surface water runoff can erode sediments and transport them into the harbour due to intense rainfall causing strong surface water flows and the structureless and sodic nature of soils in the Darwin regions (BAA-201 0003; Santos, 2021).

There are currently six groundwater bores located at the DLNG Facility and one offsite reference bore that have been monitored biannually since 2015 (DEPWS, 2022 and BAA-201 0003; Santos, 2021). Groundwater levels vary seasonally, with higher levels during the wet season and lower levels during the dry season. Groundwater levels averaged 5.43 mAHD in the wet season and 2.45 mAHD in the dry season in 2021 (CDM Smith, 2021a). Field measurements of groundwater from March 2015 to August 2021 found that pH was mostly acidic, ranging from 4.1 to 7.7 with an average of 6 pH units, and conductivity ranged from 98 microSiemens per centimetre (µS/cm) to 91,800 µS/cm with an average of 16,994 µS/cm. Conductivity varies subject to the seasons and bore proximity to the saline Darwin Harbour. Heavy metals are naturally elevated in all bores, which reflects the geology of the area (ConocoPhillips, 2019). The onshore Project Area overlaps the DLNG Facility's Irrigation Area, which is irrigated with wastewater from the DLNG wastewater treatment plant. All average metal concentrations, except arsenic, iron and manganese, are higher at the reference bore than the onsite bores which is likely a result from the irrigation water diluting natural concentrations (ConocoPhillips, 2019). Total nitrogen concentrations range from below the limit of reporting (LOR) to 66 mg/L and total phosphorus concentrations range from below the LOR to 1.76 mg/L (CDM Smith, 2021a). In comparison to the reference bore, some of the onsite bores have recorded elevated nutrient concentrations (ConocoPhillips, 2019).

5.2.3.2 Wetlands

The Port Darwin wetlands (NT029 Port Darwin) are listed as a Nationally Important Wetland under the Directory of Important Wetlands in Australia (Australian Government, 2022). The wetlands are located on the inner shores of the entire embayment of Port Darwin and includes 48,000 hectares (BAA-201 0003; Santos, 2021). The onshore Project Area is adjacent to a mangrove wetland to the south which is of low ecological value (BAA-201 0003; Santos, 2021; Australian Government, 2022).

5.2.3.3 Intertidal area

Part of the DPD Project Area is situated in a low-lying intertidal area. The clayey nature of the underlying soils and the surrounding area results in localised pooling of rainfall and limited/low infiltration rates. The site is largely cleared of large vegetation due to historical earthworks associated with the installation of the existing Bayu-Undan to Darwin GEP.

The coastline of the site is fringed by mangroves and clayey tidal flats to the north and south of the site.

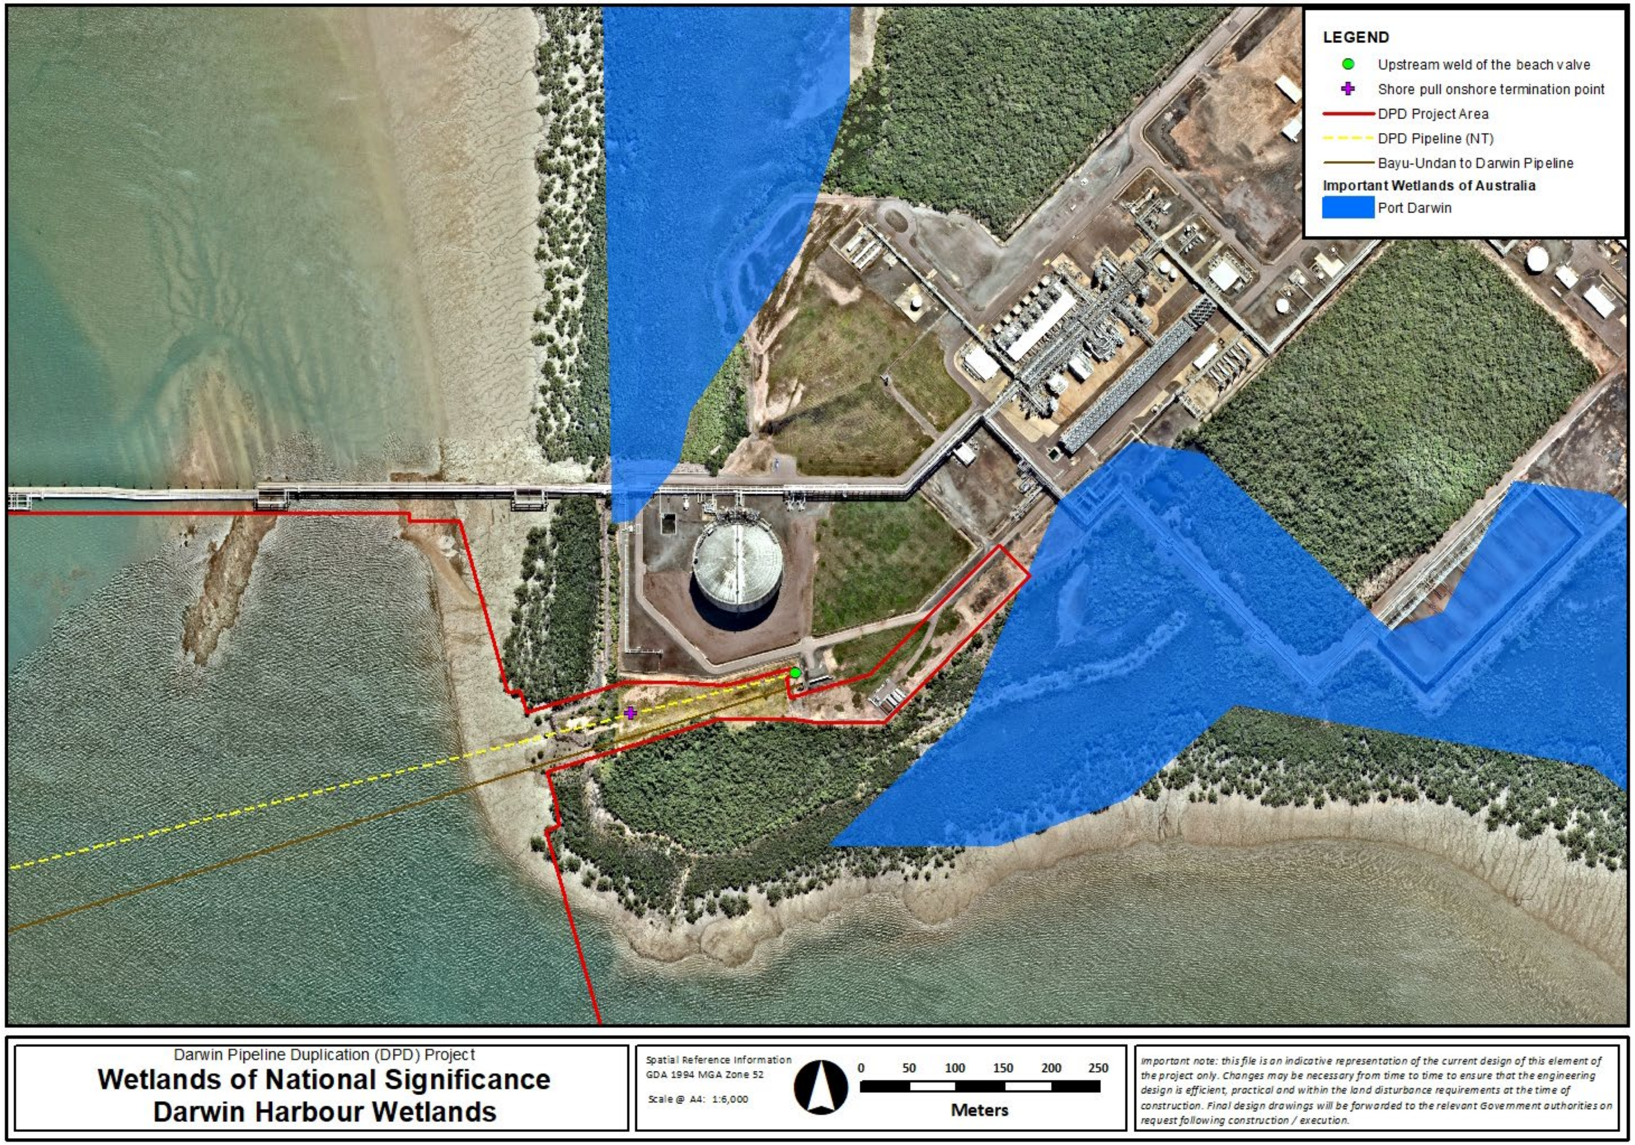

Figure 5-1: Wetlands of national significance - Darwin Harbour wetlands

5.2.4 Climate and air quality

5.2.4.1 Climate

The climate of the onshore Project Area is characterised by a tropical monsoonal climate with a distinct dry season (June to September) and wet season (October to April) (BOM, 2019). As described at the Darwin Airport weather station (BOM, 2022), the dry season is dominated by cooler temperatures, low humidity and minimal rainfall, whereas the wet season is dominated by warmer temperatures, high humidity and high rainfall, with high rainfall rates usually occurring during storm events.

Wind speeds are generally stronger in the dry season, generally coming from a south-easterly direction in the morning and from an easterly or north-westerly direction in the afternoons (BOM, 2022). Winds generally come from a westerly direction in the morning and from a north-westerly direction in the afternoon during the wet season.

Tropical cyclones occur on average once every four years (BOM, 2018). Storm surges often result in flooding, raised tidal levels and increased wave heights resulting in damage. These impacts are mostly felt within 50km of the coastline.

5.2.4.2 Air quality

Within nearshore NT coastal waters, particularly within Darwin Harbour, local and regional air quality is impacted by several anthropogenic influences, such as local industry, shipping and urban traffic and bushfires on a seasonal basis (BAA-201 0003; Santos, 2021). Air quality monitored by the NT EPA monitoring network in Darwin and its surrounds, including particular matter, carbon monoxide, sulphur dioxide, nitrogen dioxide, nitrogen oxide and ozone, found that Darwin has good air quality (Katestone, 2016).

5.2.5 Community and economy

5.2.5.1 Baseline noise

Noise modelling for the DLNG Facility by Bechtel Australia Pty Ltd (2001) predicted that the operational facility would not exceed 70 decibels A-weighted (dB (A)) at the property boundary with levels at Darwin predicted to be well below 45 dB (A) during normal atmospheric conditions. Noise monitoring that was undertaken in 2006 (SVT, 2007) to measure ambient background and construction noise for the DLNG Facility validated these findings, as the results indicated typical minimum noise levels at commercial or residential areas ranged from 34.2 dB (A) to 41.0 dB (A).

5.2.5.2 Petroleum industry

The onshore Project Area is entirely within the DLNG disturbance envelope. Gas produced offshore is conveyed via the Bayu-Undan to Darwin GEP to be converted into LNG at the DLNG Facility. The LNG is then transported to international markets (BAA-201 0003; Santos, 2021).

There is another LNG facility on Middle Arm, which is operated by INPEX, called the Ichthys LNG Project and is located approximately 5.5 km to the east of the DLNG.

5.2.6 Culture and heritage

There are no World Heritage properties and no heritage places on the National Heritage List or the Register of the National Estate within the onshore Project Area (DCCEEW, 2022f). No European heritage sites are currently listed at Wickham Point, with the remnants of artefacts documented and removed prior to the construction of the DLNG Facility (BAA-201 0003; Santos, 2021).

There are no Aboriginal sacred sites identified by the Aboriginal Areas Protection Authority under the *Northern Territory Aboriginal Sacred Sites Act 1989* (NT) within the onshore Project Area (BAA-201 0003; Santos, 2021). There are no known Aboriginal burial grounds on Wickham Point, and possible burial grounds located at the northern extremity of Wickham Peninsula are well separated from the onshore Project Area (ConocoPhillips, 2018). A number of middens within and adjacent to the DLNG Facility disturbance envelope were subject to investigation with the former Heritage Branch of Department of Infrastructure, Planning and Environment. Shell middens are the most commonly recorded type of archaeological site within the Darwin region.

5.2.7 Recovery plans

Recovery Plans set out the research and management actions necessary to stop the decline of and support the recovery of listed Threatened species under the EPBC Act. **Table 5-3** summarises the current threats relevant to the activity, with more information about the specific requirements of the relevant management plans (including Conservation Advice and Conservation Management Plans) that would be applicable to the activity and demonstrates where current management requirements have been considered.

Table 5-3: Threats and strategies from relevant recovery plans, conservation advice and management plans

Name	Recovery Plan/Conservation Advice/Management Plan	Threats identified as relevant to the activity	Addressed (where relevant)
Migratory Terrestrial / Wetland Species			
Shorebirds (including common sandpiper, Oriental plover and grey plover) Seabirds (including Osprey)	National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds (Department of the Environment and Energy [DoEE], 2020) Wildlife Conservation Plan for Seabirds (DAWE, 2020)	Light pollution	**Section 7.6.3**
		Habitat loss and modification	**Section 7.6.1, 7.6.2,** and **7.7.2**

6 Impact and risk Assessment

This CEMP has employed a systematic impact and risk assessment process for the environmental management of the DPD Project construction activities. The impact and risk assessment process has been developed in line with Santos' Environmental Impact Identification (ENVID) process and is consistent with the requirements of the NT EPA Draft Guideline for the Preparation of an Environmental Management Plan (NT EPA, 2015).

6.1 Conceptual Site Model

A conceptual site model, as required by the NT EPA, is a written or illustrated representation of the nature, fate and transport of discharges, wastes or contaminants that allows assessment of potential and/or actual exposure of the environment to contaminants (NT EPA, 2015). The conceptual site model for this CEMP is embedded within the risk assessment detailed in **Table 6-7**.

6.2 Impact and risk assessment methods

The CEMP environmental impact and risk assessment was performed consistent with the Santos' Risk Matrix Procedure (SMS-LRG-OS01-TP02) and identification of management actions was consistent with Santos' Environment Hazard Controls Procedure (SMS-EXA-OS01-PD02). An environmental aspect, for the purpose of this environmental management plan, is defined as characteristics of the construction activities that could potentially affect the environment.

6.2.1 Identification of environmental hazard

Environmental hazards for this CEMP were identified using Santos' DPD Project NT EPA Referral (BAA-201 0002; Santos, 2021), DPD Project Basis of Approval (BAS-210 0005; Santos, 2022c) and discussion by the DPD Project team and environmental specialists. Key DPD Project construction activities and associated hazards and results from key technical studies were presented during ENVID workshops to inform the impact and risk assessment process.

6.2.2 Standard controls

The standard controls identified in **Table 6-7** were drawn from:

+ Santos' DPD Project NT EPA Referral (BAA-201 0002; Santos, 2021)
+ Santos' environmental plans and procedures for similar activities
+ Regulator approved management plans developed by other proponents.

Additional controls were provided by ENVID workshop attendees based on their relevant experience.

6.2.3 Impact and risk assessment

All hazards identified were assigned a consequence level following the six levels and criteria outlined in Santos' Risk Matrix Procedure (SMS-LRG-OS01-TP02). More detailed criteria were developed to assist in addressing NT EPA Key Environmental Factors. These are the NT EPA consequence descriptors shown in **Table 6-1**.

The consequence is defined as the resulting impact from an event occurring. The consequence level for this assessment was based on the credible worst-case scenario and assumed no management actions were in place. Categories of environmental consequence and detailed definitions of each severity level are outlined in **Table 6-2**

The likelihood can be described as the probability that that the described consequence will occur. When determining the likelihood of consequences, proposed prevention and mitigation controls identified to mitigate potential impacts were considered. A detailed description of likelihood levels is outlined in **Table 6-3**

The consequence and likelihood levels are not presented in this CEMP but are contained in the ENVID documentation. **Section 6.3** and **Table 6-7** outline the residual consequences and likelihoods which is the outcome after standard and additional (as low as reasonably practicable; ALARP) management actions are applied.

A likelihood level was only assigned to unplanned events as per the Santos Risk Matrix Procedures (SMS-LRG-OS01-TP02), shown in **Table 6-4**. The consequence and likelihood for each impact was then assessed to determine the residual risk that remained after proposed standard controls were considered.

Table 6-1: NT EPA consequence descriptor

Consequence Level		I	II	III	IV	V	VI
Acceptability		Acceptable	Acceptable	Unacceptable	Unacceptable	Unacceptable	Unacceptable
Consequence Level Description		**Negligible** No impact of negligible impact	**Minor** Detectable but insignificant change to local population, industry or ecosystem factors Localised effect	**Moderate** Significant impact to local population industry or ecosystem factors	**Major** Major long-term effect on local population industry or ecosystem factors	**Severe** Complete loss of local population industry or ecosystem factors AND/OR extensive regional impacts with slow recovery	**Critical** Irreversible impacts to regional population industry or ecosystem factors
Environmental Receptors	**Marine Ecosystems** Fauna, habitat, conservation significant areas and ecological function, processes and integrity	Short term behavioural impacts only to small proportion of local population and not during critical lifecycle activity. No decrease in local population size / area of occupancy of species / loss or disruption of habitat critical / disruption to the breeding cycle/ vales of a protected area. No introduction of disease and no reduction in habitat area/function.	Detectable but insignificant decrease in local population size and threat to local population viability. Insignificant disruption to the breeding cycle of local population / area of occupancy of species / loss of habitat critical to survival of a species/ values of a protected area. Detectable but insignificant loss of area/function of habitat with rapid recovery within 2 years.	Moderate. Significant decrease in local population size but no threat to overall population viability. Significant behavioural disruption or disruption to the breeding cycle of local population / Significant reduction in area of occupancy of species / loss of habitat critical to survival of a species. Modify, destroy, remove or decrease availability of quality habitat to the extent that a long-term decline in local population or function of habitat is likely with recovery over medium term (2-10 years) Introduction of disease likely to cause significant population decline	Long term decrease in local population size and threat to local population viability. Major disruption to the breeding cycle of local population / area of occupancy of species / loss of habitat critical to survival of a species/ values of a protected area Fragmentation of existing population / Loss or change of habitat to the extent that a long-term decline in local population and function of habitat is likely with slow recovery over decades Introduction of disease likely to cause long term population decline	Complete loss of local population, habitat critical to survival of local population or protected area/conservation significant area Widespread (regional) decline in population size or habitat critical to regional population Extensive destruction of local habitat with no recovery or long term (decades) or widespread loss of area or function of primary producers on a regional scale	Complete loss of regional population Complete loss of habitat critical to survival of regional population
	Marine Environmental Quality Water quality, sediment quality, ecosystem health and parameters that support fishing, aquaculture, recreation, aesthetics and cultural/spiritual values	Negligible. No or negligible reduction in physical environment nor decrease in ecosystem function/health. No or negligible loss of value to socio-economic activities	Detectable but localised, short term and insignificant impact to physical environment or ecosystem function/health or value to socio-economic activities. Rapid recovery evident within ~ 2 years.	Significant wide-scale medium term impact to physical environment, decrease in ecosystem function/health or value to socio-economic activities. Recovery over medium term (2-10 years).	Wide-scale, long term impact to physical environment, long term decrease in ecosystem function/health or value to socio-economic activities. Slow recovery over decades.	Extensive impact to/destruction of physical environment with no recovery or shutdown of socio-economic activities Long term (decades) and widespread loss of ecosystem function/health on a regional scale that damages value to socio-economic activities.	Complete destruction of regional physical environment / habitat with no recovery Complete loss of area or function of primary producers on a regional scale

Consequence Level		I	II	III	IV	V	VI
	Coastal Processes Geophysical processes, primary productivity/ nutrient cycling, conservation significant areas/coastal landforms and cultural, aesthetic or recreation values	Short term changes to local geophysical/hydrological processes, widespread loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale	Detectable but insignificant loss or change to local geophysical/hydrological processes, area or function of primary producers/nutrient cycling or conservation significant areas with rapid recovery within 2 years.	Moderate. Significant modification, destruction, removal or change of local geophysical/hydrological processes, wide-scale loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale with recovery over medium term (2-10 years).	Long term loss or change of local geophysical/hydrological processes, widespread loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale with slow recovery over decades	Extensive destruction of local geophysical/hydrological processes, widespread loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale with no recovery or long term (decades)	Complete loss or change of geophysical/hydrological processes. Complete loss of area or function of primary producers/nutrient cycling or conservation significant areas on a regional scale.
	Community and Economy Includes: fisheries (commercial and recreational); tourism; oil and gas; defence; commercial shipping	No or negligible loss of value of the local industry. No or negligible reduction in key natural features or populations supporting the activity.	Detectable but insignificant short-term loss of value of the local industry. Detectable but insignificant reduction in key natural features or population supporting the local activity.	Significant loss of value of the local industry. Significant medium-term reduction of key natural features or populations supporting the local activity.	Major long-term loss of value of the local industry and threat to viability. Major reduction of key natural features or populations supporting the local activity.	Shutdown of local industry or widespread major damage to regional industry. Permanent loss of key natural features or populations supporting the local industry.	Permanent shutdown of local or regional industry Permanent loss of key natural features or populations supporting the local or regional industry
	Culture and heritage Includes: Indigenous heritage and maritime heritage (i.e. shipwrecks)	No or negligible impact on the area's cultural or heritage values. No or negligible alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Detectable but insignificant impact on one or more of the area's cultural or heritage values. Detectable but insignificant alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Significant impact on one or more of the area's cultural or heritage values. Significant alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Major long-term effect on one or more of the area's cultural or heritage values. Major alteration, modification, obscuring or diminishing of the area's cultural or heritage values.	Complete loss of one or more of the area's cultural or heritage values.	Permanent loss of one or more of the area's cultural or heritage values with no recovery.
	Terrestrial Impacts Includes terrestrial fauna and flora	Short term behavioural impacts only to small proportion of local population and not during critical lifecycle activity. No decrease in local population size / area of occupancy of species / loss or disruption of habitat critical / disruption to the breeding cycle/ vales of a protected area. No introduction of disease and no reduction in physical environment/ habitat area/function.	Detectable but insignificant decrease in local population size and threat to local population viability. Insignificant disruption to the breeding cycle of local population / area of occupancy of species / loss of habitat critical to survival of a species/ values of a protected area. Detectable but insignificant loss of area/function of physical environment/ habitat with rapid recovery within 2 years.	Significant decrease in local population size but no threat to overall population viability. Significant behavioural disruption or disruption to the breeding cycle of local population / Significant reduction in area of occupancy of species / loss of habitat critical to survival of a species. Modify, destroy, remove or decrease availability of local physical environment/ habitat to the extent that a long-term decline in local population or function of habitat is likely with recovery over medium term (2-10 years) Introduction of disease likely to cause significant population decline	Long term decrease in local population size and threat to local population viability. Major disruption to the breeding cycle of local population / area of occupancy of species / loss of habitat critical to survival of a species/ values of a protected area Fragmentation of existing population / Large scale loss or change of physical environment/ habitat to the extent that a long-term decline in local population and function of habitat is likely with slow recovery over decades Introduction of disease likely to cause long term population decline	Complete loss of local population, habitat critical to survival of local population or protected area/conservation significant area Widespread (regional) decline in population size or habitat critical to regional population Extensive destruction of local physical environment/ habitat with no recovery or long term (decades) or widespread loss of area or function of primary producers on a regional scale	Complete loss of regional population, complete loss of habitat critical to survival of regional population Complete destruction of regional physical environment / habitat with no recovery. Complete loss of area or function of primary producers on a regional scale.

Table 6-2: Environmental consequence level descriptions

Consequence Level	Consequence Level Description
I	**Negligible** – No impact or negligible impact
II	**Minor** – Detectable but insignificant change to local population, industry or ecosystem factors
III	**Moderate** – Significant impact to local population, industry or ecosystem factors
IV	**Major** – Major long-term effect on local population, industry or ecosystem factors
V	**Severe** – Complete loss of local population, industry or ecosystem factors AND/OR extensive regional impacts with slow recovery
VI	**Critical** – Irreversible impact to regional population, industry or ecosystem factors

Table 6-3: Likelihood descriptions

No.	Matrix	Description
F	Almost Certain	Occurs in almost all circumstances OR could occur within days to weeks
E	Likely	Occurs in most circumstances OR could occur within weeks to months
D	Occasional	Has occurred before in Santos OR could occur within months to years
C	Possible	Has occurred before in the industry OR could occur within the next few years
B	Unlikely	Has occurred elsewhere OR could occur within decades
A	Remote	Requires exceptional circumstances and is unlikely even in the long term

Table 6-4: Risk assessment matrix

		Consequence					
		I	II	II	IV	V	VI
Likelihood	F	Low	Medium	High	Very High	Very High	Very High
	E	Low	Medium	High	High	Very High	Very High
	D	Low	Low	Medium	High	High	Very High
	C	Very Low	Low	Low	Medium	High	Very High
	B	Very Low	Very Low	Low	Low	Medium	High
	A	Very Low	Very Low	Very Low	Low	Medium	Medium

6.3 Residual consequences and risks

6.3.1 Planned events

The residual consequence levels from the planned events following implementation of standard and additional (as low as reasonably practicable; ALARP) management actions (detailed in **Section 7**) are summarised in **Table 6-5**. Given the likelihood of a planned event occurring is 100% (in other words, it will occur), the risk ranking is not assessed. A comprehensive impact assessment for each of the planned events, and subsequent management actions proposed by Santos to reduce the risk and impacts to ALARP and/or acceptable levels are detailed in the following subsections. Within the ENVID developed by Santos some environmental aspects had multiple residual consequence ratings since multiple environmental factors were assessed against, in these cases the residual consequence of greatest severity was chosen.

Additional management actions have been adopted from the NT EPA referral's environmental management and mitigation measures (BAA-201 0003; Santos, 2021) and the DLNG OEMP (ConocoPhillips, 2018). The NT EPA referral's management actions were included to ensure this CEMP was consistent with the actions identified in the DPD Project NT EPA referral, and the DLNG OEMP's management actions were included to ensure that management of onshore works will be compliant with the DLNG Facility's operational environmental requirements.

Table 6-5: Summary of the residual consequence levels associated with planned events

CEMP Section	Event	Residual consequence
7.6.1	Ground disturbance and clearing – physical presence	II – Minor
7.6.2	Ground disturbance and clearing – acid sulfate soils	I – Negligible
7.6.3	Light emissions	II – Minor
7.6.4	Noise emissions	II – Minor
7.6.5	Atmospheric emissions	I – Negligible

6.3.2 Unplanned events

The residual risk levels from unplanned events following implementation of standard and additional (as low as reasonably practicable; ALARP) management actions (detailed in **Section 7**) are summarised in **Table 6-6**. Comprehensive risk assessment for each of the unplanned events, and subsequent management actions proposed to reduce the risk to ALARP and acceptable levels are detailed in the following subsections. Within the ENVID some unplanned events had multiple residual risk ratings since multiple environmental factors were assessed against, in these cases the residual risk of greater severity was chosen for this summary.

Subsequent to the completion of ENVID workshops, an additional environmental risk associated with the activity was identified; specifically the risk of a fire on site spreading to surrounding bushland.

Table 6-6: Summary of the residual risk levels associated with unplanned events

CEMP Section	Unplanned event	Residual risk level
7.7.1	Interaction with terrestrial fauna	Very low
7.7.2	Introduction or spread of invasive species (plants, insects and fauna)	Low
7.7.3	Release of non-hazardous and hazardous materials	Very low
7.7.4	Spread of fire to surrounding bushland	Low

6.4 Impact/risk assessment summary

The outcomes of the impact/risk assessment are presented in **Table 6-7**, and includes reference to the relevant management strategy within this CEMP used to manage individual environmental aspects.

Table 6-7: Summary of onshore construction impact and risk assessment outcomes

Aspect	Activity	Description of hazard	Spatial scale	Temporal scale	Potential impacts/risks	Sensitive receptors	Residual consequence (planned event) /risk level (unplanned event)	Management strategy
Planned events								
Ground disturbance and clearing – physical presence	Onshore construction including: + temporary storage of fill to be stockpiled in the disturbance footprint for use as backfill + disposal of excess filltrenching done by DLNG from nominal shorepull termination point (2 m above HAT) to the upstream weld of the beach valve	Clearing of regrown native grasses and weeds in a previously disturbed area will be required prior to excavating a trench for onshore pipeline section. Excavated soil will be temporarily stockpiled within the onshore Project Area to be used as fill or disposed of if in excess. The Barossa team will prepare the DPD site pad (**Figure 2-3**), including vegetation clearing, which overlaps part of the onshore pipeline alignment. As such, the DLNG team will only be required to partially clear the onshore pipeline alignment.	Localised within the onshore Project Area.	Temporary duration when the section of trench will be open. The trench will be backfilled at the conclusion of pre-commissioning works. The clearing of any vegetation currently present onsite will be permanent.	Excavating the trench may result in: + minimal clearing of the ground/vegetation + digging soil and placing it adjacent for later re-use + bringing in of geotextile and hardstand + additional fill of specific parameters to be brought to site if engineered backfill required. This may require disposal of excess 'original' soil – may need to be tested/treated prior to disposal + potential risk from erosion + spread of weeds Site clearing may impact terrestrial fauna and may require some ground clearing. If heavy rainfall is received, water may need to be pumped from the trench to adjacent land area. If stormwater runoff enters Darwin Harbour, coastal water quality may be impacted. Onshore construction activities have the potential to generate dust in the immediate and surrounding areas.	+ **Terrestrial impacts** (sediment quality, vegetation and terrestrial fauna) + **Marine environmental** quality (coastal water quality) + Marine ecosystem (marine fauna)	**II – Minor**	**Section 7.6.1**
Acid Sulfate Soils disturbance	Onshore construction including trench / excavation	The alignment of the onshore pipeline has been previously disturbed to install the Bayu-Undan to Darwin pipeline, however trenching works for the DPD pipeline may disturb natural ASS or PASS materials. This presents a risk of oxidation of ASS and subsequent mobilisation of heavy metals and acidification products. If encountered, the ASS or PASS materials will be stored on	The location of ASS or PASS materials potentially disturbed would be localised to the onshore Project Area. Any subsequent mobilisation of heavy metals and acidification products may extend outside the onshore Project Area and into the coastal waters of Darwin Harbour.	Temporary duration when trenching occurs.	Excavating the trench may disturb acid sulfate soils. This presents a risk of oxidation of acid sulfate soils and subsequent mobilization of heavy metals and acidification products. ASS disturbance may potentially impact ground water, surface water and fauna that come into contact with acidification products.	**Terrestrial impacts** (terrestrial fauna, groundwater and surface water quality).	I – Negligible	**Section 7.6.2**

Aspect	Activity	Description of hazard	Spatial scale	Temporal scale	Potential impacts/risks	Sensitive receptors	Residual consequence (planned event) /risk level (unplanned event)	Management strategy
		limestone pads within the onshore Project Area and treated with lime prior to reuse or disposal to landfill. Dewatering is dependent on the groundwater levels at the time of excavation. While it is considered unlikely that dewatering be required dewatering measures that may be implemented are outlined in the ASSDMP						
Light emissions	Onshore construction including operation of onshore plant and equipment e.g. trenching, pipelay and backfill	Potential impacts from light emissions may occur in the onshore Project Area from: + Lighting of the work areas + Lighting on the required onshore equipment and machinery Lighting will typically consist of bright white (in other words, metal halide, halogen, fluorescent) lights. It is expected that majority of activities will be undertaken during daylight hours, for safety and logistical reasons (BAA-201 0003; Santos, 2021).	Localised: Limited light 'spill' or 'glow' on land and surface waters surrounding the onshore location. The night environment is already compromised by artificial light sources from the DLNG Facility. Potential impacts from lighting used during construction (if required) will be minor in this context.	Lighting for night works will be ongoing for the duration of the activity (if required).	Change in fauna behaviour due to light emissions.	**Terrestrial impacts** (terrestrial fauna)	II – Minor	**Section 7.6.3**
Noise emissions	Onshore construction including operation of onshore plant and equipment	Onshore sources of noise emissions will be generated by the operation of required equipment and machinery (i.e., during excavation of trench). The greatest noise emissions will be from air compressors used during dewatering and pre-commissioning works. These noise emissions could change terrestrial fauna behaviour (avoidance / attraction / disruption of normal behaviour).	Noise levels are not expected to impact on the community and economy receptors due to its being localised to the DLNG facility in an industrial setting.	Noise is ongoing for the duration of the activity.	Change in fauna behaviour due to noise emissions including avoidance / attraction / disruption of normal behaviour.	**Terrestrial impacts** (terrestrial fauna)	II – Minor	**Section 7.6.4**
Atmospheric emissions	Atmospheric emissions from onshore combustion engines	Potential impacts from atmospheric emissions may occur in the onshore Project Area from the following source:	Broad: The quantities of gaseous emissions are relatively small however wind will disperse carbon	Temporary and intermittent for the duration of the duration of the onshore construction and pre-commissioning activity.	Atmospheric emissions from combustion engines can result in deterioration of local air quality. Atmospheric emissions can cause an	+ Terrestrial impacts + Air quality / Atmospheric	I – Negligible	**Section 7.6.5**

Aspect	Activity	Description of hazard	Spatial scale	Temporal scale	Potential impacts/risks	Sensitive receptors	Residual consequence (planned event) /risk level (unplanned event)	Management strategy
		+ Operation of generators, and mobile and fixed equipment and vehicles	dioxide evenly throughout the atmosphere		incremental increase in global GHG concentrations. The onshore site is an industrial site (DLNG Plant) and removed from residential/commercial areas. Given the nature and scale of gas export pipeline installation activities (low frequency and relatively short duration), the risk is considered to have a negligible impact.	emissions (local air quality)		
Unplanned events								
Interaction with terrestrial fauna	Onshore construction e.g.trenching, backfilling, excavation, trucking movements, and transportation to/from site	There will be an increased presence of personnel and machinery and vehicle movements in the onshore Project Area during the construction and pre-commissioning works. In addition, the onshore pipeline's trench will remain open for several months until its pre-commissioning works are completed. Increased traffic may result in changes to fauna behaviour or interaction with terrestrial fauna, including potential strike or collision, potentially resulting in severe injury or mortality. The open onshore pipeline trench could potentially result in severe injury or mortality from fauna entrapment.	Localised within the onshore Project Area.	Temporary and intermittent interaction with terrestrial fauna.	Behavioural impacts, injury or death to terrestrial fauna.	**Terrestrial impacts** (terrestrial mammals, reptiles, and birds)	Very low	**Section 7.7.1**
Introduction and spread of invasive species (plants, insects and fauna)	Onshore construction e.g. excavators, trucks and transportation to/from site.	The introduction or spread of invasive plant species or weeds may occur due to vegetation clearing, improper stockpiling of cleared vegetation containing weeds, machinery and vehicle movements, and importing rock and fill from offsite locations. Wind-borne incursions of weeds may also occur, as weeds are present within the DLNG Plant	Localised to the onshore Project Area, and its surrounding local environment	Temporary to long-term (if invasive species and pests become established above current levels)	Potential establishment of an invasive species because of the activity requires that invasive species to: + Be present on a vector + Be released from the vector + Establish in the receiving environment. Potential spread of an invasive species observed around the DLNG	**Terrestrial impacts** (terrestrial flora and fauna)	Low	**Section 7.7.2**

Aspect	Activity	Description of hazard	Spatial scale	Temporal scale	Potential impacts/risks	Sensitive receptors	Residual consequence (planned event) /risk level (unplanned event)	Management strategy
		and the broader surrounds (BAA-201 0003; Santos, 2021). The introduction or spread of invasive insects and fauna (e.g., ants, cane toads) may occur due to machinery and vehicle movements, and attraction to construction or pre-commissioning activities.			Plant because of the activity may also occur. Invasive species could displace and outcompete local species.			
Release of non-hazardous and hazardous materials	+ Onshore construction e.g., excavators, trucks and transportation to/from site. + Storage of hazardous and non-hazardous liquids + Storage of waste	Minor hydrocarbon and chemical spills to land may occur during the storage, handling and transfer of fuel and chemicals during construction and pre-commissioning works. Uncontained waste dispersed into surrounding marine and terrestrial setting.	Localised: Volumes are likely to be minor and be restricted to within the onshore Project Area.	Temporary duration for the activity.	Contamination of soils, surface water or groundwater	+ **Marine environmental** quality (coastal water quality) + Marine ecosystem (marine fauna) + **Terrestrial impacts** (physical environment, terrestrial flora and fauna)	Very low	**Section 7.7.3**
Spread of fire to surrounding bushland	Onshore construction e.g. excavators, trucks and transportation to/from site.	The onshore works have the potential to increase the risk of starting a bushfire, as there will be additional fuel and ignition sources located onsite. A bushfire would lead to destruction of surrounding terrestrial ecosystems and associated terrestrial vegetation and fauna. Bushfires can occur in most vegetated areas with an ignition source, suitable climatic conditions, and sufficient fuel.	Localised to Wickham Point	Temporary duration for the activity	Fire damage to a potentially large area of terrestrial ecosystems and associated terrestrial fauna and vegetation (ConocoPhillips, 2018).	+ Terrestrial impacts + Air quality	Low	**Section 7.7.4**

6.5 Assessment of potential for cumulative impacts

The following section provides a summary of potential cumulative impacts associated with the onshore DPD Project construction activities. Further detail is provided within the DPD Project Supplementary Environmental Report (SER) (BAS-210 0020).

6.5.1 Cumulative assessment methodology

The SER (BAS-210 0020) provides a whole of project assessment of cumulative impacts to three key NT EPA environmental factors: Marine Environmental Quality, Marine Ecosystems and Atmospheric Processes, and three other NT EPA environmental factors: Coastal Processes, Community and Economy and Culture and Heritage (NT EPA, 2022).

Identified projects and activities with the potential for cumulative impacts with the DPD Project are discussed in further detail within Section 12.4 of the SER (BAS-210 0020). Two of the NT EPA environmental factors were considered sensitive for cumulative impacts under the scope of this CEMP and are discussed in **Sections 6.5.2 and 6.5.3**.

6.5.2 Cumulative impacts to atmospheric processes

This Project construction activities will generate atmospheric emissions which will contribute to the overall concentration of GHG in the Earth's atmosphere. Emissions resulting from construction activities (i.e. use of combustion engines) will occur on a short-term basis. The DPD project is included in Santos' Climate transition action plan and will adhere to the Santos GHG management plan and energy management program.

6.5.3 Cumulative impacts to community and economy

Direct impacts to social, recreational and ecological values from activities detailed within this CEMP are not predicted to be significant and will be localised to an existing disturbance area (DLNG facility) where public access is restricted, therefore direct cumulative impacts to these values are not predicted.

7 Environmental management strategies

This section outlines the environmental management strategies (EMSs) that will be implemented for management of areas and activities associated with the DPD Project construction works, therefore minimising and/or mitigating impacts and risks to the environment.

The EMSs to be implemented as part of this CEMP comprise of the following:

+ Planned impact management strategies (**Section 7.6**)
+ Unplanned risks management strategies (**Section 7.7**).

These EMS outline the commitments and objectives that are relevant and state specific measurable targets to achieve proposed objectives. Performance indicators and monitoring activities are used to quantify success in meeting requirements and identify the need for corrective actions. This ensures the continuous improvement of the effectiveness of the DPD Project's EMS. The EMS define the reporting requirements, terms and responsibilities.

All EMS are structured to align with the template presented in **Table 7-1**.

Table 7-1: Environmental management strategies template

Item	Content
Environmental Performance Objectives (EPO)	Environmental management goal(s) tailored to each aspect per NT EPA requirements.
Target	Aspect specific measurable performance necessary to successfully achieve objective. Part 1 of NT EPA required performance criteria.
Performance Indicator	Quantitative or qualitative measures representing the performance related to Target(s). Part 2 of NT EPA required performance criteria.
Management actions	Tasks to be undertaken to meet objective/s.

7.1 NT EPA hierarchy

In the development of the EMS outlined within this CEMP Santos applied the Environmental Decision-Making Hierarchy outlined within the EP Act. This hierarchy being:

+ To ensure that actions are designed to avoid adverse impacts on the environment
+ To identify management options to mitigate adverse impacts on the environment to the greatest extent practicable
+ And if appropriate, provide for environmental offsets in accordance with the EP Act for residual adverse impacts on the environment that cannot be avoided or mitigated[1].

[1] No offsets were deemed appropriate for this project.

7.2 Environmental performance objectives

To ensure environmental risks and impacts will be of an acceptable level, environmental performance objectives (EPOs) have been defined and are listed in following sections for planned and unplanned events. The EPOs were developed based on each environmental aspect and associated impact/risk.

7.3 Performance criteria

To assess whether EPOs are being achieved it is important to define specific performance criteria, which will take the form of targets and performance indicators. Detailed specific measurable targets must be defined and then met to achieve overarching EPOs. Performance indicators are the factor that is measured to assess whether the performance targets have been achieved.

7.4 Management actions

To mitigate impacts of the DPD Project construction activities and to achieve EPOs and performance criteria, management actions will be defined and implemented. This will include standard, additional (ALARP) and adaptive management actions that will be implemented if triggered.

7.5 Adaptive management mechanism

The consequences of all planned events impacts were assessed as minor to negligible and the level of unplanned events risks were assessed as low to very low. A monitoring and adaptive management mechanism will be applied to the following event to ensure EPOs are met:

+ Acid sulfate soils: It is understood that the soil across the onshore zone (within the onshore Project Area) is likely to be non-ASS material. The ASSDMP (BAS-210 0049) provides operating strategies for earthworks and contingency dewatering in the onshore zone, which includes adaptive management measures in the event of encountering PASS or ASS material.

Adaptive management can also be triggered through Santos' incident response and assurance processes, with corrective actions and management adapted as required to address any incidents and non-conformances identified.

7.6 Planned events impact management strategies

Santos' environmental impact assessment identified six impacts arising from planned events to be undertaken in the onshore Project Area. Management strategies have been adopted in this CEMP based on the ENVID outcomes and additional review (refer to **Section 6**).

7.6.1 Ground disturbance and clearing – physical presence

7.6.1.1 Environmental performance objectives, performance criteria and management actions

The EPOs and performance criteria for ground disturbance and clearing – physical presence are described in **Table 7-2**.

Table 7-2: Ground disturbance and clearing – physical presence EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Avoid impacts to native vegetation and fauna from ground disturbance and clearing	Planned ground disturbance is limited to within previously cleared areas	Recorded areas disturbed via excavation logs
	Zero incidents of disturbance to vegetation outside previously cleared areas	Number of recorded incidents of damage to environment outside of previously cleared areas
	Zero incidents of injury to terrestrial native fauna as a result of the DPD construction activities	Number of recorded incidents relating to terrestrial fauna injury or mortality as a result of ground disturbance.

This EPO aligns with the following NT EPA Factor objectives (NT EPA, 2022):

+ Terrestrial environmental quality – Protect the quality and integrity of land and soils so that environmental values are supported and maintained.
+ Terrestrial ecosystems – Protect terrestrial habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.
+ Marine environmental quality (coastal water quality)
+ Marine ecosystem (marine fauna)

The management actions considered for this planned event are shown in **Table 7-3**. EPS and measurement criteria for these management actions will be developed in consultation with the DLNG team and construction contractors, for inclusion in this CEMP prior to the commencement of DPD Project construction activities.

Table 7-3: Management actions for ground disturbance and clearing – physical presence during onshore DPD construction activities

MA Reference	Management Action
Standard management actions	
Avoidance	
DPD-DLNG-MA01	Restrict disturbance to within the onshore Project Area and existing DLNG site area
DPD-DLNG-MA02	Establish appropriate access restrictions to the onshore Project Area
Mitigation	
DPD-DLNG-MA03	Pump water through a silt separator when dewatering in the excavated trench in sections where the trench does not naturally drain to harbour
DPD-DLNG-MA04	Geotextiles will be installed under primary construction area (i.e. site pad)
DPD-DLNG-MA05	Trench inspections to be performed daily to check for trapped wildlife
DPD-DLNG-MA06	Insert caps on ends of pipe if the pipe is to be unattended for periods >12 hours; to prevent fauna ingress.
DPD-DLNG-MA07	Ensure any native vertebrates injured by DPD construction activities are referred to an appropriate wildlife carer group or veterinarian
DPD-DLNG-MA08	Return onshore site to natural grade to match existing topography following completion of the activity
DPD-DLNG-MA09	Maintain batters or install fauna ladders on trench entry and exit to allow fauna to exit the trench
Additional (ALARP) management actions	
Avoidance	
DPD-DLNG-MA10	Limit vehicles to access roads, prepared site pad or defined boundaries within the onshore Project Area/DLNG disturbance envelope
Mitigation	

MA Reference	Management Action
DPD-DLNG-MA11	Use water truck for dust suppression
DPD-DLNG-MA12	Establish and implement vehicle speed controls

7.6.1.2 Demonstration of ALARP and residual impact

Construction works for the activities in this CEMP will be confined to the Project Area and previously disturbed areas within the DLNG site area. Given the type of construction occurring there were no credible alternatives to reduce ground disturbance identified in the ENVID workshops. Table 7.3 details the management actions to reduce impact to onshore sediment quality, water quality, air quality, and terrestrial fauna.

Inclusion of additional fauna impact mitigations means that there will be regular inspections of trenches and preventative measures in place to prevent fauna ingress into the pipeline. Trench batter design will provide a gradient that prevents entrapment and injury, allowing fauna to move freely, with trench ends left open to assist with fauna egress.

Given the temporary and localised nature of the impacts and the existing disturbance at the site, the management actions in place are appropriate for the nature and scale of this activity. Any known impacts and potential risks have been reduced to ALARP and the impact level is considered Minor and acceptable.

7.6.2 Ground disturbance and clearing – acid sulfate soils

7.6.2.1 Environmental performance objectives, criteria and management actions

The EPO and performance criteria for ground disturbance and clearing – acid sulfate soils are described in **Table 7-4** .

Table 7-4: Ground disturbance and clearing – acid sulfate soils EPO and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Prevent project attributable mobilisation of heavy metals and acidification products to the surrounding environment	No incidents of project attributable mobilisation of heavy metals and acidification products to the surrounding environment	Records of ASS presence in sediment/soil via excavation logs/ daily observations/ photographs Incident investigation records

These EPOs align with the following NT EPA Factor objectives (NT EPA, 2022):

+ Terrestrial environmental quality – Protect the quality and integrity of land and soils so that environmental values are supported and maintained.
+ Terrestrial ecosystems – Protect terrestrial habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions considered for this planned event are shown in **Table 7-5**. Environmental Performance Standards and measurement criteria for these management actions will be developed in consultation with the DLNG team and construction contractors, for inclusion in this CEMP prior to the commencement of DPD Project construction activities.

Table 7-5: Management actions for ground disturbance and clearing – Acid Sulfate Soils during onshore DPD construction activities

MA Reference	Management Action
Standard management actions	
Mitigation	
DPD-DLNG-MA13	Implement ASS and groundwater management and monitoring requirements within the ASSDMP (BAS-210 0049) if ASS or groundwater is encountered during onshore construction activities. The ASSDMP includes requirements for: + ASS stockpiling, laboratory testing and treatment + Groundwater laboratory testing and treatment + Maintenance of testing and inspection records + Contingency dewatering
Additional (ALARP) management actions	
Mitigation	
DPD-DLNG-MA14	Treat ASS material such that no acidic soil or runoff can be released to the environment before it can be used as backfill within the Project Area

7.6.2.2 Demonstration of ALARP and residual impact

During the construction of the Bayu-Undan to Darwin GEP natural material within the onshore Project Area was replaced by imported (non-ASS) fill material (generally sand) up to a depth of approximately 6 m below ground level. Hence it is considered that material at the site is likely to be non-ASS.

None-the-less, should ASS material be encountered during earthworks within the onshore Project Area, it will be managed in line with the ASSDMP (BAS 210 0049). Any suspected ASS will be removed from the onshore zone's excavation area and stockpiled separately from non-ASS materials on a bunded limestone pad ahead of confirmatory testing.

Terrestrial fauna and vegetation may interact with stockpiled soils, however given that these will be managed within short temporal scales in accordance with the ASSDMP, there no significant impact is expected.

Following implementation of standard and additional (ALARP) management actions, including the implementation of the ASSDMP (BAS-210 0049), the assessed residual consequence for this impact is negligible and cannot be reduced further. It is considered therefore that the impact of the activities conducted is ALARP and is considered acceptable.

7.6.3 Light emissions

7.6.3.1 Environmental performance objectives, criteria and management actions

The EPOs and performance criteria for light emissions are described in **Table 7-5** .

Table 7-6: Light emissions EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
No harm to native fauna from project lighting	No reports of injury or mortality to native fauna from light generated during DPD construction activities	Reports of sighting of live, injured, or dead terrestrial fauna
	Limit light to that required for safe work environment	Records of light inspections

This EPO aligns with the following NT EPA Factor objectives (NT EPA, 2022):

- Terrestrial environmental quality – Protect the quality and integrity of land and soils so that environmental values are supported and maintained.
- Terrestrial ecosystems – Protect terrestrial habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions considered for this planned event are shown in **Table 7-7**. Environmental Performance Standards and measurement criteria for these management actions will be developed in consultation with the DLNG team and construction contractors, for inclusion in this CEMP prior to the commencement of DPD Project construction activities.

Table 7-7: Management actions for light emissions during onshore DPD construction activities

MA Reference	Management Action
Standard management actions	
Mitigation	
DPD-DLNG-MA15	Lights to be orientated directly over the area of work and overspill reduced where practicable by using screens or hoods on lights
DPD-DLNG-MA16	Light audit undertaken within 14 days of commencing construction activities
Additional (ALARP) management actions	
N/A	
Additional (ALARP) management actions not adopted	
1	Marine fauna observers specifically looking out for turtle hatchlings entrapped within light spill with adaptive management measures should a significant number be spotted. Reason for rejection: + The onshore construction area is not near turtle nesting beaches.
2	Construction activities limited to non-nesting timeframes Reason for rejection: + Cost disproportionate to benefit given proximity to important nesting beaches and existing lighting from DLNG facility

7.6.3.2 Demonstration of ALARP and residual impact

Artificial lighting will be required to maintain safe working conditions if night works are undertaken. The onshore Project Area is directly adjacent to the operational DLNG Facility, any artificial lights required for night works are unlikely to have a noticeable effect on the existing night environment, which is already influenced by lighting at the DLNG Facility. No threatened or migratory species are expected to be impacted by the minor and temporary increase in light emissions. Further, the use of artificial lighting, will be oriented away from adjacent vegetation/marine environment and at an intensity to allow work to proceed safely.

The potential consequences of the anthropogenic light in the onshore Project Area are expected to be restricted to short-term behavioural impacts on individual fauna that may be present in the onshore Project Area during the activity. Terrestrial fauna may be disturbed or attracted by artificial light, which may increase their risk of predation or interaction with machinery or vehicles. The short duration of the activity is unlikely to lead to any significant impacts to local populations.

The assessed residual consequence for this impact is minor, following implementation of standard management actions. Therefore, due to management actions in place, the terrestrial impacts from artificial lighting are ALARP and considered environmentally acceptable.

7.6.4 Noise emissions

7.6.4.1 Environmental performance objectives, criteria and management actions

The EPO and performance criteria for noise emissions are described in **Table 7-8**.

Table 7-8: Noise emissions EPO and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Limit harm to native fauna from noise emissions from onshore construction	Full compliance with preventative maintenance procedures for power generating equipment and compressors, including industry standard noise reduction equipment.	Recorded incidents of non-compliance

This EPO aligns with the following NT EPA Factor objectives (NT EPA, 2022):

+ Terrestrial environmental quality – Protect the quality and integrity of land and soils so that environmental values are supported and maintained.
+ Terrestrial ecosystems – Protect terrestrial habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions considered for this planned event are shown in **Table 7-9**. Environmental Performance Standards and measurement criteria for these management actions will be developed in consultation with the DLNG team and construction contractors, for inclusion in this CEMP prior to the commencement of DPD Project construction activities.

Santos

Table 7-9: Management actions for noise emissions during onshore DPD construction activities

MA Reference	Management Action
Standard management actions	
Mitigation	
DPD-DLNG-MA17	Preventative maintenance of equipment and machinery
Additional (ALARP) management actions	
N/A	
Additional (ALARP) management actions not adopted	
1	Avoid night works. Reason for rejection: + This would have schedule implications which would extend duration of works thereby extending the period in which the impact is realised. Additionally the cost of implementing far exceeds the benefit gained. ALARP justification will be reviewed if safety risks are unacceptable for certain night activities.

7.6.4.2 Demonstration of ALARP and residual impact

Equipment and machinery used onshore are considered essential to undertaking the installation and pre-commissioning works for the onshore pipeline and noise emissions are an unavoidable consequence of construction activities. Given the routine maintenance of the equipment and machinery by suitably qualified personnel, and adherence to industry standards, all practicable management measures are considered to have been implemented.

Noise emitted by the equipment and machinery during onshore construction and pre-commissioning works may affect fauna behaviour. Avoidance behaviour is likely to be localised to the onshore Project Area and temporary. Considering the location within the existing DLNG Facility disturbance envelope and the surrounding industrial land uses of Darwin Harbour local impacts to fauna may result in detectable but insignificant impacts to in local population size and local population viability.

The residual consequence of noise emissions on receptors is assessed as minor, following the implementation of standard management actions, and will not have a significant impact. The impact of noise emissions to the receiving environment are therefore ALARP and considered acceptable.

7.6.5 Atmospheric emissions

7.6.5.1 Environmental performance objectives, criteria and management actions

The EPO and performance criteria for atmospheric emissions are described in **Table 7-10**.

Table 7-10: Atmospheric emissions EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
Minimise atmospheric emissions generated during DPD construction activities.	Full compliance with preventative maintenance procedures for power generating equipment.	Recorded incidents of non-compliances

This EPO aligns with the following NT EPA Factor objectives (NT EPA, 2022):

+ Air quality – Protect air quality and minimise emissions and their impact so that environmental values are maintained.
+ Terrestrial ecosystems – Protect terrestrial habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions considered for this planned event are shown in **Table 7-11**. Environmental Performance Standards and measurement criteria for these management actions will be developed in consultation with the DLNG team and construction contractors, for inclusion in this CEMP prior to the commencement of DPD Project construction activities.

Table 7-11: Management actions for atmospheric emissions during onshore DPD construction activities

MA Reference	Management Action
Standard management actions	
Mitigation	
DPD-DLNG-MA17	Preventative maintenance of equipment and machinery
Monitoring	
DPD-DLNG-MA18	Monitor and report fuel consumption
Additional (ALARP) management actions	
Monitoring	
DPD-DLNG-MA19	The Barossa project is included in Santos' Climate transition action plan and will adhere to the Santos GHG management plan and energy management program

7.6.5.2 Demonstration of ALARP and residual impact

Power generation through combustion of fossil fuels is essential to undertaking the onshore construction and pre-commissioning works, either by power generation or by operating equipment and vehicles. There are no practicable alternatives to the use of equipment, vehicles and mobile plant powered by combustion engines for the activity. Given the routine maintenance of these systems by suitably qualified personnel, all practicable management measures are considered to have been implemented.

Records of fuel consumption during the onshore works will be maintained to identify the quantity of GHG emissions that were generated from fuel combustion. This information would inform annual reporting under the *National Greenhouse and Energy Reporting Act 2007*.

The location of the activity is within an industrial site that is removed from residential areas. Given the nature and scale of the activity (low number of equipment and short duration), the residual consequence on air quality and sensitive receptors is expected to be negligible, following the implementation of standard management actions and impacts from emissions that are generated by the activity are considered environmentally acceptable.

7.7 Unplanned events risk management strategies

Santos' environmental risk assessment identified four potential sources of environmental risk associated with the activity. Management strategies have been adopted in this CEMP based on the ENVID outcomes (refer to **Section 6**).

7.7.1 Interaction with terrestrial fauna

7.7.1.1 Environmental performance objectives, criteria and management actions

The EPO and performance criteria are described in **Table 7-12**.

Table 7-12: Interaction with terrestrial fauna EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
No harm to native terrestrial fauna from ground disturbance and clearing	Ground disturbance limited to within previously cleared areas	Recorded areas disturbed via excavation logs
	Zero injury to terrestrial native fauna as a result of the DPD construction activities	Recorded number of incidents relating to terrestrial fauna injury or mortality.

This EPO aligns with the following NT EPA Factor objectives (NT EPA, 2022):

+ Terrestrial environmental quality – Protect the quality and integrity of land and soils so that environmental values are supported and maintained.
+ Terrestrial ecosystems – Protect terrestrial habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions considered for this planned event are shown in **Table 7-13**. Environmental Performance Standards and measurement criteria for these management actions will be developed in consultation with the DLNG team and construction contractors, for inclusion in this CEMP prior to the commencement of DPD Project construction activities.

Table 7-13: Management actions for interaction with terrestrial fauna during onshore DPD construction activities

MA Reference	Management Action
Standard management actions	
Avoidance	
DPD-DLNG-MA10	Limit vehicles to access roads, prepared site pad or defined boundaries within the onshore Project Area/DLNG disturbance envelope
Mitigation	
DPD-DLNG-MA07	Ensure any native vertebrates injured by DPD construction activities are referred to an appropriate wildlife carer group or veterinarian
DPD-DLNG-MA12	Establish and implement vehicle speed controls
DPD-DLNG-MA20	Maintain the onshore Project Area as a cleared site during construction activities
Additional (ALARP) management actions	
N/A	

7.7.1.2 Demonstration of ALARP and residual risk

There are no alternative options to using vehicles and machinery to undertake the activity. Any impact caused by the physical presence of vehicles and machinery is likely to be localised and temporary, with terrestrial species expected to resume normal behaviours in the surrounding environment once construction activities are completed.

In the event that vehicles or machinery come in close proximity to terrestrial fauna, management actions will be implemented to reduce the likelihood of a terrestrial fauna collision to ALARP. This includes limiting the vehicle speed, restricting vehicles to designated access roads, informing personnel of risks to environment and maintaining a cleared onshore Project Area. Should fauna become harmed during the activity, they will be appropriately rehabilitated and relocated as required.

The inherent likelihood of encountering fauna in the onshore Project Area is limited by the short duration of the activity, lack of suitable habitat within the onshore Project Area, the fact that the onshore Project Area is highly disturbed and the expected behaviour of individuals to move away from vehicle and machinery noises. With the controls adopted, the assessed residual risk for this impact is very low and considered to be reduced to ALARP and is therefore acceptable.

7.7.2 Introduction and spread of invasive species

7.7.2.1 Environmental performance objectives, criteria and management actions

The EPOs and performance criteria for the introduction and spread of invasive species are described in **Table 7-14**.

Table 7-14: Introduction and spread of invasive species EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	**Performance Indicator/s**
No introduction and spread of invasive species	Zero incidents of increase in abundance or distribution of invasive species from DPD project onshore construction activities.	Records of incidents relating to the introduction of invasive species attributed to the construction works
	Ground disturbance limited to within previously cleared areas	Records of areas disturbed via excavation logs

This EPO aligns with the following NT EPA Factor objectives (NT EPA, 2022):

- Terrestrial environmental quality – Protect the quality and integrity of land and soils so that environmental values are supported and maintained.
- Terrestrial ecosystems – Protect terrestrial habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions considered for this planned event are shown in **Table 7-15**. Environmental Performance Standards and measurement criteria for these management actions will be developed in consultation with the DLNG team and construction contractors, for inclusion in this CEMP prior to the commencement of DPD Project construction activities.

Table 7-15: Management actions for introduction and spread of invasive species during onshore DPD construction activities

MA Reference	Management Action
Standard management actions	
Avoidance	
DPD-DLNG-MA02	Establish appropriate access restrictions to the onshore Project Area
DPD-DLNG-MA10	Limit vehicles to access roads, prepared site pad or defined boundaries within the onshore Project Area/DLNG disturbance envelope
Mitigation	
DPD-DLNG-MA21	Comply with DLNG inspection requirements for new vehicles, plant, and equipment to site
DPD-DLNG-MA22	All equipment and material imported from overseas will be inspected by the Australia Quarantine and Inspection Service (AQIS)
DPD-DLNG-MA23	Provide and routinely collect onsite covered putrescible waste bins

7.7.2.2 Demonstration of ALARP and residual risk

Importation of equipment and material, and vehicle movement, is required for the activity. Management for invasive species for this activity will comply with the *Weeds Management Act 2001* (NT) and the requirements of the DLNG Facility. The risk of bringing invasive species into the onshore Project Area will be minimised by the inspection requirements of DLNG and AQIS, while the spread of invasive species will be minimised by restricting access to the onshore Project Area and access roads.

Vehicles for construction will not transit to or from the worksite each day. In most cases, they will enter the site, then remain onsite until no longer required, reducing the risks of contamination. Given the existing presence of invasive species and ongoing weed management by the DLNG Facility, with the controls adopted, the residual risk of the introduction or spread of invasive species is assessed as ALARP.

The pathways for introducing and spreading invasive species and the existing presence of invasive flora and fauna species within the DLNG Facility and its surrounds are well known. Following the implementation of management actions, the residual risk of introduction and spread of invasive species is low and therefore considered acceptable.

7.7.3 Release of non-hazardous and hazardous materials

7.7.3.1 Environmental performance objectives, performance criteria and management actions

The EPOs relevant to the release of non-hazardous and hazardous materials, including performance criteria, are described in **Table 7-16.**

Table 7-16: Release of non-hazardous and hazardous materials EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
No significant environmental impact resulting from release of non-hazardous and hazardous materials associated with the DPD construction activities	Zero incidents of release of hazardous materials to the terrestrial or marine environment during DPD construction activities	

These EPOs align with the following NT EPA Factor objectives (NT EPA, 2022):

+ Marine environmental quality – Protect the quality and productivity of water, sediment and biota so that environmental values are maintained.
+ Marine ecosystems – Protect marine habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.
+ Terrestrial environmental quality – Protect the quality and integrity of land and soils so that environmental values are supported and maintained.
+ Terrestrial ecosystems – Protect terrestrial habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions considered for this planned event are shown in **Table 7-17.** Environmental Performance Standards and measurement criteria for these management actions will be developed in consultation with the DLNG team and construction contractors, for inclusion in this CEMP prior to the commencement of DPD Project construction activities.

Table 7-17: Management actions for release of non-hazardous and hazardous material

MA reference	Management actions
Standard management actions	
Mitigation	
DPD-DLNG-MA24	Waste Management Plan in place which includes standards for bin types, lids and covers, waste segregation and bin storage
DPD-DLNG-MA25	HSE inductions – cover requirements for waste management, e.g. label and cover waste skips and bins
DPD-DLNG-MA26	No Perfluorinated Chemicals (PFAS)/ Perfluorooctane sulfonate (PFOS) will be used in firefighting foam
DPD-DLNG-MA27	Inspection and maintenance of all equipment using chemicals
DPD-DLNG-MA28	Implement approved chemical selection procedure
DPD-DLNG-MA29	Implement Santos' approved procedures for handling of treated seawater
DPD-DLNG-MA30	Comply with Australian Standards for storage and secondary containment of hazardous chemicals
DPD-DLNG-MA31	Maintain spill response equipment and procedures
DPD-DLNG-MA32	Implement and comply with the existing DLNG Emergency Response Plan (DLNG/HSE/ER/002), including in the event of a storm.
Additional (ALARP) management actions	
N/A	

7.7.3.2 Demonstration of ALARP and Residual risk

The storage and use of hydrocarbons and chemicals is required to undertake the activity. As such their removal from the activity is not practicable.

The identified management actions implemented include chemical selection process, treated seawater handling procedure and spill clean-up equipment and procedures to reduce the impact in a spill event. Management actions relating to waste management are incorporated within the Santos waste management plan and preventative measures are also documented in the DLNG Emergency Response Plan to prevent impact during a cyclone event.

Containment of small spills with secondary containment and spill response equipment will prevent spills spreading into the terrestrial and marine environment. The maintenance of bunding and spill response equipment provides assurance that these are available to contain spills in the event of a small leak. Hazardous liquids will be managed in accordance with relevant legislation and industry standards and Santos' procedures.

The management actions proposed are in line with applicable actions described in relevant recovery plans and conservation advice to reduce the risk of habitat degradation and deteriorating water quality (for example, from pollution) to a level considered to be ALARP by Santos. The assessed residual risk for this impact is low. It is therefore considered that the impact of the activities is acceptable.

7.7.4 Spread of fire to surrounding bushland

7.7.4.1 Environmental performance objectives, criteria and management actions

The EPO and performance criteria for the spread of fire to surrounding bushland are described in **Table 7-18**.

Table 7-18: Spread of fire to surrounding bushland EPOs and associated performance criteria

EPO	Performance Criteria	
	Target/s	Performance Indicator/s
No bushfires caused by onshore construction activities	Zero incidents of bushfires resulting from the DPD Project onshore construction activities	Number of recorded incidents

This EPO aligns with the following NT EPA Factor objectives (NT EPA 2022):

+ Terrestrial environmental quality – Protect the quality and integrity of land and soils so that environmental values are supported and maintained. Terrestrial ecosystems – Protect terrestrial habitats to maintain environmental values including biodiversity, ecological integrity and ecological functioning.

The management actions considered for this planned event are shown in **Table 7-19** . Environmental Performance Standards and measurement criteria for these management actions will be developed in consultation with the DLNG team and construction contractors, for inclusion in this CEMP prior to the commencement of DPD Project construction activities.

Table 7-19: Management actions for spread of fire to surrounding bushland

MA Reference	Management Action
Standard management actions	
Mitigation	
DPD-DLNG-MA30	Comply with Australian Standards for storage and secondary containment of hazardous chemicals
DPD-DLNG-MA32	Implement and comply with the existing DLNG Emergency Response Plan (DLNG/HSE/ER/002), including in the event of a storm.
DPD-DLNG-MA33	Implement and comply with the existing DLNG Work Permit Procedure (SMS-OS-OS02-PD03) and associated manuals. This includes the requirement to have firefighting equipment close by whilst undertaking hot work activities.

7.7.4.2 Demonstration of ALARP and residual risk

The use of machinery and undertaking hot works (i.e. welding)' and storage and use of potential fuel sources, such as hydrocarbons and chemicals, are required to undertake the activity. As such their removal from the activity is not viable.

The DLNG HSE site induction, which contractors present onsite will be required to complete, will provide information on the facility safety protocols, muster and evacuation processes and emergency response arrangements (ConocoPhillips, 2017). The DLNG Facility has several existing and substantive controls in place to protect the facility, which include:

+ maintaining fire breaks on the property boundary
+ managing weeds as required to reduce the fuel load risk (ConocoPhillips, 2018).
+ Protocols for storage of hydrocarbons and chemicals
+ Permitting required for hotwork activities

Following the implementation of the standard management actions, the residual risk for this impact is assessed as Low and cannot be reduced further. It is considered therefore considered that the impact of the activities is reduced to ALARP and is acceptable.

7.8 Summary of management actions

Appendix 2 contains a summary of all management actions within this CEMP.

8 Implementation Strategy

This section presents the processes and procedures that will be implemented to ensure the environmental requirements within this CEMP will be met, including:

- Specific systems, practices and procedures that ensure both environmental impacts and risks are reduced to ALARP and Environmental Performance Objectives (EPOs), Performance Criteria and Performance Standards of this CEMP are being met;
- A clear chain of command, outlining roles and responsibilities of personnel involved in the implementation, management and review of this CEMP;
- Measures to ensure that employees and/or contractors working in relation to this activity are aware of their responsibilities regarding the environment and have the appropriate skill and training;
- Auditing, review and revision processes;
- Incident recording and reporting in line with Santos and regulatory requirements;
- Maintenance of quantitative records of discharges and emissions; and
- Details of emergency response and oil spill arrangements.

This implementation strategy is consistent with the Barossa Health, Safety & Environment Management Plan for Execute (BAA-200 0003).

Stakeholder engagement is assessed separately for the requirements of the activity. Ongoing stakeholder management strategies are discussed in **Section 9**.

While the scope of work covered by this CEMP is located primarily outside the battery limits of the DLNG facility, some activities, including access to the onshore construction site, will occur within the DLNG perimeter and the construction activity will be in close proximity to the DLNG facility perimeter. Therefore, additional DLNG HSE requirements (e.g. permit to work requirements) will apply in some situations.

Environmental requirements for the DLNG facility, including an implementation strategy, are outlined within the DLNG Operations Environmental Management Plan (DLNG/HSE/PLN/001).

8.1 Leadership, accountability and responsibility

To enable the DPD Project to succeed in meeting environmental objectives as outlined within this CEMP, the following measures apply:

- Appropriately skilled and qualified DPD Project team is established with HSE accountabilities, responsibilities, and resources clearly defined;
- Setting of EPOs and Performance Criteria (incl. Targets and Performance Indicators) and establishment of the practices and tools used to measure performance and drive continual improvement (**Section 7**); and
- Implementing HSE Leadership Teams with key contractors to discuss HSE performance and improvement

The Barossa Project Director is responsible for delivery of the Barossa Development, including the DPD Project, and has responsibilities for:

- Accountability for project HSE performance

+ Demonstrating strong and visible HSE leadership
+ Endorsing HSE performance indicators and targets
+ Communicating HSE performance and events to the Chief Operating Officer, Upstream Oil & Gas and Group Executive Committee.
+ Providing HSE resources.
+ Engaging with senior regulatory managers.

The Barossa Project Director is supported by the Barossa Project Management Team. The effective implementation of this CEMP requires collaboration and cooperation among Santos Barossa Team personnel and contractors. The accountabilities of key Santos and contractor personnel in relation to the implementation, management and review of the CEMP is outlined in **Table 8-1**. Santos' OPEP will outline the roles and responsibilities in an emergency.

Roles and responsibilities at the DLNG facility, relevant to environmental management, are outlined within the DLNG Operations Environmental Management Plan (DLNG/HSE/PLN/001).

Table 8-1: Chain of command and key roles and responsibilities

Title (role)	Environmental responsibilities
Office-based personnel	
Santos Darwin Life Extension (DLE) Manager	+ Confirm that the campaign is undertaken in accordance with this CEMP. + Provide sufficient resources to implement the management controls in this CEMP. + Confirm Contractor personnel attend an environmental induction (**Section 8.2.1**) upon commencing work on the campaign. + Action the management controls, as detailed in the EPSs in this CEMP (**Section 7)** as required, prior to the commencement of the activity. + Confirm the Contractor meets the requirements of the Santos management system and relevant standards/procedures.
Santos Barossa HSE Manager	+ Provide assurance that adequate resources are provided to support all environmental activities associated with this CEMP. + Develop a program to implement and monitor CEMP commitments. + Liaise with NT EPA, DITT, DCCEEW and other regulators. + Ensure incident notification process is in place and investigations completed to identify root causes. + Review and submit environmental performance reports and external environmental incident notification reports.

Title (role)	Environmental responsibilities
DLE Pipeline Onshore Scope Lead	+ Confirm the campaign is undertaken in accordance with this CEMP. + Communicate any changes to the activity that may affect the risk and impacts assessment, EPOs, EPSs and MAs detailed in this CEMP to the Santos HSE team. + Coordinate resources required to enable the commitments in this CEMP to be maintained. + Confirm the reporting of environmental incidents meets both external and Santos' incident reporting requirements. + Liaise with Santos Environmental Advisor on environmental incidents and what constitutes a reportable incident. + Track and close out of any corrective actions raised from environmental audits as required by this CEMP.
Santos Barossa Crisis and Emergency Management Specialist	+ Develop Santos Crisis Management and Emergency Response Plans and procedures. + Ensure emergency response drills are undertaken as per Santos Crisis Management and Emergency Response plans and procedures.
Santos Emergency Response Coordinator	+ Undertake Santos Incident Management Team (IMT) drills and exercises in accordance with the Crisis and Incident Management Exercise Schedule. + Undertake assurance activities on oil spill response arrangements + Review Santos Emergency Response Plans and procedures.
Santos Barossa Environmental Advisor/s	+ Develop onshore environmental approval documents, including DPD Project EMPs, for submission and acceptance by DITT. + Provide environmental inductions to contractor personnel. + Ensure environmental inspections and audits are undertaken against EMP commitments as per the Barossa Project Environmental Compliance Assurance Plan (BAA-200 0635). + Review and approve chemical products + Prepare environmental performance reports. + Advise on environmental incident reporting requirements, including what constitutes a reportable incident
Santos Barossa External Relations Advisor	+ Prepare and implement the relevant and interested persons consultation program for the DPD activity. + Manage and report on any relevant and interested persons consultation received in relation to the activity. + Undertake ongoing engagement with relevant and interested persons, for the duration of the activity, as required.

Title (role)	Environmental responsibilities
Contractor Project Manager	+ Undertake the onshore construction activity in accordance with this CEMP. + Provide the resources required to enable the commitments in this CEMP to be maintained. + Ensure that all Contractor site personnel attend HSE inductions, as required, and that attendance records are saved. + Ensure incidents are reported and investigated, as required.
Site based personnel	
Santos Senior Client Site Representative	+ Confirm contractors undertake the activity in a manner consistent with the EPOs and environmental management procedures detailed in this CEMP. + Confirm the management measures detailed in this CEMP are implemented. + Communicate any changes to the activity to the Santos Environmental Advisor. + Confirm all chemical components and other fluids that may be used on site are approved for use. + Advise the Santos DLE Onshore Pipeline Scope Lead of any changes in activities that may lead to nonconformance with the EPOs in this CEMP. + Report environmental incidents to Santos DLE Onshore Pipeline Scope Lead.
Construction Superintendent (Contractor Personnel)	+ Responsible for ensuring that pipeline construction activities are performed in accordance with this CEMP.
Onsite HSE Advisors (Santos and/or Contractor)	+ Support the Santos Senior Client Site Representative to ensure that the controls detailed in this CEMP relevant to onshore activities are implemented and assist in collection and recording of evidence of implementation (other controls are implemented and evidence collected onshore). + Support the Santos Senior Client Site Representative to ensure environmental incidents or breaches of objectives and/ or standards outlined in this CEMP, are reported, and corrective actions for incidents and breaches are developed, tracked and closed out in a timely manner. + Ensure periodic environmental inspections/reviews are completed and corrective actions from inspections are developed, tracked and closed out in a timely manner. + Review Contractors procedures, input into Toolbox talks and JSAs. + Provide day to day environmental support for activities in consultation with the Santos Environmental Advisor.

Title (role)	Environmental responsibilities
All Project personnel	+ Act in an environmentally responsible manner. + Undertake work in accordance with accepted HSE systems and procedures. + Comply with this CEMP and all regulatory requirements as applicable to assigned role. + Report any unsafe conditions, near misses or environmental incidents immediately to supervisors. + Attend environmental inductions and HSE meetings, and complete training as required. + Report wildlife sightings as applicable in accordance with Project requirements

8.2 Workforce training and competency

This section describes the mechanisms that will be in place, so all Project personnel (including employee and contractor roles) are aware of his or her responsibilities in relation to the CEMP and has appropriate training and competencies.

8.2.1 Inductions

Santos and its contractors will develop a mandatory project induction, which will detail CEMP requirements. Project induction attendance will be logged and held with the Project Administration Assistant. Santos personnel will be required to complete required contractor site and facility inductions, including DLNG facility inductions, including permitting requirements, as applicable for working in and around the DLNG facility.

All Project site roles will complete an induction that will include a component addressing their CEMP responsibilities. Induction attendance records for all personnel will be maintained. Inductions will include information about:

+ Environment, Health and Safety Policy
+ Regulatory regime
+ Operating environment
+ Activities with highest risk
+ CEMP EPOs, Performance Indicators and management commitments (e.g. **Section 7**)
+ Incident reporting and notifications
+ Regulatory compliance reporting
+ Process for assessing changes to CEMP activities
+ Oil pollution emergency response.

8.2.2 Training and competency

The implementation of training requirements will ensure project personnel have the skills, knowledge and competencies to conduct work in a safe manner without harm to their health or the environment.

All members of the workforce will complete relevant training and/or hold relevant qualifications and certificates for their roles.

Santos and its contractors are individually responsible for ensuring that their personnel are qualified and trained. The systems, procedures and responsible persons will vary and will be managed using online databases, staff on-boarding process and training departments, etc.

Personnel qualification and training records will be sampled before and/or during an activity. Such checks may be performed during the procurement process, inductions, crew change, and operational inspections and audits.

8.2.3 Workforce involvement and communication

Daily operational meetings will be held at which HSE will be a standing agenda item. It is a requirement that supervisors attend daily operational meetings and that all personnel attend daily toolbox or pre-shift meetings. Toolbox or pre-shift meetings will be held to plan jobs and discuss work tasks, including HSE risks and their controls.

HSE performance will be monitored and reported during the activity, and performance metrics (including environmental performance indicators and the number of environmental incidents) will be regularly communicated to the workforce. Findings, learnings and corrective actions identified from assurance activities and incident investigations will be communicated to project personnel to drive continuous improvement (e.g. through HSE Alerts, pre-shift / toolbox meetings).

8.3 Audits and inspections

Environmental Audits and Inspections undertaken to provide assurance of requirements within this CEMP are being met may include:

+ Routine environmental inspections (during Project execution)
+ Contractor Environmental Audits
+ Regulator Inspections and Audits (as required by Regulator)

For this CEMP the environmental audit and inspection processes are described in the Barossa Project Environmental Compliance Assurance Plan (BAA-200 0635).

An Environmental Assurance Activities Schedule (EAS) will be developed and maintained by the Barossa HSE Team which will align with the Barossa Project Integrated Audit Schedule. The EAS will provide an overview and schedule of assurance (verification) activities required to meet compliance for each activity (e.g., inspections, audits, assessments, and reviews). Additionally, it will allow Santos and the Barossa HSE Team to plan and resource appropriately to ensure all environmental assurance requirements can be met.

Audit criteria, as included within a terms of reference (ToR), will typically include a selection of management actions and environmental performance standards and outcomes; however, may also include parts of the activity description, stakeholder consultation and implementation strategies.

Audit findings may include opportunities for improvement and non-conformances (requirements not met). Audit non-conformances are managed as described in **Section 8.5**

8.4 Environmental Incident Reporting

8.4.1 Internal incident reporting

All personnel will be informed through inductions and daily operational meetings of their duty to report HSE incidents and hazards. Reported HSE incidents and hazards will be shared during daily operational meetings and will be documented in the incident management systems as appropriate. HSE incidents will be investigated and reported in accordance with the Santos Incident Reporting and Investigation Procedure (SMS-HSS-OS07-PD01) and contractor procedures.

The incident reporting requirements will be provided to all crew on-board the facilities and support vessels with special attention to the reporting time frames to provide for accurate and timely reporting.

8.4.2 External incident reporting

Certain incidents will require notification to external Regulatory authorities under NT and Commonwealth legislation. This includes requirements below; additional requirements may apply as conditions of approval of the DPD Project.

8.4.2.1 Reportable Incident – Waste Management and Pollution Control Act 1998 (NT)

As per Part 3 Section 14 of the Waste Management and Pollution Control Act 1998 (WMCA Act 1998), incidents causing, or that may threaten to cause, pollution resulting in material environmental harm or serious environmental harm, will be reported to the NT EPA as soon as practicable after (and in any case within 24 hours after) first becoming aware of the incident. An incident includes "*an accident, emergency or malfunction and a deliberate action, whether or not that action was taken by the person conducting the activity in the course of which the incident occurred*".

A notification to the NT EPA of an incident as per Part 3 Section 14 of the WMCA Act 1998 will specify:

+ the incident causing or threatening to cause pollution;
+ the place where the incident occurred;
+ the date and time of the incident;
+ how the pollution has occurred, is occurring or may occur;
+ the attempts made to prevent, reduce, control, rectify or clean up the pollution or resultant environmental harm caused or threatening to be caused by the incident; and
+ the identity of the person notifying.

8.4.2.2 Wildlife incident reporting

Any incident resulting in a significant impact to a species listed as threatened or migratory under the *Environmental Protection and Biodiversity Protection Act 1999* (EPBC Act 1999) is to be reported to DCCEEW as soon as practicable (and in any case within 24 hours) of becoming aware of the event occurring.

The report will contain:

+ time, location and description of the incident
+ a summary of the response being undertaken
+ details of the relevant contact person.

8.5 Corrective actions

Corrective actions identified from environmental assurance activities and incident investigations will be derived in collaboration with contractors. For this CEMP, corrective actions and contingency processes are described as per the Barossa Project Environmental Compliance Assurance Plan (BAA-200 0635) and Barossa Health, Safety & Environment Management Plan for Execute (BAA-200 0003).

CEMP non-conformances will be addressed and resolved by a systematic corrective action process as outlined in Santos' Management System. Santos' incident and action tracking management system (HSE Toolbox) will be used to track corrective actions in the following instances:

+ Where there has been or potentially been a reportable incident
+ Where there has been a non-compliance in accordance with a statutory plan
+ Where any corrective action requires notification to an external regulatory or statutory body
+ Where there are corrective actions from formal audits (Contractor Pre-Start Audit, external regulator audit etc.).

Once entered, corrective actions, time frames and responsible persons (including action owners and event validators) will be assigned. Corrective action 'close out' will be monitored using a management escalation process.

Environmental corrective actions identified through compliance assurance activities are to be promptly managed to ensure timeframes for external reporting are met and that decision making is made visible.

8.6 Continuous improvement

For this CEMP, continuous improvement will be driven by the list below and may result in a review of the CEMP.

+ Improvements identified from the review of business-level HSE key performance indicators
+ Actions arising from Santos and departmental HSE improvement plans
+ Corrective actions and feedback from HSE audits and inspections, incident investigations and after-action reviews
+ Opportunities for improvement and changes identified during pre-activity reviews and MoC documents
+ Actions taken to address concerns and issues raised during the ongoing stakeholder management process (**Section 9**).

Identified continuous improvement opportunities will be assessed in accordance with the MoC process (**Section 8.9.2**) to ensure any potential changes to this CEMP are managed in a controlled manner.

8.7 Emergency preparedness and response

Emergency preparedness and response arrangements, applicable to activities covered by this CEMP, including for spill response, will be included in Santos and Contractor procedures.

Emergency response arrangements as outlined within the DLNG facility Emergency Response Plan (DLNG/HSE/ER/002) may apply for some incidents.

8.7.1 Contractor Emergency Plans

DPD Project contractors are responsible for having comprehensive Emergency Response Plans (ERP) that address emergency response actions associated with all credible incidents for the activity. These will describe the interface arrangements between Contractor and Santos Incident Management structures and cover all aspects of emergency response including technical, logistical and medical support.

Contractor ERPs will outline roles and responsibilities of contractor personnel for emergency events. The ERP is accepted by Santos and reviewed on an annual basis by the contractor or if a significant change has occurred to the incident management or emergency response arrangements.

Scenario-based drills are performed to test the emergency response arrangements and updates are made to improve the ERPs, if required.

8.7.2 Santos Incident Management and Oil Spill Response Arrangements

Santos maintains Incident and Crisis Management Teams (IMT and CMT) and support arrangements to respond to all-hazard incidents, including oil spill incidents, at its sites and for activities under its control or influence, including activities covered under this CEMP. Santos' crisis and incident management arrangement are outlined within the Crisis, Incident Management & Emergency Response Procedure (SMS-HSS-OS05-PD01). IMT and CMT training and exercise requirements, including OPEP exercises, are included within an annual training and exercise plan and schedule.

8.8 Reporting and notifications

Environmental reporting for the DPD Project construction activities will include reports between Subcontractors and Contractors, Contractors and Santos, and Santos and Stakeholders, including Regulatory authorities. Reports will be delivered within agreed upon timeframes. outlines an initial assessment of reporting requirements relevant to this CEMP.

External reporting requirements may be dictated by approval conditions associated with the DPD Project and finalisation of this CEMP will include all relevant external regulatory reporting requirements.

A detailed schedule of reporting requirements and submission dates for the DPD Project will be developed as per the Barossa Project Environmental Compliance Plan (BAA-200 0635).

Table 8-2: **Summary of key environmental reporting requirements.**

Report/ Notification	Responsibility	Content	Frequency	Recipient
Pre-start				
Pre-start contractor audit	Santos DLNG/Barossa Team	Confirmation of compliance with CEMP commitments relating to operational procedures and processes that Santos require to be in place prior to the commencement of the activity.	Prior to commencement of the activity	Santos
Pre-start notifications	Santos Barossa Team / Contractors	Details on DPD Project commencement to meet requirements of stakeholders (including Regulatory authorities)	Prior to commencement of the activity	Various stakeholders
Execution and completion				
Regular Stakeholder updates	Santos Barossa Team	Regular updates on DPD Project during planning and execution as per Stakeholder Management Plan (refer Section 9)	Throughout planning and execution	Various stakeholders
Contractor environmental execution audit	Santos Barossa Team	Confirmation of compliance with CEMP commitments relevant to execution of the activity.	Prior to completion of the activity	Santos
Daily Reports	Contractor Site Superintendent	Update on day's activities, including any identified non-conformance against this CEMP, and any issues that may need addressing.	Daily	Santos
Environmental Reports/Checklists	Contractor Site Superintendent	Compliance against key regulatory and contractual commitments (including CEMP commitments). Reporting of fuel usage, discharges and emissions etc.	Monthly at minimum	Santos

Report/ Notification	Responsibility	Content	Frequency	Recipient
HSE Meetings Records	Contractor and Santos Barossa Team	Monthly, dedicated HSE meetings are held with the onshore and Perth-based management (including contractor management) and advisors to address targeted health, safety and environment incidents and initiatives. Minutes of these meetings are produced and distributed as appropriate.	Monthly	Santos
Completion notifications	Santos Barossa Team / Contractors	Details on DPD Project completion to meet requirements of stakeholders (including Regulatory authorities)	Following completion of the activity	Various stakeholders
Acid Sulfate Soils Monitoring, Inspection and Testing Records (as required)	Santos Contractor and ASS Monitoring Contractor	Records of ASS monitoring, inspection and testing (if applicable) as per requirements of the DPD Project Acid Sulfate Soils and Dewatering Management Plan (BAS-210 0049)	Dependent upon detection of ASS	Santos DEPWS DITT NT EPA
Environmental Performance/ Compliance Assurance Report	Santos Barossa Team	Provides a summary of compliance performance, including the environmental performance objectives, standards and measurement criteria within this CEMP and any other conditions of approval on the DPD Project.	At completion of the activity and not less than annually	DITT NTEPA (DEPWS) DCCEEW (if required)
Incident reporting				

Report/ Notification	Responsibility	Content	Frequency	Recipient
Incident Report – Internal	Contractor and Santos Barossa Team	Provides framework for Internal notification of incidents including spills. The first report contains tools for assessing the severity of the incident and escalating as per the incident notification procedure. Incident reporting will also be undertaken through Santos' online EHS Toolbox system.	Incident specific	Santos
Incident Report – Reportable Environmental Incident (WMPC Act 1998)	Santos Barossa Team	Reporting of Reportable Incidents as per Part 3 of the Waste Management and Pollution Control Act 1998 (WMPC Act 1998) (Refer **Section 8.4.2.1**)	Incident specific	NT EPA
Incident Report – Wildlife Incidents	Santos Barossa Team	Reporting of incidents involving EPBC Act species (Refer **Section 8.4.2.2**)	Incident specific	DCCEW DEPWS

8.9 Document management

This CEMP will be revised based on conditions of environmental approvals and/or licences and submitted to the appropriate regulator, for review and approval as required, prior to DPD Project implementation (i.e. commencement of construction activities).

8.9.1 Information management and document control

This CEMP, as well as any approved management of change (MoC) documents, are controlled documents and current versions will be available on Santos' document control system and made available to Project contractors.

8.9.2 Management of change

Following regulatory review and approval of this CEMP any changes to Project activities as described in this document, which have the potential to materially increase environmental impacts and risks, will be evaluated and controlled following the impact and risk assessment process followed in **Section 6**. The documentation and approval of management of change (MoC) assessments will follow the process outlined within the Santos Management of Change Procedure (SMS-LRG-OS01-PD04). MoC records will be retained and details of MoCs outlined within Regulatory compliance/performance reports.

If there is a change in the petroleum instrument holder, or operator for the activity, a revision of the CEMP will be submitted to DITT as soon as practicable after the change.

8.9.3 Reviews

This CEMP addresses a temporary construction activity. The CEMP will be reviewed annually, or as required in response to regulatory requirements and any changes to impacts, risks or management actions raised in Santos' assurance processes, incident response, stakeholder engagement or contractor engagement. These changes will be evaluated through the MoC process, and significant updates required to be communicated to regulators will be submitted to DITT.

9 Stakeholder Consultation

The stakeholder engagement approach used for the Project is in accordance with Santos's corporate approach to stakeholder engagement and industry leading standards and practice. The approach recognises and is aligned with the NT EPA's Guidance for Proponents – Stakeholder Engagement (NT EPA 2021a), the NT EPA's guidance for Preparing a Supplementary Environmental Report (NT EPA 2021b) and the International Association for Public Participation's (IAP2) Quality Assurance Standard for Community and Stakeholder Engagement (IAP2 2015).

Due to the iterative nature of the stakeholder process all relevant details have been contained in one document, the SER (BAS-210 0020), to contain updates to one location. The SER provides an outline of the objectives, process and key stakeholders consulted for the DPD Project. Additionally, the Stakeholder Engagement Plan (SEP) is attached to the SER. It details all consultation undertaken to date and information on future engagement activities.

In preparing the SER, and project management plans, Santos has considered and assessed each submission individually, and taken into consideration the issues raised when engaging with stakeholders to assess potential impacts and proposed management measures.

The SER provides a summary of the issues raised relevant to the Project and Santos' assessment and response to these issues. A full register, with all submissions and responses, is provided as an attachment to the SER.

Appendix 1 Santos Environment, Health and Safety Policies

Environment, Health & Safety

Santos

Policy

Our Commitment

Santos is committed to being the safest gas company wherever we have a presence and preventing harm to people and the environment

Our Actions

We will:

1. Integrate environment, health and safety management requirements into the way we work
2. Comply with all relevant environmental, health and safety laws and continuously improve our management systems
3. Include environmental, health and safety considerations in business planning, decision making and asset management processes
4. Identify, control and monitor risks that have the potential for harm to people and the environment, so far as is reasonably practicable
5. Report, investigate and learn from our incidents
6. Consult and communicate with, and promote the participation of all workers to maintain a strong environment, health and safety culture
7. Empower our people, regardless of position, to "Stop the Job" when they feel it necessary to prevent harm to themselves, others or the environment
8. Work proactively and collaboratively with our stakeholders and the communities in which we operate
9. Set, measure, review and monitor objectives and targets to demonstrate proactive processes are in place to reduce the risk of harm to people and the environment
10. Report publicly on our environmental, health and safety performance

Governance

The Environment Health Safety and Sustainability Committee is responsible for reviewing the effectiveness of this policy.

This policy will be reviewed at appropriate intervals and revised when necessary to keep it current.

Appendix 2 Summary of management actions and associated performance criteria for the proposed activity

MA reference	Management Actions
DPD-DLNG-MA01	Restrict disturbance to within the onshore Project Area and existing DLNG site area
DPD-DLNG-MA02	Establish appropriate access restrictions to the onshore Project Area
DPD-DLNG-MA03	Pump water through a silt separator when dewatering in the excavated trench in sections where the trench does not naturally drain to sea
DPD-DLNG-MA04	Geotextiles will be installed under primary construction area (i.e. site pad)
DPD-DLNG-MA05	Trench inspections to be performed daily to check for trapped wildlife
DPD-DLNG-MA06	Insert caps on ends of pipe if the pipe is to be unattended for periods >12 hours; to prevent fauna ingress.
DPD-DLNG-MA07	Ensure any native vertebrates injured by DPD construction activities are referred to an appropriate wildlife carer group or veterinarian
DPD-DLNG-MA08	Return onshore site to natural grade to match existing topography following completion of the activity
DPD-DLNG-MA09	Maintain batters or install fauna ladders on trench entry and exit to allow fauna to exit the trench
DPD-DLNG-MA10	Limit vehicles to access roads, prepared site pad or defined boundaries within the onshore Project Area/DLNG disturbance envelope
DPD-DLNG-MA11	Use water truck for dust suppression
DPD-DLNG-MA12	Establish and implement vehicle speed controls

MA reference	Management Actions
DPD-DLNG-MA13	Implement ASS and groundwater management and monitoring requirements within the ASSDMP (BAS-210 0049) if ASS or groundwater is encountered during onshore construction activities. The ASSDMP includes requirements for: + ASS stockpiling, laboratory testing and treatment + Groundwater laboratory testing and treatment + Maintenance of testing and inspection records
DPD-DLNG-MA14	Treat ASS material such that no acid can be released to the environment before it can be used as backfill within the Project Area
DPD-DLNG-MA15	Lights to be orientated directly over the area of work and overspill reduced where practicable by using screens or hoods on lights
DPD-DLNG-MA16	Light audit undertaken within 14 days of commencing construction activities
DPD-DLNG-MA17	Preventative maintenance of equipment and machinery
DPD-DLNG-MA18	Monitor and report fuel consumption
DPD-DLNG-MA19	The Barossa project is included in Santos' Climate transition action plan and will adhere to the Santos GHG management plan and energy management program
DPD-DLNG-MA20	Maintain the onshore Project Area as a cleared site during construction activities
DPD-DLNG-MA21	Comply with DLNG inspection requirements for new vehicles, plant, and equipment to site
DPD-DLNG-MA22	All equipment and material imported from overseas will be inspected by the Australia Quarantine and Inspection Service (AQIS)
DPD-DLNG-MA23	Provide and routinely collect onsite covered putrescible waste bins
DPD-DLNG-MA24	Waste Management Plan in place which includes standards for bin types, lids and covers, waste segregation and bin storage
DPD-DLNG-MA25	HSE inductions – cover requirements for waste management, e.g. label and cover waste skips and bins
DPD-DLNG-MA26	No Perfluorinated Chemicals (PFAS)/ Perfluorooctane sulfonate (PFOS) will be used in firefighting foam
DPD-DLNG-MA27	Inspection and maintenance of all equipment using chemicals
DPD-DLNG-MA28	Implement approved chemical selection procedure

MA reference	Management Actions
DPD-DLNG-MA29	Implement Santos' approved procedures for handling of treated seawater
DPD-DLNG-MA30	Comply with Australian Standards for storage and secondary containment of hazardous chemicals
DPD-DLNG-MA31	Maintain spill response equipment and procedures
DPD-DLNG-MA32	Implement and comply with the existing DLNG Emergency Response Plan (DLNG/HSE/ER/002), including in the event of a storm.
DPD-DLNG-MA33	Implement and comply with the existing DLNG Work Permit Procedure (SMS-OS-OS02-PD03) and associated manuals. This includes the requirement to have firefighting equipment close by whilst undertaking these activities.

1 Executive Summary

1.1 Background

This acid sulfate soils (ASS) and dewatering management plan (ASSDMP) has been prepared for the intertidal / onshore earthworks to be undertaken as part of the Darwin Pipeline Duplication Project ('the DPD Project').

This ASSDMP applies to the proposed earthworks associated with the construction of the pipeline shore crossing, adjacent to the existing Darwin liquefied natural gas ('DLNG') Facility at Wickham Point Road, Wickham, Northern Territory 0822 ('the site') (**Figure 2-1**). The shore crossing earthworks comprises an approximately 533 m linear trench extending from the lowest astronomical tide (LAT) mark to the upstream weld of the proposed beach valve tie-in point at the existing DLNG Facility.

The proposed pipeline shore crossing for the DPD Project is adjacent to the existing Bayu-Undan to Darwin pipeline and within the same disturbance corridor. As part of the construction of the Bayu-Undan Pipeline, natural material was removed and replaced by site-won, non-ASS, fill material across the length of the on-shore pipeline crossing.

Based on this information, this ASSDMP has been prepared on the assumption that material across the proposed development extent at the site is likely to be non-ASS material except within the intertidal zone, where ASS (as lateritic clay) may be present.

1.2 Proposed works

The construction of a duplicated pipeline shore crossing will comprise the excavation of an approximately 533 m long trench, extending inshore from the LAT to a proposed beach valve connection point. The trench is anticipated to be up to 5.0 m deep and 4.0 m wide (at its base).

The site is broadly split into two sections:

+ An 'intertidal' zone, extending from the LAT mark to the shore pull onshore termination point.
+ An 'onshore' zone, extending approximately 206 m from the shore pull onshore termination point to the upstream weld of the proposed beach valve tie-in point.

At the time of writing, the proposed earthworks methodology and schedule for the intertidal and onshore zones was still to be finalised, however the anticipated earthworks plan is as follows:

+ Intertidal zone – where the tide allows (i.e., during periods of high tide), the trench will be excavated via a vessel-based backhoe dredge (BHD) assisted by split hopper barges (SHB). During periods of low tide, the trench will be excavated via conventional land-based methods (tracked excavator)
+ Onshore zone – the trench will be excavated using a land-based backhoe excavator.

The trench will be excavated in a staged approach and will be undertaken from the shore site using an excavator from temporary causeways (up to approximately 200m long and 25 m wide either side of the pipeline).

Based upon information presented within the DPD Project's onshore Delivery Management Plan (Downer, 2022), earthworks at the site are anticipated to commence during the following timeframes:

+ Intertidal zone – between Q1 2024 and Q2 2024.

Santos

- Onshore zone – between Q2 2024 and Q4 2024.

These timeframes are indicative only and may be revised.

1.3 Objectives

The principal objectives for the ASSDMP are as follows:

1. Present relevant historical ASS investigation data and management measures
2. Detail the proposed soil management programs to be adopted during the site earthworks to mitigate or control potential impacts relating to the disturbance of ASS associated with construction earthworks (i.e., open trench excavations).
3. Detail the proposed dewatering management programs (if required) to be adopted during the excavation and dewatering of soils associated with construction earthworks (i.e., open trench excavations).

1.4 Soil findings

Historical investigation data indicated that prior to the development of the DLNG Facility, ASS material at the site could be found up to 2.5 m below ground level (bgl), underlain by siltstone bedrock.

Based upon a review of historical earthworks undertaken at the site as part of the development of the DLNG Facility, the site has had its natural material removed across the onshore zone and replaced by imported (non-ASS) fill material (generally sand) up to a depth of approximately 6 m bgl.

Based on this, ASS associated with the naturally occurring soil material is no longer expected to be present within the onshore zone, however the presence of ASS cannot be completely discounted and may require management.

Based upon data provided within the historical investigations undertaken at the site and surrounds, ASS material previously present at the site was characterised as 'Lateritic clays with various amounts of sand, silt and quartz gravel' (estuarine mud) and is present from natural surface level in the intertidal zone.

1.5 Management measures

For the purposes of managing ASS, the following management measures will be implemented:

1.5.1 Intertidal zone

- ASS material, as estuarine mud, is anticipated from surface level.

Management during high-tide periods:

- Excavation via Marine BHD assisted by SHB.
- Disposal of excavated material will be at an offshore spoil disposal ground.

Management during low-tide periods (where dredging vessel draught permits):

- Conventional earthworks plant, namely: backhoe or tracked excavator
- All encountered material (including ASS) will be stockpiled at a predetermined location situated below mean sea level and as close to the LAT mark as possible, resulting in the material being exposed during low tides

- The tidal action would gradually remove the stockpiled material and disperse it to the marine environment
- The excavated material would be removed directly from the trench excavation to the stockpile location and remain saturated at all times due to periodic tidal inundation: thereby limiting the likelihood of drying out and acidification
- This management measure is for material located within the intertidal zone, extending from LAT inshore.

1.5.2 Onshore zone

ASS material, as estuarine mud, is not anticipated in this section of the site.

Should this material be encountered during earthworks for trenching and site preparation works, suspected unexpected ASS material is to be removed from the excavation and stockpiled separately from non-ASS materials on a limestone pad ahead of confirmatory testing. Due to the timing of excavation and construction of the anchor pit (which is to occur during site preparation works), specific management procedures for the anchor pit excavation are detailed below.

The requirements for management of this material are detailed in **Appendix A**.

1.5.2.1 Anchor pit excavation

As excavation and construction of the anchor pit will occur during the site preparation works, should ASS be encountered, such material will be placed as close to the LAT mark as possible (per the intertidal zone management measures above), whilst the causeway in the intertidal zone is available. Once the causeway is unavailable, encountered ASS material, must be treated on a limestone pad as per the onshore zone management above.

Should ASS material be encountered, during the excavation, and present at the base of the anchor pit, as a contingency measure, a thin layer (10 – 20 mm) of limestone should be placed at the base of excavation and on the batters, where ASS is present.

2 Introduction

This acid sulfate soils (ASS) and dewatering management plan (ASSDMP) has been prepared for the intertidal / onshore earthworks to be undertaken as part of the Santos Darwin Pipeline Duplication Project ('the DPD Project').

This ASSDMP applies to the proposed earthworks associated with the construction of the pipeline shore crossing, adjacent to the existing Darwin LNG ('DLNG') Facility at Wickham Point Road, Wickham, Northern Territory 0822 ('the site') (**Figure 2-1**).

The shore crossing earthworks comprises an approximately 533 m linear trench extending from the Lowest Astronomical Tide mark (LAT) to the upstream weld of the proposed beach valve tie-in point at the existing DLNG Facility.

The location and layout of the site is presented in **Figure 2-1** to **Figure 2-3** (overleaf).

2.1 Acid sulfate soils – definition

ASS are naturally occurring soils, sediments and peats that contain iron sulfides, predominantly in the form of pyrite materials. These soils are commonly found in estuarine and river settings and low-lying land bordering the coast.

ASS materials are benign when in a waterlogged state. However, when these soils or sediments are drained or excavated, oxygen from the atmosphere reacts with the iron sulfides in the soil, resulting in the production of sulfuric acid. This acidity releases elements such as metals and nutrients from the soil profile which can then be mobilised/transported to waterways, wetlands and groundwater systems, often with damaging environmental and economic impacts (DER, 2015a).

The oxidation of metal sulfides is a natural weathering process that generally occurs slowly and does not pose an environmental concern. However, excavation and drainage can exponentially increase the rate of acid generation. Additionally, water draining from oxidised ASS can be strongly acidic, which acts upon soils and sediment to produce high solution concentrations of toxic metals, especially aluminium and iron. These high concentrations of metals may have a deleterious effect on human health, the environment and potentially damage infrastructure. Potential Acid Sulfate Soils (PASS) are soils containing iron sulfides or sulfidic materials in an anaerobic environment and therefore have not been exposed to air and oxidised. However, if disturbed and exposed to air and oxidised, PASS become Actual Acid Sulfate Soils (AASS).

For the purpose of this management plan, the term ASS also includes PASS.

2.2 Dewatering – regulatory context

Guidance for the approach to dewatering in shallow groundwater environments is presented in the National Acid Sulfate Soils Guidance document '*Guidance for the dewatering of acid sulfate soils in shallow groundwater environments*' (Water Quality Australia, June 2018d).

The guidance presents management principles to dewatering which '*should be applied across Australia*'. One of the principles is as follows:

'Receiving marine, estuarine, brackish, or fresh waters are not to be used as a primary means of diluting and/or neutralising ASS or associated contaminated waters.'

Given the setting of the site in close proximity to the marine environment, this report presents the dewatering approach that will ensure this guiding principle is adhered to, and that appropriate treatment and management practices for dewatering effluent are followed.

2.3 Project background

The DPD Project involves the construction of a pipeline to connect the existing Barossa Gas Export Pipeline (GEP) to the DLNG. The pipeline will run from where the Barossa GEP approaches the existing Bayu-Undan pipeline to the existing DLNG facility in Darwin Harbour. The DPD Project pipeline includes a ~23 km segment in Commonwealth waters (DPD Pipeline (Commonwealth)) and ~100 km segment in NT waters and lands (DPD Pipeline (NT)).

2.3.1 Report context

This ASSDMP applies to the proposed earthworks associated with the intertidal and onshore project area of the pipeline, covering an area from the LAT mark, to an onshore beach valve tie-in point.

This ASSDMP forms part of a suite of environmental management plans under overarching Construction Environmental Management Plans (CEMPs) for onshore and offshore construction which cover all activities from the 3 nautical mile (NM) Commonwealth/NT waters boundary to the beach valve receipt point:

+ The DPD Project Offshore Pipeline CEMP (BAS-210 0024) addresses all construction activities to be completed from the 3 NM Commonwealth/NT waters boundary to the upstream weld of the proposed beach valve receipt point (Santos, 2022c)
+ The DPD Project Onshore Pipeline CEMP (BAS-210 0025) addresses all onshore construction activities to be completed from the upstream weld of the proposed beach valve to the pipeline shore pull onshore termination point.

The work under the Offshore and Onshore CEMPs will be undertaken by different contractors. Under the offshore CEMP, there are two additional management plans that address specific activities during construction (**Figure 2-5**). These are the:

+ Trenching and Spoil Disposal Monitoring and Management Plan (TSDMMP) (BAS-210 0023) that addresses all trenching and spoil disposal activities from the 3 NM Commonwealth/NT waters boundary to the shore pull onshore termination point
+ Marine Megafauna Noise Management Plan (MMNMP) (BAS-210 0022) that addresses all activities associated with noise impacts to marine megafauna from the 3 NM Commonwealth/NT waters boundary to the shore pull onshore termination point.

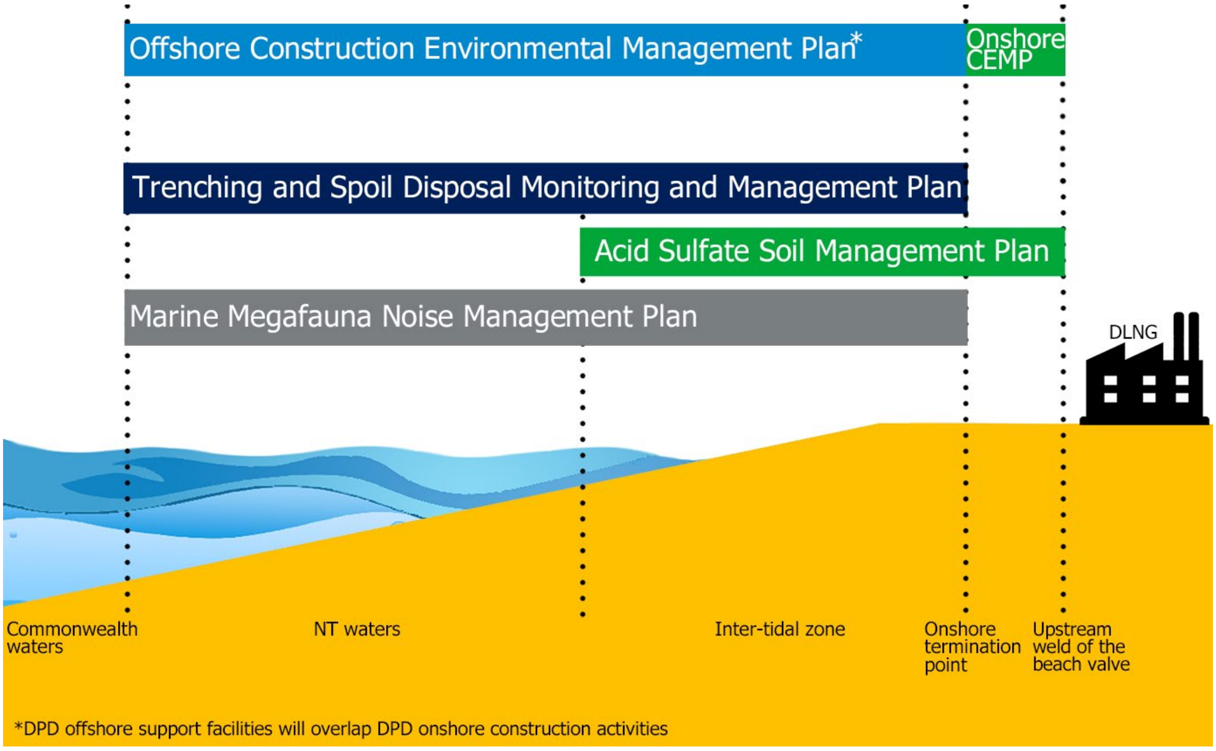

Figure 2-5: Conceptual model of management plan geographical scopes

2.3.2 Site works

The site is broadly split into two sections:

+ An 'intertidal' zone, extending from the LAT mark, to the shore pull onshore termination point.
+ An 'onshore' zone, extending 206 m from the shore pull onshore termination point to the upstream weld of the proposed beach valve tie-in point.

The location of these sections is presented in **Figure 2-2** and **Table 2-1**.

Table 2-1: Trench zone locations

Location	Kilometre point	Coordinates1	
		Easting	Northing
Upstream weld of the beach valve	KP122.690	702,472.29	8,614,655.73
Shore pull onshore termination point	KP122.484	702,272.73	8,614,606.40
LAT mark	KP122.157	701,954.81	8,614,527.82

Note:

1. Coordinates are displayed in Geocentric Datum of Australia (1994) (GDA94 MGA Zone 52).

2.4 Site background

The site is located within the DLNG Facility approved disturbance footprint. Santos is the registered owner and operator of the DLNG Facility.

This DLNG Facility and Bayu-Undan to Darwin GEP has been operating since 2006. The shore crossing route for the Bayu-Undan to Darwin GEP is situated to the south-western corner of the DLNG Facility (in the same development footprint as the site).

Several phases of desktop-based and intrusive investigations were undertaken in the vicinity of the site and across the wider area to support the development of the DLNG Facility, including work to assess and manage ASS risks across the development area.

A historical investigation undertaken by URS in 2002 (URS, 2002b) previously identified the presence of ASS across the DLNG Facility development area adjacent to the site. A subsequent ASSDMP (URS, 2004) was prepared for the development of the DLNG Facility and focussed on the presence of ASS across the wider development area.

A review of the 'Darwin 10 MTPA LNG Facility Public Environmental Report' prepared for the development of the DLNG Facility (URS, 2002a) identified the proposed earthworks strategy for the DLNG Facility development included retaining mangrove mud identified to underlie its development footprint.

As part of the construction of the initial Bayu-Undan to Darwin GEP crossing, natural material was removed and replaced by site-won, non-ASS, fill material across the length of the on-shore pipeline crossing.

The extent of historical ground disturbance associated with the development of this pipeline crossing is indicated in aerial imagery from June 2004, presented in **Figure 2-6**: . The image indicates the Bayu-Undan sea-to-shore pipeline crossing site has been subject to extensive ground disturbance, with extensive excavations present.

Based on this information, this ASSDMP has been prepared on the assumption that material across the proposed development extent at the site is likely to be non-ASS material except in the intertidal zone.

Figure 2-6: Aerial image of the site and surrounds – June 2004 (Image source: Google Earth, accessed: 19/08/22)

2.4.1 Scope and objectives

The principal objectives for the ASSDMP are as follows:

+ Present relevant historical ASS investigation data and management measures.
+ Detail the proposed soil management measures to be adopted during the site earthworks to mitigate or control potential impacts relating to the disturbance of ASS associated with construction earthworks (i.e., open trench excavations).
+ Detail the proposed dewatering management programs (if required) to be adopted during the excavation and dewatering of soils associated with construction earthworks (i.e., open trench excavations).

To meet the objectives of this ASSDMP, the following scope of work was undertaken:

+ A desktop review of publicly available information and pertinent historical reports for the site, including summarising the findings of the historical investigations
+ Assessment of ASS risk at the site, based on historical data, including the assessment of potential environmental impacts associated with the proposed earthworks
+ Assessment and presentation of ASS management measures based on historical data
+ Development of management measures, which detail the following:
  – Soil removal, handling and stockpiling operations, including the neutralisation of acidity associated with ASS (if required)
  – Treated soil validation testing programs (if required)

– Contingency measures and appropriate responses that may be implemented to rectify any breaches of the nominated triggers and management measures
– Contingency dewatering strategy.

The control measures presented herein are based on the review of historical reports only.

2.4.2 Assumptions

This management measures presented within this ASSDMP are based on the following assumptions:

+ The site has undergone extensive historical earthworks, and ground disturbance activities associated with the DPD Project will be limited to disturbance of historically imported non-ASS material except within the intertidal zone.
+ The management measures are based on a desktop review of historical information for the site and wider area.
+ The site extends to the upstream weld of the proposed beach valve tie-in point, approximately 205 m inshore of the shore pull onshore termination point. Further onshore works, between the upstream weld of the beach valve and the DLNG Facility process tie-in point are outside the scope of this ASSDMP

2.4.3 ASSDMP format

The remainder of this ASSDMP comprises the following sections:

Table 2-2: Report format

Section	Title	Description
3	Site description	Details the relevant environmental characteristics of the site with respect to ASS management.
4	Proposed earthworks and dewatering program	Outlines the overall earthworks and dewatering operations for the site.
5	Soil results	Assesses the presence and distribution of ASS within the soil at the site.
6	Groundwater quality	Provides a baseline assessment of groundwater prior to construction
7	Groundwater modelling	Details the findings of empirical groundwater modelling undertaken in support of the proposed dewatering program.
8	Assessment of potential environmental impacts	Details the potential environmental impacts from the DPD Project that might result due to disturbance of ASS through the earthworks program.
9	Proposed earthworks operating strategy	Outlines the proposed earthworks associated with the DPD Project.
10	ASS environmental reporting	Presents the environmental reporting requirements associated with the management of ASS at the site.
11	References	Lists the guidance and literature references referred to within this report.

Section	Title	Description
Appendix A	Identification and management of unexpected ASS – onshore zone	Presents procedures for the on-site identification and management of unexpected ASS material in the onshore zone.
Appendix B	Dewatering operating strategy	Presents the proposed options in managing dewatering effluent and containing relevant monitoring requirements for dewatering effluent and groundwater.

2.4.4 Guidance literature

Preparation of this ASSDMP report was undertaken with reference to the following key guidance documents on ASS and water quality:

+ Acid Sulfate Soils Laboratory Methods Guidelines (McElnea, A.E. and Ahern, C.R. 2004)
+ Australian/New Zealand Standard 5667.1:1998, Water quality – Sampling. Part 1: Guidance on the design of sampling program, sampling techniques and the preservation and handling of sampling (Standards Australia, 1998a)
+ Australian/New Zealand Standard 5667.4:1998. Water Quality – Sampling. Part 4: Guidance on sampling from lakes, natural and man-made (Standards Australia, 1998b)
+ Australian/New Zealand Standard 5667.12:1998, Water Quality — Sampling. Part 12: Guidance on Sampling of Bottom Sediments (Standards Australia, 1998c)
+ National Acid Sulfate Soils Guidance. National acid sulfate soils identification and laboratory methods manual. (Water Quality Australia, June 2018a).
+ National Acid Sulfate Soils Guidance. Guidance for the dewatering of acid sulfate soils in shallow groundwater environments. (Water Quality Australia, June 2018d).

3 Site description

3.1 Site details

A detailed site summary is provided in **Table 3-1**, below, with the site locality presented in **Figure 2-1**.

Table 3-1: Site details summary

Reference name	Darwin Pipeline Duplication (DPD) Project	
Address	Darwin LNG Facility, Wickham Point Road, Wickham, NT 0822	
Designated plant and pipeline operator	Santos	
Local government authority	Litchfield Municipality	
Current zoning	Industrial	
Area and elevation	**Area**	**Elevation**
	0.40 ha	DLNG: 12 – 15 m LAT
Site location and layout	**Figure 2-1** **Figure 2-2** **Figure 2-3**	
Coordinates – LAT (GDA 94, Zone 52)	**Easting**	**Northing**
	701,954.81	8,614,527.82
Coordinates – Shore pull onshore termination point (GDA 94, Zone 52)	**Easting**	**Northing**
	702,272.73	8,614,606.40
Coordinates – Upstream weld of the beach valve tie-in (GDA 94, Zone 52)	**Easting**	**Northing**
	702,472.29	8,614,655.73

3.2 Site setting

3.2.1 Climate

Relevant information pertaining to the site's wider setting is presented within the DPD Project's Northern Territory Environmental Protection Authority (NT EPA) referral document (Santos, 2021).

The site's climatic setting can be summarised as follows:

+ The climate is characterised by a tropical monsoonal climate with a distinct dry season (May to September) and wet season (October to March), separately by a relatively short transition period.
+ The average annual rainfall for Darwin is 1,720 millimetres (mm), with the wettest months being January to March.

Santos

- Rainfall is higher than evaporation from December to March and lower from April to November. The mean maximum temperature range is from 30.6°C (July) to 33.3°C (October and November).

3.2.2 Geology

The site's regional geological setting (based on Dames & Moore, 1997) is described as:

- Quaternary Deposits (Q)
  - Qcl – Sand, silt, clay: colluvial sediments deposited by unconcentrated surface runoff
  - Qca – Mud, clay, silt: intertidal marine alluvium
- Early Proterozoic Deposits – Finniss River Group – Burrell Creek Formation (Pf)
  - Pfb – shale, siltstone, and phyllite in places, colour banded fine to very coarse sandstone (quartz, arentite, sublitharenite, arkose), quartzite, quartz pebble conglomerate, minor graphitic phyllite, quartz-mica schist and gneiss.

The site's local geological setting (URS, 2002), prior to construction of the DLNG Facility is summarised as follows:

- Characterised by a strongly foliated and metamorphosed sequence of steeply dipping interbedded sandstone and siltstone
- Thick lateritic ironstone soil has developed on hinterland areas, whereas marine and mangrove mud characterises the seaward margin
- The marine and mangrove mud comprises predominantly silty sediments with varying amounts of sand, clay, and lateritic gravel
- Based on the understanding of the previous earthworks at the site, it is understood the site's geological setting has been highly modified, and the presence of the natural geology at the site is not anticipated.

3.2.3 Intertidal setting

The site is situated in a low-lying intertidal area of the Middle Arm Peninsula, within the wider Darwin Harbour area (**Figure 2-1**).

The clayey nature of the underlying soils and the surrounding area results in localised pooling of rainfall and limited/low infiltration rates. The site is largely cleared of large vegetation due to historical earthworks associated with the installation of the Bayu-Undan pipeline.

The coastline of the site is fringed by mangroves and clayey tidal flats to the north and south of the site.

3.2.4 Topography

The site's topographic profile is largely flat across the onshore half of the proposed pipeline extent, at approximately 12 m LAT, with a maximum height of approximately 15 m LAT. The topography of the site slopes gradually towards the coast extending towards its western extent, to a height of 0 m LAT on its western boundary.

3.2.5 Acid sulfate soil risk

The Australian Soil Information System (ASRIS) is an online data resource provided by the Federal Government's Department of Agriculture, Fisheries, and Forestry, in conjunction with the Commonwealth Scientific and Industrial Research Organisation (CSIRO).

A review of the ASRIS database (accessed: 25/05/2022), based upon an undisturbed site, indicates the site has a 'high probability' of ASS being present, albeit with 'low confidence'.

3.2.6 Groundwater and surface water

Groundwater and surface water information presented within the DPD Project's NT EPA Referral (BAA-201 0003; Santos, 2021) is summarised as follows:

+ There are no permanent freshwater habitats at the shore crossing or the adjacent mainland peninsula. However, there are several small creek lines that flow from upland areas to the harbour during the wet season.
+ Periodic monitoring of groundwater has been undertaken at the DLNG Facility and wider area since 2015. During periodic monitoring, encountered depths to groundwater at monitoring locations closest to the Site (BH05 and BH07) ranged between 1.34 m below top of casing (btoc) (approximately 0.80 m bgl) at BH05 in April 2021; and 3.14m btoc (approximately 2.60 m bgl) at BH07 in April 2021.
+ Periodic groundwater monitoring at the location closest to the site (BH7) has indicated that groundwater levels monitored in 2021 (the latest available annual reporting timeframe) range between approximately 2.4 m AHD (5.4 m LAT) and 4.7 m AHD (7.7 m LAT), dependent upon seasonal rainfall cycles. A higher groundwater level has been noted during the wet season compared to the dry season. This data is based on an historical monitoring location situated to the north of the site, and so groundwater levels at the site may vary.
+ During historical monitoring, the ambient groundwater pH typically varied between 3.9 to 6.7 pH units, whilst the recorded conductivity range varied between 109 to 82,000 micro-Siemens per centimetre (µS/cm). This variation was attributed to the climatic seasonality of the area. Increased rainfall of the wet season presents a freshwater input into the groundwater regime.
+ The Darwin Harbour surface water body is located across the intertidal zone, extending from 0 m LAT to 8.2 m above LAT during periods of high tide.

4 Proposed earthworks and dewatering program

The timing and extent of ground disturbance and dewatering associated with the development of the site can play a large role in the extent of management measures required for the site.

The proposed earthworks and dewatering programs are summarised in the following sections.

4.1 Earthworks program

The following presents a general summary of the anticipated earthworks at the site:

Table 4-1: Summary of proposed earthworks at the site

Earthworks zone	Zone definition	Proposed earthworks
Intertidal zone	Extending from 0 m LAT to the shore pull onshore termination point, over a distance of approximately 327 m (see **Figure 2-2**).	High-tide periods: + Vessel-based backhoe dredge (BHD) assisted by split hopper barges (SHB) + Disposal of excavated material will be at an offshore spoil disposal ground Low-tide periods: + Conventional earthworks plant, namely: land-based backhoe or tracked excavator + Disposal of excavated material will be through stockpiling as close to the LAT mark as possible, as per the procedures presented below.
Onshore zone	Extending from the shore pull onshore termination point to approximately the upstream weld of the beach valve tie-in point over a distance of approximately 206 m (see **Figure 2-2**).	+ The trench, including the anchor pit, will be excavated via conventional earthworks plant, namely: backhoe or tracked excavator + Management of excavated material will be as per the stockpiling and treatment procedures presented in **Appendix A**.

4.2 Proposed ground disturbance

The following presents a general summary of the anticipated ground disturbance extents:

4.2.1 Intertidal zone:

+ Trenching across this part of the site is anticipated to be approximately 327 m long, up to 5.0 m deep, and up to 4.0 m wide at the base.
+ Trenching will be undertaken by means of a combination between excavator and BHD. The exact location where vessel-based excavation and land-based excavation are separated will be determined during the course of the work.

+ This trenching may require the construction of temporary causeways (up to approximately 131.9 m long and 21.75 m wide either side of the pipeline) to enable trenching via conventional earthmoving equipment (excavator and dump trucks).
+ Given the location of this section of trenching, the excavation is anticipated to be periodically inundated by the tide.

4.2.2 Onshore zone:

+ A backhoe excavator will be used for land-based excavation. The excavations will create a trench, approximately 210 m in length, in a staged approach.
+ Based on the anticipated duration of earthworks, the trench may remain open for up to four months.
+ The trench is anticipated to be up to 5.0 m deep, and 4.0 m wide at its base.
+ Excavation pit for the hold back anchor (anchor pit), it is anticipated that the pit will be 25 m x 30 m, with battered sides, and 5 m deep (maximum depth of 8.5 m LAT).

4.3 Proposed dewatering

The use of the term 'dewatering' refers to the removal/pumping of groundwater.

The removal and/or pumping of rainwater from excavations is considered not to be required during construction and as such is not considered within this management plan. As a contingency however, a dewatering management plan has been included (Appendix B) should it be required.

4.3.1 Intertidal zone

Given the intertidal setting of this extent of the trench, no dewatering is proposed for earthworks in this section of the site as it will be subject to periodic tidal inundation.

4.3.2 Onshore zone

The requirement for dewatering is in part dependent on the groundwater levels at the time of excavation, hence varies seasonally with rainfall. Based on the current understanding of the earthworks and associated timeframes, dewatering is considered not to be required across the onshore zone.

Should however groundwater be encountered during the onshore earthworks, dewatering measures should be implemented.

The dewatering measures (if required) are presented within **Appendix B**.

5 Soils

5.1 Previous investigations

The identification and assessment of ASS for the site is based on the following historical reports:

+ D&M, 1997. 'Darwin LNG Plant – Draft Environmental Impact Statement: Appendix G – Wickham Point and Middle Arm Peninsula Terrain Analysis', Dames & Moore Pty Ltd. Ref.: 0053-164-073. July 1997
+ URS, 2002. 'Acid Sulfate Soil Investigation – Wickham Point, Northern Territory', URS Australia Pty Ltd. Ref.: 00533-244-562 R001. 19 July 2002
+ URS, 2004. 'Bayu-Darwin Pipeline Project – Acid Sulfate Soil Management Plan', URS Australia Pty Ltd. Ref.: 561-F6359.1. 6 April 2004
+ BHBJV, 2004. 'ConocoPhillips Bayu-Darwin Pipeline Project: Shore Approach, Dredging & Rock Dumping Subcontract No. BDPP-S-CO-002: Manufacturing Procedure Specification Dry Excavation', Ballast Ham / Boskalis Joint Venture, Ref.: BD-O-PR-1824, 21 April 2004.

5.2 Dames & Moore Pty Ltd, July 1997

Dames & Moore Pty Ltd (D&M) completed a historical investigation of ASS as part of a terrain analysis across the wider Wickham Point area in October 1996 on behalf of Phillips Petroleum as part of the development of the new DLNG facility.

5.2.1 Scope

The investigation comprised the following:

+ Review of desktop data for the area
+ Collection of six soil samples from near-shore locations across the wider area
+ Sample locations were accessed by boat and were collected from depths of up to 1.0 m bgl
+ Laboratory analysis on the collected soil samples.

5.2.2 Findings

Two sample locations (WP-W1 and WP-W2) were in the intertidal area in close proximity to the DPD Project site. The soils were identified as estuarine mud (brown/dark grey/green clayey silts/sands/ gravels) and the results of the laboratory analysis are summarised as follows:

+ Sulfate concentrations ranged between 0.21%S (WP-W1 0.0–0.5 m) and 0.34%S (WP–W1 0.1 m).
+ Acid neutralising capacity (ANC) concentrations ranged between 9.91%S (WP-W2 0.0–0.5 m) to 11.9%S (WP–W1 0.1 m).

The report concluded the following:

+ Sulfur concentrations in the samples could give rise to acid generation, however, due to the inherent neutralising capacity of the materials (largely due to the finely disseminated $CaCO_3$ content in the soil most likely generated from shell fragments and/or coral detritus), being an order of magnitude higher than sulfur concentrations "there would not be any nett acid production potential".

5.3 URS Australia Pty Ltd, 19 July 2002

URS completed an historical investigation of ASS across the wider Wickham Point area in 2002 on behalf of Phillips Petroleum as part of the development of the new DLNG facility.

5.3.1 Scope

The investigation comprised the following:

- Review of historical reports for the area
- Advancement of 45 boreholes, distributed across six 'sites', spread across the wider Wickham Point area, and installation of monitoring wells
- Completion of ASS field tests and laboratory analysis (peroxide oxidation combined acidity and sulfur (POCAS) suite analysis and Chromium reducible sulfur (CRS)) on soil samples at 0.5 m depth intervals
- Collection of soil samples at 0.5 m intervals for laboratory analysis
- Boreholes were advanced by hand auger to refusal, or to the 'limit of the hand auger'.

5.3.2 Findings

One of the sites (Site 6) was adjacent to the northern boundary of the DPD Project site, and included ten boreholes, of which six were advanced in onshore locations.

- A review of a geotechnical study (JFA, 2001) for the DLNG Facility, which included Site 6, identified the following:
  - Eight samples were obtained from three boreholes (P8, P9B, and P10) for laboratory (POCAS) analysis, with only Peroxide Oxidisable Sulfur (S_{POS} %S) and Titratable Peroxide Acidity (TPA; %S) reported.
  - S_{POS} concentrations ranged between 0.02 and 0.74%S (in P10_0.55–0.72 m and P9B_0.35–0.50 m respectively).
  - 'Non-detections' of TPA (i.e., 0.01%S) indicate a high acid self-neutralising capacity in all samples tested. This is likely due to the presence of large shell-grit/carbonate content
- The URS, 2002 investigation encountered the following ground conditions at Site 6:
  - Sediments comprised marine silts, sand, and gravel underlying the shoreline mangrove communities.
  - Hand auger refusal occurred on bedrock at depths ranging from 0.1 to 1.0 m bgl.
  - Field testing was undertaken upon four samples with the test results indicating 'zero to very low' likelihood of ASS.
  - Laboratory analysis was undertaken upon two samples from the Site 6 which indicated:
- SCR results ranged between 1.26–1.62%S (from sample depths of 0.2–0.6 m and 0.2–0.4 m bgl, respectively).
- High self-neutralising capacity in the samples, based on the high acidity (pHNaCl – between 8.7 and 8.8), and the concentration of 25–30% fine carbonate/shell content with a particle size of <1mm.

- The laboratory analysis indicated the samples were indicative of PASS.
- The report states that 'no additional lime should be required for neutralisation of acidity if complete oxidation were to occur'.
- These results were broadly consistent across the remaining investigation areas, distributed across Wickham Point.

5.4 URS Australia Pty Ltd, 6 April 2004

URS completed a historical ASSDMP document on behalf of a Multiplex-Saipem Joint Venture. The ASSDMP was prepared to enable the assessment of potential ASS impacts to the Bayu-Darwin Pipeline Project, and to present a contingency plan for unexpected disturbances of ASS.

The context for the document, as presented within the ASSDMP itself, was as follows:

- Although not expected to be present or be of major significance on this site, a detailed ASSDMP has been prepared prior to the proposed pipeline excavation works within estuarine sediments (mudflats). ASS have been identified in areas in close proximity to the proposed mudflat excavation site and on site but based on available site information these sulfidic soils are believed to have the capacity to self-neutralise.

The ASSDMP included a summary of historical investigations at the site, including an additional scope of investigation work undertaken by Thiess Pty Ltd (Thiess) in 2003. Theiss advanced boreholes at two locations within the development footprint of the subject site of this ASSDMP (the site).

The findings of the historical investigations were summarised as follows:

- The encountered sediments were generally marine silts and sand layers, extending to depths of up to 1.0 m bgl.
- Two samples taken from the proposed excavation site confirmed the presence of sulfidic material. The self-neutralising capacity of the soil was found to be such that the net acid generating capacity is negative (i.e., the soil has a high buffering capacity).
- Whilst these samples did not extend down the length of the excavation, they are similar in nature to those collected 100–300 m to the north of the proposed excavation site (Site 6, URS 2002).
- At Site 6 an extensive ASS investigation was carried out with all samples also having a negative net acid generating capacity. Similar ground conditions and results are anticipated at the site.
- The site investigations confirmed that the underlying strongly foliated metamorphosed sequence of interbedded sandstone and siltstone (URS, 2002) does not contain sulfidic material and therefore does not have the potential to generate acid when exposed to the atmosphere, thus does not require ASS management.

5.5 ConocoPhillips, 21 April 2004

The ConocoPhillips, 2004 report presents a Manufacturing Procedure Specification for the construction of the DLNG Facility, as part of the 'Bayu-Darwin Pipeline Project'. The document makes reference to the URS ASSDMP (URS, 2004) as the main reference document for the management of ASS.

The report presents a summary of a Thiess risk assessment undertaken for the interception of ASS material during earthworks. The scope of work undertaken by Thiess included:

- A review of historical ASS investigation data and conclusions
- Additional ASS sampling undertaken in January 2004, comprising:
  - Obtaining one soil sample from 'centreline' of the proposed onshore pipeline easement
  - Obtaining one soil sample from 'south of the centreline' of the proposed onshore pipeline easement
  - Laboratory analysis for SPOCAS analysis on both samples, which indicated that whilst sulfur concentrations were above management criteria, the soils were identified as self-neutralising.

5.6 Summary

Based upon a review of historical earthworks undertaken at the site as part of the development of the DLNG Facility, the site has had its natural material removed across the onshore zone and replaced by imported (non-ASS) fill material (generally sand).

Based on this, it is understood that ASS associated with the naturally occurring soil material is no longer present within the onshore zone, however its presence in the Onshore and Intertidal Zones cannot be discounted and may require management.

Based upon data provided within the historical investigations undertaken at the site and surrounds, ASS material previously present at the site was characterised as follows:

- 'Lateritic clays with various amounts of sand, silt and quartz gravel.' (URS, 2002).
- Generally self-neutralising due to its inherent high buffering capacity, generally associated with its high fine carbonate/shell content.

Historical investigation data indicated that prior to the development of the DLNG Facility, ASS material at the site could be found up to 2.5 m bgl, underlain by siltstone bedrock.

For management purposes, all material at the site should be considered non-ASS unless it matched the visual ASS descriptions, presented within this ASSDMP.

Whilst the majority of material onshore is considered to not require management, vigilance will be maintained during on-site works to identify natural in-situ material PASS (lateritic clays) which may have not been removed during the DLNG Facility construction.

6 Groundwater

This ASSDMP provides a discussion of the site's baseline groundwater conditions recognising the interrelationship between PASS and groundwater quality (e.g., existing ASS impacts), and the potential significance of dewatering management in maintaining shallow groundwater quality in the short and longer terms, i.e., both during and after construction.

Historical groundwater monitoring data undertaken as part of the DLNG Facility's operational license requirements (CDM Smith, 2021) identified the following groundwater quality information for the local area adjacent to the onshore zone:

+ Localised recharge of the groundwater table occurs via infiltration of rainfall through alluvial sediments.
+ Groundwater, if discharging at the coastlines, may be mixing with marine water where it is saline and seeping to near-surface environments where it is fresh.
+ Groundwater monitoring undertaken as part of the July 2021 report identified the following:
  - Groundwater across the monitoring network was identified to be acidic, with the field pH of groundwater in the local area ranging from 4.53 to 6.35 pH units.
  - Field pH values for groundwater across the monitoring well network exceeded the applied Darwin Harbour Water Quality Objectives for the site.
  - Dissolved aluminium concentrations in groundwater ranged from 0.005 mg/L to 0.852 mg/L.

Based upon a review of historical groundwater information, groundwater at the site is anticipated to be acidic and will require treatment, prior to infiltration, should dewatering of groundwater across the onshore zone be necessary.

7 Groundwater modelling

Dewatering may be required as part of the earthworks in the onshore zone.

Should groundwater be encountered during earthworks, dewatering must be implemented in accordance with the measures presented in **Appendix B**.

To inform the proposed dewatering requirements for the onshore zone, an overall approach to dewatering based on the historical groundwater information for the area is presented below.

7.1 Empirical approach

Based on the information for the DPD Project, no defined timeline or anticipated duration is available for dewatering at the site during the construction and installation of the pipeline.

Groundwater drawdown estimates were conducted utilising the empirical method as outlined in National Acid Sulfate Soils Guidance '*Guidance for the dewatering of acid sulfate soils in shallow groundwater environments*' (Water Quality Australia, June 2018d).

The radius of the cone of depression of the water table was estimated using Sichardt's equation:

$$R_o = 3000 * \mathrm{s} * \sqrt{k}$$

Where:

R_o = radius of influence of an equivalent pumping bore (m)

s = maximum drawdown of ground water (m)

k = hydraulic conductivity of aquifer matrix (units of m/s)

In the absence of site-specific hydraulic data, a K value of 3.5 x 10^{-4} m/s has been assumed (Water Quality Australia, June 2018d).

Changes in the water table elevation resulting from dewatering activities correlate with the pumping rate, the hydraulic conductivity of the aquifer matrix and the radius of influence of pumping by the following equation:

$$H^2 - h^2 = \frac{nq}{\pi k}(\ln R_o - \ln r_e)$$

Where:

H = saturated thickness of the aquifer undisturbed by pumping (m)

h = saturated thickness of the aquifer at maximum drawdown (m)

re = effective radius of an equivalent pumping bore (m)

q = pumping rate of individual dewatering well points (m^3/s)

n = number of well points used to dewater the excavation

Other parameters have been previously defined

The pumping time required for the cone of depression of the water table to extent out to the radius of influence (Ro) is given by the Cooper-Jacob empirical relationship.

$$R_o = \left(\frac{2.25 * k * h * t}{S}\right)^{\frac{1}{2}}$$

Santos

Where:

t = pumping time (s)

h = specific yield of aquifer sediments

Other parameters have been previously defined

Groundwater dewatering calculations were undertaken to assess potential environmental impacts resulting from the dewatering. The calculations provide guidance and estimations for:

+ The extent and magnitude of on- and off-site drawdown arising from dewatering operations and its potential environmental impacts on surrounding areas
+ An estimate of the volume of water that will be abstracted to achieve the required on-site drawdown.

7.2 Dewatering scenario

The following scenario for dewatering at the site was based upon the proposed earthworks. The dewatering scenario is based upon the trench having a width of five metres, being conducted in 50 m lengths. A maximum drawdown of 6 m was anticipated.

The calculation adopted the following assumptions, which were biased to being conservative in the estimation of aquifer properties (i.e., tending to over-predict dewatering required):

+ The saturated thickness of the aquifer undisturbed by pumping (H): 10.0 m
+ The saturated thickness of the aquifer at maximum drawdown (h): 4.0 m
+ A well point (n) per 2 metres of length: 10
+ The hydraulic conductivity of the aquifer matrix (k) is 1.16×10^{-5} m/s as described in the National Guidance (Water Quality Australia, June 2018a) for clayey sands
+ Groundwater is required to be drawdown by 6 m
+ The specific yield (S) is 0.1 in the absence of site-specific hydraulic information.

7.3 Results

The following results were obtained based on the assumptions presented above. The results related to each 50 m length of pipeline:

+ The radius of influence was 61 m.
+ The pumping rate was calculated at 1.6 L/s (per well) taking approximately 16 hours to achieve the drawdown for a 50 m section of the trench.
+ A calculated total of 6,327 kL of dewater was estimated to be abstracted requiring disposal to achieve drawdown per 50 m section of the excavation, i.e., cone of depression.

Based on the above, an average pumping rate of ~1.6 L/s per 50 m linear excavation extent was adopted for the site, which equates to an extracted volume of water of 6,327 m^3 over a 16-hour period per day.

7.4 Limitations of empirical method

The empirical method for estimating dewatering volumes is provided in the National Guidance (Water Quality Australia, June 2018d), however it is simplistic and does not take potential hydrogeological complexities into account. This empirical method provides estimated flows from groundwater based upon simplistic geological conditions, default hydraulic conductivity estimates and theoretical calculations.

Similarly, the method does not include the influence of rainfall recharge which can affect groundwater inflow and dewatering rates. For these reasons, the results provided are broad estimates only and may require some adjustment on-site.

8 Assessment of potential environmental impacts

The identified potential environmental impacts associated with earth working and dewatering of ASS for the various proposed construction activities are detailed in **Table 8-1**.

Santos

Table 8-1: Potential Environmental Impacts

Potential impact	Description	Predictions	Management measure
Oxidation of PASS			
Soils/sediments (excavated)	+ Generation of ASS through the inappropriate handling, treatment or disposal of excavated soils.	+ PASS in the intertidal zone is anticipated to have suitable self-neutralising capacity to avoid potential ecological damage. + PASS in the onshore zone is not anticipated to be encountered however, if encountered, will require management. + The receiving environment (the surface water) for the disposal of encountered ASS will have a high buffering capacity: minimising potential impacts from ASS disposal.	+ As per the Earthwork Operating Strategy (**Section 9**)
Soils/sediments (*in-situ*)	+ ASS oxidation effects caused through exposure of the soils to air via open excavation.	+ Drawdown of groundwater is not anticipated to impact ASS within the extent of proposed excavations. + Excavated material from the intertidal zone will remain saturated at all times prior to placement at disposal location. + Excavated material from the onshore zone is anticipated to be non-ASS (as historically imported fill). ASS oxidation and impacts associated with this zone are not anticipated.	+ As per the Earthwork Operating Strategy **(Section 9)**
Groundwater	+ Potential for acid and metal leaching through groundwater from oxidised ASS.	+ Drawdown of groundwater, if required, will be managed via the dewatering operating strategy. + Excavated material from the onshore zone is anticipated to be non-ASS (as historically imported fill). ASS oxidation and impacts associated with this zone are not anticipated.	+ As per Dewatering Operating Strategy (**Appendix B**).

Potential impact	Description	Predictions	Management measure
Surface water	+ Potential for acid and metal mobilisation into adjacent surface water (inter-tidal area of Darwin Harbour) from oxidised ASS.	+ Drawdown of groundwater, if required, will be managed via the dewatering operating strategy. + Excavated material from the intertidal zone will remain saturated at all times prior to placement at disposal location.	+ As per Dewatering Operating Strategy (**Appendix B**) and the Earthwork Operating Strategy (**Section 9**).
Sediment plume			
Poor surface water quality	+ Sediment plumes generated in Darwin Harbour during the excavation and placement of sediments/soils from the intertidal zone.	+ Given the low anticipated sediment generation volumes associated with the excavation and dispersals of emplaced PASS material at the site, the risk of adverse impacts on surface water quality is low.	+ None required.
Dewater Discharge			
Impacts to the adjacent surface water body	+ Discharge of acidic groundwater sourced from dewatering of the excavated trench in the Onshore Zone could impact the adjacent surface water body (Darwin Harbour) if not treated appropriately.	+ Should dewatering be undertaken as part of the Onshore Zone earthworks, a dewatering rate of 1.6 L/sec will be required. + This will need to be managed in accordance with the procedures presented in this document in order to avoid impacts to the adjacent surface water body (Darwin Harbour). + Note: discharge of dewatered groundwater from the Onshore Zone directly to Darwin Harbour is not acceptable.	+ As per Dewatering Operating Strategy (**Appendix B**).

9 Earthworks operating strategy

9.1 Overview

For the purposes of managing ASS, the site is spilt into the following zones (as presented in **Figure 2-3**):

+ The 'intertidal' zone, extending from the LAT mark to the shore pull onshore termination point.
+ The 'onshore' zone, extending approximately 206 m from the shore pull onshore termination point to the upstream weld of the proposed beach valve tie-in point.

For the purposes of managing ASS, the following applies:

+ Intertidal zone: ASS management measures will be required for estuarine muds (brown/dark grey/green clayey silts, sand and gravels) material from natural surface level to the top of encountered hard strata.
+ Onshore zone: All material is considered non-ASS and does not require active management. There remains the potential, albeit low, for natural in-situ lateritic (red/brown) clays/silt/sand to be present which will requirement management if encountered.

Further information on the identification of ASS *in-situ* is presented in **Appendix A**.

9.2 ASS management measures

This management measure will comprise similar steps to that presented within the ASSDMP for the DLNG Facility (URS, 2004), and is summarised below.

9.2.1 Intertidal zone

+ ASS material, as estuarine mud, is anticipated from surface level. Management measures are as follows:

High-tide periods:

+ Excavation via vessel-based BHD assisted by SHB
+ Disposal of excavated material will be at the DPD offshore spoil disposal ground (**Figure 2-1**).

Low-tide periods:

+ Conventional earthworks land-based plant, namely: backhoe or tracked excavator
+ All material will be stockpiled at a predetermined location situated as close to the LAT mark as possible, resulting in the material being saturated across most tidal states.
+ All material would be removed directly from the trench excavation to the stockpile location and remain saturated during most tidal states due to periodic tidal inundation: thereby limiting the likelihood of drying out and acidification.
+ The tidal action would gradually remove the stockpiled material and disperse it to the marine environment.

Visual inspections will be undertaken of the immediate marine environment to ensure adequate dispersal of material placed in the intertidal zone. Where residual material (mounding) is identified during the visual inspection, excess will be transferred via SHB to the DPD offshore spoil disposal ground.

Table 9-1 presents a summary of the performance indicators used to assess the effectiveness of the ASS management. The adherence to these performance indicators should be documented throughout the treatment process for inclusion in the final ASS Closure Report.

Table 9-1: Summary of ASSDMP performance indicators – intertidal zone

Item	Performance Indicator
Soil handling	+ All material will be managed as ASS (or suspected ASS) and will be stockpiled accordingly. + Accurate material movement records kept.
Stockpile all suspected ASS as close to the LAT mark as possible and have it transported to the DPD offshore spoil disposal ground or removed by tidal action.	+ All ASS placed in the intertidal zone removed by tidal action within 2.5 days from being excavated. + Where ASS is still present in a stockpile beyond 2.5 days, the remaining material should be moved via vessel-based BHD assisted by SHB and then disposed of at the DPD offshore spoil disposal ground. + All ASS material is kept saturated from excavation to placement as close to the LAT as possible, for removal via tidal action. + Records are kept for the volume of ASS material disposed of in this manner.

9.2.2 Onshore zone

+ ASS material, as estuarine mud, is not anticipated in this section of the site.

Should this material be encountered during earthworks for trenching and site preparation works, suspected unexpected ASS material is to be removed from the excavation and stockpiled separately from non-ASS materials on a limestone pad ahead of confirmatory testing. Due to the timing of excavation and construction of the anchor pit (which is to occur during site preparation works), specific management procedures for the anchor pit excavation are detailed below.

The requirements for management of this material are detailed in **Appendix A**.

9.2.2.1 Anchor pit excavation

As excavation and construction of the anchor pit will occur during the site preparation works, should ASS be encountered, such material will be placed as close to the LAT mark as possible (per the intertidal zone management measures above), whilst the causeway(s) in the intertidal zone is available. Once the causeway(s) is unavailable, encountered ASS material, must be treated on a limestone pad as detailed above (**Section 9.2.2**).

Should ASS material be encountered, during the excavation, and present at the base of the anchor pit, as a contingency measure, a thin layer (10 – 20 mm) of limestone should be placed at the base of excavation and on the batters, where ASS is present.

Santos

10 ASS environmental reporting

10.1 ASS closure report

A closure report will be prepared by an environmental professional and issued to the NT EPA at the completion of earthworks and detail (where required):

+ Management measures undertaken at the site and their effectiveness.
+ Soil validation results, both field and laboratory testing as specified in the ASSDMP (if required; see **Appendix A**).
+ Amount of neutralising agent used during construction (if required; see **Appendix A**).
+ Discussion of potential human health and environmental risk, and any remediation required.
+ Photographic record of the earthworks program.

10.2 Unexpected ASS

Should unexpected ASS be encountered the Contractor's site manager shall be responsible for:

+ Ensuring laboratory analysis is carried out to verify treatment for each identified ASS location at the frequency stipulated in this ASSDMP (see **Table A-2**, **Appendix A**).
+ Applying additional lime/calculating additional liming rates, where soils require further treatment, submitting subsequent verification samples to a laboratory for analysis, and verifying that the results meet the neutralisation criteria.
+ Maintaining a register of testing results and a record of inspections.
+ Compiling a summary report of all test results and inspections at the end each week and submitting to the Santos Project Manager.

Santos

Appendix A: Identification and management of unexpected ASS – onshore zone

General

The procedures outlined below are provided for the identification and management of unexpected ASS material that may be exposed during onshore ground disturbance activities (open excavations in the onshore zone).

Suspected unexpected ASS material is to be removed from the excavation and stockpiled separately from non-ASS materials on a limestone pad ahead of confirmatory testing as outlined below.

Identification of ASS at the site

Vigilance should be maintained during on-site works to assist with the identification of potential unexpected silt/clay or suspected ASS material encountered at the site during the course of earthworks.

Suspected ASS materials are often fine grained and located near the water table and may exhibit a “rotten egg” odour. Based on the results of previous investigations, material which appears to be clayey should be assumed to ASS.

The following visual indicators can be used to assist with the on-site identification of ASS:

+ Unusually clear or milky green drain water
+ Extensive rust coloured iron stains on any drain surfaces
+ Iron-stained drain water
+ Butter coloured jarosite present in surface spoil
+ Iron oxide mottling.

Other indicators, where none of the above is present, are waterlogged estuarine sands or silty sands having:

+ Mid to dark grey to dark greenish grey in colour; or
+ Soft and buttery clay consistency.

Material that is suspected ASS material and possesses the above traits can be confirmed by suitably qualified personnel or consultant.

If encountered the material should be stockpiled separately and treated in accordance with the management measures presented below.

Training

Equipment operators and supervisors shall be trained in the basic recognition of ASS as part of induction training. It is recommended that an experienced ASS practitioner shall be appointed to conduct site inspections and assist in the identification of ASS on an as required basis.

Auditing

An experienced ASS practitioner shall make weekly site inspections for the first two weeks of the works (dependent upon the proposed earthworks duration). The frequency of inspections required following this initial inspection period would be reviewed based on specific requirements of the ground disturbance works. The frequency may be reduced once a high level of compliance has been demonstrated.

Unexpected ASS management procedure – onshore zone

ASS is not anticipated within the proposed earthworks extent at the onshore zone. Given this, the requirements of this management measure (as an 'unexpected ASS' management procedure) are summarised below with specific procedures for the anchor pit:

Roles and responsibilities

The following responsibilities for the monitoring requirements are outlined below. All formal reporting to the Regulator will be undertaken by a suitably qualified person.

Table A-1: Monitoring Roles and Responsibilities

Monitoring activity	Parameters	Responsibility
Validation of Treated PASS Soils		
Collection of soil samples upon notification from site contractor	+ Laboratory: pHF and pHFOX, and SPOCAS[1]	+ Environmental Consultant
Review of results and notification to site contractor	+ -	+ Environmental Consultant

Note

1. Suspension Peroxide Oxidation and Combined Acidity and Sulfate.

Excavation and stockpiling of unexpected ASS material

+ Suspected ASS should be excavated and kept separate to non-ASS material.
+ The suspected ASS should be transported to a defined, bunded limestone pad for stockpiling.

Details on the construction of the treatment pad are provided below:

+ The limestone pads will be constructed in accordance with National Acid Sulfate Soils Guidance (2018b); i.e., ~300 mm thickness, with 150 mm high perimeter bunds and graded to corner/sump to capture any leachate/runoff from the drying vegetation.
+ A 'suitably qualified person' should undertake confirmatory sampling and assessment of the material to confirm the presence of ASS and required treatment rate.
+ ASS field screening (pH_F and pH_{FOX}) and CRS suite analysis with the inclusion of TPA is to be conducted at a minimum rate of 2 per 250 m^3 of recovered suspected ASS material (as per National Acid Sulfate Soils Guidance. [WQA, June 2018a]).
+ Based on the outcome of this testing, i.e., Net Acidity > 0.03%S, the 'suitably qualified person' will determine the appropriate aglime treatment rate.
+ Where aglime is applied, the 'suitably qualified person' will be notified to allow visual inspection and sampling and analysis (i.e., pH_F and pH_{FOX} per the Validation Sampling requirements).

- Based upon the results of the sampling:
  - If the treated material does not comply with the validation criteria the material should be treated with additional aglime as determined by the 'suitably qualified person'. Should the results indicate partial treatment then the liming rate, based upon SPOCAS analysis results, may be reduced to ensure that material is not over limed.
  - If treated material complies with relevant validation criteria, then no addition treatment will be necessary.
- Treated ASS materials should not be used as backfill within excavations below the groundwater table. Only non-ASS materials shall be used to backfill below the water table.
- Alternatively, ASS material can be removed from the site and disposed of to a suitably licensed waste disposal facility that is licensed to accept untreated ASS, in accordance with the waste classification guidelines (NT EPA, 2013). Sampling and disposal requirements should be confirmed with the chosen waste disposal facility prior to removal off-site.

Anchor Pit

As excavation and construction of the anchor pit will occur during the site preparation works, should suspected ASS be encountered the following is to be implemented depending on whether the intertidal zone causeway(s) is available or not:

- Causeway(s) available:
  - Suspected ASS material will be placed as close to the LAT mark as possible and allowed to disperse with the tide (per the intertidal zone management measures (Section 9.2.1).
- Causeway(s) not available
  - suspected ASS should be transported to a defined, bunded limestone pad for stockpiling or removed from the site and disposed of to a suitably licensed waste disposal facility (as detailed above),

Should ASS material be encountered, during the excavation, and present at the base of the anchor pit, as a contingency measure, a thin layer (10 – 20 mm) of limestone should be placed at the base of excavation and on the batters, where suspected ASS is present.

Stockpile management

Specifications for the preparation of the bunded treatment area and the monitoring of collected runoff are provided below.

It is important to note, as stated in the relevant guidelines (WQA, June 2018b) 'Stockpiling of soils is not to be used as an alternative to soil neutralisation, and all soils that are to be replaced in an excavation should be appropriately treated.'

Table A-2 presents the duration that ASS materials may remain untreated in medium-term stockpiles, i.e., those stored on a limestone pad (WQA, June 2018b). Exceedances of these timescales will result in non-conformances with this ASSDMP. Irrespective of how long material a stockpile, all ASS material must be treated prior to reuse onsite.

Santos

Table A-2: Indicative maximum periods for medium-term stockpiling

Type of material		Duration of stockpiling	
Texture (AS 17626-1993)	**Approx. clay content (%)**	**Days**	**Weeks**
Coarse Texture Sands to loamy sands	<5	14 days	2 weeks
Medium Texture Sandy loams to light clays	5 - 40	21 days	3 weeks
Pyritic Peat	N/A	21 days	3 weeks
Fine Texture Medium to heavy clay with silty clays	≥40	28 days	4 weeks

Preparation of a temporary treatment facility

As part of the on-site treatment of ASS, a bunded treatment area with crushed limestone pad (a dedicated facility for stockpiling and treatment of soils) shall be prepared as follows:

+ An area of at least 2 m width shall be left between the treatment areas and bunds to allow collection of runoff and direction to sumps.
+ The treatment area shall be bunded using compacted low permeability materials. The bund wall shall be of sufficient height to contain and collect runoff from stockpiled materials. the treatment pad should be constructed from crushed limestone (minimum of 300 mm in thickness).
+ Bunds will be constructed to allow collection of run-off directed to sumps (shallow drains may be employed to assist in directing flow to sumps). sumps shall be sized to allow containment of stormwater runoff from treatment areas with due consideration of possible treatment and discharge limitations.
+ The treatment areas shall be divided into a series of identifiable treatment lots. where possible, treatment lots should consist of the same lithological unit to allow for uniform liming rates. each treatment lot shall be large enough to treat up to 250 m^3 of material. stockpile height is not to exceed 2.5 m in height.

Liming rate

Should unexpected ASS be encountered, it is recommended that stockpiled material is sampled to enable the calculation of a suitable liming rate.

The calculation of liming rates is generally based upon a bulk density of 1.6 tonne/m^3, a safety factor of 1.5, and effective neutralising value (ENV) of 50%. The liming rate has been calculated as follows:

$$LR = \%S * \rho_{soil} * CF * SF * (\frac{100}{ENV})$$

Where:

LR = liming rate

S = percentage sulfur

ρ_{soil} = bulk density of soil (tonne/m^3) assumed at 1.6 tonne/m^3

CF = conversion factor (%S to kg pure $CaCO_3$/tonne) = 31.202

SF = safety factor of 1.5 as National Acid Sulfate Soils Guidance (2018a)

ENV = effective neutralising value

Sampling protocol

Samples should be collected for ASS field screening (pH_F and pH_{FOX}) testing on all samples, and the CRS Suite with TPA on all samples to enable Acid Base Accounting and the calculation of a suitable lime treatment rate.

The number of samples required (**Table A-3**) will be in accordance with the sampling densities as specified in National Acid Sulfate Soils Guidance, National acid sulfate soils sampling and identification method manual (Water Quality Australia, June 2018a).

Table A-3: Validation sampling numbers

Volume (m^3)	Number of samples
<250	2
251-500	3
1000	4
>1,000	4 plus 1 per additional 500 m^3

Quality Control and Assurance

A minimum of one field duplicate sample will be collected per 20 primary samples.

Validation criteria

In order to verify the success of the treatment, ASS field screening (pH_F and pH_{FOX}) shall be completed on all samples, and the SPOCAS suite shall be conducted on 25% of the total samples to confirm net acidity by Acid Base Accounting.

As per national acid sulfate soils identification and laboratory methods manual. (Water Quality Australia, June 2018a), the following verification conditions must be achieved to confirm the successful treatment of ASS material:

+ Net Acidity (Potential Acidity + Existing Acidity – Acid Neutralisation Capacity) ≤ 0
+ pH_{KCL} >6.5
+ TPA < laboratory's limit of reporting (LOR).

Additional lime treatment and further verification testing shall be conducted where adequate neutralisation is not initially indicated. Where additional treatment is required, the liming rate would be based on the results of the CRS verification results.

Validation and reuse of treated material

Upon completion of lime treatment, validation samples should be collected to confirm the successful treatment of the stockpiled ASS.

Once successful on-site treatment has been undertaken, the soil may be:

Santos

- Used as backfill in excavated areas of the **onshore zone** of the site (in accordance with specification requirements including but not limited to embedment, compaction, and hygiene), or
- Reused on-site.

The reuse of treated ASS materials on-site must be supported by sampling and laboratory analysis (in accordance with NEPM, 2013) to confirm the material's geochemical suitability for re-use on-site (i.e., to confirm the material is not contaminated).

The reuse of treated ASS materials as backfill must not include the placement of treated ASS beneath the groundwater table; the placement of treated ASS must be at unsaturated depths only.

Treatment of excavation areas – onshore zone

Upon excavation of suspected ASS material, the walls and base of the trench should be evenly covered by a thin layer of aglime at a rate of 2 kg per linear metre.

Photographic evidence of this coverage, along with detailed written records of the amount and location of aglime application, should be kept.

This applies to the onshore zone only.

Treatment performance indicators

Table A-4 presents a summary of the performance indicators used to assess the effectiveness of treatment.

The adherence to these performance indicators should be documented throughout the treatment process for inclusion in the final ASS Closure Report.

Table A-4: Summary of ASSDMP Performance Indicators – Unexpected ASS

Item	Performance Indicator
Identification of ASS Units	+ Inspections conducted by suitably qualified person + Unexpected ASS units are identified correctly + All contractors/contractor personnel responsible for identification of ASS have received appropriate training.
Soil handling	+ ASS (or suspected ASS) has been stockpiled separately from non-ASS material + Accurate material movement records kept
Suitably prepared treatment area	+ Treatment areas to be constructed as per measures presented in this appendix (i.e., treatment pad, bunding, sump, stockpile height) + Guard layer used between pad and stockpile + Treatment areas collecting runoff efficiently with no seepage to surrounding environment (i.e., bunding, drains, sumps)
Liming rates	+ Correct liming rates are applied through mixing of lime into soil.
Lime Addition	+ Lime addition to be undertaken based on the rate to be calculated by the Environmental Consultant.
Treatment verification	+ Verification of treatment on each treated lot + Correct verification laboratory analysis used

Item	Performance Indicator
	+ If verification shows material has a positive net acidity, additional treatment has been employed.
Non-conformance	+ All non-conformances are reported and rectified.

Responsibilities

With regards to the monitoring and reporting of treatment, the Contractor's site manager shall be responsible for:

+ Ensuring the treatment areas are constructed as described above
+ Maintaining records of all materials being disposed of or treated at the site
+ Maintaining a register of the construction details of each treatment area prepared at the site including photographs
+ Ensuring laboratory analysis is carried out to verify treatment at the frequencies presented in **Table A-3**. Where soils require further treatment, the Contractor's Site Manager shall be responsible for calculating additional liming rates, submitting subsequent verification samples to a laboratory for analysis, and verifying that the results meet the neutralisation criteria
+ Maintaining a register of testing results and a record of inspections
+ Compiling a weekly summary report of all test results and inspections for submission to the Santos Project Manager.

Santos

Appendix B: Dewatering operating strategy

The use of the term 'dewatering' refers to the removal/pumping of groundwater.

The removal and/or pumping of rainwater from excavations (where required) is not considered within this management plan.

Given the broadly-acidic state of localised groundwater at the site and the setting of the site with regards to the marine environment, **off-site discharge of acidic groundwater without treatment should not be undertaken.**

Administrative requirements

The Dewatering Operating Strategy presented in the sections below is based on National Guidance (Water Quality Australia, June 2018d) and describes how the groundwater dewatering (where required) will be managed within the site to ensure minimal impact to the environment.

This operating strategy should be reviewed by a groundwater professional upon confirmation of the extent of ground disturbance and dewatering requirements.

The groundwater potentially encountered during the proposed trenching is a superficial aquifer system. Groundwater levels in the superficial aquifer will be monitored and reviewed, during construction, by a groundwater professional.

Dewatering treatment method and materials

Table B-1 presents the dewatering effluent treatment method and neutralising agent should dewatering be required in the onshore zone.

Table B-1: Dewatering treatment method and materials

Dewatering element	Requirement
Dewatering treatment method	Automated Dosing Unit
Neutralising agent	Calcium-based neutralising agent, the use of sodium-based neutralising agents will not be permitted.

Dewatering treatment set-up

Where dewatering is undertaken, the following management procedures will be applied to the management of dewatering effluent:

+ Effluent will be pumped into a passive lime dosing (treatment) unit for the duration of the dewatering and earthworks program, to increase the pH level. Lime dosing will be manually controlled and based upon the results of monitored pH, acidity and alkalinity.
+ Treated dewater effluent discharged from the passive lime treatment unit will be directed to a settlement basin, lined by compacted limestone. Sufficient retention time will be provided to enable the precipitation of trace metals and settlement of solids from the dewatering effluent.
+ The capacity of the passive lime treatment unit and settlement basin will be maintained such that overflow does not occur to surrounding land. A small percentage of water is expected to recharge into the superficial aquifer via the settlement pond, where compacted limestone is used as a liner.

+ Treated effluent will then be directed to a bunded recharge area, constructed into in situ soils, to recharge the treated effluent to the superficial aquifer.

Figure B-1 presents the general configuration and component parts of the typical treatment system. Prior to discharging the water into a settling basin, the dewatering effluent is processed through a passive lime treatment unit. Aeration occurs upon discharge to the settling basin and is then discharged into the recharge trench/basin system.

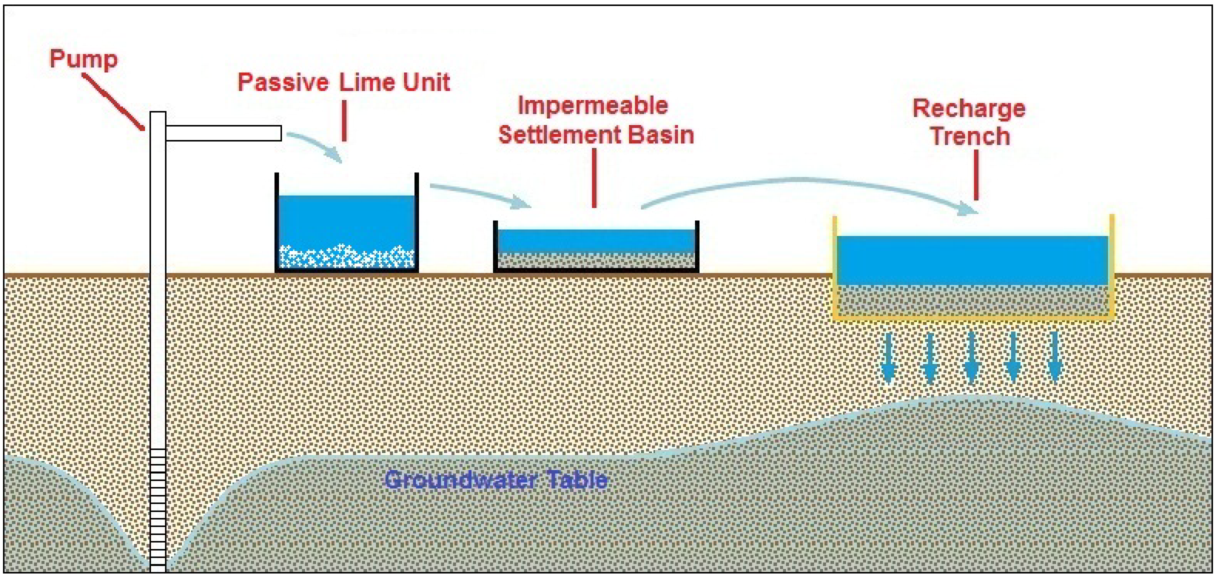

Figure B-1: Typical treatment system configuration for dewatering discharge

Should there be deterioration in the water chemistry observed at the time of construction, i.e., increase acidity and decrease in pH, then an automated lime dosing may be used in replace of the passive lime dosing unit.

Operating guidance

Table B-2: Dewatering strategy operating guidance

Dewatering element	Guidance
Criteria for Source Use	+ Potential short-term dewatering of superficial groundwater to allow the excavation of soil for the installation of the pipeline.
Dewatering Program	+ Dewatering will be limited (where required) and, if required, will be, at relatively low pumping rates, depending on the water level at the time of construction.
Timing of Pumping	+ Pumping if required will occur 24 hours a day when dewatering is required. Pumping may be temporarily suspended if dewatering is not required.
Method of Dewatering	+ The excavations are potentially to be dewatered using either groundwater spears or sump pumps. Dewater will be treated on site before being recharged to the superficial aquifer.
Abstraction Rate	+ The abstraction rate for earth works is predicted to be an average rate of 1.6 L/s, with higher initial rates.

Dewatering element	Guidance
Dewatering Effluent Treatment	+ It is recognised that the quality of abstracted dewater might differ from the monitored shallow baseline groundwater results presented in this ASSDMP. However, using the baseline data available (CDM Smith, 2021), it would appear likely that dewater would have a pH of 5.4–6.3, the total titratable acidity (TTA) will potentially exceed 40 mg/L and the alkalinity potentially be below 40 mg/L. Hence treatment for pH, acidity and alkalinity will potentially be required + Dewater treatment for pH, acidity and alkalinity correction (as necessary) would be in accordance with National Guidance, which specify that dewater having pH <6.0 and/ or TTA >40 mg/L and/or alkalinity <40 mg/L shall be subject to lime neutralisation.
Dewatering Effluent Treatment Material	+ Dewatering effluent is required to be treated with a calcium-based product.
Dewatering Effluent Disposal	+ The primary option for disposing of dewatering effluent is via recharge to the superficial aquifer.

Roles and responsibilities

The following responsibilities for the monitoring requirements, if dewatering occurs, are outlined below. Note: the baseline groundwater monitoring event is required to completed, as a contingency should dewatering occur. All formal reporting to the Regulator will be undertaken by a suitably qualified person.

Table B-3: Monitoring Roles and Responsibilities

Monitoring activity	Parameters	Responsibility
Dewatering monitoring		
Daily	+ Field analysis: pH, electrical conductivity (EC), TTA, and total alkalinity, standing water level	+ Site Contractor
Weekly	+ Field analysis: pH, EC, TTA, and total alkalinity, standing water level	+ Environmental Consultant
Fortnightly	+ Laboratory: Full Dewatering Analytical Suite[1]	
Groundwater Monitoring		
Baseline monitoring event, prior to construction	+ Field analysis: pH, EC, TTA, and total alkalinity, standing water level + Laboratory: Full Dewatering Analytical Suite[1]	+ Environmental Consultant
Every second day	+ Field analysis: pH, EC, TTA, and total alkalinity, standing water level	+ Site Contractor
Fortnightly	+ Field analysis: pH, EC, TTA, and total alkalinity, standing water level + Laboratory: Full Dewatering Analytical Suite[1]	+ Environmental Consultant
Immediately After Dewatering		
Post-Construction		
Accumulated Sediments		

Monitoring activity	Parameters	Responsibility
Upon completion of dewatering	+ Heavy metals	+ Environmental Consultant

Note

1. Total and dissolved metals, total acidity, total alkalinity, sulfate, chloride, total suspended solids (TSS), total dissolved solids (TDS), and nutrients. Field parameters including pH, EC, TTA, dissolved oxygen and redox are recorded during sampling.

All formal reporting to the Regulating Body (NT or National) will be undertaken by a suitably qualified environmental consultant.

Dewatering effluent monitoring and groundwater monitoring

Dewatering effluent monitoring:

During and following the completion of dewatering operations, monitoring will be undertaken for dewatering effluent and groundwater with reference to the applicable National Guidance (Water Quality Australia, June 2018d).

In recognition of the groundwater quality at the site, based upon the historical monitoring, the schedule for dewater having total titratable acidity (TTA) between 40–100 mg/L ($CaCO_3$ equivalents) and pH between 4–6 has been adopted and is detailed below (Table B-4). Monitoring will incorporate analysis of dewater samples collected both prior to, and following any treatment process, prior to discharge.

Table B-4: Dewatering Effluent Monitoring Program and Responsibilities

Monitoring activity	Parameters	Responsibility
Daily	+ Field analysis: pH, EC, TTA, and total alkalinity, standing water level	+ Civil Contractor
Weekly	+ Field analysis: pH, EC, TTA, and total alkalinity, standing water level	+ Environmental Consultant
Fortnightly	+ Laboratory: Full Dewatering Analytical Suite[1]	+ Environmental Consultant

Note:

1. Total and dissolved metals, total acidity, total alkalinity, sulfate, chloride, cations, total suspended solids (TSS), total dissolved solids (TDS), and nutrients. Field parameters including pH, EC, TTA, dissolved oxygen and redox are recorded during sampling.

Upon the commencement of works, the quality of the pre-treatment dewatering effluent will be assessed, and the monitoring regime amended, if required, in line with National Guidance (Water Quality Australia, June 2018d).

Groundwater monitoring:

Per National Guidance (Water Quality Australia, June 2018d), a minimum of three groundwater bores will be monitored during the works: this will require wells from the wider DLNG Facility monitoring network to be monitored.

Based upon a review of the existing well monitoring network, the proposed monitoring wells are as follows:

+ BH5
+ BH6
+ BH7.

The location of these wells is presented below.

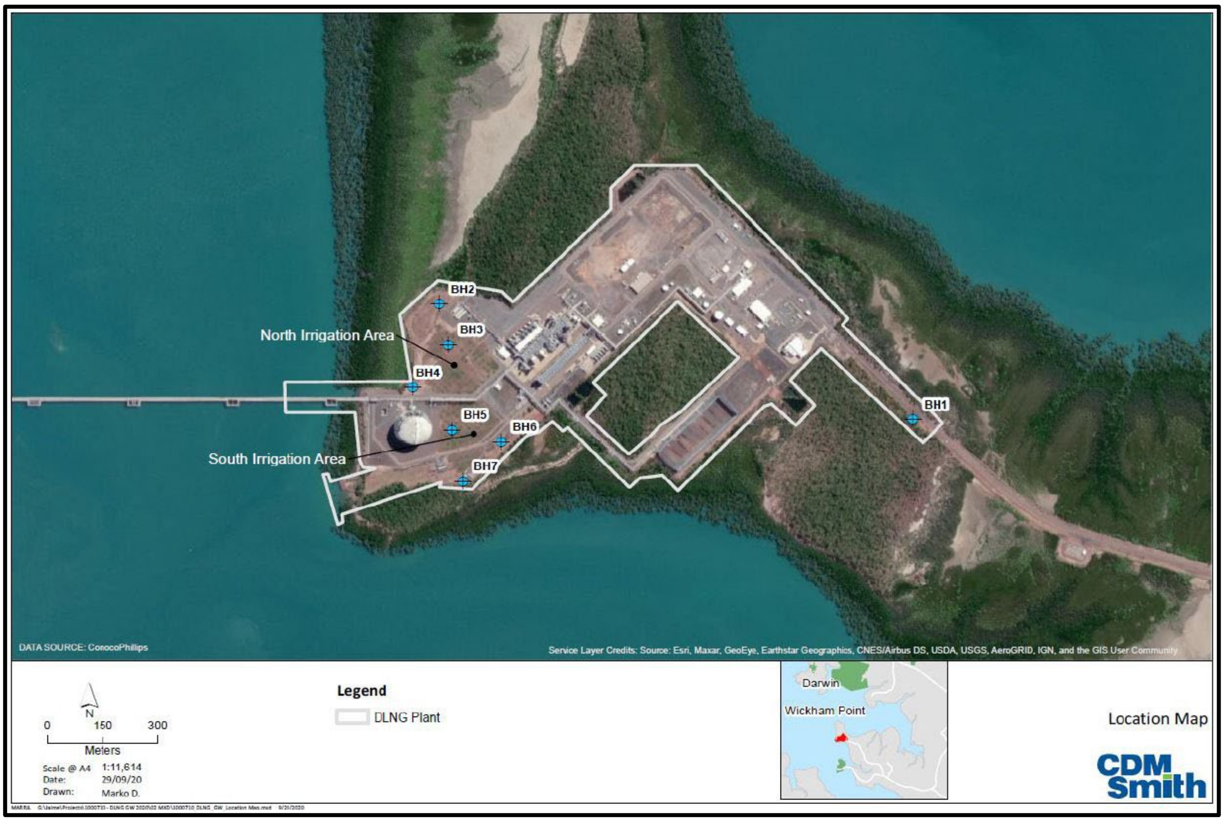

Figure B-2: Aerial image of the DLNG Facility groundwater monitoring well network (Image source: CDM Smith, 2021)

The monitoring schedule will comprise:

Table B-5: Groundwater Monitoring Program and Responsibilities

Monitoring activity	Parameters	Responsibility
Baseline monitoring event	+ Field analysis: pH, EC, TTA, and total alkalinity, standing water level + Laboratory: Full Dewatering Analytical Suite[1]	+ Environmental Consultant
Every second day	+ Field analysis: pH, EC, TTA, and total alkalinity, standing water level	+ Civil Contractor
Fortnightly	+ Field analysis: pH, EC, TTA, and total alkalinity, standing water level + Laboratory: Full Dewatering Analytical Suite[1]	+ Environmental Consultant
Immediately after dewatering		
Post-dewatering monitoring		

Note:

1. Total and dissolved metals, total acidity, total alkalinity, sulfate, chloride, cations, total suspended solids (TSS), total dissolved solids (TDS), and nutrients. Field parameters including pH, EC, TTA, dissolved oxygen and redox are recorded during sampling.

Should dewatering be required for greater then four weeks in total, groundwater will be collected every second month for six months (three sampling events) from the groundwater monitoring network for

Santos

the full ASS groundwater laboratory suite. Post-construction monitoring will commence once all dewatering works for the site has been completed.

Methodology:

Where possible for the groundwater monitoring events, groundwater samples submitted for laboratory analysis will be recovered using a low-flow bladder pump in accordance with USEPA (1996) guidance (as referenced by Australian Standard, AS/NZS 5667.11:1998). Low-stress (low-flow) purging and sampling is recommended by VEPA (2000) as samples returned are considered to be most representative of aquifer conditions, as disturbances that affect inorganic and organic contaminants are minimised.

Prior to sampling, groundwater will be purged to stability (reference parameters being pH, EC, DO, redox and temperature), measured using electronic probes. Groundwater samples will then be collected into appropriately preserved laboratory supplied containers (being field filtered for dissolved metals, as applicable). All groundwater samples will be chilled and submitted to the primary NATA accredited laboratory, for analysis within 24 hours of collection.

Quality control:

Quality control samples will be collected during each groundwater monitoring event, including a field duplicate, equipment rinsate and field blank. The full analytical suite will be conducted on the duplicate with the total and dissolved metals only from the aforementioned suite conducted on the rinsate and blank.

Water quality reference and trigger criteria

Groundwater level (drawdown) triggers:

Groundwater level triggers (below) are developed to control the depth of groundwater extraction across the site, and thereby to manage the dewatering of PASS soils.

The basis for setting the trigger levels is defined below:

+ The estimated maximum dewatering drawdown at the bore, in addition to a tolerance of 0.2 m (modelled tolerance).
+ At least three nominated groundwater monitoring wells will be monitored during the installation of the pipeline, with additional bores installed where required by the environmental consultant (e.g. should existing wells be damaged or destroyed or if monitoring indicates additional bores are required). These nominated groundwater wells will include three monitoring wells located near the site as part of the DLNG Facility monitoring network, namely: BH5, BH6, and BH7.
+ The depth to groundwater in the monitor bores and the groundwater level determined prior to the commencement of earthworks, and based upon the estimated maximum dewatering drawdown at the bore, in addition to a tolerance of 0.2 m, the drawdown triggers revised where required.

Dewatering effluent and groundwater quality reference criteria:

The criteria nominated below are consistent with targets established in National Guidance literature and have been standardised across all bores. It is noted that ASS criteria had exceeded the guidelines during the DLNG routine groundwater monitoring. It can therefore be expected that these reference criteria will likely be exceeded during the construction program.

The reference criteria will serve as a value, against which contingency responses would be considered, when taken in the wider context of "monitored data trends" over time, i.e., trends identifying deteriorating conditions.

The bore reference criteria for all bores are as follows:

+ Minimum pH: 6.0 pH units.
+ Maximum total acidity: 40 mg/L ($CaCO_3$ equivalents).
+ Maximum dissolved aluminium: 1 mg/L.

Dewatering effluent discharge reference criteria:

Presented below is a summary of the dewatering discharge criteria for groundwater dewatering effluent, as specified in National Guidance (WQA, 2018d).

Table B-6: Dewatering effluent quality

Analyte	Discharge Reference Criteria
Acidity	<40 mg/L ($CaCO_3$ equivalents)
pH	7.5 to 8.0 pH units
Alkalinity	>30 mg/L ($CaCO_3$ equivalents)

Contingency responses

The contingency responses provided below are examples of operating measures that can and may[1] be applied where water quality/levels in the receiving environment is compromised. The approach to determining a contingency response is based upon identifying, managing and addressing the specific cause of the water quality impact.

Groundwater pH and drawdown:

Where the drawdown triggers or pH refence criteria are exceeded, the following contingency measures may be implemented in consultation with the Regulator:

+ Monitoring frequency increased to daily.
+ The addition of a comprehensive suite of groundwater monitoring at an appropriate frequency may be required where dewater discharge varies significantly from pre-dewatering conditions.
+ Pumping rates may be reduced.
+ The area under abstraction at any one time may be reduced.
+ The groundwater recharge infrastructure may be modified.
+ Where a reduction in pumping rate or area under abstraction does not abate drawdown, pumps shall be suspended to allow groundwater levels to recover above the nominated trigger thresholds, unless otherwise agreed with the Regulator / project engineers.

Dewatering discharge:

[1] The word "may" is used because more than one appropriate response might apply. In any case, where a breach occurs, the incident would be reported to the Regulator and advice given and received regarding the appropriate course of action to take.

Santos

Where the dewatering effluent discharge reference criteria (Table B-6) are exceeded, the following contingency measures may be implemented in consultation with the Regulator:

+ Increased liming of dewater, and or adjustment/enhancement of existing infrastructure.
+ Pumping rates decreased.
+ Reducing the area under abstraction.
+ Modifications to the settlement basin infrastructure to promote improved settling, and precipitation of metals.

Dewatering management:

The dewatering settlement and infiltration infrastructure should be maintained in such a state to ensure the integrity of the ponds, and all dewater is contained within the ponds.

Where the integrity of the ponds is compromised and or effluent is not contained within the ponds, the following measure may be implemented in consultation with the engineers and regulators (if necessary):

+ Reduce pump rates or cease all dewatering.
+ Reduce the area under abstraction.
+ Modifications to the settlement and infiltration pond infrastructure to ensure all dewater is contained in bunded areas. This may include the addition of extra ponds, increasing the area of the bunded infiltration and or utilising storage bladders to allow slower infiltration rates.
+ Pumping of effluent from the settlement pond to the infiltration area. Any pumping should be minimal and pumping occurring the furthest distance from any treatment (i.e., lime dosing) as possible.

Where any breaches occur, the environment/groundwater consultant and engineer are required to be notified immediately and the aforementioned contingency measures implemented under direction from the Regulator.

Appendix 2 Consultation Register

1 Introduction

1.1 Purpose

On 8 December 2021, Santos submitted a referral form and supporting information to the NT EPA for the activities required to construct and operate a 100 km gas export pipeline segment in NT waters and lands (Darwin Pipeline Duplication Project).

The NT EPA published a statutory notice on 18 January 2022 inviting public comment on the submitted referral form and supporting information. The initial version of this Stakeholder Engagement Plan (SEP) was amongst the supporting documentation provided for public comment.

On 7 April 2022 the NT EPA published a Notice of Decision and Statement of Reasons advising that the method of environmental impact assessment for the DPD Project would be via a Supplementary Environmental Report (SER) that responds to submissions received on the referral and provides any additional information required by the NT EPA.

The submitted SER includes a high-level summary of Santos' engagement process (**Section 4**) while Section 5 summarises the key issues raised in submissions by stakeholders and the responses and actions taken by Santos as a result. An updated version of the Stakeholder Engagement Plan (this document) is also provided as Appendix 13.

The Stakeholder Engagement Plan (SEP) has been updated to include information on all consultation that has been undertaken by Santos since submittal of the initial referral and after the public comments were provided to Santos by the NT EPA. It also provides additional information on Santos' ongoing plan to communicate and consult with stakeholders during the remainder of the NT EPA assessment process, including the further public comment period, and during the lead-up to and execution of the proposed activities.

The SEP creates a structured process of engagement to guide Project team members on their engagement and enable Santos to articulate its commitments clearly and transparently to Government, community and other stakeholders.

The SEP enables Santos to build an understanding of stakeholder values and concerns by creating meaningful opportunities for stakeholder participation from the early stages of preparation for the Project environmental referral.

1.2 Outcomes and Objectives

1.2.1 Outcomes

Engagement for the Project is focused on achieving the following outcomes:

+ All identified key stakeholders are appropriately informed of the Project;
+ Stakeholders are provided with meaningful opportunities for consultation on the Project;
+ Traditional Owners are provided opportunities for meaningful engagement and their culture and values respected; and

- The Project specific environmental assessment has been actively informed by the input and feedback received from stakeholders.

1.2.2 Objectives

The SEP aims to achieve outcomes by:

- Creating a structured process focused on:
  - Building trust and mutual understanding between Santos and Project stakeholders
  - Addressing statutory stakeholder consultation requirements
  - Meaningfully engaging with stakeholders, specifically with regards to the environmental assessment and approvals process.
- Providing opportunities for Santos to understand stakeholder values and expectations;
- Embedding the importance of using local contractors and employees as much as possible throughout the Project;
- Ensuring that Traditional Owners and Indigenous groups are engaged in the appropriate manner;
- Securing stakeholder feedback that will be used as input for the environmental assessment process and to inform Santos' longer-term activities and community involvement; and
- Aligning with Santos' Corporate approach to stakeholder engagement.

1.3 Regulatory Requirements

As per the NT EPA environmental impact assessment guidance, proponents are responsible for undertaking stakeholder engagement and consultation from the earliest stage of the environmental impact assessment process and continuing throughout the process.

Santos is required to provide details of any stakeholder engagement and consultation undertaken to meet the requirements of section 43 of the EP Act and outline how this consultation has informed the assessment, including the environmental impact assessment, identification and management of impacts, and selection of offsets. Section 43 of the EP Act provide the general duty of proponents and states the following with regard to stakeholder consultation:

A proponent of an action has the following general duties under an environmental impact assessment process:

a. To provide communities that may be affected by a proposed action with information and opportunities for consultation to assist each community's understanding of the proposed action and its potential impacts and benefits;

b. To consult with affected communities, including Indigenous communities, in a culturally appropriate manner; and

c. To seek and document community knowledge and understanding (including scientific and traditional knowledge and understanding) of the natural and cultural values of areas that may be impacted by the proposed action."

2 Engagement Approach

2.1 Overview of Approach

Santos is committed to undertaking projects in a manner that will both deliver on regulatory requirements and engage and contribute to the communities in which it operates. More broadly, Santos is focused on understanding and integrating those matters that will ensure the long-term outcomes aspired to by relevant stakeholders. The key focus will be on:

+ Governance and systems frameworks to support the business operations and how Santos works with stakeholders;
+ The formation of long-term, meaningful relationships and partnerships with stakeholders;
+ Alignment with relevant Northern Territory standards regarding stakeholder impact assessment, management and social investment; and
+ An active risk management approach and a focus on creating longer term value for the communities where Santos operates.

2.2 Principles for Project Engagement

In developing its approach for project engagement, Santos has referred to industry leading standards and practice including the Northern Territory Stakeholder Engagement and Consultation guidance (NT EPA, 2021a), Northern Territory guidance for preparing an environmental impact statement ((NT EPA, 2021b), the International Association for Public Participation's (IAP2) Quality Assurance Standard For Community and Stakeholder Engagement (IAP2, 2015) and relevant International Finance Corporation guides (IFC, 2007).

The NT EPA guidance related to stakeholder consultation focuses on an ongoing process of stakeholder engagement that involves building relationships, actively sharing information, and bringing stakeholder voices into decisions that may affect or interest them. The Project SEP has been prepared with this outcome as a key focus.

As outlined above, Santos actively builds community investment into its overall business and planning process. Engagement for this Project will be based on the following key principles:

+ Focusing on achieving genuine outcomes for communities;
+ Providing a flexible and proactive approach;
+ Being visible and transparent;
+ Where investment in communities is undertaken, supporting projects that encourage community self-sufficiency and sustainability; and
+ Enhancing social return on investment through strategic reviews of outcomes.

To achieve engagement objectives and outcomes it is important to define and explain the parameters of the Project including decisions that have already been made, decision-making processes and governance structures, statutory obligations and regulatory requirements.

When Santos engages with stakeholders it is important that there is clarity regarding what can and cannot be influenced with regards to the Project. This is particularly important in terms of managing stakeholder expectations. The following points provide a frame of reference for what can and cannot be influenced.

2.3 Engagement Undertaken to Date

Santos has undertaken engagement throughout the Project planning and formal assessment period. Engagement has occurred with key stakeholders, including government agencies, representative industry and community bodies, regular Harbour users and the Port of Darwin where a significant portion of the project activities will be undertaken. A summary of the consultation undertaken by Santos to date is provided in **Appendix 2**.

3 Stakeholder Analysis

3.1 Approach to Analysis

The analysis of stakeholders has been undertaken with a focus on understanding stakeholder values, understanding concerns and opportunities arising from the Project, and understanding potential impacts, risks, and levels of interest and influence. The intent of this initial analysis is to provide Santos with the foundation through which to inform the referral and continue engagement as the Project develops.

3.2 IAP2 Core Values

Stakeholder values are an important frame through which to understand what may be of importance. In accordance with the NT EPA stakeholder engagement and consultation guidelines, consultation will be guided by the principles of engagement, based on stakeholder level of interest and concern as outlined by the. The IAP2 core values for practicing public participation and community engagement are:

1. Public participation is based on the belief that those who are affected by a decision have a right to be involved in the decision-making process;
2. Public participation includes the promise that the public's contribution will influence the decision;
3. Public participation promotes sustainable decisions by recognising and communicating the needs and interests of all participants, including decision makers;
4. Public participation seeks out and facilitates the involvement of those potentially affected by or interested in a decision;
5. Public participation seeks input from participants in designing how they participate;
6. Public participation provides participants with the information they need to participate in a meaningful way; and
7. Public participation communicates to participants how their input affected the decision (IAP2 2014).

The purpose of these core values is to help make better decisions which reflect the interests and concerns of potentially affected people and entities (IAP2 2014).

3.3 Stakeholder Groups

A full list of currently identified stakeholders for the Project is provided in **Appendix 2**.

It is to be acknowledged that this is an initial list and as the SEP is implemented, further categories, stakeholders and more specific stakeholder details will be added.

3.4 Level of Engagement

The Project consultation associated with the referral and subsequent phases of the Project will be in accordance with the IAP2 principles to determine the appropriate levels of engagement (IAP2 2015). As the Project progresses, the level of engagement will be identified and determined on a case-by- case basis and certain stakeholders may be involved and collaborate on aspects of the Project.

Stakeholder engagement is an essential component in the process of assessing the Project’s social, economic and environmental impact.

For the purpose of managing the level of engagement with stakeholder, stakeholders have been grouped as follows:

+ Level 1: Landholders, Indigenous Stakeholders or Traditional Owners, surrounding tenure holders, operating licence holders (e.g. fishing tourism, industry) and Government;
+ Level 2: Key interest groups and local communities;
+ Level 3: General public, community and special interest groups, wider region and Territory - based organisations.
+ Approaches or requirements that must be implemented due to statutory obligations and regulatory requirements.

Table 3-1 provides the IAP2 spectrum’s level of engagement and Santos’ relevant approach at each level. For Level 3 stakeholders the level of participation for this Project is anticipated to be inform and consult, for Level 2 stakeholders inform, consult and involve, and for Level 1 stakeholders, collaboration is anticipated.

The stakeholders’ ability to influence decisions depends on the decision type and what aspects of the Project are negotiable and what aspects are non-negotiable (IAP2 2015). The process is intended to be flexible and open to including relevant stakeholders to the maximum extent possible, while maintaining focus on targeted engagement where it makes sense.

Table 3-1: IAP2 Levels of Engagement

Level of Engagement	Stakeholder Level	Approach to the Community and Stakeholders
Inform	1, 2 and 3	Santos will aim to keep stakeholders informed
Consult	1, 2 and 3	Santos will keep stakeholders informed, listen to and acknowledge concerns and aspirations, and provide feedback on how stakeholder input influenced the decision.
Involve	1 and 2	Santos will work with stakeholders to ensure that their concerns and aspirations are directly reflected in the assessment completed and control measures employed and provide feedback on how stakeholder input influenced decision.
Collaborate	1	Santos will look to stakeholders for advice and innovation in formulating solutions and incorporate their advice and recommendations into the decisions to the maximum extent possible.
Empower	1	Santos will implement relevant stakeholder decisions where appropriate and feasible.

Amended from IAP2 2015

3.5 Identification of Potential Concerns and Opportunities

Potential concerns and opportunities that may be experienced by stakeholders during the lifecycle of the project have been outlined in **Table 3-2** below. The purpose of this identification is to understand stakeholder perspectives on what may be of concern to them regarding the project so that Santos can understand potential impacts to stakeholders and what may trigger potential risks.

Understanding stakeholder concerns and their view regarding potential impacts (both actual and perceived) means that Santos can tailor why and how it engages with stakeholders and control the key messages that are communicated. This is also critical to understanding potential stakeholder risks, which in many cases are driven by perceptions stakeholders have of things that are important to them and may often be emotive and subjective. Often these perceptions may not be 'actual impacts' or supported by technical studies but it is critical to understand these.

Table 3-2 is an initial identification of potential concerns and opportunities and as such must be re- visited once Santos has undertaken more detailed engagement with stakeholders during the life of the Project. It is important that as part of this, environmental concerns and opportunities are identified as these are often key areas of interest for stakeholders.

Although this SEP is focused on the pre-construction lifecycle phase, potential concerns and opportunities have been identified across the project lifecycle as these perceptions and potential impacts will influence how stakeholders need to be engaged from the beginning of the project.

Table 3-2 : Potential concerns and opportunities that may be experienced by stakeholders during the project lifecycle

Project Phase	Potential concerns (perceived or actual)	Potential opportunities (perceived or actual)
Pre-construction (includes approvals)	+ Potential contamination of water or land from access for surveys + Potential introduction of invasive species from access for surveys + Potential direct mortality of fauna from vessel/vehicle access + Potential to disturb unidentified Indigenous and non- Indigenous cultural heritage items through initial surveys and investigations + Potential for minor rubbish from initial investigative surveys and site investigations	+ Surveys build understanding of activities likely to be impacting greater regional environment + Build understanding of the fauna condition and habitat values + Protection of fauna habitat due to any offsetting + Increased training and employment opportunities improving capabilities and skills in local and regional areas + Increase in local and regional socio-economic conditions + Opportunities for local suppliers and contractors + Employment and business opportunities for Indigenous community members
Construction (construction of the Project)	+ Potential water quality impacts, resulting from disturbance, accidental pollutant and contaminant releases + Exposure of soil to erosive factors during earthworks + Potential contamination of water or land through contaminant release (e.g. diesel leakage) + Site clearance and resulting environmental impact + General interference to the activities of other users of the marine environment + Disturbance to habitat connectivity + Excessive noise during construction potentially leading to species fragmentation	+ Data from monitoring health of water resources during construction + Greater understanding of ecological environment due to any ongoing Project investigations + Management and protection of fauna habitat + Increased training and employment opportunities improving capabilities and skills in local and regional areas + Increase in the local and regional socio-economic conditions + Opportunities for local suppliers and contractors + Employment and business opportunities for Indigenous community members

Project Phase	Potential concerns (perceived or actual)	Potential opportunities (perceived or actual)
	+ Artificial light spill on the environment potentially disturbing and altering behaviour of a range of species + Visual amenity impacts + Potential for inappropriate behaviour of contractors and employees + Potential disturbance of unidentified Indigenous and non-Indigenous cultural heritage (despite cultural heritage clearance)	+ Protection of any identified items of cultural heritage significance
Operations (Note: majority of listed concerns relate to the resulting ongoing operation of the DLNG facility)	+ Potential water quality impacts, resulting from watercourse disturbance, accidental pollutant and contaminant releases + Potential contaminant release (e.g. diesel leakage) + Disturbance to habitat connectivity + Potential spread and introduction of weeds during operation + Potential fire leading to destruction of habitat + Site clearance and resulting environmental impact + Potential for inappropriate behaviour of personnel + Potential disturbance of unidentified Indigenous and non-Indigenous cultural heritage (despite cultural heritage clearance) + Potential increase in local waste volumes during operation + Potential water and land contamination	+ Management and protection of remaining flora on site + Greater understanding of ecological environment due to any ongoing Project investigations + Management and protection of fauna habitat remaining on site + Potential to provide visual amenity management measures + Increased training and employment opportunities improving capabilities and skills in local and regional areas + Increase in the local and regional socio-economic conditions + Opportunities for local suppliers and contractors + Employment and business opportunities for Indigenous community members + Protection of any identified items of cultural heritage significance
Decommissioning	+ Loss of jobs and employment (Note: the majority of risks listed above for construction and operations would also apply for decommissioning work)	+ Rehabilitation of the Project site and habitat + Potential re-use of Project components

3.6 Level of Engagement and Activities

Based on the analysis above, the following levels of engagement have been identified for stakeholder groups. These levels are based on the principle that engagement will be tailored by considering levels of stakeholder impact, interest and influence, and risk – with the assumption that the higher the level of impact and risk – the deeper the level of engagement required. This approach needs be flexible based on each specific stakeholder group and potential changes in stakeholder expectations and risk. Description of engagement levels and example activities are provided in **Table 3-3**.

Table 3-3: Different depths of engagement / communication

Level of engagement	Description	Example Activities
General	+ General provision of project information and updates (this includes overview of potential impacts and mitigation / management strategies) + Opportunities to provide feedback through general activities and communication mechanisms (e.g. via website, email, as part of statutory consultation approach) + Audience: all stakeholders have access to information and activities	+ Website + Project information sessions + Media releases + Public consultation process
Targeted	+ Targeted engagement and communications specific to stakeholder group + Targeted engagement and communication activities designed to gain specific feedback + Ongoing opportunities to provide feedback and discuss key project elements (e.g. how potential impacts to a specific value could be managed) + Audience: while information may or not be publicly available activities are targeted towards specific group of stakeholders and are generally not open to 'general public'	+ Targeted group briefings or presentations + Targeted group or individual meetings + Targeted information portal e.g. ICN + Access to all general activities
Individualised	+ Engagement and communications developed for needs and expectations of specific stakeholder + Focus on gaining specific feedback and input from individuals / small group of individuals + Information in the form it was provided only + accessible to specific party with which it was shared e.g. while a Minister may be provided + information about jobs etc. that is available to the public the content of the conversation will be confidential	+ One-on-one meetings focused on specific topic of interest for both parties + Negotiation of formal contract or partnership (e.g. supplier agreement) + Shared value definition workshop / partnership + regarding social investment + Personalised email / phone conversations

Level of engagement	Description	Example Activities
Regulatory	+ Ongoing interaction with the regulator. This will be tailored depending on agency roles + More structured and individualised engagement will occur with lead agency + Ongoing opportunities to provide feedback	+ Structured meetings and communication schedule with lead agency + One-on-one / group meetings as required + Ongoing email and phone communication as required

3.7 Monitoring and Evaluation

Santos will maintain a stakeholder management register to record external stakeholder interactions for the Project (pre-construction, construction, operation). It is important that this register is updated by all team members following engagement activities so these can be monitored and any stakeholder concerns or opportunities followed up. This is particularly important for the approvals process as records of engagement activities need to be summarised and provided as part of approvals documents to demonstrate adequate engagement has been undertaken.

From a risk management perspective, this is also important for Santos as/if issues arise there is a formal record of engagement that has been undertaken, and how these issues have been closed out as appropriate. If Santos undertakes broader sustainability reporting at a corporate level, these types of records can also be drawn on to align with Corporate.

With regards to monitoring the effectiveness of this plan, the implementation will be reviewed quarterly. The plan should be revised, including the stakeholder analysis, prior to the commencement of each Project stage to incorporate lessons learned, stakeholder feedback and evolving issues, opportunities and risks that may have arisen.

Any review should consider the following:

+ Feedback from the regulator, external stakeholders, Santos employees and contractors;
+ Any complaints or findings from audit, review and inspections;
+ The outcomes of any incidents and how they can be managed / mitigated in the future;
+ Changes in Santos organisation structures, roles and responsibilities; and
+ Changes in regulation and guidelines that may impact engagement expectations of the regulator and community.

4 Stakeholder Engagement Program

The following engagement program establishes the activities to be undertaken and key project milestones. All engagement undertaken for the Project to date is summarised in the register located in **Appendix 2**.

Santos

Table 4-1 Engagement Program

Stage	Aims and Activities	Deliverables	Status
Stage 1 – Preparation of Referral prior to submittal to NT EPA October to December 2021	Aims: Advise stakeholders of proposed DPD activities and regulatory assessment process and discuss key issues/concerns to inform preparation of referral Key activities: + Initial engagement with NT regulators (EPA, DEPWS, DIPL, DITT) and key stakeholders representing other users of the marine environment + Notification to all identified stakeholders on submittal of referral and ongoing opportunity to engage with Santos + Initial engagement with Commonwealth Waters regulator (DCCEEW) to discuss EPBC Referral process. + Ongoing engagement with potential suppliers via ICN NT	+ Total of 40 stakeholder meetings held + Email, phone contact + Distribution of fact sheet via email + Information posted to Santos website + Project page on ICN Gateway website + Santos ASX and media statements issued	Complete
Stage 2 – Public Comment Period on Referral and ongoing engagement awaiting NT EPA decision January to March 2022	Aims: To ensure stakeholders are aware of opportunity to comment on referral documentation, respond to requests for further information and continue to gather information on issues/concerns. Key activities: + Engagement with NT EPA (via DEPWS) on referral contents and public comment process + Notification to all identified stakeholders of availability of referral documents for public comment + Engagement with stakeholders (e.g. Paspaley Pearling, AFANT) responding directly to Santos on issues/concerns related to the referral + Continued engagement with NT Government agencies and private organisations on technical issues, secondary project approvals (e.g.	+ Total of 22 stakeholder meetings held + Email, phone + Distribution of project update via email + Publication of Referral documentation on NT EPA website + Notification via email of public comment period + Information posted to Santos website + Project page on ICN Gateway website + Santos ASX and media statements issued	Complete

Stage	Aims and Activities	Deliverables	Status
	planning permits, pipeline licences, waste discharge permits) and collaborative opportunities + Engagement with the Aboriginal Areas Protection Authority (AAPA) on the process for obtaining a Clearance Certificate for the proposed Operational Area, including independent consultation with indigenous Traditional Owners and Representative Bodies + Ongoing engagement with potential suppliers via ICN NT + Continued engagement with Commonwealth Waters regulator (DCCEEW) to discuss EPBC Referral process.
